These are plotted onto a risk matrix and the frequency of each of the hazards is factored into the risk assessment. The intention is to ensure that the focus of major emergency management is on the hazards most likely to occur in an area, that the scale of preparation is in proportion to the risks and that the response to major emergencies builds out of normal response issues, such as resource mobilisation, co-ordination, decision making, etc.

A broader National Risk Assessment prepared by the Department of the Taoiseach (Prime Minister) includes a summary risk assessment for major emergencies with a review of fiscal, economic and social risks.

The MEM Framework separately sets out a risk assessment procedure aimed at the participating principal response agencies as a basis of major emergency management planning and preparedness strategies;

*"Each principal response agency should, in association with its partner response agencies, carry out a risk assessment in accordance with the procedures set down in this section. The initial risk assessment should be reviewed and updated annually, or as circumstances require."*¹²⁰⁵

¹²⁰³ Council Conclusions on a Community framework on disaster prevention within the EU, 2979th JUSTICE and HOME AFFAIRS Council meeting Brussels, 30 November 2009.

¹²⁰⁴ Department of Defence, 2012.

¹²⁰⁵ National Steering Group on Major Emergency Management; "A Framework for Major Emergency Management", 2006, Available from: www.mem.ie.

The risk assessment procedure underpins work in the later stages of the emergency management cycle. The risk assessment process is carried out initially within each principal response agency that focuses on their own procedures and perspectives and feeds this information into an inter-agency team, working under the aegis of the Regional Steering Group on Major Emergency Management.

The outcomes from the Regional process are then incorporated into each principal response agency's Major Emergency Plan.

The risk assessment comprises four stages as illustrated in Figure 2 which are;

1. Establishing the context
2. Hazard Identification
3. Risk Assessment
4. Recording potential hazards on a risk matrix

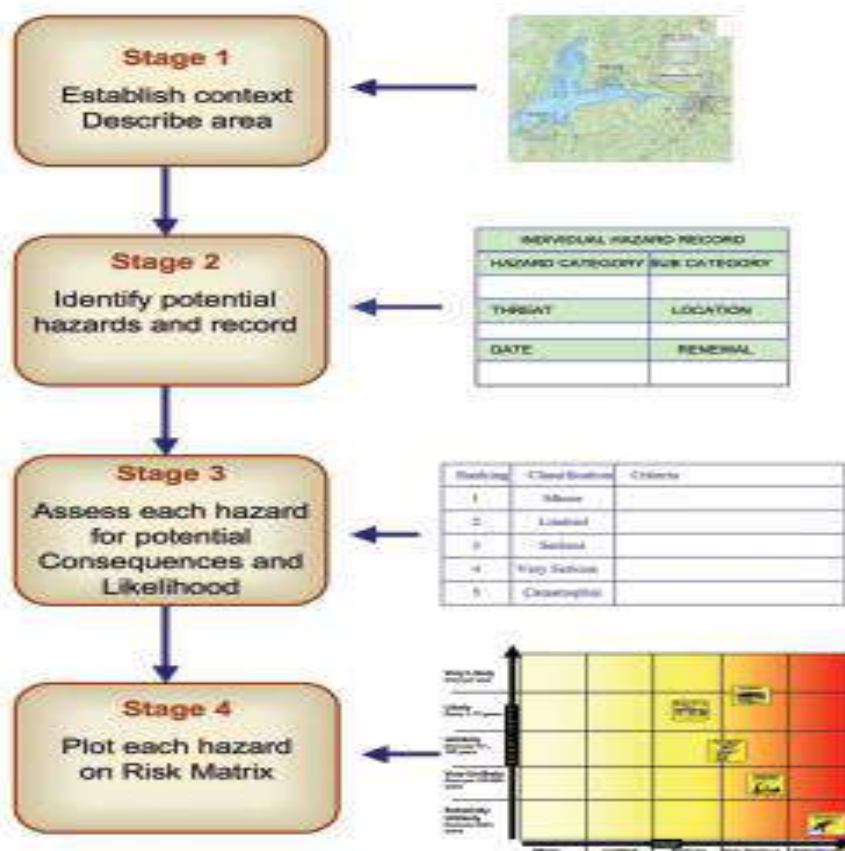

The current National risk assessment for Ireland has identified the following as the most likely and the most impactful risks for Ireland:

Table 14: Most likely and most impactful hazards

Most Likely	Most Impactful
Low Temperatures	Loss of critical infrastructure
Flooding	Infectious diseases
Radiation (domestic)	Disruption to energy supply

(Source: OEP; *A National Risk Assessment for Ireland*, 2012)

Figure 8: Schematic Risk assessment Process

(Source: A Framework for Major Emergency Management, 2006)

Table 15: Classification of Likelihood

Ranking	Classification	Likelihood
1	Extremely Unlikely	May occur only in exceptional circumstances; Once every 500 or more years
2	Very Unlikely	Is not expected to occur; and/or no recorded incidents or anecdotal evidence; and/or very few incidents in associated organisations, facilities or communicates; and / or little opportunity, reason or means to occur; May occur once every 100-500 years.
3	Unlikely	May occur at some time; and /or few, infrequent, random recorded incidents or little anecdotal evidence; some incidents in associated or comparable organisations worldwide; some opportunity, reason or means to occur; may occur once per 10-100 years.
4	Likely	Likely to or may occur; regular recorded incidents and strong anecdotal evidence and will probably occur once per 1-10 years
5	Very Likely	Very likely to occur; high level of recorded incidents and/or strong anecdotal evidence. Will probably occur more than once a year.

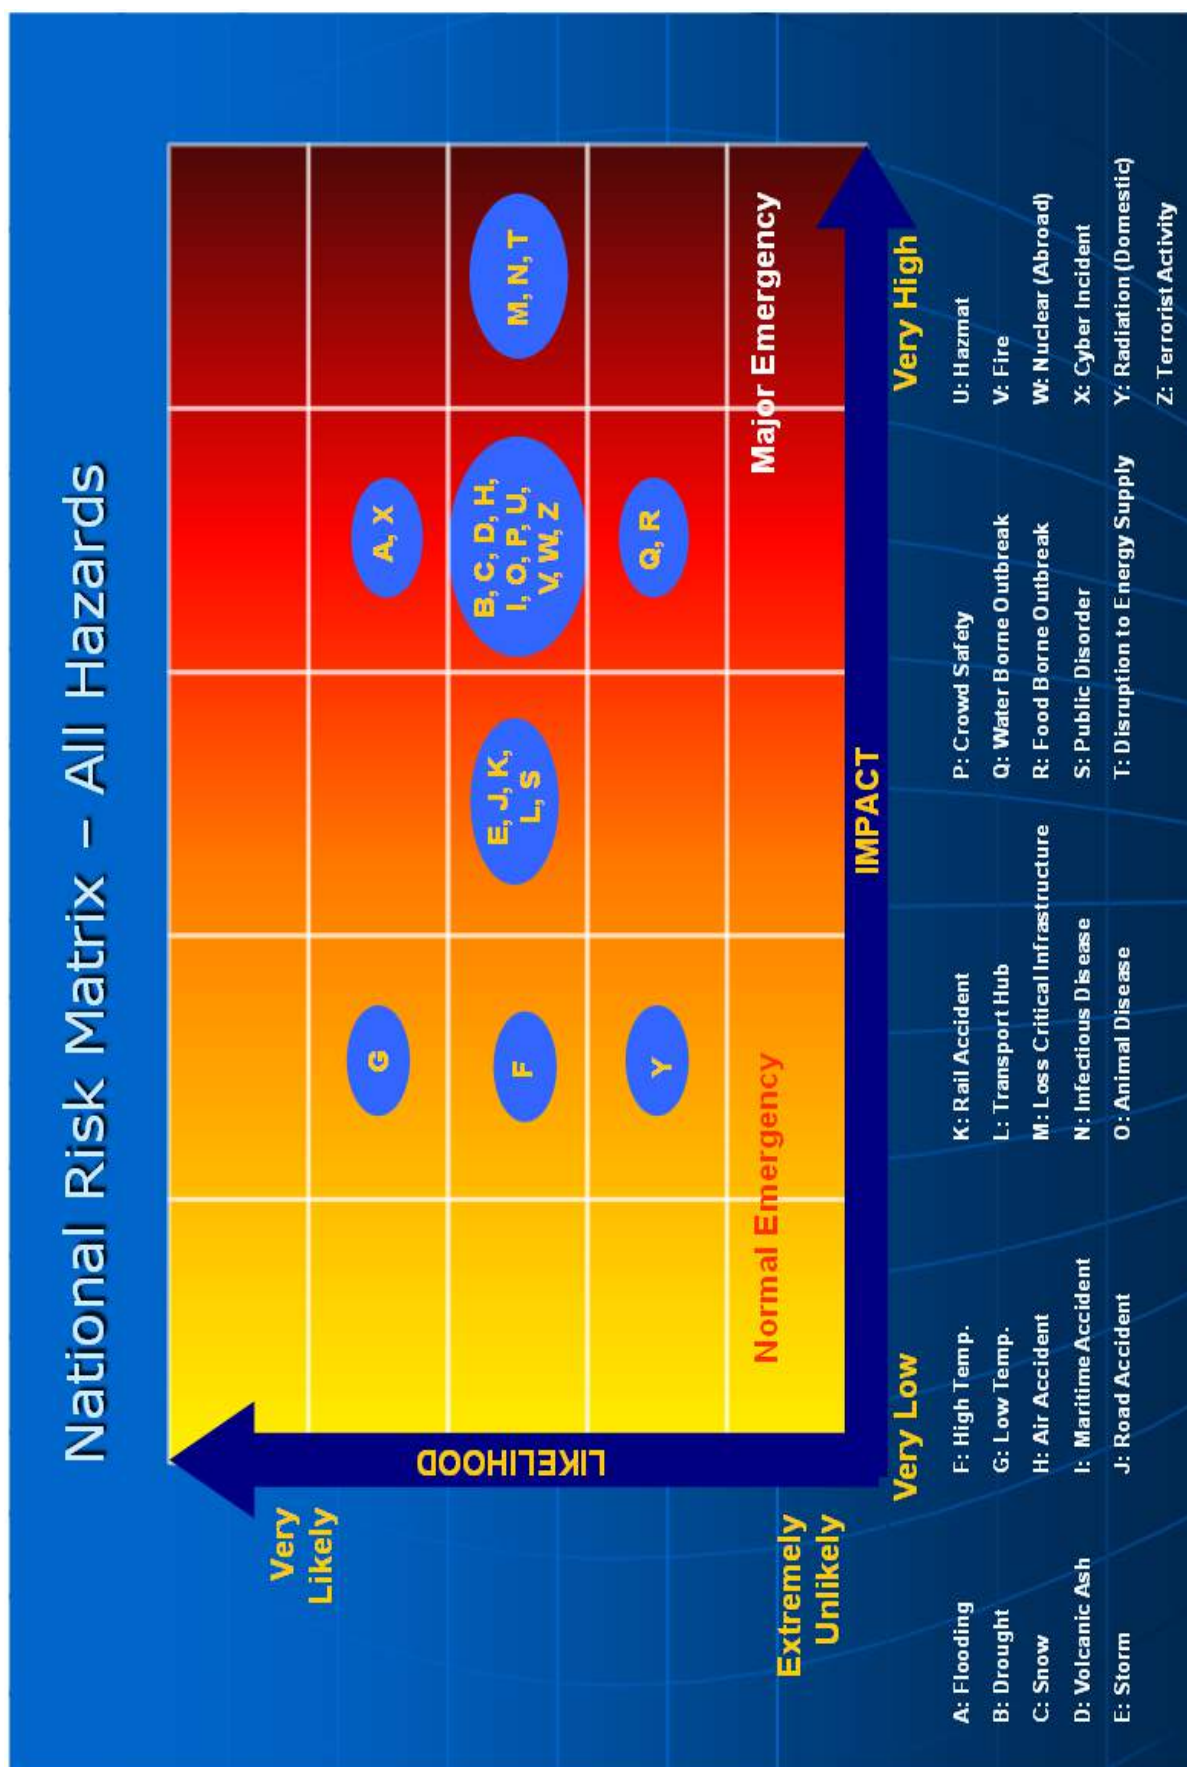

(Source: OEP; A National Risk Assessment for Ireland, 2012)

Table 16: Classification of Impact

Ranking	Classification	Impact	Description
1	Minor	Life, Health, Welfare Environment Infrastructure Social	Small number of people affected; no fatalities and small number of minor injuries with first-aid treatment. No contamination, localised effects <0.5M Euros Minor localised disruption to community services or infrastructure (<6 hours).
2	Limited	Life, Health, Welfare Environment Infrastructure Social	Single fatality; limited number of people affected; a few serious injuries with hospitalisation and medical treatment required. Localised displacement of a small number of people for 6-24 hours. Personal support satisfied through local arrangements. Simple contamination, localised effects of short duration 0.5-3M Euros Normal community functioning with some inconvenience.
3	Serious	Life, Health, Welfare Environment Infrastructure Social	Significant number of people in affected area impacted with multiple fatalities (<5), multiple serious or extensive injuries (20), significant hospitalisation. Large number of people displaced for 6-24 hours or possibly beyond; up to 500 evacuated. External resources required for personal support. Simple contamination, widespread effects or extended duration 3-10M Euros Community only partially functioning, some services available.
4	Very Serious	Life, Health, Welfare Environment Infrastructure Social	5 to 50 fatalities, up to 100 serious injuries, up to 2000 evacuated Heavy contamination, localised effects or extended duration 10-25M Euros Community functioning poorly, minimal services available
5	Catastrophic	Life, Health, Welfare Environment Infrastructure Social	Large numbers of people impacted with significant numbers of fatalities (>50), injuries in the hundreds, more than 2000 evacuated. Very heavy contamination, widespread effects of extended duration. >25M Euros Serious damage to infrastructure causing significant disruption to, or loss of, key services for prolonged period. Community unable to function without significant support.

(Source: OEP; A National Risk Assessment for Ireland, 2012)

Figure 9: National Risk Matrix

(Source: OEP; A National Risk Assessment for Ireland, 2012)

The risk assessment provides a basis for determining a range of steps at later stages of the emergency management cycle - especially in the Mitigation and the Planning and Preparedness stages. Each principal response agency uses the chosen scenarios as a basis for determining a range of essential response requirements for major emergencies. Response dimensions are qualitative or quantitative statement of the performance required of a system or resource to deliver an appropriate responses to mitigate the impact of the emergency.

These responses cover topics such as:

- Provision of resources or specialist equipment
- Number and quality of local responders
- Situations where plans or 'Standard Operating Procedures' are required for specific risks
- Areas where training and exercising should be focussed
- Situations/sites/events where specific protocols need to be established with third parties such as utility companies or with the private sector

In relation to *public perception of risk* there is limited research. Eurobarometer 383 (2012) places Ireland significantly below average in terms of levels of concern with the likely impact of natural and man-made disasters. The same research shows Ireland as having the second highest self-perceived level of awareness of EU-level civil protection activities.

1.2 Policy and Governance

There is no single agency responsible for major emergency management in Ireland and there is no dedicated legislative structure governing the area. Each Government ministry and public authority is responsible for maintaining emergency management functionality according to their statutory remits.

At a strategic level, the Government Task Force on Emergency Planning is the top-level body which coordinates and oversees the emergency management activities of all Government Departments and Public Authorities. This Taskforce, comprising those Ministers and/or Senior Officials of Government Departments and Public Authorities making a key contribution to the emergency management process, is chaired by the Minister for Defence. It meets 6-8 times a year and is viewed as a highly active forum.

The Office of Emergency Planning (OEP), within the Department of Defence, supports the work of the Government Task Force. The OEP operates a central coordination facility located in Dublin which is activated as appropriate and is highly flexible. The facility has the ability to ensure effective communication between government departments and agencies.

There is a clear distinction drawn between bodies which have an ongoing strategic remit and those which are activated when an emergency is anticipated, underway or requires a significant recovery effort. Ireland has adopted the "Lead Department" principle which means that the Government

Department having responsibility for a particular area of public life (transport, energy, health etc) takes the lead when an emergency occurs in that area.

In 2008, the Government agreed and published the “Strategic Emergency Planning Guidance”¹²⁰⁶ document which defines the Lead Department with respect to a range of major emergencies.

A number of sectoral documents cover operational plans by Lead Departments or a combination of Departments which have to work together in response to more common emergencies. Principal examples include maritime emergencies, nuclear accidents and pandemic flu (see appendix). However the most significant relates to the police, health and fire services which operate a permanent structure and strategy for addressing the most common major emergencies. The *MEM Framework* is distributed to all local authorities and responsibility for identifying risk and preparing plans are delegated at local level. The Framework implements the national “all-hazards” approach¹²⁰⁷. The Framework is constructed around a five-stage systematic frame for emergency management¹²⁰⁸. Major Emergency Management arrangements fit in with existing organisational and Government structures and coordination mechanisms are added as required. Principal response agencies are identified for each type of emergency and response is designed to build up from the lowest appropriate units of An Garda Síochána, The Health Service Executive and the Local Authorities.

Figure 124: Five-Stage Emergency Management Paradigm. (Source: A Framework for Major Emergency Management 2006).

Local authorities coordinate planning and response between first responder agencies, volunteer agencies and the media within their area. Local preparedness and response varies across the 26 county councils and the 5 city councils however *all plans are required to share the common feature of scalability up to and including a national emergency response.*

The Framework sets out arrangements which facilitate the principal emergency services in scaling-up the response as required, so as to utilise the full resources of the principal response agencies, and to work together in the management of large-scale incidents. The Framework provides the mechanisms for linking the work of the principal response agencies with those at other levels of Government.¹²⁰⁹

¹²⁰⁶ Department of Defence, 2004, “Strategic Emergency Planning Guidance Document”, Available from: www.emergencyplanning.ie.

¹²⁰⁷ “All-Hazards” is a term used in recognition of the common elements in the response to emergencies, regardless of the particular hazard that has given rise to the emergency.

¹²⁰⁸ The Five-stage systematic frame for emergency management is referred to as the “Safety Chain” in the Netherlands, “Integrated Emergency Management” in the UK.

¹²⁰⁹ National Steering Group on Major Emergency Management; “A Framework for Major Emergency Management”, 2006, Available from: www.mem.ie

In 2015 a unified national strategy document has been under discussion within government. It is understood that this does not involve a major alteration of the current approach; rather it proposes to evolve current practice and to broaden agreed strategic principles. A more comprehensive approach to mitigation and critical infrastructure is under discussion.

1.2.1 Strategy scope and focus

In April, 2011 the Government Task Force on Emergency Planning approved the “Guidelines for Coordinating a National-Level Emergency/Crisis Response”¹²¹⁰. This guidance document sets out the various steps involved in coordinating a national-level response for emergencies/crises. It sets out the triggers and activation procedures for convening a meeting of a National Coordination Group and the role of this Group. It clarifies the responsibilities of the lead government department and the roles and working relationships of all other departments/ agencies, which are required to contribute and undertake their roles in the context of the national emergency/ crisis management effort.

At national level, the objectives of civil protection or emergency planning are to implement measures to identify and mitigate natural and technological hazards. The planning, response and recovery for major emergencies which threaten persons, infrastructure, the environment or property is the focus at national, regional and local level and strategy is based on the nationally-determined strategy at all levels. The MEM Framework, which concerns the most frequent emergencies, is designed primarily to provide for the protection, support and welfare of the public in times of emergency. The Framework identifies uniform procedures in relation to those matters that can be standardised nationally such as the allocations of functions and responsibilities between agencies, command and control of operations and inter-agency co-ordination arrangements. The scope of the Framework also includes;

- Mobilising, controlling and making the best use of available resources for response at local, regional, national and international level, as appropriate.
- Setting out and allocating responsibility for ensuring that inter-agency coordination arrangements are developed and in place at local and regional level for effective coordination of individual response efforts to major emergencies, so that the combined result is greater than the sum of their individual efforts.
- Providing common terminology to facilitate coordinated and safe working
- Identifying and prioritising risks so as to ensure that existing services are prepared and equipped to deal with a range of realistic potential emergencies.
- Underpinning collective preparedness by the principal response agencies so as to ensure a prompt and effective coordinated response by them to a major emergency
- Ensuring that downstream crises arising from an emergency are managed effectively

¹²¹⁰ Department of Defence, 2011, “Guidelines for Coordinating a National-Level Emergency/Crisis Response”, Available from: www.emergencyplanning.ie

The Framework provides for an overall, combined response as soon as a major emergency is declared however it does not seek to address the detailed response procedures of the relevant response agencies in relation to specific incidents or hazards.

Separate to the MEM Framework, there are specific National Emergency Plans dealing with areas such as pandemic and nuclear accident which can be activated by the lead Government Department or the appropriate national body.

1.2.2 Monitoring and analytical support to policy making; R&D

Ireland does not have a specific separate budget for resilience-related research and development. However it has in place an active system of review which is central to policy development.

Support for **risk assessment** is provided by various Government Departments depending on the risk identified or the impact predicted. This support is usually provided through the temporary provision of personnel, the provision of critical information or resources or through project specific funding. The OEP convenes a meeting every six weeks and all ministries are invited to attend. It is at these meetings that monitoring and analytical support is managed. Academic support is provided by Dublin City University (DCU) Business School which employs experts in the field of Emergency Management. DCU provides support through reviewing and assessment of response mechanisms as well as assisting in drafting the Framework documents.

After-event reviews are prepared as are annual reviews of plans. Ireland has a policy of open access to plans in this area, so reviews, strategies and standard operating procedures are publicly available. There is a high acceptance within the system of the right of the media and general public to be informed and have access to most information.

DCU and Maynooth University offer postgraduate-level courses dealing with emergency and humanitarian management. As these courses progress they are increasing the level of policy expertise in Ireland.

The Irish weather service *Met Éireann* is involved in significant academic research projects concerning the prediction and understanding of adverse weather events. Due to Ireland's location, this work is of significant relevance to the UK and much of the EU. *Met Éireann* is a participant in Meteoalarm¹²¹¹.

1.2.3 Policy for Prevention

Ireland does not have a separate prevention strategy. In general, responsibility for the mitigation of specific hazards lies with the organisations and companies which own and operate the facilities and

¹²¹¹ For more information on Meteoalarm see; www.meteoalarm.eu

services where the relevant hazards are found, such as airlines, railway companies, chemical manufacturers, etc. Such organisations are referred to as “risk holders”. There are also statutory provisions, which provide for regulation/risk management, and bodies which hold responsibility in this regard are called “risk regulators”.

It is accepted that the principal response agencies may not be in a position to implement significant mitigation as part of the major emergency management process. However, An Garda Síochána, the Health Service Executive and the Local Authorities can be involved directly in extensive mitigation of potential generic emergencies through their work as “risk regulators” in other areas.

Typical examples include:

- the enforcement of legislation related to road safety and safety in places of assembly (An Garda Síochána);
- monitoring of food and water safety (the Health Service Executive);
- control of development through the planning and building control process and the enforcement of fire safety and dangerous substance legislation (the Local Authorities).
- Flood mapping and mitigation efforts (Office of Public Works)
- The National Climate Change Plan (Department of the Environment, Heritage and Local Government and the Environmental Protection Agency)

The ‘risk regulators’ can often require specific plans based on a site or hazard and they often practice scenario based exercises on a regular basis with the ‘risk holders’. Reviews of plans and exercises inform updates and can often increase mitigation measures.

Mitigation by the principal response agencies is generally limited by resources. It is accepted that educating the public on possible emergencies is a vital element of building resilience in communities and the development of key messages for targeted audiences is an essential first step. However for most of the period of the Framework’s operation there has been a fiscal emergency in Ireland and the resources allocated to preparedness are low.

The Office of Public Works is currently rolling-out **flood mapping** to the public. A total of €225 million has been set aside for capital flood risk management and mitigation expenditure in the 'Infrastructure and Capital Investment Medium Term Exchequer Framework for the period 2012-2016'. This annual allocation of €45m has enabled the OPW, in conjunction with its local authority partners, to address both existing and future flood risk pro-actively and systematically through a number of complementary programmes. This is the most significant ongoing risk communication measure undertaken by an Irish government department. It is intended that this work will have a long-term impact on local risk mitigation and is being accompanied by local communications work in priority localities.

Appropriate messages and effective mediums to disseminate the message are generally known from national to local level however resources are limited and a very limited approach to raising

awareness. This has an impact on mitigation and building resilience in communities across the country.

1.2.4 Policy for Preparedness

Each Department and Agency is responsible for addressing preparedness measures relating to the areas for which they are the designated principal responder. In practice this focuses on operational preparedness rather than a wider civil preparedness agenda.

In terms of the most frequent major emergencies, in addition to national level planning the relevant Chief Superintendent of each Division of An Garda Síochána, the designated Senior Manager in each Health Service Executive Area and the City or County Manager of each Local Authority is responsible for the principal response agency's major emergency management arrangements and preparedness. While these districts do not involve aligned boundaries and populations sizes, in practice this is not felt to be a problem.

The MEM Framework makes explicit the expectations in regard to preparedness;

- Emergency plans must be prepared by each agency and be consistent with the Framework
- Inter-operability must be factored into emergency plans and reviewed for consistency with partner agencies
- Principal response agencies must actively participate in the appropriate regional steering group
- Principal response agencies should participate in the preparation of a Plan for Regional Level Coordination through the regional steering group and participate in its annual review..
- Each principal response agency should provide for working with appropriate national bodies and responding to and activating appropriate aspects of their Major Emergency Plan following requests arising from national emergency situations.
- Principal response agencies should have sub-plans for responding to notification from the Local Authorities of severe weather warnings, whether a major emergency is declared or not.
- Each principal response agency should review its preparedness on an annual basis by “walking through” a selection of scenarios identified in the risk matrix.
- Each principal response agency should put support teams in place for key roles and should prepare Operational Protocols
- Each principal response agency should prepare and implement a staff development and training programme designed to build the knowledge, skills and experience of staff that will fill key roles in response to a major emergency.
- Internal exercise programmes on a three-year cycle with clearly defined and progressive objectives are required to validate its preparedness for responding to major emergencies. Joint or inter-agency training and exercise programmes should be included.
- Each principal response agency should ensure that arrangements are in place to authorise procurement and use of resources to assist in response to major emergencies

The fulfilment of the MEM Framework's preparedness strategies varies, especially as soon after the MEM Framework was published, a dramatic fiscal consolidation was implemented which impacted

on all levels of the Irish public sector. However, there does appear to be a significant commitment to the effective implementation of commitments under the Framework.

Major Emergency Plans, based on the MEM Framework, are in place in all local authority areas and may be activated by any one of the Principal Response Agencies: the Local Authorities, An Garda Síochána and the Health Service Executive. The Major Emergency Plan of each agency sets out that agency's generic response arrangements, incident specific sub-plans as well as its contribution to the combined response of all agencies. The detail and rigour of some plans is greater than others and regional plans usually focus on risks that have occurred in the past or on those with a catastrophic impact. Coordination features heavily in the Framework and this is communicated in regional Emergency Plans which are tested periodically for their command and control functions using table top exercises which reduces the cost of exercising considerably.

The overwhelming focus of preparedness work is on ensuring that agencies are ready to respond well to emergencies. Extremely limited, and undefined, resources have been available to invest in more general resilience promotion.

Agencies at local level undertake basic educational roles in relation to schools and organisations. At a national level a limited 'Winter Ready' publicity campaign is run each year focused on actions which would be of assistance in severe weather as well as most crises situations.

1.2.5 Policy for Response

As outlined earlier, Ireland operates on the dual principles of identified principal responders and control at the lowest appropriate level. In the implementation of the Framework significant emphasis is placed on identifying key roles and responsibilities as well as operating procedures.

The Framework identifies the following information as key messages for the public concerning crisis preparation and response;

- The types of emergencies which are most likely
- What is being done to protect the community
- Early warning systems (where applicable)
- What you can do to protect yourself and your family
- Looking out for vulnerable neighbours
- Shelter/ evacuate ("Go in, Stay in, Tune in")
- Making a call for assistance using 999/ 112
- What to do if you happen upon an emergency
- How critical incident stress can affect you
- Where to get more information

The relevant Chief Superintendent of each Division of An Garda Síochána, the designated Senior Manager in each Health Service Executive Area and the City or County Manager of each Local Authority are responsible for the effectiveness of their agency's response to any major emergency which occurs in its functional area.

A Major Emergency Mobilisation Procedure is usually appended in each Emergency Plan and once an emergency is declared the command, control or communication centre will notify all principal response agencies that will in turn activate their internal mobilisation procedure. The response can be scaled up from a local response to a regional or national response.

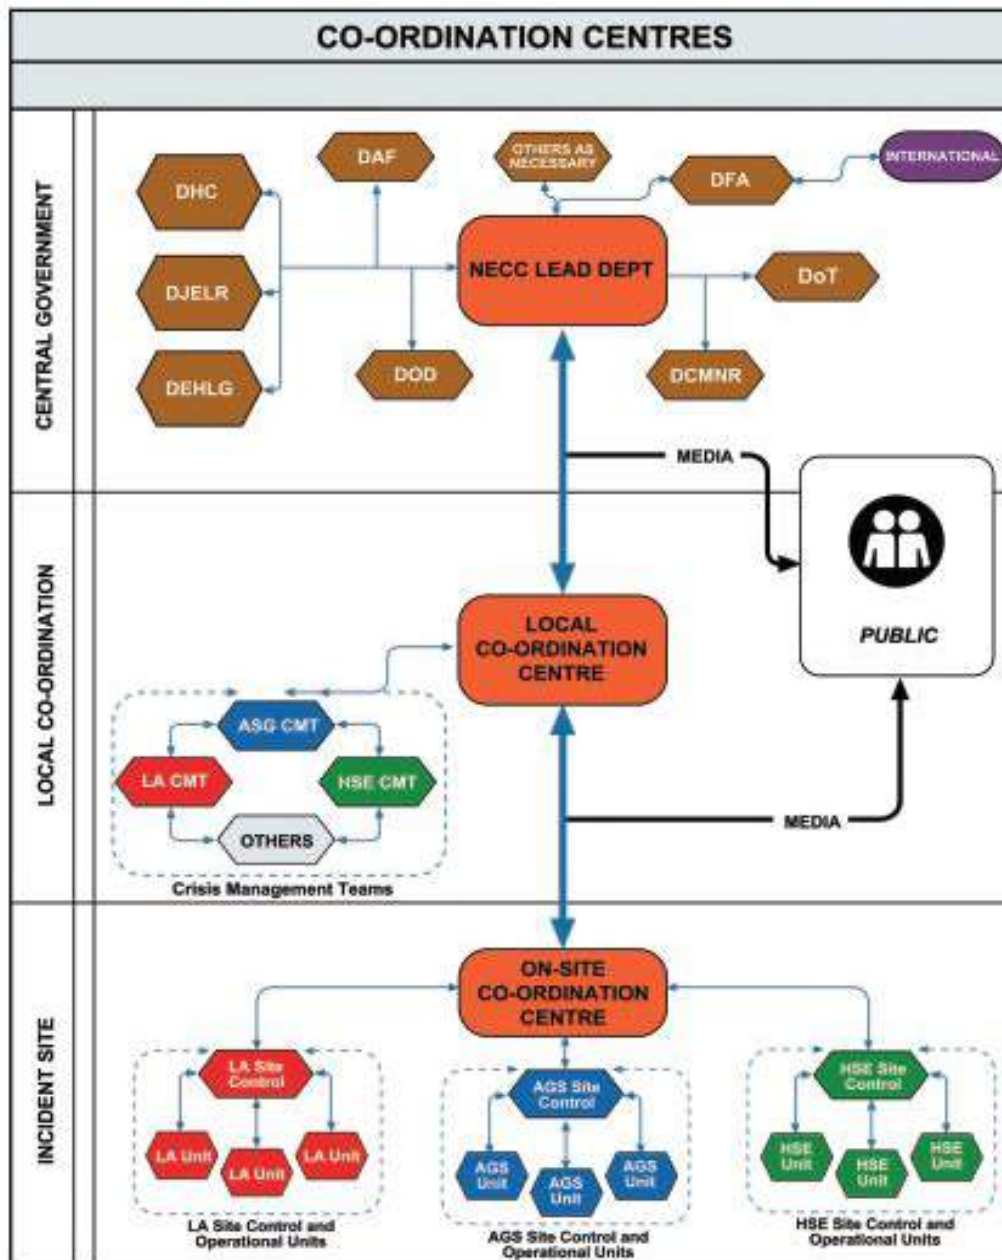

On a more general national level, protocols are in place for the triggering of a National Coordination Group to be chaired by the lead department and ensuring a cross-government approach.

The Government Information Service (GIS) plays a key role in preparing and projecting the Government's message on emergency management and response issues. An Emergency Planning Media Unit, chaired by the GIS, promotes and coordinates this work. This group, comprising Press and Information Officers of Government Departments and other key public authorities, continues to update and coordinate arrangements for handling enquiries from the media, as well as providing information and advice to the public.

The use of social media to share information in any stage of an emergency varies between Government Departments, PRAs and Local Authorities. There is a strong awareness of the power of social media to engage with the public however with limited resources, it is not always possible especially in smaller Local Authorities. There is no programme available or policy on social media that covers all of these levels in an emergency. Action 10 of "Supporting Public Service Reform eGovernment 2012-15" states that; "All public bodies will develop a social media usage policy and will prepare a short plan regarding how they will maximise the potential of social media to improve access to services"¹²¹².

¹²¹² Department of Public Expenditure and Reform; "Supporting Public Service Reform eGovernment 2012-2015", Available from www.e.gov.ie.

Figure 11: Coordination Centres for emergencies under MEM Framework

(Source: A Framework for Major Emergency Management Appendices, 2008)

1.2.6 Policy for Relief and Recovery

Relief and recovery is recognized as an important phase in the MEM Framework and it should happen after the individual services have been stood down and an operational debrief has been carried out by each agency. Each principal response agency has a mandate in the recovery phase; An Garda Siochana

- Identification of fatalities
- Preservation and gathering of evidence
- Investigation and criminal issues
- Dealing with survivors
- Dealing with relatives of the deceased and survivors
- Provision of an appropriate response to the immediate public need

Health Service Executive

- Provision of health care and support for casualties and survivors
- Support for relatives of casualties and survivors
- Restoration of health services
- Responding to community welfare needs

Local Authority

- Clean-up
- Rebuilding the community and infrastructure
- Responding to community welfare needs
- Restoration of services

A policy of preparing after-event reports for all significant emergencies is implemented. These identify short, medium and long-term impacts as well as lessons learned and are publicly available. All agencies accept their responsibility to keep the public informed of relief and recovery activity.

1.3 Financing

1.3.1 Investing in preparedness

There is no consolidated figure for investment in preparedness. The bulk of investment is within the core ongoing funding of responder agencies.

A figure of roughly €45 million per annum is available for flood risk management and mitigation, plus another roughly €10 million (2015 estimate) for the repair of flood- damages to flood protection infrastructure in past storms.¹²¹³ A Preliminary Flood Risk Assessment for the country (as required by the EU Floods Directive) is being published to inform the prioritising of areas for more detailed analysis in the individual catchment areas under the Catchment Flood Risk Assessment and Management (CFRAM) programme.

There is no evolved engagement by the insurance industry or other private sector actors, though the Department of Finance has begun discussions with Insurance Ireland, the umbrella organisation for the insurance industry. There is no expectation of EU funding for preparedness work other than in the context of general infrastructure development funded through regional development policies.

There is no distinct disaster mitigation fund. Identification and mitigation of hazards forms part of the normal operations of public and private organisations. The Framework defines mitigation as “any

¹²¹³ Department of Public Expenditure & Reform; “Infrastructure and Capital Investment 2012-14: Medium term exchequer framework”. Available from: www.per.gov.ie.

actions which are taken in advance of the occurrence of an emergency to reduce the probability of that event happening or that reduce the loss/damage that might otherwise have been caused if the event does happen”¹²¹⁴.

1.3.2 Investing in consequence management

All expenditures incurred during a particular emergency or crisis must be properly authorised, executed and accounted for under the appropriate public expenditures mechanisms. There is no developed research on expectations or practice in the funding of recovery activities. In practice there has been a mix of agencies funding recovery from within their budgets, central government providing some extra funding and, above a certain level, the state assisting in cases where there is no insurance. The most recent review of damage from the acute winter storms in 2013/14 focused solely on the cost to public infrastructure and facilities.

Public/private activity in relation to flood insurance is at a low level, however it is likely to be a significant issue in the coming years as the flood-mapping exercise is completed and begins to be reflected in home insurance costs and availability.

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

Ireland has an evolved system of post-disaster assessment. The MEM Framework document requires that there be a review of the response to all major emergencies declared through its Steering Group. The review panel draws information from the response agencies and the panel is made up of representatives of government ministries as well as academics and senior officers from the principal response agencies. Each agency is expected to complete a self-assessment on the preparedness and response phases.

The assessment of economic impact is generally limited to the impact on public infrastructure. This is a significant gap.

All such reviews are published. Post-disaster assessments are viewed as accessible and constructive. In addition, within agencies and in the Steering Group for Major Emergency Management an ongoing programme of reflection is evident. Candid discussions are encouraged.

The review panel for after-event reports includes an external expert element. As such, the reports are seen as challenging and constructive rather than defensive of the interests of agencies.

¹²¹⁴ National Steering Group on Major Emergency Management; “A Framework for Major Emergency Management”, 2006, Available from: www.mem.ie.

A similar approach to independent review and transparency is applied across other departments and agencies.

1.4.2 Departmental Lessons Learned systems

Departmental lessons learned are established through the Steering Group for Major Emergency Management where each department is represented. Internal agency communications stem from this.

1.4.3 Centralised (national) Lessons Learned system

Systems are in place to derive lessons learned from experiences which includes external input from academic institutions and experts. The OEP facilitates the sharing of information between stakeholders. The OEP also provides a forum to learn lessons from disasters that occur in other countries. An example of this is Hurricane Sandy in the US which provided an opportunity to examine and review Ireland's ability to deal with a severe wind storm. This review was carried out under the guidance of the OEP three weeks before the high wind storms occurred in 2013-2014 and is believed to have contributed to the effectiveness of the national response.

1.4.4 International exchange for Lessons Learned

Ireland exchanges information through Government Departments with Great Britain and the devolved administration in Northern Ireland on issues of mutual interest. Cross border policing has a formalised process due to the ongoing peace process, however other agencies and Governmental Departments lack this structure and policies.

Government Departments are aware of the international dimension of emergency planning. Contacts have been established and strengthened where necessary with the mechanisms provided by the United Nations, the European Union, the World Health Organisation and other international bodies for dealing with emergency planning and response. This has allowed Ireland to tap into reservoirs of knowledge and learn lessons from this community.

1.4.5 Regular policy reviews

Ireland has an active approach to policy review procedure. Through the separation of strategic oversight and operational implementation the effect is to ensure ongoing review. Due to Ireland's flat governing structures these are not reflected in legislation while practice as set out in national documents is often updated well in advance of this being reflected in revised documents. A transparent approach to after-event reviews means that all persons have the opportunity to review policy effectiveness.

The national strategic policy framework is currently under review and being discussed at a senior level within government.

1.5 Resilience

Resilience is not a consistently applied principle. The MEM Framework and its supporting guidance and protocol documents refer to resilience in the following manner;

“Resilience is the term used to describe the inherent capacity of communities, services and infrastructure to withstand the consequences of an incident, and to recover/restore normality.”¹²¹⁵

As such, it is firmly a ‘bounce back’ concept rather than drawing on more complex ideas.

Local authorities are substantially responsible for building resilience in local communities however the budget for this varies in each area and it is generally larger in areas that have experienced some form of significant emergency. The document *“Preparing for Major Emergencies”*¹²¹⁶, issued to each household in the country during 2008 by the Office of Emergency Planning, provides important information for individuals on how to prepare for a major emergency and what to do in the event of a major emergency. This and the annual ‘Winter Ready’ campaign represent the only distinct national resilience promotion efforts.

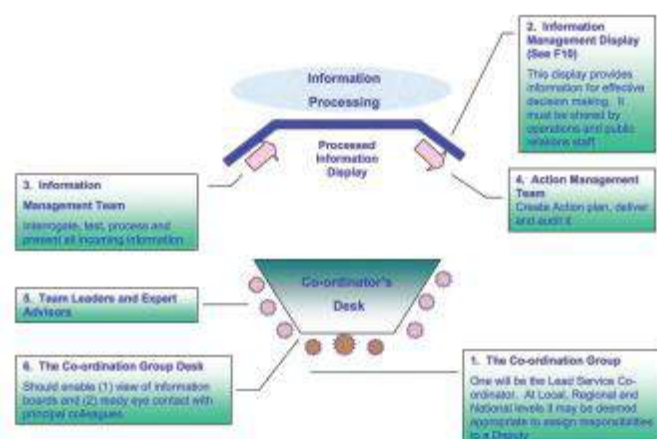

Planning regulations seek to mitigate the potential impact of disasters on infrastructure and the general built environment.

1.6 Information sharing and data protection

Ireland has a relatively open approach to information sharing in this area. Data protection standards are overseen by a national Data Protection Commissioner and are in line with EU regulations.

Information sharing occurs between PRAs as part of crisis management procedures in the event of a National Emergency. For example, the HSE will provide information on vulnerable people to the Gardai who will check on them to ensure that they are safe prior, during or after an event. Information on individual casualties will be provided only by An Garda Síochána, who will establish a Casualty Bureau to collect and collate the details of all casualties and survivors. Once it is operational, the telephone numbers for the public to contact the

Figure 126: Generic Coordination centre information sharing

(Source: A Framework for Major Emergency Management Appendices, 2008)

¹²¹⁵ National Steering Group on Major Emergency Management, *A Framework for Major Emergency Management*, 2006, Available from: www.mem.ie

¹²¹⁶ Office of Emergency Planning; *“Preparing for Major Emergencies”*, 2008, Available from: www.mem.ie

Casualty Bureau will be issued to the media by the Garda Press Office.

Government Departments may share information on specific threats such as infectious animal diseases or terrorist threats.

Local Authorities may use volunteer organisations to help cope in the event of an emergency. In the pre-planning phase, the Local Authority identifies the competencies required for any personnel and while the volunteer organisation will exercise with the PRAs, the responsibility for personnel rests with the volunteer organisation that provides them and therefore information is not shared in a formal way and *a database of volunteers is not maintained at local, regional or national level.*

2 Legislation

2.1 Crisis (emergency, disaster) management concept

Ireland does not have specific emergency management legislation beyond standard legislation for police, fire, environment and health authorities. Emergency planning is part of general planning carried out by each Government department/ agency under its appropriate legislation. Emergency Planning arrangements and actions are governed by a policy framework adopted by government.

The obligation to exercise an oversight in relation to peacetime emergency planning is placed, by Government decision (Ref. S180/46/01/0002), in the Minister for Defence through the Office of Emergency Planning. This is an administrative rather than statutory arrangement.

Ireland is a strongly centralised government with only 31 local authorities which hold powers which are both limited in scope and subject to central oversight. There are no local powers relating to police or health agencies. As such, it can be argued that a separate statutory basis for crisis coordination is not as important in Ireland as it is in federalized and regionalised countries. In after-event assessments the lack of clarity on powers has not been identified as an issue.

In interviews for this review, respondents stated that they value the flexibility which not having detailed legislation allows.

Each government department is responsible for ensuring that emergency plans exist in respect of its own area of responsibility. Operational responsibility for incidents however, rests with the emergency services under the aegis of the department concerned. Individual departments are also responsible for any necessary coordination between departments and/or services. Lists of contact officers and experts in the public services are kept up to date on a central level. Depending on the magnitude of the disaster, the Government can set up a national committee to monitor and advise on the crisis at central level.

In the event of being called on for assistance in a major emergency, the Defence Forces will operate under the provisions of the Defence Acts, 1954 to 1998, as amended, and in accordance with agreed Memoranda of Understanding (MOUs) and Service Level Agreements (SLAs). The principal response agencies can request assistance from the Defence Forces either in Aid to the Civil Power (An Garda Síochána) or in Aid to the Civil Authority (Local Authority or Health Service Executive). The major distinguishing feature between the two types of Aid is that the Defence Forces response to requests for Aid to the Civil Power is primarily an armed response while Defence Forces response to requests for Aid to the Civil Authority will be unarmed. In addition, the Defence Forces have a key role to play in responding to emergencies involving improvised explosive devices, when they are called upon to

assist An Garda Síochána by the provision of Explosive Ordnance Disposal (EOD) teams in an Aid to the Civil Power role.

2.2 General crisis (emergency, disaster) management law

As stated in 3.1, overall crisis management arrangements are not set out in separate legislation.

Airports are required by International Civil Aviation Organisation (ICAO) rules to prepare emergency plans and to maintain emergency services commensurate with the categories of aircraft using the airport.

For all ports, the *Harbours Act, 1996*, places responsibility on the harbour master for the safety of shipping and all activities within the defined port limits. The legislation also requires that emergency plans be prepared in respect of the major ports. These emergency plans are designed generally to deal with incidents, in the first place using the port's own resources. The Irish Coast Guard is responsible for co-ordinating the response to marine incidents outside port limits, except in case of search and rescue, when all marine areas, including ports, are within its remit.

There are both legislative and procedural arrangements, which require that emergency plans be prepared for specific sites or events (e.g. SEVESO sites¹²¹⁷, airports, ports, major sports events, etc.).

Publicly licensed broadcasters are obliged as part of their licence to carry warnings. This power has not been invoked as, in practice, authorities find broadcasters to be willing to carry timely and accurate information when needed.

2.3 Emergency rule

The Irish constitution allows for emergency legislation to be passed by parliament but only insofar as it is necessitated by armed rebellion or war.¹²¹⁸ There is no legislation for emergency rule during disasters.

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

The obligation to exercise an oversight in relation to peacetime emergency planning is placed, by Government decision (Ref. S180/46/01/0002), in the Minister for Defence through the Office of Emergency Planning however the responsibility to ensure that emergency plans are adequately

¹²¹⁷ Upper Tier and Lower Tier SEVESO sites are defined in: Article 3 of Directive 2012/18/EU of the European Parliament and of the Council of 4 July 2012.

¹²¹⁸ Bunreacht na hÉireann, Article 28.3.3.

assessed, reviewed, exercised and validated remains with the lead Minister and Government Department responsible for a particular area.

The MEM Framework establishes formal operational procedures between the principal emergency response agencies (police, health, fire, local authorities). These include a coordination approach based in the Department of the Environment, Heritage & Local Government.

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

Local authorities have significant responsibilities under the national policy framework however they do not have distinct powers to act autonomously. There are no regional authorities but key agencies have regional coordination structures which are established on an administrative basis

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

There are no national legal regulations governing the involvement of volunteers and specialised NGOs in civil protection however individual organisations do have some legislative underpinning.

The Civil Defence service¹²¹⁹ is a statutory organisation of volunteers which can provide a very important resource for use during major emergencies, in support of the principal response agencies. The Civil Defence Act 2002 aims to enable the ongoing development of Civil Defence on a national basis into a second-line emergency service working in support of and in cooperation with all of the mainstream emergency services. Civil Defence services, which include over 3,000 active volunteers, are structured on a county basis and are run by the Local Authorities. A Civil Defence Board, with a national Civil Defence Headquarters, oversees and assists the development of the Local Authority based Civil Defence organisation.

The Irish Red Cross is established and regulated under the Red Cross Acts, 1938-54. These statutes define a role for the Irish Red Cross as an auxiliary to the state authorities in time of emergency and also provide a specific mandate to assist the medical services of the Irish Defence Forces in time of armed conflict. The Chairman of the Red Cross is appointed by the President, on the advice of the Government. The Department of Defence is the Government Department associated with the organisation – a senior official of that department sits on the Board of the Irish Red Cross.¹²²⁰

Irish Red Cross's membership comprises 2,500 volunteers, supported by staff in Head Office in Dublin and three regional offices. Volunteers are organised in local units, with overarching county and regional structures. The membership is country wide, with 111 units in twenty-five of the twenty-six counties in the state. The main relationship with the principal response agencies in major emergency

¹²¹⁹ Information on the Civil Defence service can be obtained on www.civildefence.ie

¹²²⁰ Information on the Irish Red Cross can be obtained on www.irishredcross.ie

response is as an auxiliary resource to the ambulance services. Subsidiary search and rescue and in-shore rescue units of the Irish Red Cross support An Garda Síochána and the Irish Coast Guard.

The normal range of voluntary emergency services includes the Order of Malta Ambulance Corps, St John's Ambulance Service, Mountain Rescue Teams, Cave Rescue Teams, Search and Rescue Dog Associations, River Rescue Units, Community Inshore Rescue Units, the Royal National Lifeboat Institution and Sub-Aqua Units. Their ongoing service to the public includes attendance at public events, as well as searches for missing persons and the rescue of persons in distress.

2.7 Legal regulations for international engagements of first responders and crisis managers

There are no legal regulations for the engagement of first responders and crisis managers in international civil protection tasks.

Ireland accepts its responsibility to participate in the Community Civil Protection Mechanism to facilitate the provision of assistance between the member states in the event of major emergencies and Ireland would request that assistance through the National Liaison Officer at the Department of the Environment, Heritage and Local Government (National Directorate for Fire and Emergency Management).

There is a long-standing tradition of mutual assistance between the emergency services in Northern Ireland and the border counties. An April 2002 agreement between the British and Irish Governments provides for a range of co-operative measures between An Garda Síochána and the Police Service of Northern Ireland.

Existing arrangements between individual emergency services in both jurisdictions are in place and operational. During an emergency, agencies inform the Local/Regional Co-ordination Centre of any unilateral activation of arrangements with services in Northern Ireland. Requests from a local or regional coordination group for additional assistance, outside of/above that arranged by the individual services, are transmitted by An Garda Síochána to the Police Service of Northern Ireland, in accordance with internal code procedures of An Garda Síochána.

3 Organisation

3.1 Organisational chart

Figure 13: Core National Political, Strategic & Operational Response structure

- The Government Task Force on Emergency Planning is the top-level body which coordinates and oversees the emergency management activities of all Government Departments and Public Authorities. This taskforce is comprised of Ministers and/or senior officials of Government Departments and Public Authorities making a key contribution to the emergency management process.
- The Office of Emergency Planning which exists within the Department of Defence supports the work of the Government Task Force.
- Where there is a security dimension to an emergency the National Security Committee chaired by the Department of the Taoiseach has a role.
- The National Cyber Security Centre is under the Department of Communication, Energy and Natural Resources and is responsible for leading efforts relating to cyber security in general including the response to emergencies.

- Ireland has adopted the 'Lead Department' principle which means that the Government Department having responsibility for a particular area takes the lead when an emergency occurs in that area. This process is supported by the "Strategic Emergency Planning Guidance" which is a document published by the Government in 2008 and defines the lead department with respect to a range of emergencies.
- On a day-to-day operational basis the MEM framework between the police, health and local authorities is chaired by the National Directorate for Fire and Emergency Management, in the Department of the Environment Community and Local Government.
- There are eight regions for civil protection purposes and arising from the framework, each of these regions has an inter-agency Regional Steering Group (RSG) on Major Emergency Management. The RSG is comprised of senior personnel from the PRAs within that region and each region also has Regional Working Groups (RWGs) to support the RSG and to undertake the functions assigned at regional level.
- These eight designated Major Emergency Management (MEM) regions within the country consist of multi-agency teams. Each PRA initially prepares a structured hazard analysis and risk assessment using the Framework as guidance and then coordinates a multi-agency plan for the region. The plans are scalable and are linked with National Plans as per the guidance of the Framework.
- The Local Authorities coordinate the EM plans through a structured hazard analysis and risk assessment carried out by the PRAs. The focus is primarily on a comprehensive emergency management process through an all hazards approach as directed by the Framework.
- Volunteers and volunteer organisations are coordinated through the PRAs who lead the response and collaborate with volunteer organisations in training and planning. For example; St. Johns ambulance and the Order of Malta work under the HSE.
- Some private businesses are required, as part of licencing agreements, to have comprehensive emergency plans due to the nature of their industry (i.e. pharmaceutical, chemical, aviation). The local authorities ensure that the PRAs and these private businesses plan, practice and review these plans every three years or less depending on their agreements.

3.2 Organisational cooperation

- The lead role for planning the State's response to an emergency rests with the functional Minister and his or her Government Department, with support from other key departments and public authorities. The functional Department has the lead role in the areas of risk assessment, prevention, mitigation, response, maintenance of public confidence and recovery, working in association with other Government Departments and public authorities.
- It is the responsibility of the lead Department to work with other Government Departments and PRAs to ensure that their plans are sufficiently detailed and properly coordinated.
- Due to their central involvement in most identified risks and past emergencies the police, health service and local authorities have a highly developed procedure for cooperation as set

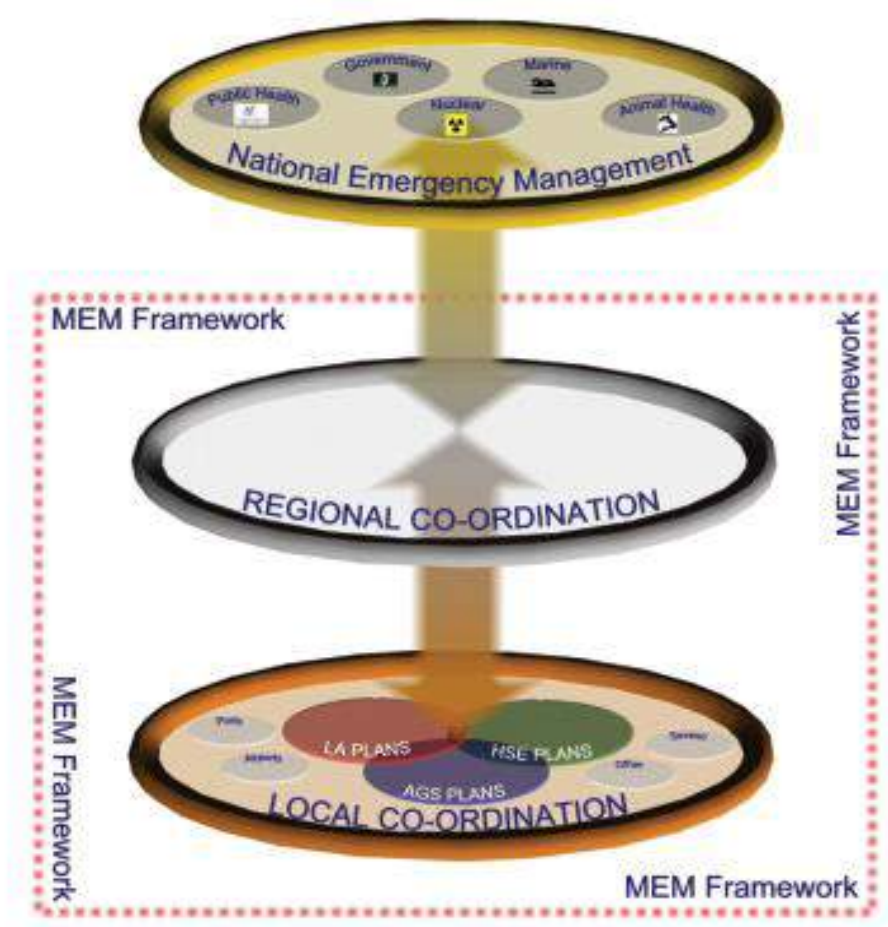

out in the MEM Framework. These principal response agencies take a leading role in promoting cooperation.

- Command and control issues are addressed through consultation and engagement with all parties involved in response, through a structured exercise programme.

There are a number of organisations and agencies, which may be called on to assist the principal response agencies in responding to major emergencies. The arrangements for this assistance should be agreed with each agency (or confirmed in the case of pre-agreement) and set out in each principal response agency's Major Emergency Plan. The organisations may be grouped as follows:

- Defence Forces;
- Civil Defence;
- Irish Red Cross;
- Voluntary Emergency Services;
- Utilities; and
- Private Sector

Figure 14: Links between Major Emergency Plans and National and Other Plans

(Source: *A Framework for Major Emergency Management*, 2006)

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

It is the stated policy to develop Standard Operating Procedures (SOPs) for all identified risks and fields of cooperation. These are reviewed on an ongoing basis and available to the public.

SOPs are localised and agency specific however in the event of a major emergency the Framework document provides guidance. The SOPs for the local coordination centre that must be established in the event of a major emergency are standardised regardless of the type of emergency or location. The local coordination centre is established by the Principal Response Agency (PRA) in a designated building that it has already prepared SOPs for that centre with their inter-agency colleagues. Action cards are to be prepared and used to support the SOP, comprising pocket-sized single or multi-page laminated cards for all roles/posts/tasks in the set-up and operation of the centre. This includes principal Local Co-ordination Group members, Information Officers, Action Managers, Media Liaison Managers/staff, Log Keepers, Facilities Managers, security staff, IT support staff, and any others with functions assigned in local circumstances.

Additionally each principal response agency has SOPs which cover ordinary and extraordinary procedures as well as the inter-operability aspect of major emergency response. An Emergency Operations Plan (EOP) is a detailed document that outlines the personnel, roles, responsibilities, actions and processes to be followed in the event of an emergency. It may detail the resources available and when and where personnel will be called on to perform a strategy of mitigating actions to avert further deterioration of the situation and protect and stabilise the organisation and people affected by the emergency and it is the responsibility of each region to ensure that they have a working emergency plan.

4.2 Operations planning

- General framework for planning is set out in the Strategic Emergency Planning Guide published by the Government Task Force on Emergency Planning.
- In accordance with the principal of lead department responsibility, each department prepares its own emergency plans pertaining to their departmental remit.
- The most detailed operational planning for national emergencies is contained in the 'A Framework for Major Emergency Management'.
- Under the MEM Framework there are eight regions for civil protection purposes and each has a major emergency plan. There are 26 county councils and 5 city councils that make up

the local authorities who all have local plans for a major emergency. PRA also have emergency plans that cover their specific remit.

4.3 Logistics support in crises

- The core logistical support for crises is provided from within the resources of departments and agencies. However these may be supplemented:
- Private logistics providers may be contracted as and when required.
- Military logistical support is available as the Department of Defence oversees the OEP which is tasked with the coordination of major emergency management.
- There is no separate crisis logistics organisation in Ireland.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

Ireland does not have a distinct national alerting system. It has never had a widespread siren system. It has developed warning procedures which are led by the relevant principal responder and distributed through all available channels, principally the broadcast media.

- Each principal response agency leads communications in their identified crises. This is supplemented by cross-government coordination. At times of significant national crises the central government communications operation is expected to play a major role.
- There have been no identified problems with getting the broadcast media to quickly carry warnings.
- Met Eireann (the Irish Met Office) is responsible for colour-coded weather warnings which conform to IMO standards.
- Technical infrastructure used to communicate with the public during a crisis or emergency include motorway alert messaging system and limited localised flood warning measures (voice messages and text alerts).

Figure 129: Info Management System
(Source: A Framework for Major Emergency Management, 2006).

5 Capabilities

5.1 Human resources

- Permanent disaster planning and management personnel 6 (Office of Emergency Planning).
- Capacity to mobilise personnel at a national level from other Departments by the Lead Department as and when required. Regional and Local levels mobilise personnel through emergency plans that are in place and scale up the response to draw in extra personnel.
- Involvement of volunteers, volunteer organisations, and specialised NGO personnel through planning, exercising and training with their related PRA or Local Authority.
- The Fire Services have 3,245 serving fire personnel of which 1026 are full time and 2039 are retained on a 24 hour basis across the 220 fire stations. 900 of these serving fire personnel are stationed with Dublin Fire Brigade.
- Limited spare capacity in hospitals is an identified weakness.
- An Garda Síochána has 14,500 garda and civilian personnel. In the last decade, the Garda Reserve has been introduced which has focused on community policing. The Gardai can also provide dog support, air support, mounted support and water support. An Garda Síochána have an agreement in place with the Police Service of Northern Ireland and a framework exists for collaboration and assistance when required.
- The Irish Coast Guard Service has responsibility for the national system of marine emergency management in Ireland's Exclusive Economic Zone (EEZ) and inland waterways. It is responsible for response to, and coordination of, maritime accidents which require Search and Rescue and Counter Pollution and Salvage operations. It also has responsibility for vessel traffic monitoring. It has three principal Marine Rescue Centres, 55 operational units (including both permanent and volunteer staff) and operates 6 medium-lift helicopters. It is an unarmed, non-security service. Operations in respect of maritime security, illegal drug trafficking, illegal migration and fisheries enforcement are coordinated by other bodies.
- Mountain Rescue Ireland has 365 members spread across twelve teams in Ireland. MRI is a 24 hour 999/112 emergency service provided by unpaid and voluntary teams.
- The Royal National Lifeboat Institution (RNLI) operates 44 lifeboat stations across the island of Ireland. It is an all-island organisation which is ultimately overseen from London though it has substantial local autonomy. It is a volunteer 24 hour 999/112 emergency service with 4,600 volunteers working as lifeboat crews and a further 3,000 supporting them as shore crew members which provide a 24 hour search and rescue service. The RNLI has specially trained volunteers on call for flooding emergencies who can deal with both urban and rural environments. In addition there are Community Rescue Boat services which are also volunteer based. The CRB and RNLI crews have both off-shore and inland waterway capabilities.
- Irish Red Cross's membership comprises 2,500 volunteers, supported by staff in Head Office in Dublin and three regional offices. Volunteers are organised in local units, with overarching

county and regional structures. The membership is country wide, with 111 units in twenty-five of the twenty-six counties in the state. The main relationship with the principal response agencies in major emergency response is as an auxiliary resource to the ambulance services. Subsidiary search and rescue and in-shore rescue units of the Irish Red Cross support An Garda Síochána and the Irish Coast Guard.

- The Civil Defence service is a statutory organisation of volunteers, which can provide a very important resource for use during major emergencies, in support of the principal response agencies. Civil Defence services, which include over 3,000 active volunteers, are structured on a county basis and are run by the Local Authorities. A Civil Defence Board, with a national Civil Defence Headquarters, oversees and assists the development of the Local Authority based Civil Defence organisation.
- There is a range of voluntary emergency services in Ireland which may be called on in an emergency under the Framework by one of the PRAs. These include; the Order of Malta Ambulance Corps, St John's Ambulance Service, Cave Rescue Teams, Search and Rescue Dog Associations, River Rescue Units, Community Inshore Rescue Units, Sub-Aqua Units, etc.

5.2 Materiel (non-financial) resources

- Crisis management centres have been identified in all eight regions. They are used from day-to-day as emergency call centres.
- Ireland has a total oil reserve stocks for 108 days of which 18 are for industry and 90 are for public consumption under the National Oil Reserves Agency (NORA) act of 2007. 36 days' worth of this oil is held abroad. Ireland is 92% import dependant for its energy needs¹²²¹
- Helicopters may be drafted in to assist in an emergency situation from An Garda Síochána which may be used for aerial surveillance; the Irish Coast Guard's six helicopters may provide medium-lift capability; The Defence Forces helicopters may be requested through previously agreed Memorandums of Understanding and Service Level Agreements; and the private sector.
- There are a number of organisations and agencies which may be called on to assist the principal response agencies in responding to major emergencies in addition to specialist national and local organisations, such as the Environmental Protection Agency(www.EPA.ie), the Health and Safety Authority (www.HSA.ie) and local port and airport authorities.
- An "Electricity Interconnection and Trading Agreement (16th June 1995)" exists between the Electricity Supply Board (ESB) and Northern Ireland Electricity (NIE) PLC in relation to sharing of power system reserve requirements, emergency support, coordination of outages of transmission plant and notification of certain system operation matters.

¹²²¹ Forfas; "The Irish Energy Tetralemma: A Framework for fuel choices in Ireland", Available from: http://www.forfas.ie/media/forfas130810-irish_energy_tetralemma-a_framework_for_fuel_choices_in_ireland.pdf.

5.3 Training

- National, local and departmental exercises are outlined in the MEM Framework documents
- Centralised specialist training for specific hazards occurs in each of the PRAs.
- Training of volunteers and NGO personnel occurs within these organisations and in collaboration with the PRA that they work with. Exercising takes place on a regular basis at local and regional level to reinforce training.
- Cross-border and multinational training activities occurs primarily within the Gardai.
- Certification systems are specific to the Principal Response Agency, Volunteer organisation or NGO. There is a great deal of mutual recognition, collaborative training and agreed priorities however there is no national certification partly due to the division of responsibility and proficiency between PRAs.
- National educational programmes focus on personal rather than public emergencies such as road safety, fire safety and winter ready campaigns.
- Specialised training programmes for high-level decision makers are provided as and when required to Government departments and run on a more regular basis for PRAs.

5.4 Procurement

5.4.1 Procurement regulation

Background

The public procurement process in public sector organisations is heavily decentralised. Public bodies perform the function independently within a framework of EU/national laws and national guidelines. The National Public Procurement Policy Unit (NPPPU) was established in the Department of Finance as a result of an April 2002 Government decision. Its role is to develop public sector procurement, policy and practice. The national procurement policy framework applies to:

- Central Government departments and bodies under their aegis and which are subject to audit under the Auditor General (Amendment) Act, 1993;
- Commercial and non-commercial state bodies;
- Local and regional authorities.

Public procurement policy and actions are focused on compliance with the relevant EU, WTO and national legal requirements and obligations. They must also comply with relevant procurement guidance issued by the Department of Finance.

EU Directive 2004/18/EC cover the procurement procedure of public sector bodies. Directive 2004/17/EC covers the procurement procedures of entities operating in the utilities sector. These Directives were published in OJ No L 134 of 30 April 2004 and are available on <http://europa.eu.int/eur.lexlen/index.html>, or the EU public procurement guidelines website <http://simap.eu.int> under 'Rules and Guidance'.

The procurement of defence and security materials in Ireland is regulated by Statutory Instrument No 62 of 2012 which transposed the European Award (Award of Contracts relating to Defence and

Security) regulations 2012. Procurement of utilities is regulated by Statutory Instrument No 50 of 2007 which transposed the European Communities (Award of Contracts by Utility Undertakings) Regulations 2007.

Three new Directives have been issued by the European Commission recently in respect of Public Procurement. These Directives are:

- 2014/23 - Award of Concession Contracts
- 2014/24 - Public Procurement
- 2014/25 - Procurement by entities operating in the water, energy, transport and postal services sectors

The three Directives, taken together, represent a reform of public procurement rules across the EU and require to be transposed into national law by April 2016. It is the Irish government's intention to meet this deadline.

The procedures for awarding public contracts are regulated by European Communities (Award of Public Authorities' Contracts) Regulations 2006. Procedures for awarding of public contracts can be by open, restricted and negotiated procedures. A competitive dialogue procedure is used where the contract is particularly complex or if the use of an open or restricted procedure would not allow the contract to be awarded. Negotiated procedure can be used with and without prior notice of contract. Framework agreements can be entered into with a single economic operator or several economic operators. Finally dynamic purchasing systems are also provided for in the regulations.

Adherence to procurement procedures is audited in all public bodies by the Comptroller and Auditor General and compliance is near universal. As such, all goods and services above the threshold are, except in exceptional circumstances, procured through public channels which are easily accessible to suppliers outside of Ireland.

Procurement for CM tools and services is done by individual agencies. Cross-border contracts are common but joint procurement is not.

Additional legislation would only be required for joint cross-border procurement where the conditions of the relevant Irish regulations could not be enforced or where the procured items would not be based in Ireland and under the control of the procuring agency.

5.4.2 Procurement procedures

Background

Procurement Thresholds

Contract notices below the EU threshold for publication on eTenders or by direct invitation

Amount	Type of Contract	Procedure
€0 - €24,999	Supplies or Services Contracts	Verbal quotes from competitive suppliers

€0 - €49,999	Works & Works Related Services	Quick Quote (direct invitation, not published on eTenders) See www.constructionprocurement.gov.ie See D/PER CWMF GN 2.3 Section 3.2
€25,000 - €125,000 €50,000 - €250,000	Supplies or Services Contracts Works & Works Related Services	Open Procedure Non-OJEU (See Dept. of Finance Circular 10/10) See D/PER CWMF GN 2.3 Section 1.2
€125001 – EU Threshold €250,000 – EU Threshold	Works, Supplies or Services Contracts Works & Works Related Services	Any Non-OJEU Procedure but usually Open or Restricted See CWMF GN 2.3 Section 1.2
Above EU Thresholds	Works, Supplies or Services Contracts	Any OJEU Procedure but usually Open or Restricted

(Source: eTenders.gov.ie)

The Official Journal of the European Union (OJEU) advertising thresholds came into effect in January 2014 and the main thresholds are listed below;

Works		
Contract Notice	€5,186,000	Threshold applies to Government Departments and Offices, Local and Regional Authorities and public bodies
Supplies and Services		
Contract Notice	€134,000	Threshold applies to Government Departments and Offices
Contract Notice	€207,000	Threshold applies to Local and Regional Authorities and public bodies outside the Utilities sector
Utilities		
Works Contracts / Prior Indicative Notice	€5,186,000	For entities in Utilities sector covered by GPA
Supplies and Services	€414,000	For entities in Utilities sector covered by GPA

(Source: eTenders.gov.ie)

5.5 Niche capabilities

- The Irish government and NGOs have a highly regarded capability in emergency humanitarian activities. This has not been deployed in Europe in the past but would be available to a major European disaster intervention.
- Due to its island location, Ireland has experience in marine rescue disciplines with a significant trained national volunteer corps in three organisations (Irish Coast Guard, RNLI, Community Boats Ireland). The RNLI is involved in international training programmes.

Expert interviews

In addition to the review of published material 7 interviews and 1 facility visit were conducted in the period July-September 2014. The organisations involved were:

Office of Emergency Planning (including visits to National Emergency Coordination Centre)

Cork City Council

Cork County Council

Dublin City Council

Dublin Fire Brigade

Driving Innovation in Crisis Management for **European Resilience**

ITALY

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: EOS (Klaudia Tani, Nicola Iarossi)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by Q4PR and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

Italy is a parliamentary republic and is divided into 20 regions (first level administrative division), 110 provinces and about 8,100 municipalities. Provinces are administrative sub-divisions of regions and municipalities sub-divisions of the provinces. The 1948 Constitution¹²²² established a bicameral parliament (Chamber of Deputies and Senate), a separate judiciary, and an executive branch composed of a Council of Ministers (cabinet), headed by the President of the Council (Prime Minister). The president of the republic is elected for 7 years by the parliament sitting jointly with a small number of regional delegates. The President nominates the Prime Minister, who chooses the Ministers. The Council of Ministers – in practice composed mostly of members of parliament – must retain the confidence of both houses. The regions have exclusive legislative and executive power regarding any matters not explicitly reserved for national law. According to Article 116 of the Italian Constitution, five regions are granted with “Special Statutes” by Constitutional law¹²²³. Specifically, the regions of Friuli-Venezia Giulia, Sardinia, Sicily, Trentino-Alto Adige/Südtirol and Valle d’Aosta/Vallée d’Aoste assume “special forms and conditions of autonomy pursuant to the special statutes adopted by constitutional law”¹²²⁴ and according to Article 117 “legislative powers shall be vested in the State and the Regions in compliance with the Constitution and with the constraints deriving from EU legislation and international obligations”¹²²⁵.

Figure 16: Logo of the department of Civil Protection

In Italy civil protection is the “National Service”, institutionalised in 1992¹²²⁶; an integrated system which consists of all the local and central resources necessary for managing a calamity. Compared to other European countries, Italy has widespread risks throughout its territory and for this reason has developed an intervention system which starts from a local level and involves all administrations,

¹²²² See PART II of the Italian Constitution <http://www.constitutionnet.org/files/Italy.Constitution.pdf>. Published in the Official Gazette Dec. 27, 1947, no. 298 and amended in June 12th, 2013.

including the autonomous regions. The evolution of the legislative system and successive institutional set-up of the Italian crisis management (CM) system was driven by the numerous disasters which have struck the country and continue to pose an extraordinary challenge for the country. Lessons learned from these disasters have resulted in the implementation of new institutional arrangements yielding constant improvements in disaster preparedness, prevention, and response and recovery provisions. Civil society represents an active part of the National Service, particularly through the activity of the voluntary organisations.

The coordination of the national service and the promotion of civil protection activities are undertaken by the Department of Civil Protection (Dipartimento della Protezione Civile - DPC) under the office of the President of the Council of Ministers. The Department of Civil Protection is thus the operative arm of the President of the Council.

The Civil protection expenditures reach approximately 0.009% of the country's GNI.

1 Policy

1.1 Risk Assessment

Risk prediction and prevention, relief to the affected populations, contrast and overcoming the emergency and risk mitigation are the civil protection activities identified by Law no. 225/92, which established the National Service. Protection of people and safeguard of the territory are the main objectives of these activities - which the DPC addresses, promotes and coordinates in collaboration with regional governments and the autonomous territories. Prediction activities- carried out with the participation of relevant scientific and technical bodies - aim to assess risk scenarios and, when possible, to give notice, monitor and supervise events and risk levels expected.

Key risks:

Italy has a high exposure to natural risks: earthquakes, floods, landslides, volcanic eruptions as well as fires. Natural hazards and man-made disasters contribute to a volatile environment.

Figure 17: Frequency of disasters in Italy¹²²⁷

Seismic Risk

Italy is one of the countries in the Mediterranean with the highest seismic risk, due to its particular geographic position at the convergence of the African and Eurasian plates. The highest seismicity is concentrated in the central-southern part of the peninsula, along the Apennine ridge (Val di Magra,

¹²²⁷ EM-DAT (Feb. 2015) - The OFDA/CRED - International Disaster Database <http://www.emdat.be> - Université catholique de Louvain Brussels - Belgium

Mugello, Val Tiberina, Val Nerina, Aquilano, Fucino, Valle del Liri, Beneventano, Irpinia) in Calabria and Sicily and in some northern areas, like Friuli, part of Veneto and western Liguria. Only Sardinia is not particularly affected by seismic events.

Figure 18: Civil Protection Department¹²²⁸

As shown in the Figure above, throughout 40 years, seismic risk in Italy has costed the country millions. Thus, requiring immediate action to enhance mitigation.

Volcanic Risk

In Italy volcanism owes its origin to wide ranging geological processes, involving the entire Mediterranean area and linked with the Euroasiatic and African tectonic plates converging together.

Even though less frequent and devastating than earthquakes, volcanic eruptions are still a great hazard for the densely populated zones in the Italian territory. At the moment Italy has two active volcanoes, Etna and Stromboli; as this report is been compiled, Mount Etna has erupted¹²²⁹.

¹²²⁸ French Association for Earthquake Engineering, www.afps-seisme.org/index.php/eng/content/download/1699/.../Calvi.pdf, accessed December 6th

¹²²⁹ The Guardian, Sky lights up over Sicily as Mount Etna's Voragine crater erupts, <http://www.theguardian.com/world/2015/dec/03/sicily-mount-etna-voragine-crater-erupts-lightning>, accessed December 10th

Figure 19: Italy’s Volcanoes¹²³⁰

Hydro-meteorological Risk

The terms hydro-meteorological and hydraulic risk are used to identify the phenomena triggered by “unfavourable weather conditions” and the effective or potential damage caused by water in general in liquid, solid form or underground.

Hydro-meteorological and hydraulic risks are strongly influenced by man-made actions. Density of population, the constantly shifting urbanization, abandonment of mountain areas, unauthorized buildings, continuous deforestation, the use of non-ecological agricultural techniques and the missing maintenance and upkeep of river beds and slopes have definitely worsened the hydrogeological instability and highlighted the fragility of the territory.

The most typical examples of hydrogeological phenomena comprise of thunderstorms, winds and sea storms, fog, snow and ice as well as heat waves, landslides, floods, coastal erosion, subsidence and avalanches¹²³¹. Italy for example suffers from flooding very often, which consequently creates landslides. At the moment of writing, the most recent flooding in Italy occurred on November 3rd, 2015, after a heavy non-stop rainfall of 2 days, at the southern of the country¹²³².

Tsunami Risk

Every coast of the Mediterranean Sea is exposed to tsunami risks due to the high seismicity and to the presence of various active volcanoes, both emerged and submerged. Tsunamis out of the coast

¹²³⁰ Italian Civil Protection Agency, Italy’s volcanoes, http://www.protezionecivile.gov.it/resources/cms/images/vulcani_italia_d0.jpg, accessed November 30th

¹²³² Floodlist, Southern Italy Hit by Deadly Floods After 2 Days of Heavy Rain, <http://floodlist.com/europe/southern-italy-calabria-sicily>, accessed December 8th

of Italy have been reported throughout the decades; none of them though had a large impact on the Italian society. Coastal areas like Eastern Sicily, Calabria, Puglia and Eolie archipelago are the ones mostly affected. Other ways in reaching Italian waters can always be the generation of high waves from a country that experienced an earthquake.

Fire Risk

About 30% of the Italian territory is made up of forests. Every year tens of thousands of hectares of those areas are burnt either by wilful or manmade forest fires; usually by neglect and carelessness. An estimation of 12% of the domestic forestry has been destroyed over the past thirty years¹²³³.

The consequences for the natural equilibrium are very serious and the times needed to restore the forestry and environmental ecosystem is nowadays becoming longer. Moreover, the changes attributed to climate change continue impacting the natural conditions of the soil. Damage caused by fires favour landslides coming along heavy rainfall, having even further impact on the natural strata of the soil.

The summer months are at the greatest risk, when drought, high temperatures and strong winds help evaporate a part of the water stored by the plants; causing a naturally favourable process for fires to break out and spread¹²³⁴.

Health Risk

Health risks are usually the consequence of other threats or disasters. Health risks emerge every time in critical situations possibly affecting human health as well as the natural environment. Difficult to foresee, it can be moderated when preventive actions are taken in advance. In these cases prevention could be the key into saving lives.

In the Italian case the Department of Civil Protection only engages with health risks in local communities which are unable to respond to such occurrence¹²³⁵.

In this connection the Civil Defence Department has outlined the “General criteria for organizing rescue work in catastrophes”¹²³⁶ published in 2001, followed by “General criteria for medicines and

medical devices to be kept in a first aid post (Pma II liv)”¹²³⁷ in 2003, by the “General criteria for psychosocial treatment in catastrophes”¹²³⁸ in 2006 and “Procedures and forms of medical triage”¹²³⁹ published in 2007.

Nuclear Risk

In reaction to the Chernobyl disaster of 1986 the Italian government had decided, via a referendum in 1987, to discontinue the use of nuclear energy. In addition, a national plan for nuclear emergencies was developed.

Despite the moratorium on nuclear power plants in Italy, nuclear threats remain. The Italian Civil Protection agency monitors ongoing power plants that are outside its territory, in a 200km radius; in case of an incident measures are taken at a national level. There are 13 plants surrounding Italy, namely in France, Switzerland, Germany and Slovenia.

The national plan in place for radiological emergencies, approved by Decree of the President of the Council of 19 March 2010, lays the measures necessary to deal with incidents that occur in nuclear power plants outside the Italian territory.

Environmental Risk

The Department of Civil Protection is responsible intervening in light of such environmental risks, and engaging in complex situations that range from waste to water pollution emergencies. Environmental risks also include air pollution and levels of dangerous substances in the environment.

Where land decontamination is concerned, the Department is always involved in the management of SIN - Siti di Interesse Nazionale (sites of national concern) – in other words, the areas identified in relation to site characteristics, to the quantity of and danger posed by pollutants, to the impact on the surrounding environment in terms of health and ecological risk, as well as damage to the cultural and environmental heritage. Legislation on the matter includes laws 462/98 and 388/2000, the Ministerial decree 468/01 and law 179/2002¹²⁴⁰. To date, SINs come to 57 and represent 3% of Italian territory of which 34 % is marine or inland waters, representing approximately 330,000 hectares of

¹²⁴⁰ ISPRA, Contaminated Sites Management and Environmental Liability in Italy: Regulatory and Technical Aspects, http://www.iccl.ch/download/meeting_helsinki_09/A_Italy.pdf, accessed December 8th

marine area¹²⁴¹. The responsibility in terms of administrative procedures for the SINs falls on MATT - Ministero dell'Ambiente e della Tutela del Territorio (Ministry for the Environment and Protection of the territory), with the support of ISPRA (Institute for Environmental Protection and Research).

The sites/areas of national concern require urgent intervention and involve approximately 316 municipalities in all regions of Italy, with approximately 7 million inhabitants. Furthermore, based on the APAT 2003 annual, the sites/areas of “regional interest” are approximately 12,107 polluted or potentially polluted, of which 4,383 are registered in the “Registry of contaminated sites” (only 382 have been cleaned up).

The scale of pollution, on a spatial level, and the quantity of spills in these areas require urgent and costly interventions which must be tackled through the incidents ad hoc. For example, “2,400 tonnes of thick fuel in the capsized Costa Concordia pollutes one of the Mediterranean's most prized and pristine maritime reserves”¹²⁴². That was one of the worst environmental challenges faced by Italy in two decades.

An example of such an emergency is the decontamination of the Orbetello site, where - given the situation of serious environmental danger - the Ministry for the Environment asked the Ministry for the coordination of civil protection to adopt an order in accordance with law no. 22524 of February 1992¹²⁴³. This allowed for the implementation of urgent measures to activate operations necessary to reach objectives set by the Ministry for the Environment, specifically the technical-scientific commission; pursuant to the judgement of the area as one of high risk for an environmental crisis.

Over recent years, the Department has been engaged in the management of emergencies regarding bad management of solid urban waste, with attempts made to overcome and manage emergency situations in different Italian regions such as Campania, Calabria and Sicily through civil protection orders.

Industrial Risk

The presence of factories using or keeping chemical substances for their production activities in the territory exposes the population and surrounding environment to industrial risk. An industrial accident can in fact cause harm to population and territory.

¹²⁴¹ ISPRA, Italian Environmental Yearbook 2009, <http://www.isprambiente.gov.it/contentfiles/00006500/6503-tematiche-2009-key-topics1.pdf>

¹²⁴² Aloisi S., Italy risks worst environmental disaster in 20 years, <http://www.reuters.com/article/uk-italy-ship-environment-idUSLNE80J02Y20120120>

¹²⁴³ ISPRA, The Orbetello Site – Geological Features and Mining Activities, www.cprac.org/docs2/almaden2012_romano.pdf

The effects on human health in the event of exposure to the toxic substances released into the atmosphere during an accident vary, depending on the characteristics of the substances, relevant concentration, period of exposure and quantity absorbed.

Effects on the environment are linked with contamination of soil, water and atmosphere by toxic substances. Impact on material components, mainly corresponds to infrastructures, which most of the times are critical to society's rehabilitation. Thus, raising awareness in regards to these aspects is crucial for reducing industrial risk to the lowest possible levels, preventing harm to health and environment¹²⁴⁴.

1.2 Policy and Governance

In Italy the main responsibility for civil protection, is attributed to the "National Service". The National Service is an integrated system which includes all the local and central resources necessary for managing a calamity, as regulated by law 225/92¹²⁴⁵. Civil society represents an active part of the National Service, particularly through the activity of the voluntary organisations. Compared to the other European countries, Italy has widespread risks throughout the territory and for this reason has developed an intervention system which starts from a local level and involves all the administrations. The National Service includes the following in particular:

Components: they are the local and central administrations like Municipalities, Provinces, Regions and Ministries. All the subjects involved in civil protection events, for various reasons, like public authorities, institutes and groups of scientific research, even private institutions and organisations, associated citizens and groups of volunteers' professional rolls and boards are also members.

Operational structures: they are the organised State corps like the Fire brigade, the Armed Forces and the Forestry Commission, the Mountain Rescue Team, the Red Cross and the Health Service structures. Amongst these, the voluntary organisations of the civil protection service have taken on a role of particular importance and they have grown in all regions of the country in terms of numbers and of operational capacity.

The Civil Protection Department has a unique role in this process because it heads the National Service; directs and coordinates the activities and intervenes directly in the management of events that require extraordinary resources because of their extent and duration.

¹²⁴⁴ Italian Civil Protection Agency, <http://www.protezionecivile.gov.it>

¹²⁴⁵ IFRC, Law and Regulation for the Reduction of Risk from Natural Disasters Law in Italy, <http://drr-law.org/resources/Italy-Desk-Survey.pdf>

Civil Protection activities: The system intervenes to provide relief to the population, to help overcome the emergency and aid a return to normality. The Mayor is the first person responsible for civil protection in the territory and provides relief to the population and coordinates amongst the different local structures and the volunteers.

If the Municipality cannot cope with the emergency alone, the provincial Council and the Government's territorial offices, that is the prefecture and the regional Council intervene by activating all the available resources for the areas affected by the calamity. In the most serious situations, central government intervenes: the Prime Minister has a direct responsibility in operating the Civil Protection Department.

The operation of the system is based on the principle of subsidiarity, according to which the nearest administration to the affected citizens intervenes first, while the superior administrative levels – Provincial council, Regional Council, Central Government – intervene if the administration is incapable of coping with the event within its own means. Emergency actions are planned according to the principles of the “Augustus method”, a simple, streamlined and flexible instrument¹²⁴⁶. This planning method predefines the operational structures as well as prepares a general civil protection plan and gives indications about procedures. What follows is basically a structural scheme prepared for every stage of a disaster¹²⁴⁷.

In day-to-day operations, the administrations are involved at all levels in predicting and planning actions of prevention and mitigation of risks. In this process, the scientific community, which is considered a member of the National Service, plays an essential role¹²⁴⁸.

1.2.1 Strategy scope and focus

The Department of Civil Protection, in collaboration with the regional governments and local autonomous bodies, orients, organises and coordinates civil protection projects and activities.

It coordinates activities in response to natural disasters, catastrophes or other events - “c” type events - which, due to their intensity and extent, must be tackled using special means and powers. In this case, the Prime Minister declares a state of emergency with a decree and identifies, through orders, the actions to be undertaken to manage the event.

On an operational level, the Italian Civil Protection Department:

¹²⁴⁶ Lumbroso et al. FIM FRAME: a method for assessing and improving emergency plans for floods, <http://www.nat-hazards-earth-syst-sci.net/12/1731/2012/nhess-12-1731-2012.pdf>

¹²⁴⁷ Mario Moiraghi, Origin, development and Method, pg 225

¹²⁴⁸ Italian Civil Protection Agency, <http://www.protezionecivile.gov.it>

- Issues guidelines, aimed at regions, provinces and municipalities, to prepare and implement prediction and prevention programmes in relation to various risk scenarios;
- Prepares and implements emergency plans for type “c” events, in agreement with the pertinent regions and local organisations;
- Intervenes, at the request of the regional authorities, in extinguishing forest fires using the State aircraft fleet¹²⁴⁹.

It organises periodical drills for national emergency plans, with the objective of verifying the effectiveness of emergency plans and testing out procedures for managing disasters on facilities and the population.

It also promotes information activities for national scenarios, in collaboration with other institutions and associations as well as training and research activities regarding the prediction and prevention of natural and manmade risks. The training activities, organised in close collaboration with national organisations, are aimed towards voluntary organisations, at the “competent territorial bodies”, namely regions, provinces, mountain communities and municipalities as well as schools.

Acting within the Department is the National Functional Centre, which gathers data from the Regional Functional Centres and the Centres of Competence, used to monitor phenomena nationwide, and the coordination centre system, in the National Operations Room. The Department is also where COAU - the Unified Air Operations Centre, and COEMM - the Operations Centre for Maritime Emergencies both operate.

Responsibility for deciding Civil Protection policies is assigned to the President of the Council of Ministers, or to the Minister of the Interior. The DPC, which is the operative arm of the president of the Council of Ministers, has the mandate to initiate and coordinate all activities of the associated bodies and operational units of the “National Service of Civil Protection”. This accounts for prevention/preparedness activities as well as during disaster management operations¹²⁵⁰.

1.2.2 Monitoring and analytical support to policy making; R&D

Together with its substantial political power and its capacity to fully integrate scientific research and technological expertise, the DPC is a central body through which innovation, coordination and resources are streamlined. [1]

¹²⁴⁹ CALYPSO Project, Task4.1, <http://oceania.research.um.edu.mt/cms/calypsoweb/phocadownload/2.pdf>

The Memorandum of understanding with the aim of achieving the abovementioned was signed on 20/10/2011.

¹²⁵⁰ Italian Civil Protection Agency, <http://www.protezionecivile.gov.it>

To fulfil its task of identifying the types of events, their geographical distribution and the probability of occurrence and risks, the DPC is involved in a structured system of collaboration with the scientific and research community through the “Commissione Grandi Rischi”¹²⁵¹. This Commission takes a multi hazards approach and deals with four phases of the emergency management cycle, forecasting, monitoring, surveillance and risk prevention of both natural and technological disasters.

Ministries, universities, public research institutes and public administrations combine forces with the DPC through different forms of co-operation, agreements, understandings and working teams, in order to define both prevention and forecasting measures for the different types of risk¹²⁵². For the fulfilment of the operational responsibilities of the Italian Civil Protection System, technical, scientific and industrial structures are involved with the aim of ensuring the necessary technical-scientific support¹²⁵³.

1.2.3 Policy for Prevention

The regions, assisted by the DPC’s National Research Community (also composed of Local and Regional authorities), have a role in providing guidelines to provinces to carry out risk prediction and prevention activities serving as the basis for the prefects’ emergency planning.

“Early warning, planning, training, dissemination of knowledge of civil protection, information to the population, drills, and application of technical regulations are the main instruments of civil protection for the prevention of territorial risks and are intended to prevent or limit damage in the event of an emergency”¹²⁵⁴.

However, their competences on the operational level remain limited. These tasks are reserved for the province and municipal level, whose mandate is to implement forecasting and risk prevention activities and assure that first emergency relief provisions are made¹²⁵⁵.

1.2.4 Policy for Preparedness

The Prime Minister issued on December 3rd, 2008 operational Guidelines for emergency management. The aim was to regulate the information flow between the different stakeholders involved. Activation and co-ordination of the components and structures of the Italian National Civil Protection Service (NCPS) described the organisational model of emergency management from a

¹²⁵¹ OECD Reviews of Risk Management Policies OECD Reviews of Risk Management

¹²⁵² Interview with expert from the Italian Department of Civil Protection

¹²⁵³ OECD Reviews of Risk Management Policies: Italy – Review of the Italian National Civil Protection System

¹²⁵⁴ Italian Civil Protection agency, <http://www.protezionecivile.gov.it/jcms/en/rischi.wp>

¹²⁵⁵ Italian Civil Protection Agency, <http://www.protezionecivile.gov.it>

national perspective and contributed to the local civil protection responsibilities, guaranteeing critical operational co-ordination¹²⁵⁶.

Regions are required to conduct their own planning and initiate, organize and participate in Civil Protection activities organised at a regional level as well as supporting local organizations¹²⁵⁷.

According to the model adopted by each region, the Rescue Co-ordination Centre (CCS) of the province is activated. In the CCS there are representatives of the region, the prefecture, the province and the institutions, administrations and operational structures dedicated to the management of the emergency. The CCS promotes unified direction for operations and co-ordinated actions with those carried out by the mayors of the involved municipalities. If the model adopted by the region does not indicate clearly who exercises leadership of the CCS and there is specific agreement between the prefecture and the province in force, the task is assigned to the prefecture which has the duty to ensure the safety of the people and the goods.

Each region affected by a disaster, is subjected to the immediate activation and deployment of the regional counterpart – referring to the autonomous regions - and volunteer organisations, if any. The management of health care emergency operations, deployment of its technical experts to check the safety in buildings, damage assessment as well as evaluation of risks left and induced among others, are some of the actions that the CCS is responsible for. The region will, in case there is a need for extraordinary means and powers due to the actual needs in an area affected by disaster and on the basis of requests coming from the local institutions, submit a request for a declaration of State of Emergency¹²⁵⁸.

1.2.5 Policy for Response

During crisis situation well prepared and institutionalized coordination capacity and leadership for fast and immediate resource mobilization is required. The first person responsible for initiating and implementing civil protection activities is the mayor, who organises municipal resources according to pre-established plans made to cope with specific risks and disaster impacts in his territory of power.

However, in the case an event exceeds regional and local capacities, the government (Council of Ministers) is entitled according to the Prime Minister's decree to declare a State of Emergency in which support for provinces, regions and the assistance of peripheral state administrations will be guaranteed and co-ordinated by the prefects. Decision support for declaring a State of Emergency is

¹²⁵⁶ OECD Reviews of Risk Management Policies: Italy – Review of the Italian National Civil Protection System

¹²⁵⁷ Italian Civil Protection Agency, <http://www.protezionecivile.gov.it>

¹²⁵⁸ OECD Reviews of Risk Management Policies: Italy – Review of the Italian National Civil Protection System

provided by the DPC on the national level, established under the direct authority of the Italian government and the prime minister's office.

The DPC is required to conduct an impact assessment within a very short time and to examine whether local resources are sufficient to efficiently manage a disaster. In case of required national resources the DPC takes over the responsibility for overall coordination of CM operations, while all concerned authorities at regional, provincial and municipal level perform their specific roles.

Intervention activities dealing with rescue operations are coordinated by the Operational Committee of the DPC including relevant institutions and their administrative units acting at a national and local level. They are carried out through a multi-level hierarchical organization represented by the Municipal Operational Centres (COC), the Mixed Operational Centres (COM) and Rescue Coordination Centres (CCS) at the provincial level, the Regional Operations Centres, and the Command and Control Direction (DI.COMA.C.) at the national level. Even though the DI.COMA.C. represents the national level, it is physically set up on the disaster site or close thereby. Furthermore, the DPC has institutionalised the National Situation Room (Sit.I.) at its premises, ensuring a 24 hours' presence of the DPC's main operational structures such as its permanent monitoring and control centre with regard to incidents occurring throughout the national territory¹²⁵⁹.

1.2.6 Policy for Relief and Recovery

Relief activities consist of a set of first assistance interventions to the affected populations. Finally, the emergency response comprises all the necessary steps to remove obstacles in order to resume normal life conditions in the affected territories¹²⁶⁰.

In 2009, Italy made use of the EUSF due to the damage caused by the earthquake in the Abruzzo region. Interestingly, the experience of aid provision and aid acceptance opened the eyes of Italian authorities for the need to improve its legal and institutional set-up on insurable damages, however, in the case of the Abruzzo region, the fund has not endangered or prevented the responsibility of the national authority in taking preventive actions. The money received by the fund, had more the role of refunding an extraordinary expenditure made by the Italian government. This case shows that the EUSF impact is not only providing immediate relief and recovery resources during and after emergency situations but also acts as well as engages the regions of the country into disaster preparedness activities, such as institutionalizing recovery structures and instruments¹²⁶¹.

¹²⁵⁹ ACRIMAS project : The Political and Legal Framework of EU Aftermath CM - ACRIMAS_D2-1

¹²⁶⁰ Italian Civil Protection Agency, <http://www.protezionecivile.gov.it>

¹²⁶¹ ACRIMAS project : The Political and Legal Framework of EU Aftermath CM - ACRIMAS_D2-1

1.3 Financing

1.3.1 Investing in preparedness

Yearly civil protection expenditure is estimated at: 0.009% of GDP (EUR 142m)¹²⁶².

Starting with the adoption of the new regulation on the European Civil Protection Mechanism, adopted on 17/12/2013, Italy, like other EU Member States, is committed in the risk assessment process where activities comprised in the preparedness phase will be and evaluated. A clear picture of the financial investments for preparedness will be in case available only at the end of such a process. With the intense financial issues of DG ECHO, other measures of potentially creating a more flexible post-financing had to be considered. Thus,

The budget 2015 has now been adopted with payment appropriations and commitment appropriations at almost the same level. At the same time, the reinforcements in payments towards the end of 2014 have significantly reduced the backlog of unpaid bills, which is now in the order of EUR 135 million. Therefore, although the payments deficit has not been entirely solved, (and on current projections 2015 will close with a backlog of unpaid bills not dissimilar to 2014) the new budgetary context has allowed it to stabilise¹²⁶³.

1.3.2 Investing in consequence management

An important share of the State's annual budget is devoted to restoring damages incurred as a result of natural disasters. From 1999-2008, the State spent over EUR 35 billion in ad hoc, ex post disaster compensation. Although no dedicated disaster fund has been established, yearly expenses are progressively growing.

The compensation of disaster losses is handled on a case-by-case basis, whereby the Italian government intervenes in emergencies by providing ex-post financial aid and enacting ad hoc laws (so called emergency legislation). Following a disaster the local government of the affected area (town, province or entire region according to the extent of the disaster) may petition for a "Declaration of State of Emergency". If the Cabinet approves the proposal, it opens the way to an order specifying the financial amounts to be made available to the public for long-term reconstruction.

¹²⁶² CRISYS project – Summary of National meeting: Italy

¹²⁶³ http://ec.europa.eu/atwork/synthesis/amp/doc/echo_mp_en.pdf

These funds are primarily directed toward paying for reconstruction of public infrastructure and to contribute to the rebuilding of private houses. The area identified in the declaration may make claims for compensation from the fund for recovery measures through the region where it is located, and the President of the region delegates a body to monitor reconstruction works. The Department of Civil Protection acts as an intermediary in this process¹²⁶⁴.

In this way, major disaster recovery costs were in the past supported at National level, also using dedicated and time-limited taxes; however, the European Solidarity Fund has also been used to extend the scope of recovery financing.

In 2009, Italy made use of the EUSF due to the damage caused by the earthquake in the Abruzzo region in which 300 persons lost their life. The damage costs were estimated at € 10.2 billion¹²⁶⁵. The EC verified that the criteria defining a ‘major disaster’ were met (threshold value for EUSF activation is fixed for Italy at € 3.4 billion) clearly justifying European intervention. The aid helped to cover costs for emergency operations, temporary shelter, housing and school projects (approximately € 500 Million)¹²⁶⁶.

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

The large number of disasters Italy has substantially influenced current policy Centralizing the Italian Civil Protection System was seen as a “must” to manage disasters effectively¹²⁶⁷.

There is no formalized system or structure for evaluating systematically individual events and drawing lessons from incidents that could feed into proposals for change of policy. For example, after the San Giuliano earthquake the government considered the gap between scientific knowledge and its translation into risk mitigation tools to be unacceptable, and established a Working Group to obtain scientific advice on the possible upgrade of both seismic mapping and seismic code. The output of this effort was a by-law (n. 3274) issued by the Prime minister on general criteria for seismic mapping of the national territory and on seismic codes¹²⁶⁸. Meaning that best practices were eventually translated to knowledge with the aim of enhancing seismic mitigation.

¹²⁶⁴ OECD Reviews of Risk Management Policies: *Italy – Review of the Italian National Civil Protection System*

¹²⁶⁸ Dolce, M., Seismic safety of schools in Italy, <http://www.oecd.org/edu/innovation-education/33629104.pdf>, pg. 54, accessed December 24th

1.4.2 Departmental Lessons Learned systems

The national Civil Protection Service has developed and increased its capacity and capability by continuously learning lessons and gathering experience from past events, and with the support of legislation and ordinances that have been introduced over time for this purpose. One such event that provided many such lessons for emergency planners was the San Giuliano earthquake in 2002. It was found, for example, that:

- Even though different parts of Ital have been stroke with several earthquakes throughout the years, the culture of risk has faded away. Public awareness needs to be revived in such cases.
- The national building codes were obsolete. Authorities should act according to the latest available information with wide scientific consensus. Keeping norms unchanged allows for engineers and designers to forget the need for improvement.
- Buildings constructed in past are not necessarily safe enough. There is a need to conduct seismic assessment of the buildings and infrastructures that have a crucial role in emergencies or with relevant consequences in case of collapse.
- Due to the absence of any seismic awareness, local authorities were not ready to manage a seismic emergency. The relief model used by the national Civil Protection told local authorities what to do and how to do it, but did not check their preparedness¹²⁶⁹.

1.4.3 Centralised (national) Lessons Learned system

Disaster statistics and lessons that are informally drawn from events are not compiled in a dedicated data bank as part of the information and decision support system of the national Civil Protection Service.

1.4.4 International exchange for Lessons Learned

At the state there is no specific lesson learned program in place except the interchange within the DG-ECHO lesson learned mechanism relevant to operations where Italian first responders have been involved. In addition the Joint Research Centre of the EU, regularly publishes reports on lessons learned throughout Europe¹²⁷⁰.

¹²⁶⁹ OECD Reviews of Risk Management Policies: Italy – Review of the Italian National Civil Protection System

¹²⁷⁰ JRC Report 2002, http://esdac.jrc.ec.europa.eu/ESDB_Archive/eusoils_docs/other/eur20558EN.pdf

During the Italian Presidency of the Council of the EU, Italy and Germany also initiated the EU-UN Cooperation in Crisis Management and Peace Operations, which allows for exchange of lessons learned and exchange of best practices at an international level¹²⁷¹.

1.4.5 Regular policy reviews

At the state level there are no specific mechanisms established for reviewing the policies adopted, evaluate their effectiveness and improve the policy process.

1.5 Resilience

The vision of the Italian Civil Protection Department is a “risk-aware and resilient society able to prevent disasters and to mitigate their impact”¹²⁷². The improvement of resilience in Italy is enhanced at a regional level, specifically, through the “Making the Cities Resilient” campaign¹²⁷³.

Italy seems to rely on improved preparedness mechanism for general society resilience augmentation. For example, private and public organisations managing critical infrastructure have business continuity management plans in place.

Specific tasks in National Crisis Protection Situations, in the event of an emergency are very extensive and include the supply of all information regarding the state of fixed line telephone and mobile phone services in the areas hit by emergency and the alternative networks supplied by each operator, highlighting the organisational and infrastructural impact as well as the identification of the corrective measures needed to guarantee the best possible connection continuity of the networks throughout the national territory, in order to avoid a domino effect on other types of infrastructure and to solve traffic congestion problems that are reported in real time at the operators’ coordination centres.

ENI, a major integrated energy company, among the other tasks, have to contribute to restore safety in the areas affected by the event and coordinate all activities for the immediate restoration of safety in the damaged infrastructures and power plants¹²⁷⁴.

¹²⁷¹ 2014 Italian Presidency of the Council of the EU, EU-UN Partnerships in Crisis Management and Peace Operations: Best Practices and Next Steps http://www.iss.europa.eu/uploads/media/Background_EU_UN_seminar_Rome_01.pdf, accessed December 11th

¹²⁷⁴ OECD Reviews of Risk Management Policies: Italy – Review of the Italian National Civil Protection System

The efforts to guarantee business continuity is also in the duties of GME and TERN, the major electrical power service companies, which are also in obligation to provide a contact centre for the spreading of useful information to the community with respect to the emergency and to contribute with support to the updating of the state of the plants¹²⁷⁵.

1.6 Information sharing and data protection

1.6.1 Please describe whether the country/ IO has adopted specific policies, measures or derogations from EU law with regard to data protection

The National Service quickly reacts to understanding the severity of a specific event. The collaboration of the scientific community allows for this swift response. Thereafter, the central and regional authorities, with a network they have developed, transmit real-time information between monitoring stations. This provides the autonomous regions and all stakeholders involved in the process with the capacity to anticipate and model events. Eventually, “the result is timely issuance of early warnings to local populations and rapid deployment of first responders”¹²⁷⁶.

1.6.2 Does the country/IO have registers/databases of volunteers?

The country has adopted a national list of voluntary organizations of civil protection.

Organisations wishing to participate in the activities of forecasting, prevention and intervention in sight or in the event of natural disasters and carry out training activities and training missions in the same scope must be registered on the national list of voluntary organizations of civil protection. According to the provisions of the Directive of the President of the Council of Ministers of 9 November 2012, the national list is composed of:

- a central list, and
- lists of the territorial force in the Regions and Autonomous Provinces.

The central list

This section of the national organizations that accommodates for operational characteristics and diffusion, are of particular importance in direct liaison with the Department of Civil Protection in the case of events of national importance.

Requirement for the inclusion in the list:

- The national coordinating structures of organizations established under Law 266/1991 spread to more regions

¹²⁷⁵ OECD Reviews of Risk Management Policies: Italy – Review of the Italian National Civil Protection System

¹²⁷⁶ OECD, Review of the Italian national civil protection system, <http://www.oecd.org/futures/globalprospects/reviewoftheitaliannationalcivilprotectionsystem.htm>

- The national coordinating structures of the organizations of other component to mostly voluntary;
- Organizations with no regional organization, but able to perform specific functions deemed by the Department of Civil Protection of particular relevance and interest at the national level;
- The national coordinating structures of municipal and inter-municipal groups.

Applications for inclusion on the List Central received are numerous and, as established by the Directive, require a thorough audit. To this effect from August 1 2014 shall enter into force the first edition of the List, which will be integrated as the examination of further requesting organisations will be completed. For applicant organizations that are already listed in their respective regional lists, remains valid, with continuity, this registration.

The territorial lists

To intervene and operate in the case of activities and events of regional / local scope, organizations must be included in the list of local volunteer in their region or autonomous province.

The list is set up separately from the central register provided for by Law 266/1991 (framework law on volunteers). Organizations possessing the relevant requirements can subscribe to both. In the territorial lists can enrol:

- Voluntary organizations established under Law 266/1991 with local character
- Organizations otherwise established, but predominantly voluntary
- Local branches of the organizations, with national distribution, mentioned in the previous paragraphs
- Municipal and inter-municipal groups
- Organizations that collect most of the types mentioned above

Prior to the adoption of a Directive of November 9, 2012, the national list was made up of a single section that united organizations of national importance and those of a local nature. This list is no longer valid¹²⁷⁷.

1.6.3 Does the country have or plan to use data gathered from social media during crises? If so how? (e.g. “crowd sourcing” and “crowd tasking”, “citizen as a sensor”)

Italy has introduced, “the network #socialProCiv [...] establish a standard that, while respecting the autonomy of each actor, can help to make communication on social media in the field of civil

¹²⁷⁷ Italian Civil Protection Agency, <http://www.protezionecivile.gov.it>

protection more recognizable, clear, useful and consistent to users”¹²⁷⁸. However, this is still in the making, as a working group has been established to test the feasibility of such a network.

This working group has met already three times, at the time of writing, and has produced three documents that would serve as guidelines for #socialProCiv. The first document identifies what is the role of #socialProCiv, and which groups it refers to. This is namely the Manifesto¹²⁷⁹. The second document, is more related to policy. Specifically, “agreement of clarity and the services that each member of the network #socialProCiv must prepare by following the indications”¹²⁸⁰. The third and last one is the guidelines on how to use #socialProCiv.

2 Legislation

2.1 Crisis (emergency, disaster) management concept

In Italy, over the years responsibility regarding civil defence has progressively passed from the State to the local authorities; the main steps of this process were outlined in legislative decree no. 112 dated 1998 and the modification of Title V of the Constitution with constitutional law no. 3 dated October 18, 2001, with which the Civil Protection became a concurrent subject of legislation, thus of regional competence.

The Civil Protection and Crisis Management concepts have certainly evolved with time; this process is well described by the plethora of laws (see the following paragraph). Within these laws particular attention should be posted on the ones directly concerning the establishment of the National Service for Civil Protection which was established with law no. 225 dated 24 February 1992¹²⁸¹, later integrated and modified by law no. 401 dated November 9, 2001 focusing on the operational structure of the National Service¹²⁸² and law no. 152 dated July 26, 2005.

Taken as a whole, the legal instruments suggest opposite trends; a trend towards centralization and a trend towards decentralization within the Italian Civil Protection legislation reflect the struggle between higher or lower degree of autonomy among the regional, national level and local levels. The strong coordination role played by the Italian Department of Civil Protection and the power of the prime minister to declare a state of emergency illustrates the first trend revealing a more centralized system activated in extreme challenging emergency conditions. The fact that some provinces have evolved enormously their own regional system illustrates the later trend.

2.2 General crisis (emergency, disaster) management law

The following legislation constitutes the main pillars of the Italian CM legal framework:

¹²⁸¹ Italy Civil Protection Department, Voluntary work,
<http://www.protezionecivile.gov.it/jcms/en/volontariato.wp>, accessed December 10th

¹²⁸² Italy Civil Protection Department, Operating Structures,
http://www.protezionecivile.gov.it/jcms/en/strutture_operative.wp, accessed December 10th

- The "National Civil Protection Service", composed of all various kinds of actors at different administrative levels (compare figure 3-3), was institutionalized by Act no 225 adopted on 24 February 1992¹²⁸³.
- L.225/92 introduced a marked legal distinction between civil protection and civil defence and remains the legislative core of the Italian CM system: In the law a broader definition of "protection of civilians" extended the concept of Civil Defence aiming at protecting civilians during armed conflicts. Civil Protection is now understood as the series of actions and activities put forward by a country in order to protect human lives, goods, settlements and the environment from damages or from the danger of damages deriving from natural calamities, catastrophes and other disastrous events. Thus, Civil Protection was understood not only as a matter of post-emergency management but of forecasting and prevention as important pillars. Moreover, L.225/92 defined roles and responsibilities of and between different governmental and non-governmental executive bodies in the context of decentralization¹²⁸⁴. Competences are shared between the administrative national, regional, and community level as well as the research community, voluntary organizations and private entities. Although, the law provided the national government (cabinet) with the power to declare a "State of Emergency", this specific law was not intended to centralise civil protection actions to the State. According to the principle of subsidiary, CM-decisions are made and interventions are implemented only at a higher administrative level, if subordinate entities are unable to manage a crisis situation. The mayor (community / municipality) was appointed as the highest level of authority during a crisis and the person that would pass on the responsibility to higher authorities in case the incident required specialised actions.
- Based on the provision in the constitutional law of 16 March 1997 (L 15.3.1997 n. 59) on decentralization, the legislative Decree 112/98 has renewed the distribution of public service provision, tasks and responsibilities.
- In 2001 (L. Constitutional 18.10.2001 n. 3), a constitutional reform increased the legislative and executive power of the regions and regional governments were given the opportunity to develop their own Civil Protection structures; that was also in accordance to the autonomy of certain regions, as mentioned above.

¹²⁸³ Dpr 21 settembre 1994, n. 613: the regulations concerning the participation of voluntary organizations in the activities of civil protection (source in Italian), http://www.protezionecivile.gov.it/jcms/en/view_prov.wp?facetNode_1=f4_4_3&prevPage=provvedimenti&atcode=f4_4_3&contentId=LEG21155

¹²⁸⁴ ACRIMAS project, D2.1 Report on Current CM Framework http://www.acrimas.eu/attachments/article/5/D2.1_ACRIMAS_Report_on_CM_Framework_v2-1.pdf

- Also in 2001, law 343 and 401 significantly changed the operational-coordination structure of Civil Protection. Specifically, “the prime minister, in collaboration with the regions and local communities, is responsible for the planning of operational emergency guidelines, forecasting and prevention programmes, rescue programmes and the coordination of their implementation”¹²⁸⁵.
- In 2002 law 245 transferred full authority to the Prime Minister to initiate CM activities during an emergency situation, and the level of emergency is defined by the risk level¹²⁸⁶. In this specific decree, extensive disasters are not properly defined.

2.3 Emergency rule

In Italy, for the purposes of civil protection, calamitous events are classified in three different types. For each event, on the base of its extent, intensity and capacity of the civil protection response, the relevant civil protection levels are identified which should take the direction and coordination of interventions:

- type a (municipal level);
- type b (provincial and regional);
- type c (national).

The state of emergency may be declared as "imminent" and not just at "the occurrence" of a natural disasters, or related human activities that, for intensity and extent must be tackled with immediate intervention with extraordinary powers and means (Decree law n. 59 of 15 May 2012, converted into Law n. 100 of 12 July 2012).

For events "type c" the Council of Ministers shall act the state of emergency, proposed by the Chairman of the Board, or, by proxy, of a Minister with the portfolio or the Undersecretary of State at the Presidency of the Council of Ministers Secretary of the Board. The request may also come from the President of the Region concerned. Until the entry into force of Decree-Law n. 59/2012, converted into Law n. 100/2012, the declaration of a state of emergency was accomplished by a decree of the President of the Council of Ministers.

The duration of the state of emergency, in accordance with article 10 of Law n. 119 of October 15, 2013, may not exceed 180 days and may be extended up to an additional 180 days, with further deliberation by the Council of Ministers. In fact, standing to the art. 2, (Italian Law 225/92), mentions that, events with an intensity and extent that require extraordinary means and power, the Council of

¹²⁸⁵ ACRIMAS project, D2.1 Report on Current CM Framework
[http://www.acrimas.eu/attachments/article/5/D2.1 ACRIMAS Report on CM Framework v2-1.pdf](http://www.acrimas.eu/attachments/article/5/D2.1%20ACRIMAS%20Report%20on%20CM%20Framework%20v2-1.pdf)

¹²⁸⁶ OECD Reviews of Risk Management Policies OECD Reviews of Risk Management

Ministers, approves the proposal for state of emergency by the Prime Minister, and decides duration and territorial coverage

Interventions to deal with the emergency will be defined by ordinances notwithstanding the provisions of the law, but within the limits and according to the criteria indicated by the declaration of a state of emergency and in accordance with the law.

The orders are issued by the Head of the Department of Civil Protection, unless otherwise determined by resolution of the state of emergency by the Council of Ministers. The implementation of the ordinances is handled, in any case, by the Head of the Department. Before the law 100/2012, orders were issued by the President of the Council of Ministers or by a Minister appointed by him. The enactment requires the prior acquisition of consent from territorial regions concerned.

At least ten days before the expiration of the state of emergency is issued, an order of the Head of Department identifying the respective public administration in the ordinary status of government, and regulates the governing replacement for the activities to definitively overcome the difficulties caused by the emergency.

If an emergency occurs, even before the declaration of a state of emergency, the President of the Council of Ministers may order the involvement of national operational structures, on the proposal of the Head of the Department of Civil Protection and heard the President of the region concerned. In these cases, assessed in relation to the serious risk of impairment of the integrity of human life, the coordination is entrusted to the Head of the Department of Civil Protection. (art. 3 of Decree-Law n. 245 of 2002 converted into Law 286 of 2002)¹²⁸⁷.

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

Based on the provision in the constitutional law of 16 March 1997 (L 15.3.1997 n. 59) on decentralization the legislative Decree 112/98 has renewed the distribution of public service provision, tasks and responsibilities of the government between the different levels of government towards a stronger decentralization of power and tasks to the regions and local authorities (provinces and municipalities). Civil Protection power has been transferred from the prefects, chief representatives of central government in the provinces, to the regional and provincial governments.

Also in 2001, the additional laws 343 as well as 401 have changed the operational-coordination structure of Italy's Civil Protection Services. The Prime Minister, in collaboration with the regions and

¹²⁸⁷ Italian Civil Protection Agency, <http://www.protezionecivile.gov.it>

local communities, is responsible for the planning of operational emergency guidelines, forecasting and prevention programmes, rescue programmes and the coordination of their implementation.

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

In 2001 (L. Constitutional 18.10.2001 n. 3), a constitutional reform increased the legislative and executive power of the regions to stimulate regional and local institutions' competence and responsibilities while at the same time safeguarding the state's role of overall guidance and coordination. Within the frame of the reorganization of Italy's administrative structure, the regions were also required to improve their Civil Protection service by transferring operational CM responsibilities to the local level and supporting and promoting local CM-organizations. Thus, regional governments were given the opportunity to develop their own Civil Protection structures according to the requirements of their specific territorial and risk specificities¹²⁸⁸.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

With,

the floods of Florence in 1966 and the Friuli and Irpinia earthquakes above all. A great spontaneous mobilisation of citizens made it clear that the solidarity of the people was by no means lacking, but an organised public system which knew how to employ them and get the best out of them was required. Since then the voluntary organisation of the Civil Protection Department has blended religious and non-religious bodies and guarantees the right to receive professional relief¹²⁸⁹.

http://www.protezionecivile.gov.it/jcms/en/volontariato.wp?facetNode_1=f1_5

Figure 20: Italy Voluntary Work Flyer

In 2001 (L. Constitutional 18.10.2001 n. 3), a constitutional reform not only touched vertical subsidiarity power relations but also horizontal relationships between the public and private sector, by increasing the role of associations and business enterprises during high level coordination activities between Civil Protection authorities, volunteer organizations and critical infrastructure operators.^[4]

2.7 Legal regulations for international engagements of first responders and crisis managers

In the event of natural disasters or serious events abroad, the Civil Protection Department may define the measures, signed by the President of the Council of Ministers, for the declaration of a state of emergency and to cope with the disaster (art. 4 of Law n. 152 of 2005)¹²⁹⁰.

¹²⁹⁰ Italian Civil Protection Agency, <http://www.protezionecivile.gov.it>

3 Organisation

3.1 Organisational chart

Civil protection in Italy is not a structure, but an integrated system that allows the coordinated use of all available state and private resources. The operational structure set-up in case of major disasters takes into account the administrative organisation of the country.

The general mission of national civil protection is, both at central and local levels, to protect the lives, goods, properties and environment from damage or threats caused by natural and technological disasters and other calamities.

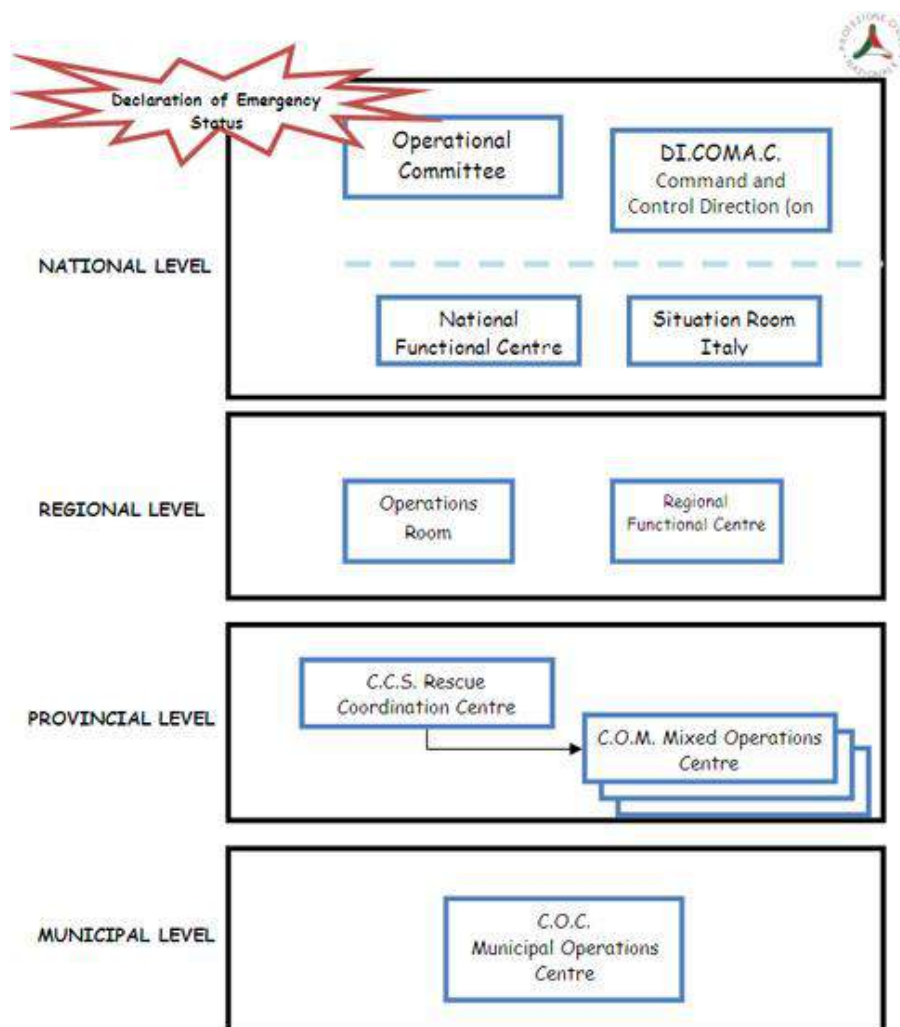

Figure 21: Organisational Chart of CM in Italy

The "National Service of Civil Protection" was institutionalised by Act no 225 adopted on 24 February 1992. As stated in its first article, the Act is drawn up by the state administrations, both central and peripheral, the regions, the provinces, the municipalities and the mountain communities, the national public and local institutions and all other institutions or organisations, both public and private, present on the national territory. Together, they constitute the National Service of Civil Protection with designated components and operational structures.

The responsibility to decide civil protection policies is assigned to the President of the Council of Ministers, or to the Minister of the Interior appointed by him.

The coordination of the national service and the promotion of civil protection activities are undertaken by the Department of Civil Protection (Dipartimento della Protezione Civile - DPC) under the office of the President of the Council of Ministers. The Department of Civil Protection is thus the operative arm of the President of the Council, when it comes to coping with the protection of the country's people and goods.

The DPC is managed by a Head of Department and is divided into eight main offices, where each one is managed by a General Director. Each office is furthermore divided into two or more "Services" carrying out specific tasks¹²⁹¹.

¹²⁹¹ DG ECHO, <http://ec.europa.eu/echo>

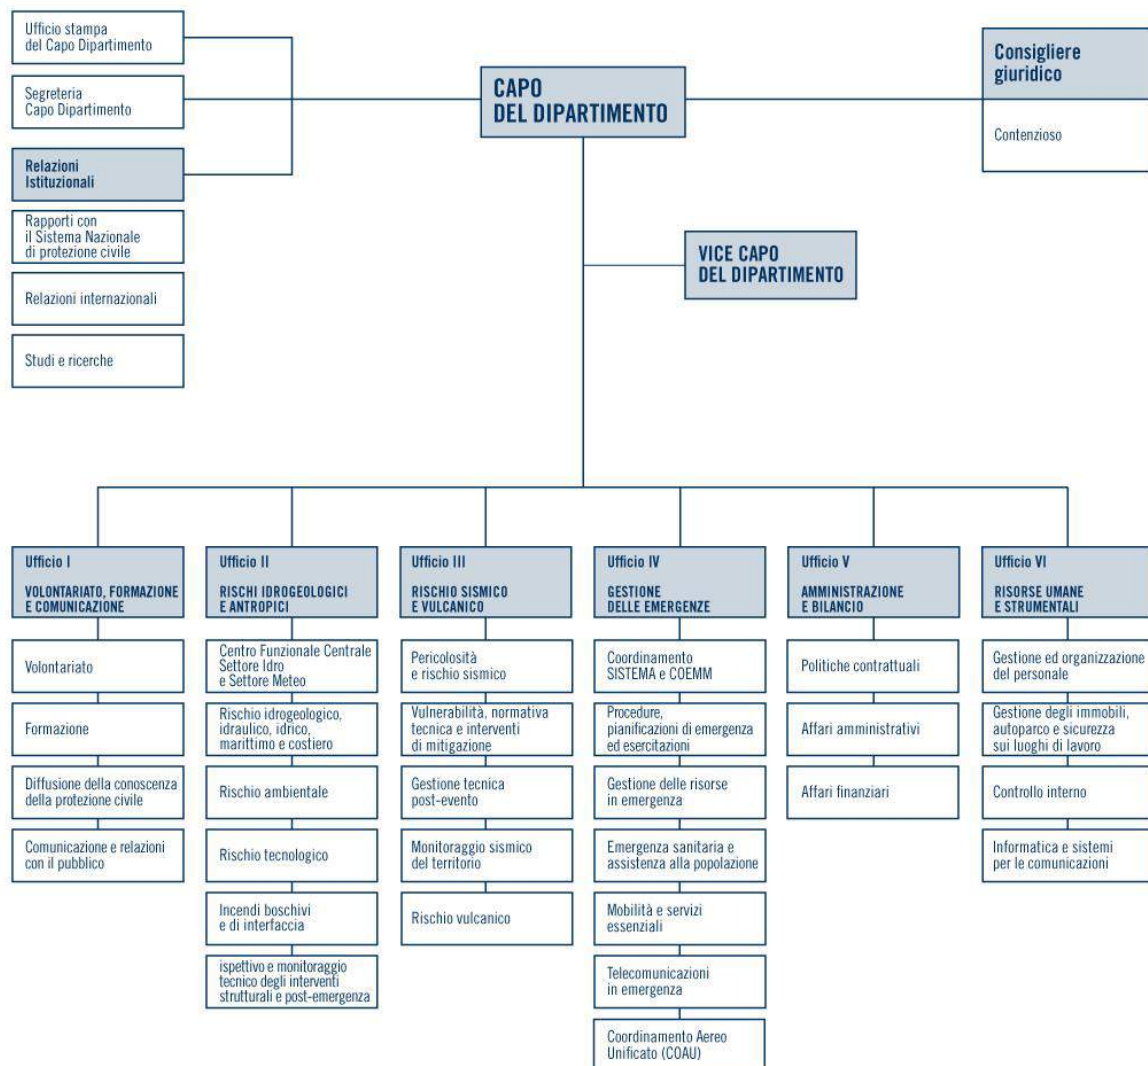

Figure 22: DPC (Dipartimento Protezione Civile) Chart

The Department is divided in six offices and 34 services. The following directly report to the Head of Department: Vice Head of Department, Legal Advisor, Press Office, Secretary of the Head of Department and Institutional Relations Office and a manager of first category with consultancy tasks of study and research.

Besides the personnel structures, the Department is composed of further six offices, divided into services: Office I - Voluntary work, Training and Communication, Office II - Hydrogeological and Anthropical Risks, Office II - Hydrogeological and Anthropical Risks, Office IV - Emergency Management, Office V - Administration and Budget, Office VI - Human and Instrumental Resources¹²⁹².

- Interdepartmental (inter-ministerial) emergency and disaster management authority

¹²⁹² Italy Civil Protection Department, Organizational Chart, http://www.protezionecivile.gov.it/jcms/en/organigramma_ist.wp. Please note that the chart is not available in English, and that the overview of the departmental structure has been extracted by the official website.

The inter-ministerial coordination in case of national emergencies takes place primarily within the Operational Committee, which meets under the direction of the head of the Department of Civil Protection.

- National permanent emergency and disaster management unit(s)/ formations; first responders

Act 225/92¹²⁹³ recognises as part of the National Service of Civil Protection, being a "national operational structure" the institutional components such as:

- the National Fire-Fighters Corps,
- the armed forces,
- the police force,
- the National Forestry Corps,
- the Coast Guard.

In fact, the "Civil Protection National Service" is composed of different operational units that are coordinated centrally by the DPC. Operational units include: The National Fire- Fighters Corps, police and the armed forces, State Forest Corps, Italian Red Cross, National Health Service, National Alpine Rescue Corps, volunteer forces, state administrations, executive powers of the regions, provinces and municipalities, technical-scientific experts and private institutions and organizations. These operational units belong to, according to their tasks and responsibilities, to different line ministries and other public authorities and private entities.

The illustration below shows the institutional set-up of the "Civil Protection National Service"¹²⁹⁴.

¹²⁹³ Presidenza del Consiglio dei Ministri – Dipartimento della protezione civile Training workshop on Multi - Hazard Early Warning Systems Italy, <https://www.wmo.int/pages/prog/drr/events/Pula/Presentations/MHEWSItaly1.pdf>

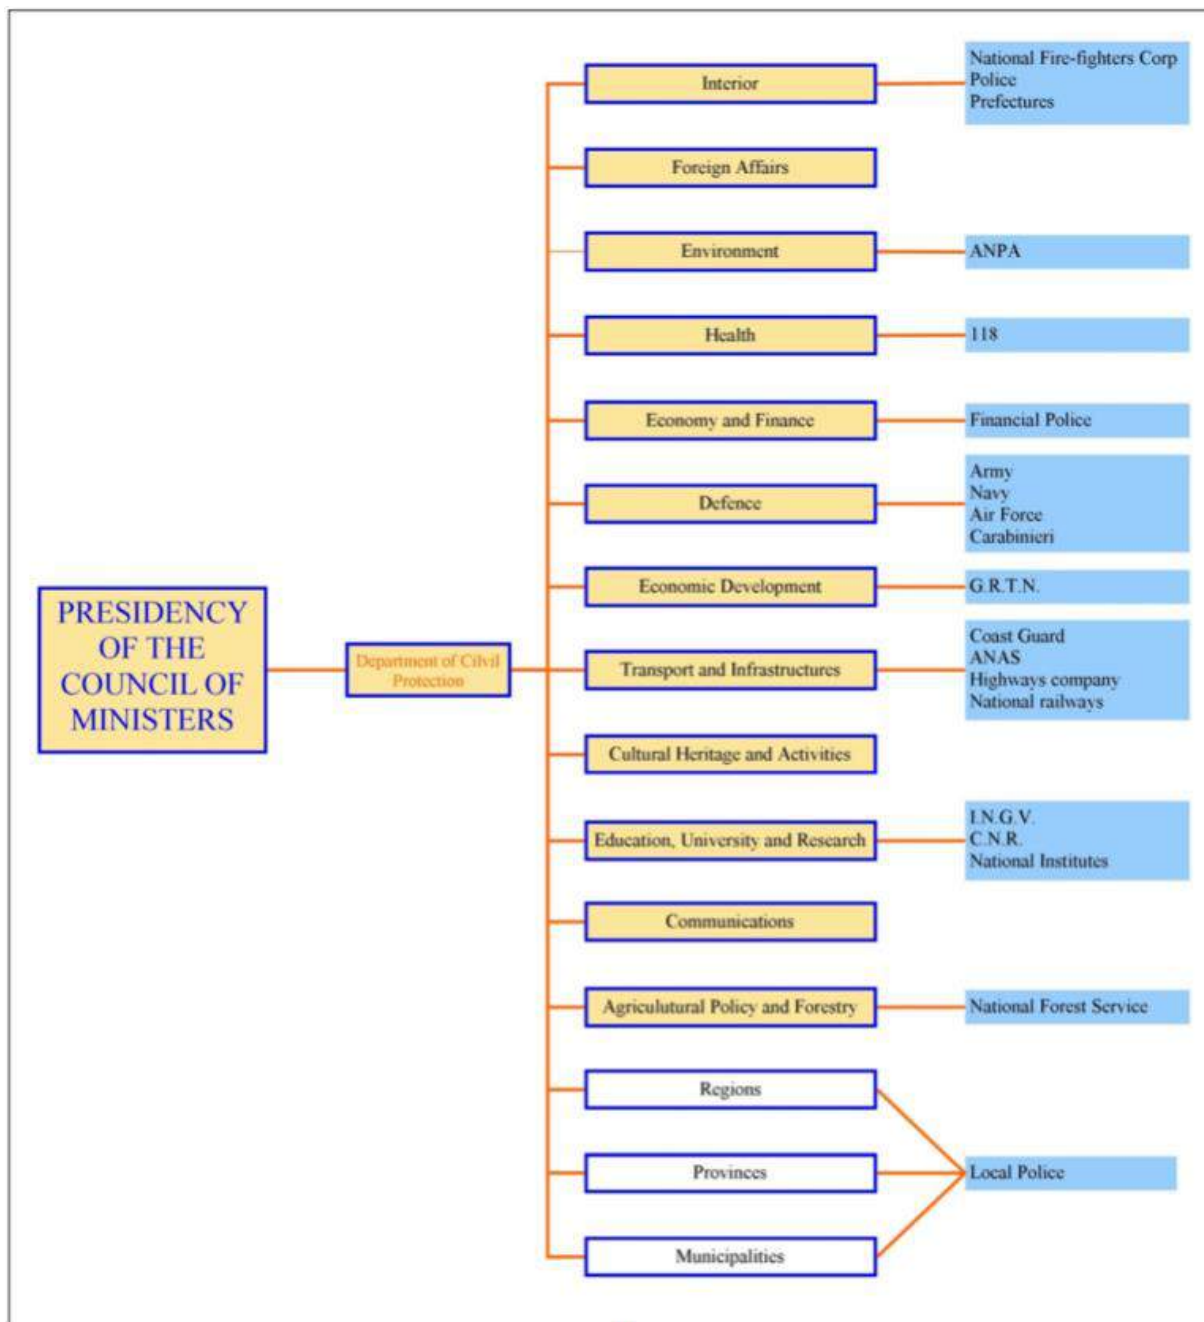

Figure 23: Italy's main emergency first-responders units

- Planned/ anticipated use of specialised military assets

Civil-Military Cooperation is fully implemented in Italy. The Armed Forces are fully integrated in the National Civil Protection Service and arrangements are in place for planning and implementing cooperation on a daily basis. The Italian Armed Forces also participate in Civil Protection operations conducted abroad¹²⁹⁵.

¹²⁹⁵ CRISYS project – Summary of National meeting: Italy

Representatives of the COI (Comando Operativo Interforze) are integrated ordinarily into the DPC Operational Rooms at central and local level, as well as into the Operational Committee which decide at high level the deployments of specific resources. The use of specific financial plan for the emergency in the Armed Forces will support the interventions which will be actuated, at operational level, following, in the most of cases, standard procedures which could be consider part of a sort of operational plan.

- **Departmental emergency and disaster management arrangements**

The Departmental emergency and Disaster bodies must ensure the implementation of the established intervention activities with respect to the specific competences and procedures of these components and structures.

In particular the representative of the:

National Fire Brigades Corps

Immediate actions

- a) provide detailed information regarding the consequences of the event for the purpose of making a first estimate of fatalities, the number of injured persons, the population in need of assistance and the accessibility to the area affected by disaster;
- b) provide information regarding the human resources, logistics and technology available and ready for immediate use on site, in particular resources for search and rescue activities, including those already deployed;
- c) provide information about additional resources available for potential use, identifying their location, characteristics, time frame for action and instructions for use;
- d) make available the mobile operational centres of the fire brigades as first co-ordination headquarters in situ;
- e) identify the co-ordinators of the urgent technical rescue operations on site.¹²⁹⁶

Within 12 hours

- a) make the personnel of the fire brigades available for safety control of strategic buildings and the structures hosting the operational and coordination centres of the rescue and relief system supported by local technical experts;
- b) guarantee the service of its staff at the operational and co-ordination centres in disaster areas¹²⁹⁷;

Within 24 hours

¹²⁹⁶ OECD, OECD Reviews of Risk Management Policies OECD Reviews of Risk Management

¹²⁹⁷ OECD, OECD Reviews of Risk Management Policies OECD Reviews of Risk Management

- a) supply the required operational and logistic support for the urgent accommodation needs of the affected population;
- b) provide information concerning the interventions carried out to secure the safety of structures and infrastructures¹²⁹⁸;

Police forces

(the national Police, the Carabinieri, the Revenue Guard Corps and the national Penitentiary Police and the national forest Corps are represented in the operational Committee)

Immediate actions

(through the direct co-ordination of the Department of Public Security, for general matters, or the prefects for local matters)

- a) provide detailed information regarding the consequences of the event for the purpose of making a first estimate of fatalities, the number of injured persons, the population in need of assistance and the accessibility to the area affected by disaster;
- b) provide information regarding the human resources, logistics and technology available and ready for immediate use on site, in particular resources for search and rescue activities;
- d) propose the possible use of additional resources, by indicating their location, characteristics, time frame for action and instructions for use;
- e) the Police administration head of the affected province is responsible of identifying the co-ordinator of public security and safety actions in the province;
- f) adopt public security and safety competence measures¹²⁹⁹;

Within 12 hours

- a) guarantee in collaboration with the health authorities the activation of the necessary scientific technical competences and experts for the procedures needed to identify bodies and ensure the presence of specialized staff at the operational and co-ordination centres activated in the affected area;
- b) ensure the presence of staff from the Police forces at the operational and co-ordination centres active in the affected area.

Within 24 hours

- a) guarantee safety in the base camps hosting the rescue teams, the population's shelter areas and the operational and co-ordination centres activated in the affected area.

¹²⁹⁸ OECD, OECD Reviews of Risk Management Policies OECD Reviews of Risk Management

¹²⁹⁹ OECD, OECD Reviews of Risk Management Policies OECD Reviews of Risk Management

Harbour Offices of the Coast Guard

Immediate actions

- a) provide detailed information regarding the consequences of the event for the purpose of making a first estimate of fatalities, the number of injured persons, the population in need of assistance and the accessibility to the area affected by the event;
- b) provide information regarding the human resources, logistics and technology available and ready for immediate use on site, in particular resources for search and rescue activities;
- c) plan the potential deployment of additional resources, identifying their location, characteristics, time frame for action and instructions or modalities for use;
- d) identify the co-ordinators of rescue operations at sea;
- e) provide information on the operability of harbour and maritime infrastructures in the areas affected by disaster;
- f) activate naval resources, also the ones provided on a private basis, supplied autonomously or jointly with other administrations, institutions or structures, for the inflow of relief operators and to guarantee a timely evacuation and treatment and transfer of injured victims (meDevaC) to safe areas or hospital facilities which can provide temporary shelter areas for the population;
- g) dispose the issuing of avURnav in order to provide restrictions of the areas at risk and to facilitate rescue and relief operations¹³⁰⁰;

Within 12 hours

- a) plan the necessary activities to survey and evaluate the damage to the bunkering ports and coast and marine industrial plants;
- b) identify the harbour infrastructures which can be utilized as gathering areas for the rescue teams and for the means and equipment;
- c) ensure the presence of its staff at the operational and co-ordination centres active in the affected area;

Within 24 hours

- a) provide all the information regarding the survey of damage to the marine environment and the necessary measures to guarantee the protection and safety of the marine areas under environmental protection and the equipment and production plants and companies involved in the **event**. [5]

- Other national civil service organisations

¹³⁰⁰ OECD, OECD Reviews of Risk Management Policies OECD Reviews of Risk Management

In the following is described the commitment and arrangement for the most relevant civil service organisation active in the emergency situation:

Italian Red Cross

Immediate actions

- a) participate in gathering detailed information regarding the consequences of the event for the purpose of drafting a first estimate of the casual ties, the number of injured persons and the population in need of assistance;
- b) provide information regarding the human resources, logistics and technology available and ready on site;
- c) plan the potential deployment of additional resources, identifying their location, characteristics, time for action and modalities for use;
- d) ensure participation in rescue and relief operations and providing assistance to the injured population¹³⁰¹;

within 12 hours

- a) ensure the presence of its personnel at the operational and coordination centres activated in the area;
- b) guarantee participation in setting up and co-ordinating the base camps hosting the resources for relief operations and shelter areas for the population;
- c) ensure participation in providing assistance to the population in particularly sensitive groups of the population;
- d) activate its permanent structures with the purpose of guaranteeing, within its capacity limits, assistance with the sheltering of the evacuated population hit by the event;
- e) propose the potential deployment of expert teams for both special rescue operations and assessing the specific risk situations (health-logistic – psychological support);
- f) propose the deployment of special teams responsible of assisting the population in contacting their families;
- g) activate the transportation staff of the Red Cross by supplying special means of transport¹³⁰²;

Within 24 hours

- a) ensure the preparation and distribution of meals for the rescue teams and the population;

¹³⁰¹ OECD, OECD Reviews of Risk Management Policies OECD Reviews of Risk Management

¹³⁰² OECD, OECD Reviews of Risk Management Policies OECD Reviews of Risk Management

b) ensure the deployment of the equipment and staff needed across the affected area for the co-ordination of water purifiers and distribution of drinkable water¹³⁰³.

- Provincial (regional) authorities and arrangements for emergency and disaster management (e.g. crisis HQ)

The functions ascribed specifically to the regions by Legislative Decree no 112/98¹³⁰⁴ are described in Article 108 which defines how to address emergencies and planning and operational functions, such as the activation of urgent interventions in case of crisis (e.g. by using the Fire-Fighters Corps), and the extinction of forest fires among others.

The most important regional tasks can be summarised as follows:

- Making regional programmes for risk prevention and forecasting
- Launching interventions through the National Fire-Fighters Corps in case of a crisis caused by an emergency or an imminent danger
- Formulating the guidelines for the drafting of emergency provincial plans.

The provinces are mainly responsible for the forecasting and prevention activities. Their functions are summarised below:

- To carry out, at the provincial level, forecasting and risk prevention activities established by regional programmes and plans through the adoption of the necessary administrative acts
- To draft provincial emergency plans on the basis of the regional guidelines
- To control how the provincial structures of the emergency services are set up by the civil protection, including the technical services to be activated in case of disasters.

The functions ascribed to the municipalities by Art. 108 of the Legislative Decree no 112/98¹³⁰⁵ concern particularly the prevision and forecasting activities (emergency preparation, setting of plans) and the operational activities (activation of first relief service to the population and urgent interventions), while confirming - without significant innovations- the important role assigned by Legislative Decree no 225/92 to the municipality, and particularly to the mayor as the local authority of civil protection¹³⁰⁶.

¹³⁰³ OECD, OECD Reviews of Risk Management Policies OECD Reviews of Risk Management

¹³⁰⁶ IFRC, Law and Regulation for the Reduction of Risk from Natural Disasters in Italy: A Desk Survey, <http://drr-law.org/resources/Italy-Desk-Survey.pdf>, pg. 2

- Local (municipal, town) authorities and arrangements for emergency and disaster management

The functions ascribed to the municipalities by Art. 108 of the Legislative Decree no 112/98 concern particularly the prevision and forecasting activities (emergency preparation, setting of plans) and the operational activities (activation of first relief service to the population and urgent interventions), while confirming - without significant innovations- the important role assigned by Legislative Decree no 225/92 to the municipality, and particularly to the mayor as the local authority of civil protection.

The functions of the municipalities can be summarised as follows:

- To launch, at the municipal level, forecasting activities and risk prevention interventions established by regional programmes and plans
- To adopt all decisions, including those concerning the emergency preparation, necessary to assure first emergency relief in case of disasters at the municipal level (type A)
- To draft municipal and inter-municipal emergency plans in the form of association or cooperation and through the mountain communities to control that these are implemented on the basis of regional guidelines¹³⁰⁷.

- Volunteers and volunteer organisations; specialised NGOs

Act 225/92¹³⁰⁸ recognises the volunteers' organisations as part of the National Service of Civil Protection, being a "national operational structure" and fundamental public component of the system.

The volunteers' organisations of civil protection keep growing thanks also to a law (Framework Act no 266/91¹³⁰⁹) which recognises the added value of organised volunteering as an expression of solidarity, participation and pluralism, while supporting its organisational development.

Another important piece of legislation to regulate the activities of the volunteers' organisation within the National Service of Civil Protection is the Decree of the President of the Republic no 194/2001¹³¹⁰, which regulates the participation of the volunteers' organisations in the civil protection activities by establishing a national register.

Currently, 3,878 voluntary organisations are recognised by the national registry of civil protection on voluntary organisations. Regions and municipalities also maintain their respective registries¹³¹¹.

¹³¹⁰ Normative acts, <http://www.normattiva.it/ricerca/semplice>

¹³¹¹ DG ECHO, <http://ec.europa.eu/echo>

- Private businesses

According to article 6 of Legislative Decree no 225/92¹³¹² the private and institutional organisations can participate in the implementation of civil protection activities. For this purpose, the national and local structures of civil protection can stipulate conventions with public and private subjects.

As Private Sector component of the National Civil Protection mechanism are considered:

- Public transportation companies
- Water, gas, electricity and telecommunication companies
- Waste and sewage management companies
- Roads and highways management companies
- Special service providers (e.g. shelter, heavy-duty machinery etc).
- Any other organization or company whose assets and/or services can be employed to face an emergency¹³¹³.

3.2 Organisational cooperation

The Civil Protection Department operates on a European and International level with civil protection interventions abroad, promoting international relations, agreements and technical scientific programmes to improve the prevention of the natural risks or those caused by man.

In particular:

- the Department participates in technical-scientific knowledge exchange and sharing projects and interventions in Europe and on an international scale (e.g. Euromed);
- the Department belongs to monitoring networks for preventing and forecasting risks;
- the Department maintains permanent relations with research centres, specialists and structures organised by the civil protection department of the other Countries;
- the Department promotes, coordinates and participates in international drills;
- the Department shares its own organisational model with the other countries, also through guided tours to international delegations interested in furthering their knowledge of the Italian Civil Protection system;
- the Department participates in meetings and events whose objective is to improve coordination and promote the civil protection culture at an international level.

¹³¹² Normative acts, <http://www.normattiva.it/ricerca/semplice>

¹³¹³ DG ECHO, <http://ec.europa.eu/echo>

It also participates in the European Civil Protection Mechanism, the instrument of the European Union activated to respond in a timely and effective manner to the emergencies occurring on an international scale. All the interventions are based on the principle of subsidiarity, according to which the actions of the Union must always be undertaken on request of and in coordination with the authorities of the affected state. The emergencies can be tackled by means of pre-constituted intervention modules.

In the event of a natural calamity or of a serious event which affects the population of a European or overseas country, the Department may make its own resources and technical competences available, in accordance with the local authorities, either in the emergency phase or in the recovery and reconstruction phase. Like for national emergencies, the Department of Civil Protection declares the state of emergency with a decree and outlines the interventions in the orders to cope with and overcome the situation. The measures prepared by the Department are signed by the Prime Minister.

Like for domestic emergencies, the Department of Civil Protection defines the measures, however, at the moment there is more involvement by the local authorities to induce the regulations ensuring their involvement in the process. “The existing Civil Protection Law (n. 225 of 1992) has been updated through Law n. 100 of 2012 which has given territories, and in particular Regional administrations, more responsibility on disaster prevention and post-disaster recovery”¹³¹⁴. Meaning, decentralising the way emergencies are handled in Italy, to strengthen resilience.

¹³¹⁴ D’Angelo L., Italy: National progress report on the implementation of the Hyogo Framework for Action (2013-2015), pg. 43, http://www.preventionweb.net/files/44371_ITA_NationalHFAPprogress_2013-15.pdf

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

SOPs are set by law for prevention and preparation to emergencies, while response is conducted on the basis of the “Augustus Methodology” explained in section 1.2, which is not compulsory but has been extensively adopted on the whole National territory, and on the basis of Prime Minister’s Decrees setting rules for operational coordination. According to OECD “the civil protection system is able to scale-up operations to a level appropriate to the event in question, as it integrates human resources and equipment from different organisations into coherent and concerted emergency management operations. Key institutional strengths and uniform planning underlie this capability, particularly the civil protection ‘Operational Committee’, and the ‘Augustus’ planning method”¹³¹⁵.

Emergency response procedures are set by law and by Prime Minister’s Decrees. The main driver of response is the local capability to face the event.

Three different “typologies” or “levels” of response are identified by the law:

- A-type events, which can be managed at local level by a single organization operating under its ordinary function;
- B-type events, that can be managed at provincial or regional level by more than one organizations cooperating under their ordinary function;
- C-type events whose extension or severity requires a National response and the employment of extraordinary measures and resources.

C-type events require a Declaration of State of Emergency issued by the Council of Ministers under proposal of the Prime Minister. The Declaration gives the Prime Minister the power to issue Ordinances that can derogate to ordinary law into a predefined timeframe and area set in the Declaration itself.

Internal Procedures are in place internally to DPC in order to activate the CM mechanism in case of emergency. The procedures and relevant guidelines are described in written documents (i.e. the so called “Libretta Rossa” for the CM system activation).

¹³¹⁵ OECD, Review of the Italian national civil protection system, <http://www.oecd.org/futures/globalprospects/reviewoftheitaliannationalcivilprotectionsystem.htm>

4.2 Operations planning

In Italy forecasting and prevention programmes and emergency plans coexist in order to ensure a multi-disciplinary and multi-sectoral coverage of the whole Civil Protection Cycle. Forecasting and Prevention Programmes always commence at a National Level.

All National Authorities are involved in their preparation under the coordination of the National Civil Protection. National Programmes are based on risk maps and event scenarios and are meant to give to Regions a common programming framework for disaster prevention and preparedness. They are then translated by Regions in directives to Provinces and Municipalities for the adoption of coordinated measures. Planning starts at local level. All Municipalities are responsible for preparing emergency plans. Provincial Plans are meant to support Mayors in first response and assistance to the population by coordinating resources located in the different Municipalities of the Province. Regional Plans provide coordination of resources of the Provinces belonging to the Region. At National level, plans are in place for the coordination of response of the entire system in case of major disasters¹³¹⁶.

As example we mention the National Plan for seismic risk prevention (art. 11, Abruzzo Decree Law):

- After the Abruzzo earthquake of 6 April 2009 a new legal measure was issued in order to give a stronger push to seismic prevention. Article 11 of decree no. 39 of 28 April 2009¹³¹⁷ provides for the funding of seismic risk prevention works on the whole national territory and allocates 965 million euros in 7 years. The Civil Protection Department manages the carrying out of article 11, by the orders of the President of the Council of Ministers¹³¹⁸.

4.3 Logistics support in crises

In general, logistics & resource planning is based on:

- Resource allocation and use of military assets
- National guidelines (*Augustus* used in planning existing systems generally work well and are frequently used timely, clear and accurate requests for assistance. Accurate methodology for registration of incoming teams, their equipment, capabilities and needs)¹³¹⁹.

¹³¹⁶ CRISYS project – Summary of National meeting: Italy

¹³¹⁷ Abruzzo Decree Law, Article 11 of decree no. 39
http://www.protezionecivile.gov.it/jcms/en/view_prov.wp?facetNode_1=f1_1&prevPage=provvedimenti&facetNode_3=f1_1_1&facetNode_2=f4_4_3&catcode=f4_4_3&contentId=LEG14148

¹³¹⁸ Italian Civil Protection Agency, <http://www.protezionecivile.gov.it>

¹³¹⁹ CRISYS project – Summary of National meeting: Italy

ANAS S.p.a, the government owned company which operates motorways have, in the event of an emergency the specific task

- to provide the logistic structures and infrastructures (heliports, deposit areas for the storage of means and other useful resources to the rescue teams) as well as escort and dispatch riders to the transportation of special material and mobile columns of rescue teams which are allowed easy access to the tollbooths¹³²⁰.

Similar duties are in charge of RFI and TRENITALIA for the railways side.

The information on logistic in emergencies is managed in liaison with different civil authorities, agencies and critical infrastructure manager. For example:

- ANAS S.p.a, in the event of an emergency have the specific task to provide information regarding the state of national mobility particularly focusing on the specific complexities determined by the event and supplies all information on the damages suffered by the road system's infrastructures. Particularly aimed at ensuring the operability of Civil Protections means.
- The specific tasks of the Civil Aviation Authority of Italy (ENAC) in the event of an emergency include the supply of information regarding the operability and capacity of airports, air routes and heliports in the areas affected by the emergency as well as adoption of necessary regulations, in order to facilitate rescue operations.
- Similarly, the ENAV (Ente Nazionale Assistenza al volo) tasks include to supply all information regarding the operability and capacity of the airports in the areas affected by the emergency and plan all measures and regulations necessary to co-ordinate and control the flow of air traffic, in agreement with the DPC/CoaU, including regulation of flight activity in the areas at risk, in order to facilitate the required rescue operations enav/aCU). ENAV is also to assist in the co-ordination of the limitation of the air flow within Italian air space or landing at airports located in the area affected by the emergency with EUROCONTROL, when necessary.
- In respect to for instance a volcano evacuation scenario, the Trenitalia and RFI will contribute in any situation and in the emergency planning which touches their structures. When in an event it would be important to evacuate many people, the train circulation situation can be changed to take away people suddenly. Emergency plans are approved by each prefecture.
- The tasks of the Italian Postal System are to supply information regarding the state of efficiency of the mail services and infrastructures in the areas hit by an emergency or disaster and perform all actions aimed at the restoration of services in the areas hit by disaster,

¹³²⁰ OECD Reviews of Risk Management Policies: Italy – Review of the Italian National Civil Protection System

including the possible deployment of additional human and technological resources including hi-tech devices¹³²¹.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

In course of alerts for floods, tsunamis and volcanic eruptions, for example, responsibility for risk communication and provision of information to the affected public is primarily placed with the mayor of the affected municipality. Nevertheless, according to an OECD report, crisis communication in Italy requires improvement. There are some information campaigns and training, but in some areas not matching the needs of the population¹³²².

DPC actively promotes the dissemination of information to the affected public to ensure timely and accurate public awareness concerning the event. These efforts include making the population aware of the relevant risk scenarios in the immediate term, and instructions on self-help measures to take.

DPC has a Press office and Communication Service that disseminate information directly and that liaises with the national and foreign media.

DPC is establishing an in-house call centre, which is under development and will be used in the event of disasters. The aim of the call centre will be:

- to provide information to the population concerning the event and the primary measures to safeguard the population;
- to handle calls of potential importance to improve the management of emergencies.

The public utility radio channel isoradio covers most of the Italian highways. It regularly broadcasts traffic reports, weather conditions, railway information and public service reminders at regular intervals around the clock. During emergencies, isoradio also provides listeners with updated information about the incident as it develops.

A recent project is aimed at improving the quality of the existing isoradio network services and at widening the coverage of highways not yet covered by the service. The new isoradio network will be carried out using three different types of radio-diffusion systems: mountain systems, highway systems and subway systems¹³²³.

¹³²¹ OECD Reviews of Risk Management Policies: Italy – Review of the Italian National Civil Protection System

¹³²² OECD, Review of the Italian National civil protection system, <http://www.oecd.org/futures/globalprospects/reviewoftheitaliannationalcivilprotectionsystem.htm>

¹³²³ OECD Reviews of Risk Management Policies: Italy – Review of the Italian National Civil Protection System

In addition to this unidirectional media the telephone infrastructure composed by the “emergency call number” 112 is widely used for bidirectional communications.

In Italy there are several possible telephone numbers to call different emergency lifeline services, for example 112 emergency calls are answered by the Carabinieri. Requirements under EC Directive 2002/22¹³²⁴ for member states to ensure that the 112 number is well known by their citizens, which is difficult when many different emergency call numbers are maintained, and leads to immediate action by the competent authority for providing the necessary help. The common European Union 112 emergency call number serves the purpose of facilitating urgent help for an individual in an emergency situation or disaster anywhere in the European Union through one single call. This is of particular importance in a country such as Italy where the important tourist industry draws so many foreigners, most of whom would not know of any other number to call than 112 should they find themselves in urgent need to obtain help.

Since the infraction procedure initiated by the European Commission in 2006, the Italian government has been developing initiatives aimed at fully complying with the European Union law on the 112 emergency number. In particular, Italy issued a decree dated 22 January 2008, which provided for a first phase of implementation of the European Directive within the Italian system. This decree was implemented within the province of Salerno to serve as a test for a subsequent implementation in the remaining Italian provinces. However, due to financial constraints, the project had to be suspended in July 2008.

Following a judgement issued by the Court of Justice on 15 January 2009, the Italian government has promoted the establishment of an operational inter-ministerial working Group co-ordinated by DPC, which is currently setting up a strategy aimed at full implementation of the Universal Service Directive, and thus comply with the judgement issued by the European Court of Justice. The working Group consists of representatives of the major ministries and institutions involved in the implementation, such as the ministry of health, the ministry of interior, the ministry of Defence and the ministry for economic Development.

Another development is the introduction of modern digital tetra communication systems and integration of these with the 112 services, which also facilitates cross sector co-operation in emergency response operations. The Review team has found that DPC believes that the 112 emergency number is critical to the facilitation of civil protection mechanisms to efficiently function. Italy however, was also warned from the European Court of Justice in 2009, that “Caller location

¹³²⁴ DIRECTIVE 2002/22/EC OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 7 March 2002 on universal service and users' rights relating to electronic communications networks and services (Universal Service Directive), <http://eur-lex.europa.eu/legal-content/EN/TXT/PDF/?uri=CELEX:32002L0022&from=EN>

information is still not available to emergency services from all mobile 112 calls in Italy, as required by EU rules, despite a judgement from the European Court of Justice in January calling on Italy to make this happen”¹³²⁵. Italy would have been heavily fined if not compliant with the EU Directive.

Since then, Italy has over exceeded the expectations and has properly made use of the 112 emergency European call number.

¹³²⁵ Telecoms: Italy urged to take action on 112 caller location to comply with Court judgement, http://europa.eu/rapid/press-release_IP-09-774_en.htm

5 Capabilities

5.1 Human resources

Civil protection in Italy mobilizes resources from all rescue and emergency services (National Fire Brigade; National, Regional and local Police; Carabinieri; Armed Forces; local, provincial, regional and National Civil Protection organizations; local, provincial, regional and National administrations and services; organizations managing essential services, academia, more than 1 Million volunteers managed by Civil Protection volunteer organizations, etc.)¹³²⁶.

- **Permanent Personnel**

Dedicated professional resources are permanently working at the DPC; rescue workers operating in the emergency services (National Fire Brigade; National, Regional and local Police; Carabinieri, etc..) are also in permanent duties and alert.

- **Volunteer**

The voluntary organisation of the Civil Protection Department has blended religious and non-religious bodies and guarantees the right to receive professional relief. With law no. 225 dated February 24 1992, establishing the National Service of Civil Protection, the voluntary organisations took on the role of “national operative structure” and became an integral part of the public system.

With decree of January 25 2008 published in the Official Gazette of the Italian Republic no. 61 dated March 12 2008, the Prime Minister established the National Council of Volunteers of Civil Protection at the Department of Civil Protection of the Prime Minister’s Office. This collegial body with consulting functions has the job of discussing the problems regarding promoting, training and developing the volunteers of the Civil Protection system. The Council also has the job of coordinating the volunteer organisations with the other members and operative structures of the National Service. The Council is made up of a representative for each national volunteer organisation, with offices in at least six regions, registered in the national list established at the department of Civil Protection. The Chairman, in harmony with the Department, convenes the Council each time he or she feels the need and in any case, at least three times a year. Apart from the members, the Head of the Civil Protection Department, the manager of the institutional and international relations of the volunteers office, the coordinator of the voluntary service and a representative of the national association of voluntary firemen, a representative of the Italian Red Cross, a representative of the

¹³²⁶ CRISYS project – Summary of National meeting: Italy

National Mountain and Speleological Rescue Corps as well as the directors of the Civil Protection department, who are called upon in relation to the items on the agenda, participate in the Council meetings. The council was updated with Decree of the Department Head dated July 30, 2010¹³²⁷.

- **Citizens**

Citizens are an integral part of Civil Protection by law. All citizens are called to provide themselves with self-protection and to assist Civil Protection operations by adopting the behaviours recommended by Civil Protection Authorities. Citizens are informed and trained through risk awareness programmes set up at National and local level, informative campaigns in schools and to the general public¹³²⁸.

The first authority of civil protection at the municipal level is the Mayor, who has the duty to inform citizens about possible dangers and security plans for all the community¹³²⁹.

5.2 Material (non-financial) resources

In case of concrete emergencies, coordination and operational activities are carried out through a multi-level hierarchical organisation. This consists of:

- the Municipal Operational Centres (C.O.C.) at the municipal level,
- the Mixed Operational Centres (C.O.M.) and Rescue Coordination Centres (C.C.S.) at the provincial level,
- the Regional Operations Centres at the regional level,
- the Command and Control Direction (DI.COMA.C.) at the national level. Even though the DI.COMA.C represents the national level, it is physically set up on the disaster site or close thereby.

Furthermore, the Department of Civil Protection has institutionalised the National Situation Room (Sit.I.) at its premises, ensuring the 24 hours' presence of the National Service of Civil Protection's main operational structures representing the permanent monitoring and control centre of incidents occurring throughout the national territory and determining risk situations endangering the population, goods, buildings and the environment while guaranteeing the coordinated intervention on behalf of a number of institutions or administrations¹³³⁰.

¹³³⁰ ACRIMAS project : The Political and Legal Framework of EU Aftermath CM - ACRIMAS_D2-1

5.3 Training

Training is performed at all levels (Municipal, Provincial, Regional and National) of the system. It involves Civil Protection professionals, members of rescue organizations and emergency services, personnel from private companies whose activities are relevant for civil protection purposes, volunteers and citizens. Exercises are an essential tool for providing training and spreading risk awareness. Table top, command post and full-scale exercises are therefore organized at all levels. Every year at least one national/European full-scale exercise is conducted; also, a high level and frequent exercising and an established public-private dialogue¹³³¹.

5.4 Procurement

5.4.1 Procurement regulation

The legislative decree number 33/2013 re-ordered obligations of publicity, transparency and dissemination of information by public authorities to citizens.

The DPC website (www.protezionecivile.gov.it) publishes a page (under the tag “Trasparenza”) which is mandatory for publication on corporate websites where all the information and data, including procurement tenders, budgetary and expenditure figures are published, in compliance with the annex of the legislative decree.

The Administration section of the page replaces and incorporates the transparent section and contracts Job opportunities previously available on the site.

From this page, using the appropriate links, it is possible to reach the information and data available on other pages of the site or the site of the Italian government. Some data are also available in tabular format as provided in Article 7 of the law. However, it is not clear in which extend the decree is actuating the procurement directives of the EU.

At the central level (DPC) standing to the data published for the year 2013 on the website of “Consiglio dei Ministri” (<http://www.governo.it/>), beside the ordinary expenditures for the normal activities carried out by the DPC offices, the main topics procured are:

- Fund for seismic risk prevention;
- Recovery support to population for the recent seism (May 2012);
- Technical and scientific services for monitoring and awareness toward natural disaster;
- Meteorological Radars and similar appliances;

¹³³¹ CRISYS project – Summary of National meeting: Italy

- Renting and operational cost for fire bombers aircrafts;
- Contribute to NGOs and other associations;
- Training and similar services¹³³²

5.4.2 Procurement procedures

In conformance with the Decree no. 33/2013, the procurement procedures are based on public tenders.

At central national level (DPC) the office which is charge to manage tenders and similar procurement act is the “Amministrazione e bilancio” office in the DPC structure (office V).

The office is responsible for the management of all the contractual relationships entered into by the Department. It also caters to the setting, management and control of financial and fiscal policies, the development and management of all accounting and financial records and management of the administrative affairs relating to the activities of the various services of the Department. It also handles relations with institutional bodies.

In particular, within this office, the service “Servizio politiche contrattuali” is committed to:

- proceed and negotiate for the supply of goods and services related to the general operation;
- prepare the bid documents to the offices of the Department on the basis of technical specifications drawn up by them or sole responsibility of the procedures covered.
- operate on the basis of the indications of the Office jurisdiction, such framework agreements entered into for the acquisition of goods and services;
- care, on the proposal of the relevant offices, any outsourcing of activities and services;
- provide training for acts of commitment accounting, settlement and payment of bills resulting from the activity of negotiation, on the basis of regularity and visa clearance on each page by the competent office or the Consignee.
- define, on the basis of guidelines and technical specifications provided by aviation, the preparation of contracts for the fleets of the Department and the shaping of measures of financial commitment and pay the resulting bills, based on the regular visa and clearance affixed by that Office.

The service is ultimately responsible for the payment of expenses connected with the settlement of disputes¹³³³.

¹³³² Italian Civil Protection Agency, <http://www.protezionecivile.gov.it>

¹³³³ Italian Civil Protection Agency, <http://www.protezionecivile.gov.it>

5.5 Niche capabilities

There appear to be two niche sectors where Italy could strongly contribute to the overall EU CM:

- Satellite based awareness, communication and detections in emergencies;
- Field Hospital assets.

In addition, the Italian aerospace firm BPD Difesa et Spazio (RCS) was actively tried to build military technologies for civil use; amongst others for forest fires. The information however is not publicly available. However, at a European level Telespazio¹³³⁴, the Italian aerospace agency will “demonstrate its activities for the European satellite navigation and localisation programme, Galileo. Telespazio built one of the control centres at the Fucino Space Centre that will manage the Galileo constellation and mission. Together with DLR GfR, a German Space Agency company, Telespazio created Spaceopal the company that manages operations to bring the Galileo system to full capacity”¹³³⁵.

¹³³⁴ Telespazio, a joint venture between Finmeccanica (67%) and Thales (33%), is one of the world’s leading operators in satellite management services, Earth observation and satellite navigation, as well as in the field of integrated communications and scientific programmes. Telespazio plays a leading role in the reference markets harnessing technological experience acquired over the years and through its participation in major European space programmes such as: Galileo, EGNOS, GMES and COSMO-SkyMed. The company in 2011 generated sales of EUR 475 million, and employed around 2,500 staff.

Driving Innovation in Crisis Management for **E**uropean **R**esilience

LATVIA

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: CSDM (Philip Spassov)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by EOS and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

Latvia is a Parliamentary Republic where the President is the Head of State. The President is elected by the Parliament (Saeima). The Government, or the Cabinet of Ministers, is appointed by the President, approved by the Parliament and led by the Prime Minister. There is no regional government level as territorially, Latvia is divided into 109 rural municipalities and 9 cities under state jurisdiction. These two main types of municipalities are led by the municipal council.

The National Security Concept is a strategic document based on analysis of national threat stating principles for prevention of threats, priorities and measures, which must be taken into account when executing new political planning documents, legislative enactments and action plans in the area of national security. The priorities determined in the Concept provide the basis for the development of the National Security Plan by the Cabinet of Ministers.

As in the other Baltic Region States the organisational structure is centralised, i.e. coordinated and mostly organised by the central national civil protection authority. In the case of Estonia, Latvia and Lithuania, the use of private rescue services is low.¹³³⁶

The Prime Minister has the responsibility for the continuous function of the operation of the crisis management system and for the implementation of the related tasks and obligations. The State Fire and Rescue Service, an organisation directly subordinated to the Ministry of Interior, plans, coordinates, leads and controls the civil protection operations. Additionally, the State Fire and Rescue Service has significant responsibility for crisis management at national level.

Figure 24. Logo of the Latvian State Fire and Rescue Service.

At local level the municipal authorities are responsible for establishing and managing the Civil Protection Commission of the municipalities and cities. The Commission coordinates civil protection measures in crisis situations in their respective administrative territories.

The civil protection framework of Latvia foresees the involvement of military forces in support of civil authorities during peacetime emergencies. Latvian Ministry of Foreign Affairs is responsible for the cooperation with the European Union as it implements and coordinates the States external security policy. Cross-border and international collaboration is also organised through the Monitoring and Information Centre operated by the European Commission.

¹³³⁶ EUROBAL TIC Survey: Civil Protection Research in the Baltic Sea Region, p.13.

Potential niche capability that could be filled by Latvia and represent interest to EU crisis management structures is the development of single crisis information systems. The Latvian civil security institutions are looking to improve cooperation in the field of crisis management as they are exploiting new ways for cooperation for the creation of a unified national information system.¹³³⁷

1 Policy

In Latvia there is no concrete definition of crisis management. In the Civil Protection Law the term “disaster management” is used as the performance of preventive, readiness, response and emergency measures for the elimination of the consequences in cases of disasters and when there are threats of disaster. Disaster management shall be implemented by the State institutions, local governments, businesses and citizens.¹³³⁸

The crisis management structure of Latvia consists of definitions such as “civil security” or “civil protection”. The main tasks of the civil security system are to carry out disaster management, to provide aid to victims of disasters and to reduce the possible damage to property and the environment caused by disasters. The main responsibility for the operation of the civil security system and the implementation of the tasks of the system is held by the prime minister of Latvia.¹³³⁹

The Latvian crisis management system has to ensure the anticipation of potential crisis factors, timely decision-making and implementation of measures, as well as management and coordination of state and municipal institutions in preventing crisis situations and mitigating their consequences. The creation of a unified crisis management system in Latvia aims at establishing means for better coordination of the actions of the respective governmental institutions involved and for envisaging the potential factors and risks in a crisis situation.¹³⁴⁰

1.1 Risk Assessment

In Latvia the most common crises are natural disasters which include extreme temperatures, storms and floods. The two of the most severe and recent extreme temperature events occurred in January 2006 and February 2012. Other disasters that have been registered include heavy snowfalls, strong winds, chemical and infrastructure accidents, oil spills and other hazardous materials spills and forest fires.¹³⁴¹

Risks caused by chemical and infrastructure accidents are associated with the transit of hazardous chemicals and oil products through the territory of the country. Long-distance oil and gas pipelines cross the territory of the country and problems could be caused by abandoned chemical substances or waste.¹³⁴²

The risk analysis mechanism is based on provisions in the Civil Protection Law where the tasks of the ministries are specified. These tasks include conducting risk assessment of possible threats to the civil security sector, submission of proposals to the Ministry of Interior at the beginning of each year in order to update the national civil protection plan, and preparing notice regarding the measures and operations carried out in civil protection during the previous year. Additionally, the Ministries must plan the actions for the provision of the operation of the sector in cases of disaster.¹³⁴³

¹³³⁸ Civil Protection Law, Section 1 (3).

¹³³⁹ ANVIL Project Country Study Latvia, p.7.

¹³⁴⁰ National Security Concept 2002, p.10.

¹³⁴¹ ANVIL Project Country Study Latvia, p.7.

¹³⁴² National Security Concept of the Republic of Latvia, 2005_nd_en, p.7.

¹³⁴³ Civil Protection Law, section 8.

Furthermore, the National Security Law envisages preparation of risk analysis by the Information Analysis Service, on the basis of information provided by national security institutions. The analysis is examined by the National Security institutions Council and based on a proposal by the Prime Minister; thereafter, it is examined by the National Security Council and the Cabinet.¹³⁴⁴

The National Civil Protection Plan provides definitions for possible types of risk and provides detailed description of potential areas of risk of storms, earthquakes, flooding, forest fires, leakage of dangerous substances, as well as points out hazardous objects within and outside the state that may endanger the national security. The Plan also assesses the threat of radiation accidents, transport emergencies, damage to gas pipelines, water supplies and electrical facilities, dangerous infectious diseases, etc.¹³⁴⁵

There are numerous government regulations defining the development of risk assessments in the specific civil protection areas. For instance, Regulation No. 1354 dated November 2009 prescribes the development of preliminary flood risk assessment, the flood hazard maps, flood risk maps and flood risk management, as well as the provision of additional information in updating documents; Regulation No.532 from 2005¹³⁴⁶ defines the regulations regarding the procedures for industrial accident risk assessment and the risk reduction measures among others.¹³⁴⁷

1.2 Policy and Governance

The Latvian civil protection system could be best described as a mixed model, where single-level co-ordination is executed by the Prime Minister's Office, while multi-level preparedness and response functions related to hazards of man-made and natural origin fall in the domain of multiple stakeholders. In other words there is no single institution or authority that has the overall responsibility for the operational and strategic levels.¹³⁴⁸ The crisis management responsibilities are distributed among the ministries and state agencies depending on the type of crisis or disaster that has occurred and the respective fields of expertise.

For example, in case of a forest fire the Ministry of Interior and the Ministry of Agriculture will be leading authorities. In emergency cases involving oil or chemical substances spills, the involved authorities would be Ministry of Economy, Ministry of Interior and the Ministry of Environment. The official division of competence of institutions/persons is based on the structure of state, rules of parliamentary democracy and the principles of division of state powers as defined by the Constitution of Latvia.¹³⁴⁹

The Prime Minister has the responsibility for the continuous function of the operation of the crisis management system and for the implementation of the related tasks and obligations. The State Fire and Rescue Service, an organisation directly subordinated to the Ministry of Interior, plans, coordinates, leads and controls the civil protection operations. The State Fire and Rescue Service has significant responsibilities for crisis management at national level.¹³⁵⁰

¹³⁴⁹ ANVIL Project Country Study Latvia, p.9.

¹³⁵⁰ International CEP Handbook 2009, p.139.

The Latvian national security is based on the total defence principle, meaning that ensuring the defence of the state is not only a military task but also a national one. The total defence system provides joint use of civil and military personnel, as well as material technical resources. The implementation of the total defence system is based on rendering of mutual support and close co-operation between the military and the civil defence systems.¹³⁵¹ The Crisis Management Council, led by the Prime Minister, is responsible for management of the coordination of operational measures of the State institutions in the event of disasters and for civil-military cooperation.

Civil-military cooperation is based on the active participation of the armed forces by providing support in search and rescue work, in conducting preventive and response activities, as well as undertaking emergency measures for mitigation of the consequences in event of disaster.¹³⁵²

At local level the municipal authorities are responsible for establishing and managing the Civil Protection Commission of the municipalities and cities. The Commission coordinates civil protection measures in crisis situations in their respective administrative territories. The civil protection measures are provided for in the National Civil Protection Plan, the Local Government Civil Protection Plans and the Civil Protection Plan of Institutions.¹³⁵³

1.2.1 Strategy scope and focus

A thorough analysis of the disasters and crises conducted by Latvian experts suggest that there are several main gaps in the strategic approach of the crisis management activities.

For example, after analysing the technological accident in the city of Talsi in 1997, which resulted in nine victims and twenty one injured, experts suggested several main areas for improvement: the response coordination between the responsible authorities, alongside the control and technical supervision of the involved equipment.

Furthermore, in the case of the Daugava River major flood in 1998 caused by high water levels, as main shortfalls were underlined the inefficient communication between the decision-making authorities, the need of improvement of relevant legislation and the allocation of the available resources. The evaluation conducted following the flood resulted in a proposition for long-term measures which included State control and maintenance of the barrage systems; cleaning of the Daugava riverbed and conducting research regarding the influence of the Daugava cascade.¹³⁵⁴

In general, several gaps that affect the crisis management system and require improvement are revealed. These gaps mainly include uneven/unstable regulation and institutionalization, resource constraints and deterioration of critical infrastructure.¹³⁵⁵

1.2.2 Monitoring and analytical support to policy making; R&D

The State Fire and Rescue Service is a comprehensive, all-hazard type of civil security institution that performs scientific research in these fields. The Fire Safety and Civil Protection College provides education for civil security experts for undertaking positions in the State Fire and Rescue Service or other

¹³⁵¹ National Security Concept (2002).

¹³⁵² ANVIL Project Country Study Latvia, p.9.

¹³⁵³ International CEP Handbook 2009, p.139.

¹³⁵⁴ *Crisis Management in a Transitional Society: THE LATVIAN EXPERIENCE*, Eric K. Stern and Dan Hansén (editors), p.327.

¹³⁵⁵ *Ibid.*, p.347.

relevant civil security institutions in Latvia. The training processes are supported by social media and electronic mass media as part of innovative educational approaches and solutions. The usage of these new appliances is carried out by the state institutions and local level authorities.

Latvia conducts extensive scientific research in the area of civil security and emergency management not only through the Fire Safety and Civil Protection College but also through numerous private sector actors and consultancies which generate applied research in the field of civil protection. Non-profit organizations are involved in public crisis management structures and major exercises and have a growing role in the field of education, training and applied research.¹³⁵⁶

Latvian universities, enterprises, non-governmental organisations and other civil associations are actively participating in EU funded research programmes in the civil protection domain. These projects mainly consist of applied research, exercises and vocational training.¹³⁵⁷

The Latvian government cooperates with the European Union in the field of civil security by supporting participation in various exercises that are carried out in this field, both with neighbouring countries and within regional organizations such as HELCOM (Baltic Marine Environment Protection Commission - Helsinki Commission) and the Council of the Baltic Sea States.

The State Fire and Rescue Service participates in the development of regulatory enactments regulating fire safety, fire fighting, rescue and civil protection, as well as in the preparation of opinions regarding the drafts of regulatory enactments developed by other authorities.

The Ministry of Interior has underlined the need for conducting studies of possible threats of storms, natural hazards and to increase applied research as key for hazard prevention and mitigation, as well as the need of improving the work in hazard identification and forecasting within the Latvian Environment, Geology and Meteorology Agency.¹³⁵⁸

1.2.3 Policy for Prevention

Latvia's authorities have distinguished the importance of improving the overall crisis management capacity of the country in order the country to efficiently deal with the full spectrum of all potential natural and man-made disasters and crises. Measures have been undertaken for the creation of a set of decision-making and response mechanisms and a national crisis management system. This system is gradually created and it should integrate the existing crisis management capabilities of the public agencies. The system will ensure the ability to coordinate the actions of relevant governmental authorities in order to foresee, prevent crises and mitigate the consequences, as well as to maximise overall efficiency. The principles of total defence will be exploited in the development of the crisis management system.¹³⁵⁹

For achieving adequate level of preparedness, functioning and development of the crisis management system it is required to regularly conduct exercises and training within the inter-institutional framework. The system should be developed in such way that it is compatible to similar structures as of the Latvia's partners in NATO, the EU and the Baltic States.¹³⁶⁰

¹³⁵⁶ ANVIL Project Country Study Latvia, pp.29-30.

¹³⁵⁷ Ibid., pp.35-36.

¹³⁵⁸ ANVIL Project Country Study Latvia, pp.19-21.

¹³⁵⁹ National Security Concept 2002.

¹³⁶⁰ ANVIL Project Country Study Latvia, pp.19-21.

Despite that the systems for training in the field of civil protection is quite different in the Baltic region, they do share some basic features. Education in civil protection and rescue has a legal foundation in all of the Baltic Region countries. Basic and advanced education at the national level is standardised through the use of certificates, as well as the development of educational and training curricula. All of the Baltic region states have specialised schools and colleges which carry out education in civil protection and rescue area.

The National Civil Protection Plan of Latvia defines the measures and objectives for prevention, readiness and response intended for states of emergency, as well as for the mitigation of consequences in crisis situations. The Plan is drawn by the Ministry of Interior in cooperation with other ministries and is approved by the Cabinet of Ministers.¹³⁶¹

According to the National Civil Protection Plan, the State Fire and Rescue Service in cooperation with local governments develops emergency plans for the provision of prevention, preparedness, response and recovery in emergency measures, taking into account the potential types of disasters, the scale and high-risk subjects in the administrative area.¹³⁶²

The functions of the State Fire and Rescue Service include implementing state policy in the field of fire safety, fire-fighting, civil protection and operation of the single emergency phone number 112. Additionally, the organisation has to perform the fire-fighting and rescue works, coordinate fire-fighting and rescue services and volunteer fire-fighter organisations established by local institutions, organisations or companies.

The tasks of the State Fire and Rescue Service for performing these functions include identification of the state of fire safety and potential hazards, and provide the state institutions and local governments with recommendations regarding improvements. Further, the institution organises and performs prevention measures in the field of state fire safety and civil protection and participates in the evaluation of measures taken for assessment and reduction of the risk of industrial accidents.¹³⁶³

Threats to cyber environment in Latvia exist, although the level is considered as average and has not directly influenced the Latvian national security, it is anticipated that electronic attack will occur and have increasing impact in the future. As part of the national security policies, ensuring the safety of information technologies as well as enhancing existing mechanisms and reducing risks caused in the area of information technologies is foreseen in the National Security Concept.

The Crisis Management Council coordinates the operational management of suppression in a crisis situation, as well as the development of plans for prevention.

As priorities of Latvia for prevention of threats in the electronic information environment two essential points are highlighted. First, it is necessary to enhance legal regulation, thus establishing framework of IT critical infrastructure protection, forming and effective institutions for prevention of IT incidents. Second priority is the enhancement of inter-institutional and international collaboration. It is necessary to continue cooperation of responsible public authorities both at the strategic and operational level, i.e. in prevention of electronic attacks and elimination of their consequences.¹³⁶⁴

¹³⁶¹ National Security Law, Section 36.

¹³⁶² National Civil Protection Plan, Part III.

¹³⁶³ State Fire and Rescue Service of Latvia. 2011. Tasks and functions. [ONLINE] Available at: http://www.vugd.gov.lv/eng/about_vugd/about_vugd [Accessed 01 December 15].

¹³⁶⁴ National Security Concept 2011, p.12.

1.2.4 Policy for Preparedness

The National Security Law defines that the national security system emergency preparedness level has to be determined depending on the type of danger, the intensity and the nature, as well as on the size of the endangered territory by the threat. A national security system emergency preparedness shall be determined for a time period, which is necessary in order to prevent the possible danger to the State or to overcome the danger to the State and to perform the emergency measures to eliminate the consequences thereof.¹³⁶⁵

The National Civil Protection Law describes the status of the system readiness control. The State institutions and local governments control the development of the civil protection plans of the relevant subordinated institutions, as well as the fulfilment of the measures provided in the plans.

The State institutions and local governments shall organise civil protection instruction for ensuring the system readiness as the types of civil protection instructions and organisational procedures will be determined by the Cabinet.¹³⁶⁶ The Crisis Management Council prepares for submission to the Cabinet proposals regarding the specification of national security system emergency preparedness.

Educational activities are important part in ensuring preparedness and are mainly organized by the Ministry of Interior and the Fire Safety and Rescue Service. The education and training courses involve key civil security actors such as heads of state institutions, local governments and commercial companies. The courses also aim at involving citizens as volunteers and they include exercises and simulations of possible crisis incidents. In addition to these activities, the state-accredited specialised institutions of higher education provide professional training in this field. This includes mandatory courses in civil security to students and organizations involved in crisis management structures.¹³⁶⁷

Moreover, the Radiation Safety Centre of State Environmental Service is the national regulatory authority in the field of radiation and nuclear safety. The Centre together with representatives from other institutions and professional associations deals with certification of radiation and nuclear safety officers.¹³⁶⁸ In a 2011 report by the Environmental Board, Radiation Safety Department evaluated the Latvian emergency preparedness and response arrangements in the radiation safety domain. In the report it was noticed that despite that there is limited radiation risk in the country the implementation of preparedness and response arrangements was needed.

The main recommendations provided by experts include the performing of exercises, incorporated verification of preparedness and response arrangements for radiological emergencies; the level of training and availability of necessary equipment at State Fire and Rescue Service, State Police, State Emergency Medical Service should ensure the sufficient protection of the personnel intervening during such type of emergency.¹³⁶⁹

The National Armed Forces Law states that State Border Guard and Bank of Latvia Security Department shall perform duties under command of the National Armed Forces to mitigate threats to national security. To ensure readiness of the state institutions in time of crisis, the National Armed Forces, the Bank of Latvia Security Department and the State Border Guard coordinate mechanisms

¹³⁶⁵ National Security Law, Section 22.

¹³⁶⁶ Civil Protection Law, section 23.

¹³⁶⁷ ANVIL Project Country Study Latvia, pp.29-30.

¹³⁶⁸ Latvia CNS report 2012, p.5.

¹³⁶⁹ Latvia CNS report 2012, p.6.

for cooperation in crisis situations and ensure interoperability regarding armament, equipment and communications and training.¹³⁷⁰

1.2.5 Policy for Response

Depending on the type of disaster the responsibility for managing the emergency measures for the response and elimination of the consequences is held by the State Fire-fighting and Rescue Service or the State institution indicated in the National Civil Protection Plan or the local government civil protection plan. The State Fire and Rescue Service performs and manages fire-fighting and rescue operations and activities, responds, performs and manages rescue operations in road accidents and fires, as well as performs rescue works in water accidents.

In cooperation with other authorities the organisation performs measures for urgent emergency response and elimination of consequences of emergency, it receives and processes signals of the single emergency number 112 and provides assistance to individuals in the event of fire or emergency.¹³⁷¹

The Latvian National Security Concept underlines the readiness of competent agencies for immediate response to crisis situations and disasters as an essential task and priority. The Information Analysis Service, an organisation supervised by the Cabinet of Ministers, has to develop and apply most modern methods and technologies for analytical work. The Concept also foresees the creation of unitary Crisis Control Centre in order to establish compatible communication channels between institutions involved in the crisis management.¹³⁷²

The National Armed Forces participate in preventive and response actions, in the performance of emergency measures for the elimination of consequences, and provide support in search and rescue activities. Other state institutions, including local governments and merchants, must cooperate with the Armed Forces in the management of disasters in accordance with the civil protection plans and agreements.¹³⁷³

To improve readiness for crisis and disaster control, Latvia develops crisis control and civil defence elements within the scope of the unitary national security system. This requires making conceptual assessment of legal framework in respect of legal regimes of crisis situations, attraction of additional resources to the civil defence system in such events, as well as of principles for establishing of the national material reserve system. The readiness of responsible authorities for immediate response to crisis situations and disasters must be developed with emphasis on preventive activities, crisis forecasting and elimination scenarios. To enhance the readiness in crisis situations and disaster management effective cooperation and coordination between competent institutions and services is underlined as national security priority.¹³⁷⁴

¹³⁷⁰ State Defence Concept, Executive Summary, p.11.

¹³⁷² National Security Concept of the Republic of Latvia (2005), p.8.

¹³⁷³ Civil Protection Law, section 12.

¹³⁷⁴ National Security Concept of the Republic of Latvia (2005), p.7

1.2.6 Policy for Relief and Recovery

As the fundamental strategic principle of the national defence is to minimise the potential for threats to national security,¹³⁷⁵ the National Civil Protection Plan includes measures for the implementation of the State civil protection system as well as measures for the liquidation of the consequences of emergency situations. The State Fire and Rescue Service manage the response and emergency measures for recovery and elimination of the consequences.

In the case of danger to the State, the Cabinet is entitled to authorise the involvement of the National Armed Forces in the maintenance of public order and liquidation of the consequences in a crisis situation.¹³⁷⁶

1.3 Financing

1.3.1 Investing in preparedness

According to the Civil Protection Law, national institutions shall finance the fulfilment of the civil protection tasks from the allocated State budget resources, while the local governments and merchants from their own resources.¹³⁷⁷

State Fire and Rescue Service resources include 92 fire station buildings, of which approximately 33% were built before 1940, 65% - in the period from 1940 to 1992, 2% - built or renovated in the period after 1990. Fire fighting depot buildings and facilities are physically and morally outdated and are in a very poor state and do not comply with European or National requirements set out by the relevant legislation.¹³⁷⁸ This example reveals the need for investing and improving current rescue facilities in order Latvia to establish better crisis management capabilities.

In addition, Latvian government has signed Memorandum of Understanding with the Swiss Federal Council regarding financial support covering various areas such as security, stability and support for reforms, environment and infrastructure, promotion of the private sector, human and social development and support to non-governmental organisations.

One of the most important projects implemented and financed in accordance with the agreement is the “Support for fire safety measures in local government general education institutions”. This project aims at improving children safety in case of fire incidents in general education institutions in peripheral and disadvantaged regions of Latvia. The project involves partners from 61 local governments in peripheral and disadvantaged regions of Latvia.¹³⁷⁹

The United States European Command in collaboration with the U.S. Embassy in Latvia have also invested in projects for the complete refurbishment of 8 fire brigade stations across Latvia worth over 2.3 million US dollars. The project improves existing station building's structure, therefore improving the work conditions of fire brigades. In Strenči, Gulbene, Aizkraukle and Ventspils, additional garage docks have been built for storing newly acquired, modern rescue equipment.

¹³⁷⁷ Civil Protection Law, section 18.

¹³⁷⁸ Strategy of the Ministry of Interior 2014 – 2016 (unofficial translation), pp.18-20.

¹³⁷⁹ Annual Report on the Implementation of the Swiss–Latvian Cooperation Programme in Latvia April 2013 – March 2014.

Furthermore, within this cooperation with the U.S. European Command Several new projects have been undertaken, such as the planning to locate an emergency medical service dispatcher centre in the currently abandoned Kuldīga city hospital building with estimated costs of 880.000 USD.¹³⁸⁰

1.3.2 Investing in consequence management

Following an analysis by the department of Strategy at the Ministry of Interior, several suggestions for improving the Latvian civil security system as a result of recent crisis experiences has been made. These suggestions involve allocating funding for improving the coordination between state institutions and local municipalities, as well as reserve funding that would be available in the case of storms, flooding and similar hazards. The allocation of these resources is intended for institutions directly responsible for emergency situations.¹³⁸¹

Moreover, the Long-Term Stabilisation Fund was created in 2008 and aims at ensuring the availability of resources in emergency situations.¹³⁸²

During the past decade the following incidents can be summarized: Chemical accident in Riga (2009), Oil spill in the Daugava River (2007), Extreme temperatures causing 40 deaths (2006), Strong storm (Erwin), causing damage at estimated USD 325 m in 2005, Floods in the Daugava River caused by melting snow (2003), Extreme temperature in Riga with 15 casualties (2003), Extreme temperature in the Riga region, 21 casualties 2001), Epidemic diphtheria in Riga, where 102 persons affected (2000), and Storm (Anatol), six casualties and estimated damages of USD 0.5 m (1999).¹³⁸³

These significant emergencies and crises that have struck Latvia have changed or played role for improving the Latvian civil security system. For instance, following the accident in Talsi (1997) the government assigned a commission with the task of coordinating the subsequent funding for victims and their families.¹³⁸⁴

All the measures taken by the authorities have signified the need for allocating additional funding for the affected areas and population. The costs for recovery in a crisis situation are not formally specified and usually include private responsibilities for disaster management.

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

The National Civil Protection Plan specifies that the crisis system performance evaluation is carried out for each specific disaster as well as for variety of threats to disasters (national and regional). The evaluation is carried out by the responsible Ministry or institution. The assessment measures include criteria such as timeframe, efficiency and safety for evaluating the performance of the responsible institution. The Plan also sets out the specific timelines for measuring the actual time spent to respond to a crisis event. Further, the measures that have been taken are evaluated as “sufficient” or

¹³⁸⁰ U.S. funds fire station depot reconstruction in Latvian regions, <http://www.vugd.gov.lv/eng/news/6014-us-funds-fire-station-depot-reconstruction-in-latvian-regions>, last accessed 15 October 2014.

¹³⁸¹ ANVIL Project Country Study Latvia, p.21.

“insufficient”, depending on the involvement of available resources, national reserve resources of the National Armed Forces, or request for international assistance has been made. The assessment report is submitted to the Ministry of Interior.¹³⁸⁵

1.4.2 Departmental Lessons Learned systems

Information and indications of such systems is not found in policy, legislative or research documents in the crisis management domain, and could not be obtained within the given timeframe.

1.4.3 Centralised (national) Lessons Learned system

The National Security Law specifies the functions of the Information Analysis Service, which is State administration institution supervised by the Cabinet of Ministers. The agency has to assess and analyse the information received from the national security institutions and provide it to the members of the National Security Council. Further, the organisation develops proposals and recommendations for the National Security Committee, the President and the Prime Minister regarding subsequent activities. It is important to mention that the Information Analysis Service also analyses and forecasts the potential danger to the State.

According to the Latvian legislation the Information Analysis Service has to be approved by the Cabinet of Ministers. The National Security Council may request from the Information Analysis Service and State security institutions all the existing information at their disposal, when it concerns national security interests.¹³⁸⁶

The analysis of threats to the State has to be prepared by the Information Analysis Service, on the basis of information provided by State security institutions. This analysis represents a comprehensive assessment as a result of which the existing and potential specific danger or risk factors to the national security are identified.¹³⁸⁷

The head of the Information Analysis Service may be invited to participate in the meetings of the National Security Council but with adviser rights.¹³⁸⁸

1.4.4 International exchange for Lessons Learned

Latvia participates in the “Baltic every day accident, disaster prevention and resilience” project through Jelgava City Municipality. The project aims at enhancing learning and sharing of lessons learned and will strive to achieve a common understanding of evaluation methods, sharing experiences and knowledge and best practices in the Baltic Sea Region.

The project will make use of the UNEP Awareness and Preparedness for Emergencies at Local Level procedures, together with the safe community and safety performance indicators concepts and existing methodology for assessing the vulnerability of local communities to disasters. It will contribute

¹³⁸⁵ National Civil Protection Plan, Chapter IV.

¹³⁸⁶ National Security Law, section 15.

¹³⁸⁷ National Security Law, section 26.

¹³⁸⁸ National Security Law, section 26.

to implementing the Priority Area Secure of the EU Strategy for the Baltic Sea Region Action Plan and the EU Host Nation Support.¹³⁸⁹

1.4.5 Regular policy reviews

The National Civil Protection Plan specifies that the crisis system performance evaluation is carried out for each specific disaster as well as for variety of threats to disasters (national and regional). The evaluation is carried out by the responsible ministry or institution. The assessment report is submitted to the Ministry of Interior.¹³⁹⁰ The Department of Strategy at the Ministry conducts analyses regarding various topics including crisis management issues.

The Latvian State Fire and Rescue Service implement the state policy with regard to fire fighting, rescue and civil protection, as well as the monitoring of the statutory fire and civil defence requirements.¹³⁹¹

The Latvian National Security Concept emphasises the importance for conducting conceptual assessment of the legal framework with regard to crisis situations, as well as on the attraction of additional resources for the civil protection system in event of threat to the national security.¹³⁹²

1.5 Resilience

The term Resilience is not highlighted in policy or legislative documents related to civil protection or crisis management. Within the framework of this country study resilience term has been identified in few research papers related to different topics. However, these topics do not cover civil protection or crisis management. For example, *The concept of the system resilience within a multi-hazard scenario: application to a Latvian case* study emphasizes primarily on infrastructure issues for withstanding severe weather conditions.¹³⁹³

1.6 Information sharing and data protection

In Latvia the main legislative act regarding data protection is the Personal Data Protection Law which is in force since 2000 and implements Directive 95/46/EC into the national legislation. This law, along with the latest amendments made, defines that the provisions of the Personal Data Protection Law are applicable to the processing of personal data in the field of criminal law and national security.

In addition, the Latvian Data State Inspectorate was established under Regulation No. 408 dated November 2000. The duties of the Inspectorate include ensuring compliance of personal data processing in the State with the requirements of the Personal Data Protection law; taking decisions and reviewing complaints regarding the protection of personal data; registering personal data processing

¹³⁸⁹ *Civil protection financial instrument 2013* available at: <http://ec.europa.eu/echo/en/funding-evaluations/financing-civil-protection-europe/civil-protection-financial-instrument-2013>, last accessed 14 October 2014.

¹³⁹⁰ National Civil Protection Plan, Chapter IV.

¹³⁹¹ SFRS Sectoral Policy, available at: http://www.vugd.gov.lv/lat/par_vugd/nozares_politika, last accessed 14 October 2014.

¹³⁹² National Security Concept of the Republic of Latvia, 2005_nd_en, p.8.

¹³⁹³ Tatjana Kuznecova, Francesco Romagnoli, Claudio Rochas, *The Concept of the System Resilience within a Multi-Hazard scenario: application to a Latvian case*, p.1.

systems; proposing and carrying out activities aimed at raising the efficiency of personal data protection and submission of reports on compliance of personal data processing systems created by government and local government institutions. Furthermore, the act states that the Latvian Data State Inspectorate together with the Office of the Director General of the State Archives of Latvia may decide on the transfer of personal data processing systems to the State archives for preservation.¹³⁹⁴

According to the Law on the Security of Information Technologies the critical infrastructure of information technologies has to be protected in order to ensure the essential functionality of the State and society. The status of the critical infrastructure of information technologies is approved by the Cabinet and in accordance with the National Security Law.

The Security Incidents Response Institution is responsible for promoting security of information technologies in Latvia. The operational tasks and rights of the Security Incidents Response Institution are delegated to the University of Latvia's Institute of Mathematics and Computer Science. The tasks of this institution include providing support for the prevention of an information technologies security incident or coordinate the prevention of such; and providing of recommendations regarding the prevention of the current risks of information technologies, drawn up in accordance with the current threats.¹³⁹⁵

Processing of personal data is allowed in order to provide protection from malicious software. The Security Incidents Response Institution is allowed to transfer processed personal data to the institutions or units specified in the Law on the Security of Information Technologies in cases of recognised threat by malicious software to the national security.¹³⁹⁶

The Crisis Communication Action Plan - 2011 to 2013 foresees the creation of educational materials, social campaigns and targeted training programs for different interest groups - schoolchildren, tourists and people with special needs, etc. Further, the creation of a single website is intended in the Plan, where all the information regarding crisis situations and subsequent actions to be taken could be found. The 112 emergency phone number sites will act as a central electronic source of information on various types of crisis situations for the public. Additionally, 112 emergency phone number accounts on social websites will be created, along with the development of guidelines for crisis communication in social media. Recommendations for local regarding suggested actions in case of crises and how to organize thematic information campaigns for actions in various crisis situations will also be developed.¹³⁹⁷

¹³⁹⁶ Ibid., section 7.

¹³⁹⁷ Crisis Communication Action Plan - 2011 to 2013, chapter IV.

2 Legislation

The overall civil protection legislative framework in Latvia is based on two main acts - the National Security Law enacted in 2000 and the Civil Protection Law, which was adopted in 2006. These laws define the roles and responsibilities for civil protection for local governments and institutions.¹³⁹⁸

The National Security Law defines the national security system and its tasks, the competence of responsible authorities and institutions for the national security system, including crisis management. In addition, the Act provides the principles and procedures of coordination, for implementation and control of their activities.¹³⁹⁹

The National Security Law also defines the provisions for the National Civil Protection Plan, which has to include measures for the implementation of the State civil protection system, as well as for preventive, readiness and response measures that are intended for states of emergency. In addition, the Plan sets out measures for the liquidation of the consequences in emergency situations, and determines the actions of the civil protection system in state of war.

The Civil Protection Law creates a system of civil protection for disaster management, ensuring the legal and organisational grounds for the protection of persons, property and the environment in cases of disasters and when there are threats of disaster.¹⁴⁰⁰

2.1 Crisis (emergency, disaster) management concept

The National Security Concept is a strategic document based on analysis of national threat stating principles for prevention of threats, priorities and measures, which must be taken into account when executing new political planning documents, legislative enactments and action plans in the area of national security. The document is prepared by the Latvian Cabinet, examined by the National Security Council and approved by the Parliament, at least once on each convening (by 1 October) from its first year of operation.¹⁴⁰¹

The Concept sets out that disasters listed in the National Civil Security Plan, such as storms, extreme temperatures, earthquakes, floods, fires, leakage of dangerous substances, industrial accidents, dangerous infectious diseases, etc., must be resolved within the framework of the civil security system. The priorities determined in the Concept provide the basis for the development of the National Security Plan by the Cabinet of Ministers. The Plan includes specific state threat neutralisation and prevention measures and means.¹⁴⁰²

In order to ensure the forecast of potential crisis, timely decision-making and implementation of measures for management and coordination of state and municipal institutions in preventing crisis situations and mitigating the consequences national crisis management system is being developed and enhanced.¹⁴⁰³

¹³⁹⁸ International CEP Handbook 2009, p.139.

¹³⁹⁹ ANVIL Project Country Study Latvia, p.15.

¹⁴⁰⁰ Ibid., p.16.

¹⁴⁰¹ National Security Law, section 26.

¹⁴⁰² National Security Concept (2002).

¹⁴⁰³ National Security Concept (2002).

The Strategy of the Ministry of Interior 2014 – 2016 sets out the strategic objectives for the Ministry and its subordinate agencies, including the State Fire and Rescue Service. They include promoting public safety and effective prevention of hazards and developing of closer cooperation national institutions and organizations for crime prevention.¹⁴⁰⁴

2.2 General crisis (emergency, disaster) management law

The National Security Law determines the national security system and tasks as such, the competence of the persons or institutions responsible for the national security system and the principles and procedures of co-ordination, implementation and control of their activities.

According to it the Crisis Management Council in case of a danger to the State coordinates civil-military co-operation and the operational measures of national administration institutions in suppression of the danger to the State. The By-law of the Crisis Management Council shall be approved by the Cabinet. The Crisis management Council is chaired by the Prime Minister and it is composed by the Ministers for the Interior, Defence, Foreign Affairs, Economics, Finance, Justice and Health. The Council may include the heads of State security institutions as well as other State officials but with advisory rights.

The competence of the Crisis Management Council includes coordination of the operational management for suppression of the emergency; to coordinate the development of plans for the prevention of danger to the State; and to prepare for submission to the Cabinet proposals regarding the specification of national security system emergency preparedness. Additionally, in the case of a danger to the State, the Council coordinates the unified and timely implementation of political decisions in national administration institutions, prepares and submits to the Cabinet proposals regarding the status of critically important infrastructure for the national security, alongside the security measures that need to be performed.

The Crisis Management Council is supported by Crisis Management Secretariat which guarantees the operation of the Council and ensures the purposeful and continuous provision of cooperation and support of the responsible institutions to the Crisis Management Council.¹⁴⁰⁵

The National Security Law also defines the provisions for the State Civil Protection Plan, which has to be drawn up by the Ministry of the Interior in co-operation with other ministries and approved by the Cabinet. The State Civil Protection Plan incorporates the measures for the implementation of the State civil protection system, as well as measures for preventive, readiness and response actions intended in states of emergency, as well as the measures for liquidation of consequences of such events.¹⁴⁰⁶

The Civil Protection Law is the other main legislative document in Latvia which provides the Structure and Organisation of the civil protection system. The purpose of the act is to create a system of civil protection for disaster management, ensuring the legal and organisational grounds for the protection of persons, property and the environment in cases of disasters and when there are threats of disaster.¹⁴⁰⁷

¹⁴⁰⁴ Strategy of the Ministry of Interior 2014 – 2016 (unofficial translation), p.20.

¹⁴⁰⁵ National Security Law, sections 23-24.

¹⁴⁰⁶ Ibid., section 36.

¹⁴⁰⁷ Civil Protection Law, section 2.

It defines that the structure of the civil protection system has to be formed by the national institutions, local governments and merchants. The main tasks of the system are to carry out disaster management; to provide aid to victims of disasters; to reduce the possible damage to property and the environment caused by disasters; and in emergency situation caused by military invasion or war to support the National Armed Forces with resources.

The Civil Protection Law also defines the management procedures of the civil protection system. The Prime Minister has the responsibility for the operation of the system and the implementation of the tasks thereof and, within the framework of the system, to manage the measures at national or regional level for the prevention and overcoming the emergency situation.

The State Fire-fighting and Rescue Service shall manage, co-ordinate and control the operation of the system, however depending on the type of disaster the emergency measures for the response and elimination of the consequences may be taken by another competent national institution indicated in the State civil protection plan or the local government civil protection plans.¹⁴⁰⁸

2.3 Emergency rule

According to the National Security Law the Cabinet has the responsibility to announce a state of emergency, exceptional state and mobilisation in cases determined by law, as well as to decide upon the necessity for support by the armed forces of the North Atlantic Treaty Organisation and European Union Member States during a state of emergency or exceptional state. In addition, the Cabinet has the responsibility for strengthening the national defence capacity in peace time.¹⁴⁰⁹

Depending on the type of danger to the State, the nature and intensity, as well as on the size of the endangered territory, a state of emergency or an exceptional state may be declared in accordance with the procedures prescribed by the law.

State of emergency is declared in cases of natural disasters or accidents, epidemics, epizooties, epiphytes, public disorder, terrorism and armed conflicts, if the safety of society, environment and economic activity is significantly endangered.

An exceptional state has to be declared in the cases in which the state is endangered by an external enemy or within the country internal disturbances have occurred, or if there is a threat that such may arise, in this way endangering the nation. In cases of a state of emergency and exceptional state, mobilisation may be announced in order to carry out tasks related to national security and national defence, as well as to liquidate consequences.¹⁴¹⁰

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

The Civil Protection Law defines the tasks of the state institutions and ministries in civil protection which include exploring possible threats in the sector and submitting proposals to the Ministry of Interior up to 20 January each year regarding the clarification of the national civil protection plan, as well as notifying regarding the measures and operations carried out in civil protection during the

¹⁴⁰⁸ Ibid., sections 1-8.

¹⁴⁰⁹ National Security Law, section 10.

¹⁴¹⁰ Ibid., sections 21- 22.

previous year. In addition, ministries need to plan actions for the provision of the operation of the sector in cases of disaster, to coordinate the operation of the subordinated authorities in cases of disasters and coordinate and control the formation of the State material reserves in the sector.

Further, the Ministries have to ensure the fulfilment of the measures specified in the State civil protection plan in case of a military invasion; to ensure the training of employees of the institution in civil protection matters.

The tasks of the other responsible national institutions performing civil protection consist of providing information regarding the resources at the disposal of the institution for the management of disasters upon request from the State Fire-fighting and Rescue Service; ensuring the fulfilment of the measures specified in the National civil protection plan; and ensuring the training of employees of the institutions in civil protection matters.¹⁴¹¹

Additionally, there are multiple other specific legal arrangements and regulations on emergency and disaster management. For example, the Fire Safety and Fire-fighting Law determines the system of fire safety, fire-fighting and rescue services and organisations, tasks and competence of natural persons and legal persons in the field of fire safety and fire-fighting, as well as the structure, functions of the State Fire-fighting and Rescue Service, course of service, obligations, rights, legal protection and social guarantees of State specialised civil servants serving in the State Fire-fighting and Rescue Service.¹⁴¹²

According to this legislative act the Cabinet defines the procedures by which institutions, organisations and commercial companies have to establish fire safety, fire-fighting and rescue services; and subsequent functions and rights.¹⁴¹³

Each civil security institution in Latvia has their specific crisis management proceeding.¹⁴¹⁴

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

At local level the Civil Protection Law describes the tasks and rights of local governments in civil protection. The emphasis is on the role of the chairperson of the local government city or county council, who holds the responsibility for the implementation of the tasks for civil protection in the relevant administrative territory. The main tasks of the local governments include establishing and managing the district civil protection commission; participating in preventive measures in the relevant administrative territory; providing support for to operation and emergency services and if necessary, to evacuate the inhabitants from the territories endangered or affected by a disaster. The civil protection commission of the local government operates pursuant to the regulations developed in accordance with the model regulations approved by the Cabinet.¹⁴¹⁵

Further, the tasks of the local governments include providing proposals regarding formation, maintenance and storage of the national material reserves and organising instruction for the members of the local civil protection commission. The rights of the local governments in civil protection are also

¹⁴¹¹ Civil Protection Law, section 8.

¹⁴¹² Fire Safety and Fire Fighting Law, section 1.

¹⁴¹³ Ibid., section 4-5.

¹⁴¹⁴ ANVIL Project Country Study Latvia, p.27.

¹⁴¹⁵ Civil Protection Law, section 9.

defined and incorporate receiving of information from the institutions and merchants located in the relevant administrative territory for the performance of civil protection tasks, as well as developing additional tasks of civil protection for merchants present in the relevant administrative territory.¹⁴¹⁶

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

The Latvian civil security system does not involve non-government relief organisations to a great extent, due to the fact that the sector has not yet developed after the independence of Latvia in 1991. Their role is more visible in the field of preparedness than in responsive matters.

There are volunteer fire-fighting units in some municipalities. The main non-government organisation in Latvia is the Latvian Red Cross with the spectrum of its operations cover the whole territory of Latvia. The Latvian Red Cross Committees are located all around Latvia and cover each district.¹⁴¹⁷

Section 19 of the Civil Protection Law specifies the involvement of legal and natural persons in response measures.¹⁴¹⁸ According to this act legal and natural persons may be involved in response measures and their property may be used in cases of disasters and if human life is endangered. However, they are entitled to receive compensation for expenses and loss caused during response measures. The procedures for compensation and the amount of compensation are determined by the Cabinet. The head of rescue operations shall involve legal and natural persons in response by entering into an agreement in writing.

In the Fire Safety and Fire-fighting Law is stated that local government and volunteer fire-fighting organisations as part of the overall fire-fighting and rescue services teams in Latvia. Volunteer fire-fighter organisations operate in accordance with the Law on Public Organisations and the Associations thereof.¹⁴¹⁹

The Civil Protection Law defines the tasks and Rights of Merchants and their tasks in civil protection include informing the fire safety, fire-fighting and rescue services and local governments regarding the disaster that occurred in the territory of the merchant's object; to ensure the training of employees concerning civil protection; to organise the fulfilment of civil protection measures at the merchant's object.

In addition, merchants have to organise and carry out preventive, response measures and measures for the elimination of the consequences in cases of emergency on the territory of the merchant's object, to establish an alarm and notification system in the objects of industrial accident risk and in other explosive, fire hazard and critically important objects. The overall responsibility is held by the head of the commercial company. Merchants have the right to establish units of civil protection for response in case of disaster and for the performance of emergency measures for the mitigation of the consequences.

¹⁴¹⁶ Civil Protection Law, section 9.

¹⁴¹⁷ ANVIL Project Country Study: Latvia, pp.29-30.

¹⁴¹⁸ Civil Protection Law, section 19.

¹⁴¹⁹ Fire Fighting Law, section 1.

2.7 Legal regulations for international engagements of first responders and crisis managers

According to the Latvian legislation, humanitarian assistance, as well as assistance for the performance of emergency response measures and the elimination of consequences, may be provided to states that have been struck by a disaster. In such scenarios, the State Fire-fighting and Rescue Service and the Centre of Emergency and Disaster Medicine has to establish rapid response unit and medical support unit respectively, for the affected states and thus provide assistance in performing response and emergency measures for the elimination of the consequences.

The Latvian Cabinet determines the procedures for the establishment, maintenance, training and financing of the referred to units, as well as the procedures by which the involvement in the international assistance provision shall be performed. The Latvian Cabinet also sets out the procedures for the receipt and provision of humanitarian assistance, as well as takes a decision regarding the provision of assistance.¹⁴²⁰

The State Fire and Rescue Service of Latvia and the Estonian Rescue Board have signed an agreement seeking to improve first responders' efficiency and effectiveness regarding response time to an emergency and additionally, for the development of capability to work in rough environment such as areas with a difficult or limited access and remote areas with a shortage of water resources. The main risks in such territories in the border area are wildfires. The project is part of the Estonian – Latvian Programme, which is co-financed by the European Regional Development Fund. The budget for this project is over 3 million euros.¹⁴²¹

With regard to the participation in NATO and EU international operations aiming to prevent crises the participation of the Latvian National Armed Forces allows the improvement of their response capabilities and interoperability.¹⁴²²

¹⁴²⁰ Civil Protection Law, section 25.

¹⁴²¹ Estonia - Latvia Programme available at: <http://www.estlat.eu/supported-projects/?project=65>, [last accessed 10 October 2014](#).

¹⁴²² National Security Concept 2011, p.4.

3 Organisation

3.1 Organisational chart

The overall responsibility for crisis management and for the continuous function of the operation of the civil protection system lies with the Prime Minister of Latvia. Civil protection operations are planned, coordinated, and led by the State Fire and Rescue Service - organisation subordinated to the Ministry of the Interior, while the heads of institutions and companies are responsible for civil protection in their own institutions and companies.

The Prime Minister leads the Crisis Management Council which is the main managing body in the emergency events. The Crisis Management Council coordinates the operational measures of the involved national institutions in events of disasters and in cases of civil-military cooperation. The Crisis Management Council Secretariat supports the activities and guarantees the successful functioning of the Council.

The State Fire and Rescue Service performs and manages fire-fighting and rescue operations and activities, responds, performs and manages rescue operations in road accidents and fires, as well as performs rescue works in water accidents. The functions of the State Fire and Rescue Service include implementing state policy in the field of fire safety, fire-fighting, civil protection and operation of the single emergency phone number 112. The State Fire and Rescue Service in cooperation with local

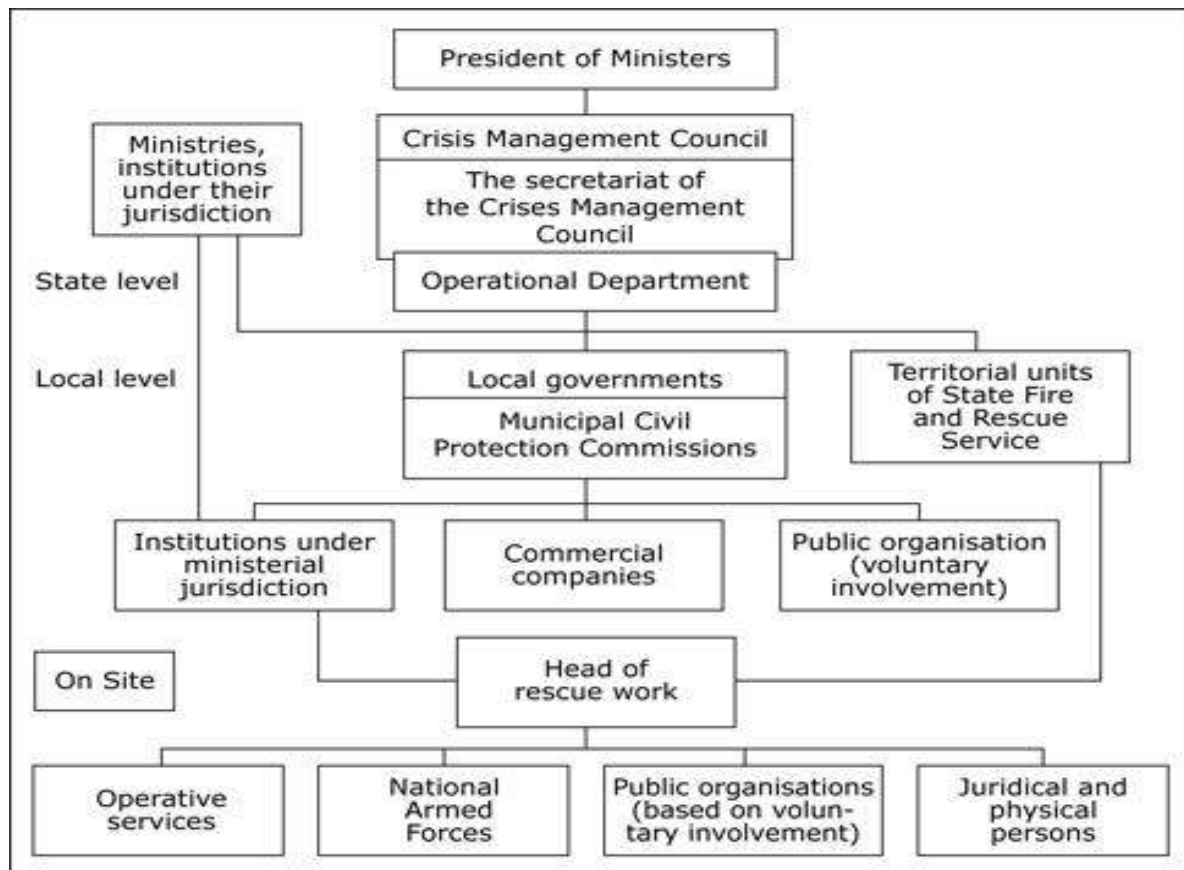

Figure 25. Structure of the Latvian Civil Protection System (Source: EC ECHO)

Figure 26. Structure of the State Fire and Rescue Service¹⁴²³

governments develops emergency plans for the provision of prevention, preparedness, response and recovery in emergency measures, taking into account the potential types of disasters, the scale and high-risk subjects in the administrative area.¹⁴²⁴

At local level the municipal authorities are responsible for establishing and managing the Civil Protection Commission of the municipalities and cities under state jurisdiction. The Commission coordinates civil protection measures in disaster events in the relevant local administrative territories.

The civil protection framework of Latvia foresees the involvement of military forces to civil authorities during peacetime emergencies. The structure of the National Armed Forces consists of the De-

¹⁴²³ Source: State Fire and Rescue Service website, available at <http://www.vugd.gov.lv/eng/structure>.

¹⁴²⁴ National Civil Protection Plan, Part III.

fence Forces, the Home Guard and the Reserve Forces. Among the duties of the Armed Forces defined in the Armed Forces Law is the participation during peacetime emergency operations. Their main tasks include support civilian services with manpower, vehicles, communication and life-support equipment, participating in rescue work and in maintaining public order, as well as to fulfil other specific tasks that require their capabilities, such as blowing up ice on rivers, clearing mines, decontamination, etc.

The Home Guard is organisation created on territorial principle in order to have a battalion ready within the territory of a district or city municipality. The Home Guard battalions have agreements concerning mutual assistance and cooperation with respective local and municipal fire brigades and police departments.¹⁴²⁵ The largest emergency assistance operations carried out so far by the National Armed Forces have been the involvement in the forest fires of 1992 and the spring floods of 1996 and 1998.¹⁴²⁶

Volunteer fire fighting units are created in some municipalities, however, their contribution to crisis management activities is somewhat limited.¹⁴²⁷

The main NGO in the crisis management domain in Latvia is the Latvian Red Cross. It represents a non-profit volunteer-based humanitarian organisation with its operations cover the whole territory of Latvia. The Latvian Red Cross Committees are located in each district having their branches in cities, municipalities and organisations all around Latvia.¹⁴²⁸

One of the main activities of The Latvian Red Cross is the participation in disaster relief operations. Therefore, the organisation has to maintain preparedness in order to participate in the training of society for action during emergencies, as well as to provide support to government bodies responsible for emergency assistance to victims involving local resources and international assistance.

The tasks of the Latvian Red Cross for reducing the impact of emergencies on the affected population include:

- operating within the framework of the Civil Protection Law and cooperating with local governments;
- participation in the districts' planning process for preparedness for emergencies in cooperation with the relevant national bodies;
- engaging disaster preparedness units in relief operations when necessary;
- storing resources to be used in emergency situations and making regular inventory of these resources;
- facilitating the cooperation of the Baltic region Red Cross disaster preparedness units and other actors to be prepared for emergency situations.

Furthermore, the organisation provides educational activities to the society on related actions in emergency situations, for reducing vulnerability, as well as for raising the communities' disaster preparedness by developing and implementing community educational activities. The organisation intends to implement a program for psychological support in crisis situations that will enhance the awareness of the population.¹⁴²⁹

¹⁴²⁸ Ibid., p.30.

¹⁴²⁹ Latvian Red Cross Strategy 2010 – 2012, pp.2-3.

3.2 Organisational cooperation

Operational crisis management responsibility normally rests with the counties and municipalities which, after declaring a state of emergency, form task forces led by the highest local political actor. The overall coordinating responsibility for civil security in Latvia lies with the Ministry of Interior. It provides assistance at local level along with other responsible for crisis management agencies.¹⁴³⁰

To be more specific, operational cooperation in crisis management operations in Latvia could be divided into two main levels of responsibility – the national level and the institutional level (where ministries and their subordinate agencies are the main operational actors).

The national level is the highest level in the Latvian civil security system and is coordinated by the Crisis Management Council. The council has a coordination function as it coordinates operational crisis management between institutions and civil-military cooperation in events of disaster and other threats to the state. The Crisis Management Council is convened only in cases of major emergency, if the crisis is multi-sectoral and requires coordination.¹⁴³¹ The Council is chaired by the Prime Minister and is composed of other Ministers, as it coordinates the implementation of political decisions in emergency situations concerning the national security. In addition it also coordinates the development of preventive plans.¹⁴³²

The main operational crisis management is the second level of institutional responsibility which is covered by the Ministries and agencies. The most important tasks of the ministries within the civil security system include the forecasting and prevention of possible threats in their sector, coordination and control of the operational response, to implement the State Civil Protection Plan and to maintain and further enhance the capacities for response and mitigation. Ministries also have to prepare action plans and coordinate the role of their subordinated bodies in emergency scenarios.

As one of subordinated organisations to the Ministry of Interior, the State Fire and Rescue Service is the main operational manager and coordinator for civil emergencies such as floods, fires, accidents, etc. Each Ministry has several subordinated agencies directly or indirectly engaged in civil security issues.¹⁴³³

Further, the Ministry of Interior coordinates several other agencies that include the State Emergency Medical Service, as the provider of health services in case of general public health emergencies; the Centre for Disease Prevention and Control, as the main responsible body in case of threats caused by diseases; the Security Police, as the main actor in events such as terrorist attacks; and the Coast Guard Service, which is the main actor in case of marine pollution and for search and rescue works at the sea.¹⁴³⁴

Cross-border and international collaboration is also organised through the European Commission within the Framework of Community Mechanism to facilitate reinforced cooperation in civil protection assistance interventions and the Euro-Atlantic Disaster Response Coordination Centre (EADRCC/NATO).

¹⁴³⁰ ANVIL Project Country Study Latvia, p.20.

¹⁴³¹ ANVIL Project Country Study Latvia, p.22.

¹⁴³² Ibid., p.22.

¹⁴³³ Ibid., p.23.

¹⁴³⁴ ANVIL Project Country Study Latvia, p.23.

An example for the procedures by which Latvia contributes to the international humanitarian and disaster relief operations could be the participation of the State Fire and Rescue Service and the Centre of Emergency and Disaster Medicine in such operations. These two organisations establish rapid response unit and medical support unit, respectively, for states affected by a disaster. Their aim is focused at responding to and providing emergency measures in the elimination of the consequences. The Latvian cabinet determines the procedures for establishing, maintaining, training and financing the relevant units, as well as the procedures the relevant international assistance has to be provided.¹⁴³⁵

Latvian Ministry of Foreign Affairs is responsible for the cooperation with the European Union as it implements and coordinates the state external security policy. The Ministry also has the leading role in organizing humanitarian assistance and in developing the legal framework with regard to the civil security system.¹⁴³⁶

Latvia is actively involved in cross-border exercises in the Baltic Sea Region by either hosting or participating. The most recent international exercises include 2006 EU Joint Assistance exercise in Ukraine; the 2008 consequence management field exercise Uusimaa that took place in Finland and was organised by the EADRCC; the field exercises in 2009 performing chemical pollution scenario in the Daugava River; the 2009 field exercises in the case of a chemical spill in Grodno Azot and the annual Latvian-Estonian exercise under the bilateral Rescue Services Agreement.¹⁴³⁷

In addition, Latvia has signed several cross-border agreements within the EU framework. Such projects include the “Building Cross-border Capacity to Perform Joint Activities in Tough Environment”, aiming at improving first responders’ efficiency and effectiveness to an emergency; INTERREG Baltic Sea Region Latvian - Lithuanian - Belarusian cross-border cooperation programme supported by the European Neighbourhood and Partnership Instrument; and the cross-border cooperation programme between Latvia and Lithuania in protection of population and environment.

Latvia engages in a broader discussion within the European Council on the strategic perspective of the further development of the Common Security and Defence Policy, the forms of military cooperation among member states and the enhancement of the EU's civilian and military capabilities.

BaltFloodCombat is a cross-border cooperation project between Estonia, Latvia and Lithuania. The three Baltic States are represented respectively by the Estonian Rescue Board, Latvian State Fire and Rescue Service and Lithuanian Fire and Rescue Department under the Ministry of the Interior. The project is within the framework of the Preparatory Action of the Civil Protection Mechanism and is funded by the European Commission. The European Commission finances 80% of the project while the remaining funding comes from the national budgets. The aim of the project is to create reliable and efficient national flood response capacity, and also to establish and register in CECIS a multinational High Capacity Pumping (HCP) module, consisting of commonly trained personnel and up-to-date equipment. Main objectives of the project include enhancing national flood response capability; strengthening European rapid response capacity, and also to discover, through innovative approach, possibilities and ways of multilateral civil protection capacity building.¹⁴³⁸

¹⁴³⁵ EC Vademecum – Country profile: Latvia, prevention and preparedness.

¹⁴³⁶ ANVIL Project Country Study Latvia, p.24.

¹⁴³⁷ Ibid., p.29.

¹⁴³⁸ BaltFloodCombat, available at: http://www.baltfloodcombat.eu/index.php?option=com_content&view=article&id=22:whats-new-in-15&catid=29:the-cms, last accessed 10 October 2014.

The Operational Management Department of the State Fire and Rescue Service is the national contact point for disaster management and response and, if necessary, ensures regular communication and exchange of information with the European Commission's Emergency Response Coordination Centre (ERCC) and the NATO Euro-Atlantic Disaster Response Coordination Centre (EADRCC).¹⁴³⁹

Latvia takes part in the EU-Civil Protection Mechanism and NATO-EADRCC systems and the OSCE Observer Mission to Georgia. In 2013 national experts participated in the EU civilian operations in Georgia and in Afghanistan, as well as in EU naval operation EUNAVFOR Atalanta. Experts from the State Fire and Rescue Service participate in various working groups and committees within the framework of EU and NATO, such as the Civil Protection Working Group of the Council of Europe.

Latvia has not officially requested cross-border or international disaster assistance through regional and international arrangements. Latvia has signed mutual civil security and civil protection agreements to receive and provide assistance in the emergency and crisis situations with Estonia (2001), Lithuania (2001), Sweden (2002), Belarus (2002), Hungary (2003), Ukraine (2006), Uzbekistan (2008), Russia (2010) and Azerbaijan (2011). In addition, Latvia actively participates in regional intergovernmental forums such as the Council of the Baltic Sea States and the Helsinki Commission (HELCOM).¹⁴⁴⁰

Moreover, Latvia has signed bilateral agreements for early warning and assistance in case of radiological or nuclear accidents with Lithuania, Estonia and Ukraine and also agreements for cooperation in case of natural and man-made accidents with Belarus, Estonia, Hungary, Lithuania and Sweden.

The Latvian Radiation Safety Centre of State Environmental Service also participates in EURDEP (European Radiological Data Exchange Platform), which represents both a standard data format and a network for the exchange of environmental radiation monitoring data between European countries in real-time.¹⁴⁴¹

¹⁴³⁹ European Union Civil Protection Mechanism, available at: www.vugd.gov.lv/lat/starptautiska_sadarbiba/eiropas_kopienas_civilas_aizsardzibas_mehanisms, last accessed 10 October 2014.

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

Information related to SOPs is not found in policy, legislative or research documents in the crisis management domain, and could not be obtained within the given timeframe.

4.2 Operations planning

The National Civil Protection Plan provides the provisions for civil protection entities undertaking preventive, preparedness, response and recovery emergency measures in occurrence of national and regional disasters, as well as a military invasion or in case of war. The Plan defines the implementation of the Civil Protection Law requirements and identifies the civil defence planning and operational objectives. Additionally, the document sets out the courses of action, tasks and the objectives in planning and carrying out civil protection measures in disaster events.¹⁴⁴²

At local level Cabinet of Ministers Regulation No. 423 dated 26 June 2007 establishes the civil protection plans of local governments, merchants and institutions as well as the procedures for developing and approving these plans. In addition, there are several other Cabinet Regulations that provide for risk reduction measures such as No. 532 "Regulations regarding the procedures for industrial accident risk assessment and risk reduction measures" (19 July 2005) and No. 626 "Regulations regarding criteria for the specification of objects of increased danger and the duties of the owners (possessors, managers) of such objects for ensuring measures for reduction of risk" (18 September 2007).¹⁴⁴³

Local governments develop the respective civil protection plans at local government level in cooperation with the State Fire and Rescue Service. Each civil security institution in Latvia has their specific crisis management proceeding.¹⁴⁴⁴

4.3 Logistics support in crises

The Ministry of Interior coordinates the emergency logistics. The Latvian armed forces provide assistance in civilian emergencies in terms of manpower and logistics when required.¹⁴⁴⁵

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

According to the Civil Protection Law the civil alarm and notification system has to ensure the warning and informing of the population regarding disasters or threats, as well as the announcement of

¹⁴⁴² National Civil Protection Plan, section 1-3.

¹⁴⁴³ Ibid., section 5.

¹⁴⁴⁴ ANVIL Project Country Study Latvia, p.27.

¹⁴⁴⁵ Ibid., p.22, p.36.

an emergency situation, the state of emergency or mobilisation. The relevant procedures for the use, establishment and financing of the civil alarm and notification system are determined by the Latvian government. Mass media has to provide information received by the State Fire and Rescue Service regarding the threat and guidance for further actions of the population free of charge in such event.¹⁴⁴⁶

The Crisis Communication Action Plan 2011 – 2013 is designed to provide a planned, coherent and coordinated communications in crisis situations and to facilitate competence of the officials involved in communication as well as to raise awareness and educate population for actions in the event of a crisis. The Plan also foresees the development of planned, integrated and coordinated public administration procedures for circulation of information in crises situations. In addition, crisis communications expert group is to be established within the Crisis Management Council. The plan anticipates the development of recommendations for crisis communication intended for government communications professionals and other officials involved in crisis communications. Moreover, the development of procedures for managing crisis events information, as well as the rights and obligations of communications officers in crisis situations are stated in the Plan.

The Crisis Communication Action Plan highlights the importance of educational activities and actions in case of crisis situation. Existing training programs in secondary and vocational education institutions are to be updated and supplemented in order to increase the crisis communication knowledge of the state and local officials responsible in crises situations. Training of state and local government

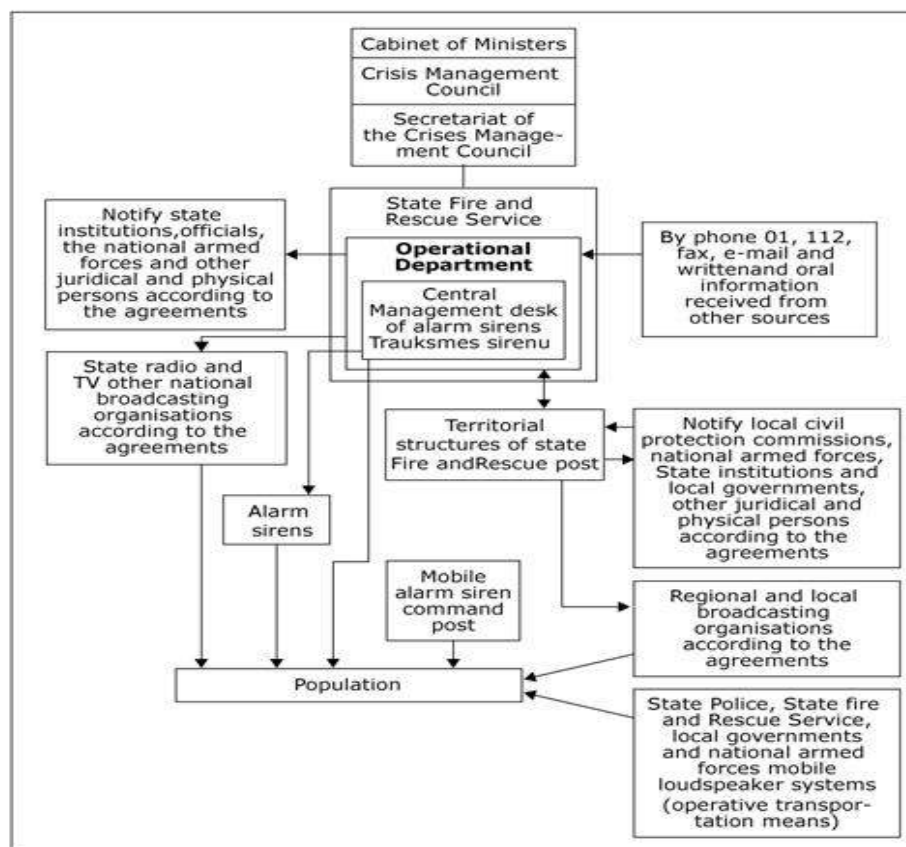

Figure 27. Civil alarm and notification system (Source: EC ECHO)

¹⁴⁴⁶ Civil Protection Law – Section 15.

officials is also listed as one of the main tasks in the Plan for the developing efficient crisis communication. The Ministry of Interior is the coordinating authority for the executing the plan.¹⁴⁴⁷

Municipalities and local governments are main actors responsible for maintaining the emergency communication system. Emergency services in Latvia have their own risk mapping services including risk registration systems.

The “112” single emergency number has been implemented in Latvia and National Geographical Information Systems (GIS) is being gradually enhanced. The GIS system aims at describing the coordination of GIS services, collection of data and creation of state GIS portal. The aim of the GIS Pilot Project is to create a digital map of Riga with the information regarding emergency events that fall under the competence of the State Police and State Fire and Rescue Service. The overall responsibility and coordination for the development of GIS services has the Information Centre of the Ministry of Interior and the State Fire and Rescue Service. Additionally, Electronic Communications Office has been established with its operational goal is to manage the resources of radio-frequency range in the field of electronic communications.¹⁴⁴⁸

¹⁴⁴⁷ Approval of the "Crisis communication plan 2011 – 2013, available at: www.vugd.gov.lv/eng/about_vugd/815-approval-of-the-crisis-communication-plan-2011-2013, Last accessed 11 October 2014.

¹⁴⁴⁸ ANVIL Project Country Study Latvia, p.27.

5 Capabilities

5.1 Human resources

The National Armed Forces provide support to the Security Police, State Police, State Border Guard, State Fire and Rescue Service, and other institutions when resources at the disposal of these institutions are not sufficient for the implementation of emergency measures necessary for crisis and consequence management and special resources (such as mine clearance and explosive devices, ships, aircraft and off-road land equipment or specific geo-spatial information) are only available by the National Armed Forces and are deemed necessary.¹⁴⁴⁹

It is prohibited to form, train and arm military public organisations of volunteers or associations of such organisations.¹⁴⁵⁰ Volunteer fire fighting units are created in some municipalities however their contribution to crisis management activities is somewhat limited.¹⁴⁵¹

Regarding cyber defence the Latvian State Defence Concept foresees the development of capabilities of the Armed Forces and the Cyber Defence Unit to react in a crisis situation and to manage the consequences of major incidents. It is planned that the Armed Forces will establish an electronic communication network for emergency situations, as well as an information technology and communication systems to ensure the support of National Armed Forces management capabilities in crisis situations will be developed.¹⁴⁵²

5.2 Materiel (non-financial) resources

In the National Security Concept the importance of making a conceptual assessment of legal framework in respect to legal regimes of national threat and crisis situations, attraction of additional resources to the civil defence system in the event of national threat, as well as of principles for establishing of the national material reserve system is highlighted.¹⁴⁵³

In Latvia, the involvement of resources in disaster management involves the operational and emergency services, civil protection formations that are mobilisable – the Operational Control Centre of the State Fire and Rescue Service, the State material reserve resources, local government resources; and the resources available at the disposal of a commercial company.

The State Material Reserves Law defines the creation and storage of state material reserves for the civil defence system the usage in cases of national risk. The material reserves are to be used for disaster management by the institutions involved, in cases of shortage in the available response measures. Reserves planning of the civil protection measures are defined in the plans provided by the Ministry of Interior, involving their subordinated institutions, as well as by local authorities and businesses. Material Reserves are to be used in cases such as disaster response activities for the elimination of consequences of an emergency; for the response actions of the involved personnel for

¹⁴⁴⁹ State Defence Concept 2012, pp.9-10.

¹⁴⁵⁰ National Security Law – Section 18.

¹⁴⁵¹ ANVIL Project Country Study Latvia, pp.29-30.

¹⁴⁵² Cyber Security Strategy of Latvia 2014–2018, p.12.

¹⁴⁵³ National Security Concept of the Republic of Latvia, 2005_nd_en p.8.

ensuring the protection of the population; for public safety and order; for the civil protection and disaster management training of involved personnel.¹⁴⁵⁴

State Fire and Rescue Service resources include 92 fire station buildings, of which approximately 33% were built before 1940, 65% - from 1940 to 1992, 2% - built or renovated in the period after 1990.¹⁴⁵⁵ Firefighting depot buildings and facilities are physically and morally outdated and are in a very poor state and do not comply with European or national requirements set out by the relevant documentation.

In addition, another issue concerning the capabilities of the State Fire and Rescue Service is the location of these fire station buildings. They are mostly situated in limited area that prevents the perspective for establishing modern fire fighting and rescue equipment, special and technical equipment, nor safety conditions for the effective performance of the functions specified.

According to statistics by the National Fire and Rescue Service over period of five years the number of rescue operations increases every year to reach 6173 for 2013, compared to 2640 in 2009, 2010 - 3431, 2011 - 4517, 2012 – 4835. The number of fires has increased by 9.16% compared to 2012, to reach 9821.¹⁴⁵⁶

According to Regulation No. 61 dated 3 February 2004 by the Cabinet of Ministers, the State Fire and Rescue Service has to ensure the arrival on scene of the response teams in cities within 5 minutes, to the rest of the urban and rural areas with a population density of 10 or more persons per square kilometre - within 15 minutes and in rural areas with a population density of less than 10 people on the square kilometres – within 25 minutes after receiving the emergency signal.¹⁴⁵⁷

Currently, only about 80% of the emergency cases, State Fire and Rescue Service unit can be sent to the scene to perform fire extinction and rescue work.

In several regions the distance from the State Fire and Rescue Service fire station building to the point of the emergency event is as much as 30 to 40 km, meaning that in about 20% of the cases it is not possible to ensure the required action and as a result of the population does not receive timely and quality assistance.

In order to provide the public with timely, high-quality assistance it is needed to improve the State Fire and Rescue Service territorial unit network.¹⁴⁵⁸

The Air Force carries out Latvian airspace surveillance, control and defence, provides air defence support to the Land Forces units and participates in search and rescue operations over the Baltic Sea, the Bay of Riga and dry land. In the beginning of the new century two new Mi-8 Hip helicopters were bought. Both helicopters are fitted with search and rescue equipment, but could also be used for transportation of troops, evacuation and support of the Special Forces.¹⁴⁵⁹

The State Border Guard has one helicopter Augusta Bell 206 and two Augusta Bell 109 capable of performing search and rescue missions both on the water and on land, and can also provide simultaneous transport of multiple victims (up to 30 people). Operational capability at sea is limited, because the helicopters' permanent site is one-hour flight from the Baltic Sea coast. The "Concept for

Search and Rescue Capability Development and Improvement Using Helicopters” envisages possible solutions for the main capabilities shortfalls when using helicopters in rescue operations.¹⁴⁶⁰

The existing radio system by the Ministry of Interior currently covers approximately 93-94% of the country by providing operational radio services in emergency situations such as natural disasters, or technological accidents, and regardless of public communications operators.¹⁴⁶¹

In Latvia there are 164 alarm sirens in Riga and other cities for population warning of potential hazards.

5.3 Training

Training and education activities are mainly organized by the Ministry of Interior and its subordinate the State Fire and Rescue Service. The training courses conducted include exercises and simulations of possible crisis incidents. The target group involves heads of state institutions, local governments and commercial companies, as well as citizens as volunteers. Volunteers have been increasingly integrated into civil protection activities, despite still having limited influence in crisis management operations.¹⁴⁶²

Alongside the training activities performed by the above mentioned institutions, the national accredited higher education institutions provide training in this field. The requirements for the civil security training are set by the government, however, local authorities and municipalities can conduct complementary courses.¹⁴⁶³

In addition, the Civil Protection Law states that educating to the population in civil protection matters through the mass media and for distributing informative materials, has to be performed by the State institutions and local governments, as well as by merchants in the relevant cases of affected persons within the merchants’ objects.

The Regulations of the Cabinet for provisions of methods and procedures for organizing civil protection training, issued in accordance with the Civil Protection Law, defines the rules of civil defence training and the procedures of their organization, as well as the types of training and procedures for civil defence training. The document divides training into four main categories:

- Local training, which testing the readiness for cases of local disaster;
- Regional-level training, which testing regional disaster preparedness;
- State-level training, which testing the readiness of national-wide disaster;
- International training, which is established to examine the coordinated actions between a number of the competent national authorities and international organizations.¹⁴⁶⁴

Local level training is organised at least once every three years and is conducted by the chairman of the local government council, head of institution. Training of employees in civil protection matters shall be organised by the employer.¹⁴⁶⁵

¹⁴⁶⁰ Government Regulation No.198 “Concept for Search and Rescue Capability Development and Improvement Using Helicopters.”

¹⁴⁶¹ Strategy of the Ministry of Interior 2014 – 2016 (unofficial translation), pp.18-20.

¹⁴⁶³ ANVIL Project Country Study Latvia, p.29.

¹⁴⁶⁴ Cabinet of Ministers Regulations No. 772, Riga, 22 September 2008.

¹⁴⁶⁵ Civil Protection Law – Section 19-21.

National and regional training is conducted by the responsible training manager, who is appointed by the Prime Minister. At national level, training has to be organised at least once in every four years.

International Training is organised according to the relevant international organization procedures and the participation of Latvian institutions is based on the basis of invitations.¹⁴⁶⁶

The Fire Safety and Civil Protection College is an educational establishment subordinate to State Fire and Rescue Service. The College provides professional educational programmes in the preparation of civil protection specialists for the State Fire and Rescue Service, and for other civil protection services and units such as fire-fighters, rescue and protection services, etc.¹⁴⁶⁷

Furthermore, national exercises are performed as part of the Latvian - Lithuanian cross-border cooperation programmes and the Baltic Sea Regional INTEREG IIIB Neighbourhood Programme between Latvia, Lithuania and Belarus. Another exercise carried out was the exercise conducted in 2005 and its main scenario was rupture of dam and subsequent floods. Latvia participates in various international exercises which include EU Joint Assistance in 2006, Ukraine, consequence management field exercise Usimma in 2008 organised by the Euro-Atlantic Disaster Response Coordination Centre (EADRCC) in cooperation with Finland; the Field exercises in 2009 with the cases of chemical pollution of the river Daugava and chemical spill in Grodno Azot, as well as the Annual Latvian-Estonian exercise under the bilateral Rescue Services Agreement.¹⁴⁶⁸

Latvian cooperation in the field of training with other NATO member states in the territory of Latvia and other Baltic States is essential for the improvement and enhancement not only of the disaster response preparedness and response, but also is important for the Latvian national armed forces. Responsible institutions have to ensure the maintenance of the host nation support system and must carry out regular mutual coordination and training in order to ensure the possibility to rapidly deploy allied forces. The host nation support system is of vital importance in prevention of the consequences of natural and human-caused catastrophes and international training.¹⁴⁶⁹

In the cyber security domain, the 2014–2018 Cyber Security Strategy of Latvia lists the required actions for improving the capabilities for crisis preparedness and capacity to act in crisis situations.

These actions include organising regular theoretical and practical training at national level with the involvement of high-level officials and the private sector in order to develop mutual understanding and to coordinate the management of crisis situations. Moreover, the strategic document outlines the need of developing regional and international cooperation, to ensure regular training for providing and receiving support in a crisis situation and to organise crisis training and security breach tests at a national, regional and international level.

In addition, planning and implementation of security measures for critical infrastructure is regulated by the Cabinet of Ministers. In order to exchange knowledge and experience, as well as for improvement of procedures, representatives of critical infrastructures are regularly involved in training organised by Information Technology Security Incident Response Institution of Latvia.¹⁴⁷⁰

¹⁴⁷⁰ Cyber Security Strategy Of Latvia 2014–2018.

5.4 Procurement

5.4.1 Procurement regulation

The national legislation of Latvia for public procurement is regulated by two main laws – the Public Procurement Law and the Law on Procurement for the Needs of Public Service Providers. The Ministry of Finance is in charge of the overall public procurement policy.

Latvia has adopted several EU Directives into its legislation such as Directive 2004/18/EC and Directive 2007/66/EC, both implemented by the Public Procurement Law which is in effect since 1 May 2006.

Directive 2009/81/EC is implemented by a separate law – the Defence and Security Procurement Law with amendments under the Directive 2009/81/EC; Directives 2004/17/EC; Directive 2004/18/EC.

The central purchasing bodies in Latvia in the security and defence sectors are the Providing Agency of the Ministry of Interior and the State Agency for Defence Properties of the Ministry of Defence. In addition, other ministries, agencies and local governments have their own purchasing structures that act as purchasing bodies.¹⁴⁷¹

5.4.2 Procurement procedures

Information and indications specific procurement procedures are not found in policy, legislative or research documents referring to the crisis management domain, and could not be obtained within the given timeframe.

5.5 Niche capabilities

Potential niche capability that could be filled by Latvia and represent interest to the EU crisis management structures is the development of single crisis information systems.

The Latvian civil security institutions are looking to improve cooperation in the field of crisis management as they are exploiting new ways for cooperation for the creation of a unified national information system. The system will contain data on registered events and provide this data for the development of analytical, planning, statistical and other activities and strengthen the collaboration among the services.¹⁴⁷²

The Ministry of Interior, the State Fire and Rescue Service and the State Police are the key actors involved in leading the initiative for developing electronic data exchange among the emergency services. Such initiative will allow having simultaneous visualization of information regarding events registered by the State Police, as well as regarding predefined types of events registered by the State Fire and Rescue Service.

Furthermore, the NATO Strategic Communications Centre of Excellence established in Latvia provides comprehensive analyses, timely advice and practical support to the Alliance in the strategic communications area of expertise. The centre conducts analyses, develops doctrines, conducts research and

¹⁴⁷¹ Comparative Survey On The National Public Procurement Systems Across The PPN, Rome 2010.

¹⁴⁷² ANVIL Project Country Study Latvia, p.28.

experimentation activities, and enhances training and interoperability through common understanding of NATO Strategic Communications policy and procedures.¹⁴⁷³

The centre's activities could serve as an example of a potential niche capability of interest to the EU. Strategic communications is a broad topic that encompasses all information disciplines within the STRATCOM community - Public Diplomacy, Public Affairs, Military Public Affairs, Information Operations and Psychological Operations. In crisis management context strategic communication play an important role as it focuses on objectives at strategic and tactical levels, and especially important for the decision making process.

Latvia could develop similar capabilities, within the European Union, in the field of strategic communications, communication during crises or other related subject to the benefit of the Member States.

¹⁴⁷³ STRATCOM COE, structure, available at: <http://www.stratcomcoe.org/Organisation/FocusAreas.aspx>, last accessed 30 November 2014.

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by ECORYS and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

The crisis management organizational structure of Lithuania is similar to the ones in Baltic Region States. It is centralised, i.e. coordinated and organised mostly by the central national civil protection authority, with limited use of private rescue services.¹⁴⁷⁴

The National Security Strategy of Lithuania establishes the basic goals and means of the national security policy. The aim of the Strategy is to provide a vision of the state's development, its national interests and the necessary actions for their implementation.

The civil protection system of Lithuania is comprised of the Government, the state and municipal institutions, economic entities, public organisations, civil protection forces such as fire and rescue, police, state border guard, medical services, public security service, state food and agriculture service, other emergency services, forces of economic entities, volunteers, the government emergency commission and emergency operation centres.¹⁴⁷⁵

The management of civil protection in Lithuania is organised at three levels – national, regional (county) and local (municipal). At national level, the Government, the Government Emergency Commission, the Emergency Management Centre, the Ministry of National Defence, the Civil Protection Department, the State Fire Prevention and Rescue Service, Ministries, and other public authorities are the main stakeholders entitled to make strategic decisions on the implementation of civil protection measures.

At county level, administrations of county governors, county civil protection departments, and county emergency management centres are responsible for organising and ensuring preparedness for emergencies as well as for assisting when necessary in their relief.

At municipal level, mayors of municipalities, civil protection departments, civil protection personnel, municipal emergency management centres, fire protection, search and rescue services, warning and information, evacuation, civil protection services and economic entities are responsible for organising preparedness for emergency situations and when required mitigate their effect.

International cooperation in Lithuania in the field of crisis management is coordinated by the Fire and Rescue Department (Figure 1, <http://www.vpgt.lt>) within the Ministry of Interior. Individual ministries and other state civil security institutions also participate in international civil protection activities.

Figure 28. Logo of the Fire and Rescue Department under the Ministry of Interior.

¹⁴⁷⁵ Timo Hellenberg and Pekka Visuri, ANVIL Project Country Study: Lithuania, June 2013, p.14.

Crisis management institutions part of the civil protection and rescue system, Training Centre, other educational institutions of civil protection as well as the forces of the civil protection and rescue system are financed by the state budget, while the economic entities are financed from their own resources.¹⁴⁷⁶

Education in civil protection and rescue has a legal foundation in all of the Baltic Region countries. Basic and advanced education at the national level is standardised through the use of certificates, as well as the development of educational and training curricula. All of the Baltic region states have specialised schools and colleges which carry out education in civil protection and rescue area.¹⁴⁷⁷

1 Policy

Civil security¹⁴⁷⁸ is a primary function of institutions and specialized agencies in Lithuania. Lithuania has no nation-wide specified definition of crisis situations or major emergencies.¹⁴⁷⁹ The national policy and strategy in the field of crisis management is set out by the Law on the Basics of the National Security and by the Law on Civil Protection.

1.1 Risk Assessment

Since gaining its independence in 1991 Lithuania has not faced any large scale natural or technological disasters. The occurrence of natural disasters is rather low due to the fact that climate is mild, ranging between maritime and continental. The most usual natural disasters are floods and storms as well as forest fires.¹⁴⁸⁰ An example of the types of hazards and events that has caused casualties and damages are depicted in Table 1 below.

There are also a considerable number of diverse cross-border risks affecting Lithuania. These include floods in the basin of the Nemunas River, which creates risk also to the Russian Kaliningrad district, and forest fires originating from the Russian Federation. Additionally, Baltic Sea pollution and related oil spills are regarded as a major risk factor.¹⁴⁸¹

According to Lithuanian legislation, all economic entities starting operation have to conduct a risk assessment. When referring to natural disasters municipalities and county administrations are responsible for preparing risk assessments. In relevant responsible institutions hazards are evaluated and mapped according to their field of activities and responsibilities.

Risks and threats to the national security of Lithuania are defined by the National Security Strategy which is approved by a resolution of the Parliament.

The Strategic Research and Analysis Centre was established by the Government with the aim of analysing and forecasting changes in the external and internal security environment, analysing the occurrence and development of threats, dangers and risks and submitting proposals to the Parliament, the President of the Republic, the State Defence Council and other institutions engaged in ensuring national security.¹⁴⁸²

The Fire and Rescue Department under the Ministry of Internal Affairs, working in close cooperation with data and assessments provided by ministries and other national institutions, prepare the Lithuanian National Risk Analysis. The document is drafted in accordance with the provisions of the European Commission working paper on “Risk Assessment and Mapping Guidelines for Disaster Management.” When finalised, the analysis is submitted to the European Commission.¹⁴⁸³

The Register of hazardous objects is one of the information management systems that are gradually being developed in Lithuania. It consists of the main database, managed by the Civil Protection Department of the Ministry of National Defence and the counties database, which is managed by the counties' Civil Protection departments. This data basis contains information on all the hazardous objects that might threaten the population in case of an emergency.

There are several governmental regulations regarding conducting risk assessments such as: Resolution no. 1558 concerning the procedure for approval and management of flood risk assessment (2009); and Resolution no. 1212 on the Rescue, Search and Emergency Work, Events, Extreme Events and Extreme Situations and Liquidation of their Consequences (2010).

¹⁴⁸⁴

Extracted from The International Disaster Database (EM-DAT), maintained by the Centre for Research on Epidemiology of Disasters at <http://www.emdat.be/database>.

Further, the Provisions on Major Industrial Accidents Prevention and Consequences Liquidation, approved in 2004 by the Lithuanian government, were prepared according to the SEVESO II Directive,¹⁴⁸⁵ as well as to the Lithuanian Civil Protection Law. In addition, risk-mapping in Lithuania has included possible accidents at chemical and other sites.¹⁴⁸⁶

1.2 Policy and Governance

The management of civil protection in Lithuania is organised in three levels - national, regional (county) and local (municipal).

The Prime Minister has the lead role at national level for the management of the civil protection operations. Other key responsible actors include the chief executive officers of ministries, departments and other public administration bodies and county governors, and in exceptional circumstances - directly to mayors of municipalities.¹⁴⁸⁷ The model of the crisis management framework in Lithuania could be described as centralised. It is mainly managed by the Government and the Ministry of Interior. At national level, the key civil protection objective is to ensure emergency preparedness and the capability development at all levels of the civil protection management system, in order to meet the main requirements for national security and civil protection in emergencies, encompassing response and recovery after emergencies.¹⁴⁸⁸

At regional (county) level, the county governors, county civil protection departments and county crisis management centres organise preparedness for emergencies and assist in the response in such situations.

At municipal level, the municipal administrators, civil protection departments, which include divisions and services, civil protection personnel, municipal emergency management centres and other civil protection entities organise preparedness for emergencies and, when necessary, respond thereto.

The Law on Basics of National Defence outlines that the crisis management system has to be created and developed to forecast and monitor emergencies and events that pose threat, in order to prepare and implement preventive measures, as well as to respond to, determine and manage crises. In addition a crisis management strategy has to be approved by the Government.

The Government Emergency Commission, formed by the Government and chaired by the Prime Minister, has the responsibility for the coordination of crisis management. The Committee consists of the main ministers responsible for crisis management, the Chancellor of the Prime Minister or First Deputy thereof. The Commission, with the approval of the Government, has the authority to call for establishment of Joint Coordination Centre consisting of representatives of appropriate ministries and other state institutions for the coordination of crisis management and response. Crisis management is regulated by laws and other legal acts.¹⁴⁸⁹

The main purpose of the civil protection and rescue system is the protection of the population from threats during war and in peacetime. The system has to ensure the readiness of all the rescue ser-

¹⁴⁸⁵ Council Directive 96/82/EC of 9 December 1996 on the control of major-accident hazards involving dangerous substances.

¹⁴⁸⁹ Law on Basics of National Defence, Part II, Chapter 14, Section II.

vices and their preventive actions and, in the event of emergencies, natural disasters, provide necessary emergency assistance and evacuation from the regions at risk.

In order to deal with large-scale disasters and to carry out rescue and emergency response operations military forces, specialists from the reserve, ministries, other state and municipal institutions and bodies, volunteer organisations, as well as other resources available could be involved. The conditions and procedures for their employment and participation in operations are defined by law.¹⁴⁹⁰

1.2.1 Strategy scope and focus

The key national documents in the field of crisis management are defined in accordance with the law of the Republic of Lithuania on the Basics of the National Security and the Law of the Republic of Lithuania on Civil Protection. The civil security system of Lithuania has mainly been developed over the past two decades, more precisely since the independence of the country, to reach sufficient preparedness and readiness to protect its population, property and environment using its resources.¹⁴⁹¹

1.2.2 Monitoring and analytical support to policy making; R&D

Lithuania conducts extensive scientific research in the area of civil security and crisis management. The Lithuanian Fire and Rescue Department was one of the key initiators of the CIVPRO civil protection network, established in 2006 by the EUROBALTIC II project for civil protection, as part of the EUROBALTIC Programme for Civil Protection, initiated by the Council of the Baltic Sea States.¹⁴⁹²

The CIVPRO network conducted studies addressing research questions in civil protection, risk management and emergency preparedness. The project performed high quality research using state-of-the-art experimental approaches and risk mapping technologies. It also built a web-based knowledge database for disseminating accurate and detailed definitions of various risks in the Baltic region. The project also promoted collaboration with experts within and beyond the network in civil protection, risk management and emergency preparedness fields of expertise (see section 3.2 for further information on international cooperation activities).¹⁴⁹³

The Fire Research Centre, under the Fire and Rescue Department of the Ministry of Interior, is a body investigating the cause of fires, performing technical expertise in fire, fire testing, developing normative and methodological documents. The Centre provides also methodological support to the formulation of fire protection policies. Each year, the Fire Research Centre conducts about 500-700 fire tests and surveys. It tests and evaluates building products, coatings, fire equipment, fire protection materials, electronics, pyrotechnics, and even toys. The tests are carried out in accordance with international standards and Lithuanian methods.

In Lithuania, academic and research communities cooperate with national or local institutions in the field of disaster reduction on ad hoc basis. Besides public entities and universities, there are private entities which participate in EU funded research programmes and projects.

¹⁴⁹⁰ Ibid., Chapter 21.

¹⁴⁹¹ ANVIL Project Country Study: Lithuania, p.32.

¹⁴⁹² Ibid., p.27.

¹⁴⁹³ Ibid., p.27.

1.2.3 Policy for Prevention

The main objective of Lithuania's Crisis Management System is to prevent crises by collecting information regarding on-going processes, analysing them and informing the superior authorities about the current situation, possible threats, as well as submitting proposals related to actions and operations required for managing crises. The Crisis Management System also maintains the readiness of the necessary integral infrastructure and keeps in preparation all the offices, institutions and procedures necessary for control of crisis management actions and operations.¹⁴⁹⁴

The Crisis Management System incorporates forecasting, prevention and control of a wide range of threats. The Lithuanian White Paper on Defence Policy especially pays attention to the importance of expanding the mechanisms for crisis forecast and prevention in order to enable detection of a crisis at an early stage. The Crisis Management System is designed at three levels:

- strategic: President, Prime Minister and ministers;
- operational: Emergency Management Centre;
- tactical: operational crisis management offices in all ministries and departments.

Crisis prevention and preparedness for crisis management is coordinated by the Office of the Prime Minister. The Office coordinates the drafting of integral crisis and emergency prevention and management plans and measures, while the ministries and other state institutions prepare similar plans and measures within the sphere of their competence providing for action and coordination with other institutions.¹⁴⁹⁵

The tasks of the Emergency Management Centre include performing and monitoring of risk factors and threats, forecasting possible crises; coordinating activities of state institutions and entities within the crisis prevention area; ensuring the operation of crisis management infrastructure and constant exchange of information on crisis management between institutions; and to develop international cooperation within the field of crisis management.¹⁴⁹⁶

1.2.4 Policy for Preparedness

Civil emergency preparedness is a key national function that directs the elaboration and implementation of preparedness and response measures undertaken by public institutions, local authorities and the private sector. An example of a preparatory work in the case of a natural disaster and for a response operation has been the flooding of the Lithuanian Nemunas River. Due to rainfalls river levels reach devastating levels approximately every 12-15 years, thus submerging vast territories of about 50,000 hectares in the regions of Klaipeda and Taurage with over 50 villages and 700 farms in areas populated by around 4,000 inhabitants. The most recent emergency event occurred in 1994 when 40,000 hectares were flooded and 19 villages, 168 farms and over 600 persons were affected. The Nemunas flooding resulted in improvements in the preparedness and response mechanisms of the Lithuanian civil security system in general. A permanent programme of preparedness to flooding and effects elimination has been established with the aim of reducing the effects and economic losses caused by floods. The Nemunas case has been an example of civil-military cooperation as the Lithuanian Army has taken active part in the rescue and response efforts in cooperation with the SFRS. Also

¹⁴⁹⁴ White Paper 2002, Lithuanian Defence Policy, pp.9-10.

¹⁴⁹⁵ Law on Basics of National Defence, Part II, Chapter 14, Section II.

¹⁴⁹⁶ White Paper 2002, Lithuanian Defence Policy, pp.9-10.

the national defence voluntary forces have accomplished some reconnaissance missions and air rescue operations.¹⁴⁹⁷

The overall responsibility for the status of the civil protection system, as well as for evaluating the preparedness of the state and municipal institutions, is held by the governmental Emergency Commission. The Government Emergency Commission is the main operational body of the civil security system in Lithuania and is technically assisted by the Fire and Rescue Service. There are two levels at which the emergency commission is established: at governmental and municipal levels. It submits proposals to the government related to the use of civil protection supplies of the State Reserve in the event of an emergency. The Commission facilitates discussion on the state of the civil security system, evaluates the preparedness of state and municipal institutions and other agencies for emergency response and takes measures to improve it. It is also in charge of government level information sharing and situational awareness.

The municipal Emergency Commission is responsible for the municipal civil protection system as well as for the preparedness and response actions during a crisis situation. It also submits requests to the Fire and Rescue Department regarding the use of civil protection supplies of the state in crisis events. In Lithuania there are 60 municipal Emergency Commissions which are also responsible for informing the public about the actual emergency and related response mechanisms.

*The state commander of operations will be appointed by the prime minister from the government cabinet, and the national operations centre will be convened. It is important to point out here that the relationship between ECs is based on the principle of supremacy of decisions: the municipal level EC is the lowest level and the government EC the highest level.*¹⁴⁹⁸

1.2.5 Policy for Response

Depending on the scope of the emergency there are two levels of emergency situations - national and municipal. In cases of emergency within a single municipality, the response to such a crisis is managed with forces of the civil protection system located within a municipality with the material resources held at the disposal of the municipality or obtained from other municipalities. In cases that the emergency covers territory that affects more than three municipalities it is categorised as national level emergency.

If an emergency has occurred within the territory of a single municipality then a local municipal Emergency Commission will be formed. The head of the municipal administration has to appoint a municipal operations commander and the municipal operations centres will be convened. The head of the municipal administration is also responsible for carrying out a response of the civil security system within the municipality. He/she declares and terminates a municipal level of emergency and organizes municipal level civil protection exercises, organizes search and rescue operations and mobilizes other forces of the civil protection system. Respectively, in case of national level emergency a government Emergency Commission will be convened.¹⁴⁹⁹

Furthermore, in peacetime part of the obligations of the Lithuanian Armed Forces is to ensure of the national security. The Lithuanian Armed Forces together with the institutions supporting them have to be ready to respond to military and non-military threats and emergencies occurring in the country

¹⁴⁹⁷ ANVIL Project Country Study: Lithuania, p.18-19.

¹⁴⁹⁸ ANVIL Project Country Study: Lithuania, p.17.

¹⁴⁹⁹ ANVIL Project Country Study: Lithuania, p.19-20.

in peacetime. In order to achieve such support and readiness to assist state or municipal institutions, the Armed Forces develop capabilities for effective and coordinated intelligence activities that allow the identification of a potential crisis at an early stage and application of preventive measures against the spreading of the crisis. In addition, in case of extreme situations and a state of emergency, the Armed Forces provide assistance to state and local municipal institutions if capabilities of these institutions are limited; and ensure security and defence of the national cyber space by contributing to the response to mass cyber-attacks carried out against Lithuanian public authorities and critically important entities.¹⁵⁰⁰

1.2.6 Policy for Relief and Recovery

The Government Emergency Commission organises emergency prevention and direct emergency relief actions where the territory of one or more counties is affected or where there is a need for assistance from public administration bodies for forces and material resources necessary for mitigation of the effects an emergency.

Lithuanian legislation foresees not only preparedness of state institutions and population for emergencies but also their active participation in reducing the consequences and engaging in recovery activities. Responsibility for recovery activities is held primarily by the municipal authorities. In cases where the available resources are insufficient, municipalities may require assistance from the government. Owners of private enterprises are obliged to establish emergency management units on stand-by preparedness for mitigation of consequences according to the contingency plans.¹⁵⁰¹

1.3 Financing

1.3.1 Investing in preparedness

Crisis management institutions part of the civil protection and rescue system, training centre, other educational institutions of civil protection as well as the forces of the civil protection and rescue system are financed by the state budget, while the private entities are financed from their own resources.¹⁵⁰²

1.3.2 Investing in consequence management

The government is the main provider of financial support to affected entities in case of natural disasters. In cases when material resources owned by legal and natural persons are used in the mitigation of disaster effects they have to be compensated by the Government accordingly.¹⁵⁰³

The resources for recovery activities are primarily taken from the objects, usually the economical entities, and in case they are not sufficient, from municipalities or the government.¹⁵⁰⁴

The compensation of damages and losses caused by natural disasters, expenses of rescue and mitigation of the effects to natural and legal persons is provided in the manner prescribed by the Government.¹⁵⁰⁵

¹⁵⁰⁰ Military Strategy of the Republic of Lithuania, approved November 22, 2012

¹⁵⁰¹ ANVIL Project Country Study: Lithuania, p.28

¹⁵⁰² Civil Protection Law, Chapter VII, article 38

¹⁵⁰³ Ibid., Chapter VII, article 38

¹⁵⁰⁴ ANVIL Project Country Study: Lithuania, p.28

Furthermore, Lithuania receives funding through the Latvia – Lithuania Cross Border Cooperation Programme (see 3.2 for cross border cooperation). 19 projects are approved for funding according to this Programme. Additionally, the projects part of the Programme requested around EUR 28 million co-financing from the European Regional Development Fund (ERDF).

Some of the approved projects include:

- “Common Fire and Rescue Service Response System on the Border” for the creation of joint fire fighting rescue service response system in the Lithuanian and Latvian border, aimed to operatively accumulate fire fighting rescue forces responding to incidents and extreme situations;
- “Continuance of Latvia-Lithuania cross-border cooperation in protection of population and environment,” which is aimed at fostering creation of effective cross-border cooperation in emergency situations, thus improving safety of citizens on both sides of the border;
- “Creation of disaster management system in neighbouring regions of Latvia and Lithuania, Phase II,” which facilitates the implementation of three main priorities set forth in the Strategy of the Programme: Legal and institutional development, Establishment of data exchange system in risk management and Development of risk management infrastructure thus ensuring accessibility, quality and effectiveness of disaster management and emergency recovery services in Latvia and Lithuania by year 2015.¹⁵⁰⁶

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

Information and indications of related to post-disaster assessment is not found in policy, legislative or research documents in the crisis management domain, and could not be obtained within the given timeframe.

1.4.2 Departmental Lessons Learned systems

Information on of such systems is not found in policy, legislative or research documents in the crisis management domain as it is intra-agency specific, and could not be obtained within the given timeframe.

1.4.3 Centralised (national) Lessons Learned system

In the process of regular risk assessment at national level, the decisions taken by state and municipal authorities are analysed in respect of their contribution to mitigate the risks and threats to national security.

1.4.4 International exchange for Lessons Learned

Such information is not found in policy, legislative or research documents in the crisis management domain, and could not be obtained within the given timeframe.

¹⁵⁰⁵ Civil Protection Law, Chapter VIII, article 41

¹⁵⁰⁶ http://www.latlit.eu/eng/news/19_projects_will_receive_cofin/_gv/print_1, last accessed 24.10.2014

1.4.5 Regular policy reviews

The Fire and Rescue Department under the Ministry of the Interior in accordance with the emergency prevention procedures set out in resolution No. 1028,¹⁵⁰⁷ approved by the Lithuanian government in 2010, prepares an annual review that analyses and summarizes the information obtained regarding the national civil protection system, the emergency preventive and preparedness measures of the state.¹⁵⁰⁸

Governmental regulations and resolutions that outline the conduct of regular policy reviews include resolution No. 966 regarding the prevention, elimination and investigation, government resolution No. 924 approved in 2009 on monitoring carried out (Official Gazette, 2009, no. 103-4322) and resolution No. 404 for regulatory monitoring (Official gazette 2009, no. 59-2294).¹⁵⁰⁹

1.5 Resilience

The term Resilience is not used in Lithuanian policy or legislative documents. Over the course of this study no information has been found within the academic domain referring to the resilience concept addressing crises, disasters, crisis management or other related topics.

1.6 Information sharing and data protection

The tasks of the Emergency Management Centre include constant exchange of information on crisis management between institutions and developing international cooperation in the field of crisis management. In addition, the Centre, while implementing the tasks assigned to it, collects and analyses information received from the national authorities, mass communication and news agencies regarding threats and ensures the protection of information representing a state or official secret.¹⁵¹⁰

The role of the society and citizens of Lithuania in crisis management is increasing due to the introduction and use of high-technologies. *The citizens' role is growing in terms of coherent risk awareness but also in terms of producing items for the authorities' situational awareness.*¹⁵¹¹ There are a number of IT related projects where risk information is collected and analysed through internet, social media and text messages. In Lithuania, citizens are considered as a valuable source of civil protection data that is being processed and stored into databases.¹⁵¹²

2 Legislation

2.1 Crisis (emergency, disaster) management concept

The National Security Strategy of Lithuania establishes the basic goals and means of the national security policy. The aim of the Strategy is to provide a vision of the state's development, its national interests and the necessary actions for their implementation.

The Strategy defines the basic goals of specialised strategies and doctrines in relevant areas of state policy. These strategies have to be based on the provisions of the National Security Strategy and must be revised every time the National Security Strategy of Lithuania is updated.

Conflict prevention is one of the main priorities listed in the National Security Strategy, in particular participating in international crisis management and establishing policies and legislation to address new security challenges, dangers, and threats.

Additionally, the Strategy foresees cooperation with NATO Member states to further strengthen regional security within the Baltic region, in order to consolidate the national security system of the Republic of Lithuania and reinforce national and international crisis management capabilities. The Strategy also highlights the readiness of Lithuanian forces to participate in international peace operations, crisis management and prevention.

The Strategy also underlines the importance of the establishment of crisis management system in Lithuania in order to ensure effective detection and prevention of threats, as well as the national security in the area of crisis management. The system is being established to function in the pre-crisis situations, ensuring comprehensive monitoring of dangerous situations and threats, crisis detection, preparation and implementation of preventive measures.

The main means and measures for improving crisis management and response capabilities include: enhancing the preventive role of the crisis management system for detecting and eliminating emergency situations and threats; establishing civil safety and rescue institutions for managing crisis situations and to ensure immediate emergency aid in the case of fire, industrial disaster or another incident.¹⁵¹³

2.2 General crisis (emergency, disaster) management law

The Civil Protection Law of Lithuania establishes principles for the organisation and operation of the civil protection and rescue system, along with the duties and rights of state and municipal institutions, economic entities, public organisations and residents.¹⁵¹⁴

The goals of the civil protection and rescue system include guaranteeing the optimum use of state resources in order to ensure public security, maintain the operability of the national economy, localise the emergency areas and mitigate the effects thereof; preparing the public for practical actions in the event of an emergency and strengthen the confidence in the civil protection and rescue systems.

¹⁵¹³ National Security Strategy of Republic of Lithuania, 2002, amended 26 June 2012.

¹⁵¹⁴ Civil Protection Law, Chapter I, art. 1.

For the implementation of the goals and tasks the civil protection institutions has to be guided by the principles for the organisation and functioning of the system. The key principles for the organisation and functioning of the rescue system include territorial, differentiation, compulsiveness, transparency, constant readiness and interoperability.¹⁵¹⁵ The territorial principle refers to national scale organisation of the civil protection, embracing the entire population as well as foreign nationals located in the territory of Lithuania. The differentiation principle that the civil protection measures and preparedness for rescue operations will be performed in individual administrative units taking into account the level, scope of danger of the emergency anticipated within the territories of the state. By compulsiveness it is meant that civil protection measures are obligatory to all institutions of public administration and local government, all economic entities and residents. The transparency principle refers to the activities of public administration and local government institutions in the sphere of civil protection that need to be transparent to the public and the mass media. The institutions and forces of civil protection and rescue system must be in constant readiness to act in emergency conditions. The interoperability principle covers the effectiveness of civil protection measures and actions in emergency situations, which has to be ensured by coordinating the interoperability plans and management system of the public administration and local government institutions, civil protection and rescue system forces, the Lithuanian Armed Forces, medical institutions and other services.

Civil protection and rescue system institutions are guided by the Constitution of Lithuania, laws and other legal acts enacted by the Parliament, decrees of the President of the Republic, Government resolutions, Prime Minister's ordinances, orders of the National Defence Minister and international treaties to which the Republic of Lithuania is a party.¹⁵¹⁶

Other Lithuanian Government resolutions in the crisis management domain include:

- Resolution No. 551, dated 8 November 2000;
- Resolution No. 1386 regarding dangerous objects of national significance, dated 2010;
- Resolution No. 512, dated 4 May 2010;
- Resolution No. 555, dated 4 May 2004;
- Resolution No. 966 regarding the prevention, elimination and investigation approval of the regulations, dated 2010;
- Resolution No. 1108 on the procedure of Lithuanian Republic's civil protection system readiness levels, dated 2010;
- Resolution No. 1212 on the procedure of the organization of rescue, search and emergency work, events, disaster and emergency liquidation and elimination of their consequences, dated 2010;
- Resolution No. 1213 on the formation and organization of emergency operations centers;
- Resolution No. 1502 on procedure for population evacuation, dated 2010;
- Resolution No.1503 regarding the State Emergency Management Plan 2010.¹⁵¹⁷

2.3 Emergency rule

Declaring an emergency is a responsibility of the Government. In addition to that, the Government is also in charge of terminating a national level of emergency, establishing the procedure for organizing rescue, search operations and urgent actions and responding to emergencies and mitigating their

¹⁵¹⁵ Ibid., Chapter I, art. 6

¹⁵¹⁶ Civil Protection Law, Chapter I, art. 7

¹⁵¹⁷ <http://www.vpgt.lt/index.php?-1747337895>, last accessed 29.10.2014

consequences. The government is in charge of evacuation measures, as well as providing shelters and other collective protection mechanisms in Lithuania.¹⁵¹⁸ The Lithuanian defence forces and volunteers can provide assistance in crisis situation when required.¹⁵¹⁹

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

The key duties and functions of the public administration and local government institutions as well as economic entities in the sphere of civil protection are as follows.

The Government is responsible for drawing up civil protection and rescue system development programmes and submitting them to the Parliament for approval; for developing the procedure for implementing civil protection and rescue system priority development trends; for establishing the emergency prevention procedure; approving the levels of civil protection preparedness, emergency criteria; approving national level plans of civil protection emergency preparedness; establishing the procedure for using the material resources in case of an emergency as well as the composition of state reserve technical means, food, clothing, the size of the reserve, etc.; preparing the civil protection training procedure; notifying the President and the Parliament about emergencies, their consequences and causes, and in support of the declaration of an emergency situation.¹⁵²⁰

The Ministry of National Defence in peacetime has to implement, in cooperation with other institutions, the Government's policy in the area of civil protection, to coordinate the activities of civil protection and rescue system institutions in accomplishing the tasks assigned to their competence.

In addition, the Ministry of National Defence has the responsibility for specifying the procedure for notifying the Emergency Management Centre of emergencies; approving the needs for shelters and other collective protection structures, the norms and procedure of provision of the population with individual means of protection; approving the plans of the national level civil protection exercise and the annual plan for the enrolment of students in the civil protection training centre; approving the annual plan of activities of its Civil Protection Department; and presenting to the Government generalised information on the state of the civil protection and rescue system.¹⁵²¹

The Civil Protection Department under the Ministry of the Interior is an essential part of the civil protection and rescue system, directing the activities of the civil protection and rescue system, organising the prevention of emergencies, coordinating the activities of public institutions and economic entities in the sphere of civil protection and planning the national preparedness for the implementation of civil protection tasks in case of emergencies in time of peace and in wartime.¹⁵²²

The tasks assigned to the Civil Protection Department include informing state institutions, economic entities and the population of a national-scale threat in case of an emergency; planning of measures to ensure the optimum use of state resources, localisation of emergency area and for mitigation of the effects of the crisis; compiling the register of objects of national significance which are potentially hazardous; controlling the activities of the civil protection and rescue system; organising the preparedness of public administration institutions and the community for actions in case of an emergency; and organising and directing the national level civil protection exercise.

¹⁵¹⁸ ANVIL Project Country Study: Lithuania, pp.13-14.

¹⁵¹⁹ Ibid., p.29.

¹⁵²⁰ Civil Protection Law, Chapter II, art. 8.

¹⁵²¹ Ibid., art. 9.

¹⁵²² Ibid., art. 10.

The State Fire Prevention and Rescue Service is part of the Civil Protection and Rescue System maintaining constant readiness and commands for the extinguishing fires, search and rescue as well as providing first aid in emergencies. The State Fire Prevention and Rescue Service is subordinate to the Fire Prevention and Rescue Department under the Ministry of the Interior.

The State Fire Prevention and Rescue Service carries out state supervision of fire prevention and its tasks include fire prevention and guaranteeing of the availability of technical and organisational measures for extinguishing fires. The work of state fire prevention supervision is organised in compliance with the regulations approved by the Government.

The activities of ministries and other institutions in the civil protection domain are directed by their chief executives or persons authorised by the chief executives. The most important tasks of ministries and other authorities include: organisation of civil protection according to the type of activity and competence assigned to them; approval of regulations of the emergency management centre of ministry or other institution of state administration, as well as plans of emergency preparedness upon coordination with the Civil Protection Department; building of departmental reserves of supplies and funds in order to increase the stability of functioning and security under emergency conditions; organisation of training in civil protection for the chief executives and experts; drawing up plans of emergency preparedness of civil protection; coordination of the planning of civil protection measures; and conducting a yearly analysis of the state of emergency preparedness of civil protection and submitting it to the Civil Protection Department.¹⁵²³

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

The County Governor is the lead authority in civil protection of the county. His/hers responsibilities are defined by the Civil Protection Law and include:

- to be responsible for civil protection preparedness in the county;
- to organise the drawing up of plans of emergency preparedness of civil protection in the county;
- to warn the public and local authorities, economic entities, the population of the imminent emergency;
- to obtain from all district municipalities information necessary for the implementation of civil protection tasks;
- in the event of emergencies to organise and implement preventive measures of civil protection within the territory of the administrative unit;
- to notify the Civil Protection Department of the emergencies which have occurred;
- to make arrangements to mitigate the emergency effects, organise supply of search and rescue operations;
- to control the preparedness of executive bodies of municipalities to avoid the likely consequences of emergencies or to mitigate the effects thereof;
- to request support from the Government for aid in case when available resources and forces prove to be insufficient;

¹⁵²³

Civil Protection Law, Chapter II, art.12.

- to perform a yearly analysis of the state of emergency preparedness of civil protection and submitting it to the Civil Protection Department.¹⁵²⁴

The Mayor of a district or city has the following responsibility for crisis management:

- to be responsible for the preparedness of civil protection within the territory of the municipality;
- to organise development of a plan of preparedness of civil protection in the event of emergencies; warn public authorities, economic entities, and the population about the scope and possible effect of the emergency;
- prescribe tasks and functions of civil protection for administrative units of the municipality, approve plans of civil protection emergency preparedness; to organise training of civil protection forces.

Further, the Mayor has to implement preventive measures for civil protection, rescue and other urgent tasks, mitigate the effects of emergencies, evacuate the population and to organise civil protection training of the population; to collect information from all the economic entities within the territory of the municipality necessary for carrying out the tasks of civil protection; to notify the district governor about emergencies within the municipality territory; to mobilise all civil protection forces within the municipality for mitigation of the emergency; to analyse the state of civil protection and submit an annual report about it to the county governor in the manner prescribed by him.

The Civil Protection Law also sets out the obligations of the Manager of an Economic Entity or an Institution in emergency situations. The manager of an economic entity or an institution has the responsibility to ensure the civil protection preparedness at the entity he is in charge of; to warn and inform the personnel about the imminent danger; project emergencies and plan preventive measures; develop plans of civil protection emergency preparedness; and to provide the personnel with individual and collective protection equipment; organise evacuation of the employees, first-response rescue operations and be in charge of them.

Public organisations may be called to take part in organising state civil protection measures for elimination of the consequences of emergencies and to provide assistance to victims in cooperation with the municipal civil protection service units.¹⁵²⁵

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

The Lithuanian civil security system involves non-profit relief organisations across national, county and municipal levels and fields of civil security. However, their role is more visible and documented in relation to response operations than in the field of prevention and preparedness.

The Civil Protection Law regulates the role of non-profit organisations in prevention, preparedness, response and mitigation of emergencies. The municipalities reach agreements with NGOs, for example the Lithuanian Red Cross, for emergency mitigation activities.¹⁵²⁶

The Lithuanian civil security system consists of a single fire and rescue forces: the State Fire and Rescue Service, local fire departments, departmental forces and voluntary fire formations. The Fire

¹⁵²⁴ Civil Protection Law, Chapter II, art.13.

¹⁵²⁵ Ibid, Chapter II, art.17.

¹⁵²⁶ ANVIL Project Country Study: Lithuania, p.27.

Safety Act defines the participation of Lithuanian residents in fire safety, as well as the creation and consolidation of the voluntary fire formations.¹⁵²⁷

2.7 Legal regulations for international engagements of first responders and crisis managers

Decisions on the participation of elements of the Lithuanian military forces in international military operations shall be taken by the President of the Republic and the Parliament in accordance with the procedure are laid down in the Constitution and the laws.¹⁵²⁸

The Law on International Operations, Military Exercises and other Events, adopted in July 2000, defines the participation of Lithuanian Army units in international exercises, and other international military co-operation events and also, in international operations abroad as well as participation of foreign states military units in international exercises and other international military co-operation events conducted on the territory of Lithuania.

The Law defines the participation of Lithuanian Army units in international rescue and humanitarian operations. The President takes the decision on the use of Lithuanian army units in international rescue and humanitarian operations and has to submit such a decision for approval to the nearest sitting of the Parliament.

Internationally the Lithuanian Government has implemented Council Decision 2007/779/EC, EURATOM on the establishing of Community Civil Protection Mechanism.¹⁵²⁹

Lithuania has entered into bilateral and multilateral agreements with the Baltic and Nordic countries with which it shares land and maritime borders and are close to the strategic and operational sphere of the Lithuanian civil security system. Lithuania, Estonia and Latvia signed bilateral agreements since 1992. In 1993 Lithuania signed an agreement with the Swedish Rescue Services Agency.

In 1998, similar agreements were signed with Finland, Denmark and Ukraine. In 2000, the Lithuanian fire and rescue service signed an agreement with the fire service of Hamburg Meckelburg-West Pomerania. This was an interregional agreement. In 2002, agreement was made with the Emergency Ministry (EMERCOM) of Russia. Further and additional bilateral agreements have been made with Belarus (2003), Poland (2003), Sweden (2003), Hungary (2001), Latvia (2001), Ukraine (2003) and Germany (1994). Also agreements with Czech Republic (2004), Georgia (2008) and Azerbaijan (2010) have been signed. There is also a separate agreement with the Pennsylvania Emergency Management Agency (2007).

¹⁵²⁷ <http://www.vpgt.lt/go.php/lit/Bendra-informacija/1121> (30 October 2014).

3 Organisation

3.1 Organisational chart

The main tasks of the Civil Protection and Rescue System in Lithuania, depending on the causes, the type and threat of the emergencies, encompass:

- warning the population of the emergency, the possible effects and the necessary measures to mitigate these effects;
- undertaking emergency prevention;
- organising the supply of the population with collective protection equipment;
- carrying out reconnaissance and mapping of the hazard area, rescue and other urgent operations;
- providing medical aid and carrying out public healthcare in case of emergencies;
- evacuating the people and property from risk territories;
- organising the restoration of disrupted critical infrastructure and services;
- creating stockpiles with essential supplies;
- making arrangements for the training for emergencies of chief officers, personnel, civil protection and rescue system forces and the population;
- investigating and analysing the causes of emergencies.

To perform these tasks, the Civil Protection and Rescue System of Lithuania is comprised of:

- Government Emergency Commission;
- the Emergency Management Centre;
- Civil Protection Department under the Ministry of National Defence;
- State Fire Prevention and Rescue Service;
- Fire protection, search and rescue;
- other territorial population warning and information, evacuation and civil protection services of ministries;
- other institutions of public administration and local government municipalities;
- civil protection and rescue system bodies of economic entities;
- environment monitoring and laboratory control network.¹⁵³⁰

As shown in Figure 2 below, the civil protection system of Lithuania is managed and organised at three levels: national, county and municipal.

At national level, the key actors are the Government, the Government Emergency Commission, the Ministry of the Interior, the Fire and Rescue Department under the Ministry of the Interior and the subordinated agencies, ministries and other state institutions make strategic decisions regarding the implementation of civil protection measures.

At county level, the system is organised by county governors, county civil protection departments and county emergency management centres.

At municipal level, municipal administrators, civil protection departments, civil protection personnel, municipal emergency management centres, fire prevention and other civil protection services, eco-

¹⁵³⁰ Civil Protection Law, Chapter I, art. 3.

conomic entities and agencies are responsible for the organisation of preparedness for emergencies and the response to such events.

Departmental emergency management centres are to be established at the ministries and other public administration institutions. Emergency management centres are to be formed under the office of the county governor and the district (city) mayor. Permanent civil protection staff has to be employed at all potentially hazardous facilities.¹⁵³¹

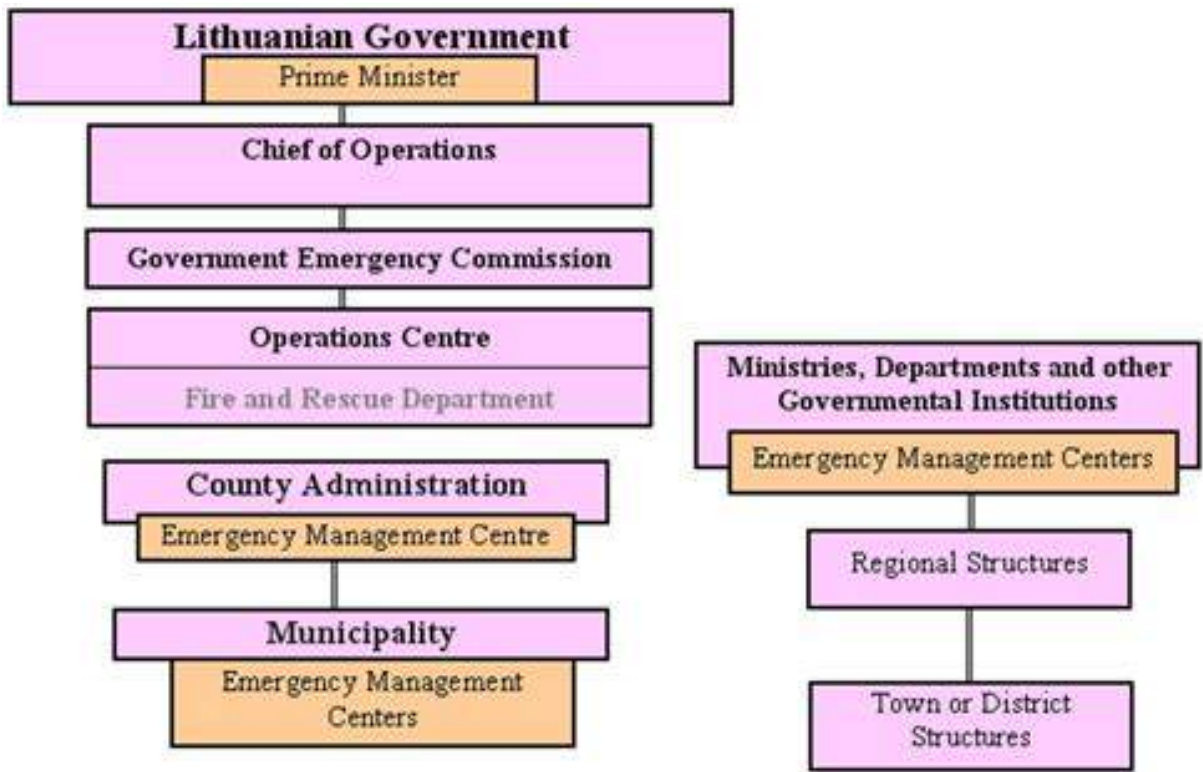

Figure 29: Organisational chart of the Lithuanian crisis management structure

Figure 2: Example of the Lithuanian online public procurement portal. 1063

1532

The Government Emergency Commission is a permanent Government commission responsible for organising emergency prevention and direct emergency relief actions in cases where an emergency encompasses the territory of one or more counties or where there is a need for assistance from public administration bodies for rallying without delay forces and material resources necessary for mitigation of the effects of an emergency. The composition of the Emergency Commission and its regulations are approved by the Government.

The Emergency Management Centre is established to function as a permanent organisation of the Emergency Commission and has the function of a Government institution. In the event of large-scale natural disasters, technological accidents and catastrophes, the Centre is responsible for organising

¹⁵³¹ Civil Protection Law, Chapter IV, art. 20-22.

¹⁵³² Country profile: Lithuania, Vademecum - Civil Protection. DG ECHO.

disaster containment, rescue of people and mitigation of the effects. If there is a need to assist the civil protection forces engaged in rescue operations, the Centre is able to mobilise services and equipment under the control of other state institutions.

In the event of emergencies the Emergency Management Centre has to adopt and submit to the ministries, other public administration institutions, local authorities and the population mandatory decisions on localisation and mitigation of the effects of an emergency.¹⁵³³

The tasks of the Emergency Management Centre include:

- performing monitoring of risk factors and threats;
- forecasting possible crises;
- coordinating activities of state institutions and entities within the crisis prevention area;
- ensuring the operation of crisis management infrastructure and constant exchange of information on crisis management between institutions;
- developing international cooperation within the field of crisis management.¹⁵³⁴

Further, the Centre, while implementing the tasks assigned to it, collects and analyses information received from the national authorities, mass communication and news agencies regarding threats and ensures the protection of information representing a state or official secret. The Centre carries out a comprehensive analysis of information received in the area of crisis management, forecasting possible crisis situations and the scope of such situations; prepares for the President, the Parliament, the Government and the Council of National Defence overviews of the most important developments, special communications and draft recommendations regarding crisis prevention.

Moreover the Centre acts as a contact point for the national authorities and international organisations that is available 24 hours a day.¹⁵³⁵

¹⁵³⁴ White Paper 2002, Lithuanian Defence Policy, pp.9-10.

¹⁵³⁵ Resolution No. 939, Regulations of the Crisis Management Centre under the Ministry of National Defence, Chapter II, art. 5.

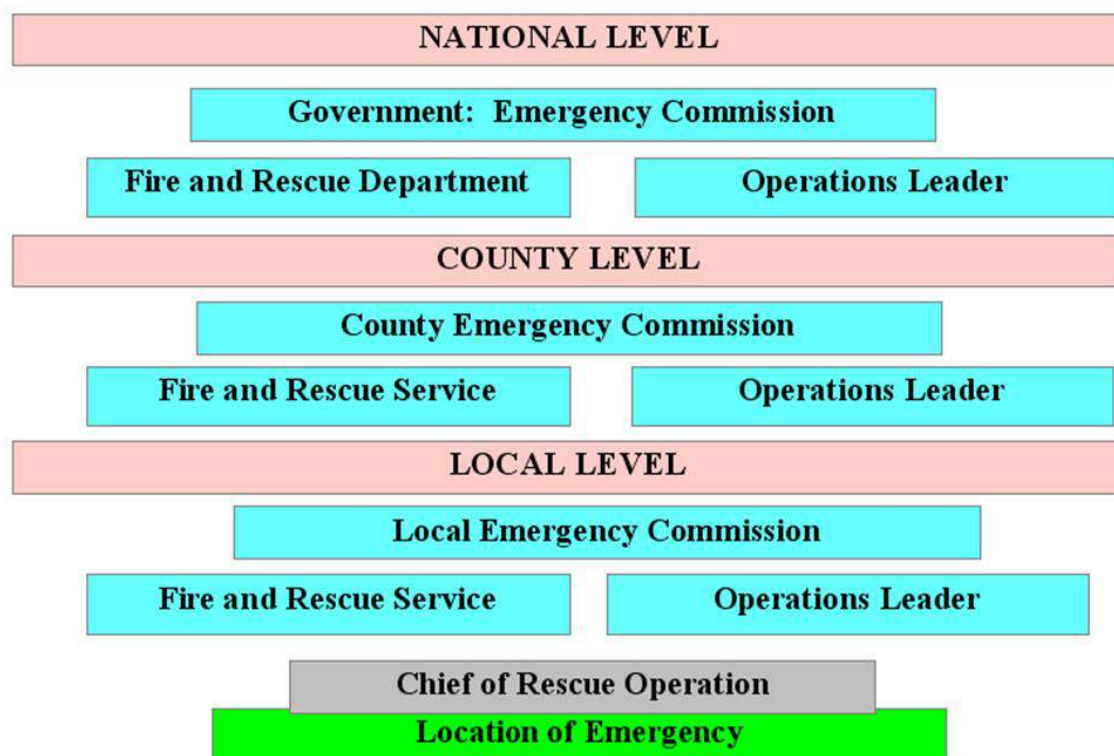

Figure 30: Lines of coordination of the Lithuanian crisis management system. (Source EC ECHO)

In addition, the Emergency Management Centre, obtains from national authorities detailed information necessary for prevention and management of crises and access to databases and registers in order to obtain the necessary information on possible threats.¹⁵³⁶

The Lithuanian civil security operators such as fire brigades and rescue teams are accountable to mayors and county commissioners, which hold the central responsibility for operational crisis management and head the crisis information exchange between state and local levels.¹⁵³⁷

The Fire and Rescue Department is an essential institution of the Lithuanian civil security system in directing the activities of the civil protection system and coordinating the overall national organization of emergency prevention. The Fire and Rescue Department also play key role in organising civil protection training, coordinating the evacuation of citizens and to mobilization inter-agency resources.¹⁵³⁸

Moreover, the Fire and Rescue Department coordinates the organisation of national civil protection exercises, informs neighbouring states of imminent emergencies, establishes national emergency operations centre and manages the civil protection supplies of the state reserve. In addition to these tasks, the Department drafts the national emergency management plan and leads the activities of the civil protection and rescue system. It is responsible for organising disaster prevention, coordinating the civil protection activities of public institutions and economic entities and ensuring preparedness to implement the planned civil protection measures in emergency situations during peacetime and war.¹⁵³⁹

¹⁵³⁸ Ibid., pp.14-15.

¹⁵³⁹ ANVIL Project Country Study: Lithuania, p.15.

The State Fire and Rescue Service of the Republic of Lithuania consists of the following entities: the Fire and Rescue Department under the Ministry of the Interior and its 17 subordinate services. These services are divided into 10 county Fire and Rescue Boards, 3 Fire and Rescue Services for the protection of critical infrastructure, the Specialised Fire and Rescue Service, the Fire-fighters Training School, the Fire Research Centre and the Emergency Response Centre.

The Fire and Rescue Department under the Ministry of the Interior is responsible for the protection of people, property and environment in case of emergencies. In addition, it is in charge of fire and emergency prevention. The Fire and Rescue Department is an independent body of the Ministry of the Interior. The main tasks of the institution include:

- Determining national policy regarding fire and civil protection of the country;
- Developing strategies for its subordinate services;
- Drafting fire and civil protection legislation for implementation;
- Performing state fire supervision;
- The Department is in charge of prevention and management of emergencies;
- Providing counseling to the public institutions and businesses in the field of civil protection;
- Coordinating fire and civil protection training;
- Recording fire and rescue statistics;
- Encouraging NGO's and volunteer organizations in the field of fire prevention.¹⁵⁴⁰

Furthermore, Counties Fire and Rescue Boards (CFRBs) are established to operate counties' located centres. The CFRB's and their subordinate fire and rescue services in districts and cities are responsible for a variety of rescue operations such as extinguish fires, rescue operations, response to industrial and traffic accidents, chemical and other emergencies as well as rescue people from water incidents. In addition the Boards provide aid to other special services when required.¹⁵⁴¹

*Moreover, there is a separate Search and Rescue Service, subordinated to the Ministry of Transport and Communications. It is comprised of the Maritime Search and Rescue Co-ordination Centre and the Aeronautic Search and Rescue Co-ordination Centre and other specialized divisions. The aim of the service is to provide a search and rescue capability for aircraft and ships in danger or experiencing other unforeseen calamities in, around or above the territory of Lithuania, in accordance with international agreements.*¹⁵⁴²

The Lithuanian Red Cross Society (LRCS), founded in 1919, is the biggest NGO in the crisis management domain in Lithuania.¹⁵⁴³ It is a part of the International Red Cross and Red Crescent Federation, with its headquarters in Geneva. LRCS is entitled to prevent suffering of human beings and provide assistance to people in need. Lithuanian Red Cross Society unites more than 2825 members, and 821 of them are the members of the Youth LRCS and number around 1200 volunteers.¹⁵⁴⁴

¹⁵⁴⁴ <http://www.redcross.lt/en/about-us/history> (30 October 2014).

3.2 Organisational cooperation

International cooperation in Lithuania in the field of crisis management is coordinated by the Fire and Rescue Department in cooperation with the disaster response monitoring and coordination centres of the United Nations. The Department represents Lithuania in the Civil Protection Work Group of the EU Council, EU DG ECHO meetings, EC SEVESO II and is a member of the European Union Fire Safety Network. Lithuania is also an active member in NATO Civil Emergency Planning Committee's work.

Individual ministries and other state civil security institutions participate in international civil protection activities. International assistance in civil protection and civil security is provided by an international emergency response team, experts and/or by providing assistance supplies. An international emergency response team is formed by the minister of the Interior and the procedures for requesting, accepting and providing international civil protection assistance are established by the government.

Furthermore, an agreement has been signed with Poland and Norway in 1995, regarding early notification in case of nuclear accident and cooperation in the field of nuclear safety and radiological protection, as well as an agreement on information exchange and cooperation in the nuclear safety and radiological protection domain with Denmark (1993).

Lithuania has been active participating and providing international assistance in various international crisis situations, which include the 1998 floods in Poland, 2005 floods in Georgia, the major earthquake in Pakistan in 2005, forest fires in Macedonia in 2007, oil spill in the Daugava River in Latvia (2007), the 2008 floods in Ukraine, Moldova and Romania, the armed conflict in Georgia (2008), forest fires in Russia (2010), floods in Pakistan (2010), floods in Poland (2010) and floods in Moldova in 2010. Lithuania has not officially requested disaster assistance through any international or regional arrangements.¹⁵⁴⁵

The Fire and Rescue Department has been actively participating in various European Union activities, adopting the legal acts of the EU in the field of civil protection. The Fire and Rescue Department represents Lithuania's interests in the Civil Protection Working Group of the Council of the European Union and in the Civil Protection Committee and the Committee for the Implementation of the Directive on the Control of Major Accidental Hazards Involving Dangerous Substances (SEVESO II). Since 2004, the Fire and Rescue Department is a member of the European Union Fire Safety Network.

The Fire and Rescue Department also takes part in the activities of the NATO Civil Emergency Planning Committee, as well as coordinates the activities of other state institutions in planning boards and committees. It is also responsible for the implementation of the UN Convention on the Transboundary Effects of Industrial Accidents.

The Civil Protection Board Situation Coordination Unit of the Fire and Rescue Department liaises with the NATO's Euro-Atlantic Disaster Response Coordination Centre and informs it about Lithuania's capabilities to provide assistance.¹⁵⁴⁶

Moreover, Lithuania participates in the BaltFloodCombat initiative. It is a cross-border cooperation project between Estonia, Latvia and Lithuania where the three Baltic States are represented respectively by the Estonian Rescue Board, Latvian Fire and Rescue Service and Lithuanian Fire and Rescue

¹⁵⁴⁵ Ibid., pp.21-22.

¹⁵⁴⁶ <http://www.vpgt.lt/go.php/lit/NATO-civilinio-pasirengimo-ekstremaliosioms-situacijoms-planavimas/742> (28 October 2014).

Department under the Ministry of the Interior. The project is within the framework of Preparatory Action of the Civil Protection Mechanism and is funded by the European Commission. The European Commission finances 80 % of the project while the remaining funding comes from the national budgets. The aim of the project is to create reliable and efficient national flood response capacity, and also to establish and register in CECIS a multinational High Capacity Pumping module, consisting of commonly trained personnel and up-to-date equipment. Main objectives of the project include enhancing national flood response capability; strengthening European rapid response capacity, and also to discover, through innovative approach, possibilities and ways of multilateral civil protection capacity building.¹⁵⁴⁷

¹⁵⁴⁷

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

The Civil Protection Law defines the procedures to be taken in cases of emergency. The Law sets out that fire fighting search and rescue activities in case of disaster are organised by the commander of rescue operations in charge of the civil protection actions at an initial emergency stage. In urgent situations for mitigating the effects of emergencies, fire protection and rescue unit officers have to perform the functions of the commander of rescue operations without a special order.¹⁵⁴⁸

All civil protection and rescue system forces, irrespective of their subordination, when arrive at the disaster scene become subordinate to the commander of rescue operations. No official has the right to interfere in the activities of the commander of rescue operations or cancel his orders and instructions to the forces of the civil protection and rescue system.

The police coordinate their actions with the commander of rescue operations or the officer performing his functions. The first aid service manages first aid on the scene of the disaster, notifying the nearest individual health care institutions about the victims and ensuring their transport. All individual health care institutions must be prepared to organise the work of the institutions in an emergency in accordance with a plan prepared in advance and co-ordinated with the municipality. Such plan is developed according to the recommendations of the Ministry of Health.¹⁵⁴⁹

The Lithuanian Armed Forces may be employed in disaster operations by the responsible for the crisis operation officers in accordance with the plans drawn up in advance on the interaction with chiefs of military districts.¹⁵⁵⁰

The National Emergency Management Plan defines the procedures for warning and informing the public, for rescue operations and coordination and for organising crisis communication, as well as the procedures for evacuation.¹⁵⁵¹

The procedure for the evacuation of the population shall be established by the Government. Taking into account the magnitude of an emergency and the threat for the population, county governors, mayors of districts/cities and managers of economic entities have to take decisions for the evacuation of the population; in individual cases, decisions evacuation of the population from the disaster area has to be made by the State Fire Prevention and Rescue Service, fire prevention services of district (city) municipalities and police officers. The population shall be evacuated in accordance with the territorial principle.¹⁵⁵²

Evacuation of the population shall be organised by evacuation commissions, formed at the district (city) emergency management centres and has to be directed by people appointed by mayor of a district (city) municipality. The expenses of the evacuation of the population and their accommodation will be compensated from the state budget in the manner prescribed by the Government.¹⁵⁵³

¹⁵⁴⁸ Civil Protection Law, Chapter V, art. 30-32.

¹⁵⁴⁹ Civil Protection Law, Chapter V, art. 30-32.

¹⁵⁵⁰ Civil Protection Law, Chapter V, art. 30-32.

¹⁵⁵² Civil Protection Law, Chapter V, art. 30-32.

¹⁵⁵³ Civil Protection Law, Chapter V, art. 30-32.

Furthermore, procedures for prevention of nuclear accidents, their containment and mitigation of their effects are defined in the Law on Nuclear Energy.

4.2 Operations planning

The main operational bodies of the civil security system in Lithuania are the Emergency Commissions, which are technically assisted by the State Fire and Rescue Service. The emergency commissions can be formed on two levels: municipal, chaired by the director of the municipal administration and government, chaired by the minister of Interior.¹⁵⁵⁴

The role of the Fire and Rescue Department is to implement the civil protection measures developed by the government and to coordinate the activities of governmental institutions and economic entities. In addition, the Department prepares civil protection plans for the management of emergencies, major accidents or natural disasters in both peacetime and wartime, as well as organises the training and education of emergency officers.¹⁵⁵⁵

In addition, the Plan is a document that defines the material and human resources of the civil protection entities in event of municipal or state level emergencies, as well as the procedures for mobilisation of human resources and for the organization of liquidation, elimination for the consequences thereof.

Disaster contingency plans of state level include:

- Plan of the Republic of Lithuania on population protection in case of a radiological accident at Ignalina Nuclear Power Plant,
- State search and rescue plan in case of an aircraft or watercraft accident in the territory of the Republic of Lithuania,
- National sea accidents pollution liquidation plan,
- State rescue and flood consequences liquidation in Klaipeda county plan.¹⁵⁵⁶

4.3 Logistics support in crises

An agreement signed between the United States Secretary Of Defense and the Republic of Lithuania Minister of National Defense concerning Mutual Logistic Support. The provisions of this agreement foresee that the parties will respond to the requests of the other party for logistic support, supplies, and services not only in peacetime, but also in periods of crisis, contingency operations or, war.¹⁵⁵⁷

Additional information is not found in policy or other official documents related to logistics support in crises.

¹⁵⁵⁴ ANVIL Project Country Study: Lithuania, p.17.

¹⁵⁵⁷ Implementing Arrangement (Ec-Lh-01) Between the United States Secretary of Defense and the Republic of Lithuania Minister of National Defense Concerning Mutual Logistic Support.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

The Minister of the Interior approves the national civil protection exercises and is in charge of information exchange on an incident or emergency event¹⁵⁵⁸ (Figure 4).

The National Emergency Management Plan states the procedures for warning and informing the public, for rescue operations and coordination, organisation of communication, the provisions of material resources and their use, as well as the procedures for evacuation.¹⁵⁵⁹

The Fire and Rescue Department is an essential institution of the Lithuanian civil security system in directing the activities of the civil protection system and for coordinating the overall national organization of emergency prevention. The Fire and Rescue Department also has the main responsibility of early warning and public information in case of an emergency.

The director of the Department is responsible for maintaining the comprehensive early warning system and civil protection signals of citizens, state and municipal institutions and economic entities in case of an emergency.

Furthermore, the Director approves civil protection recommendations, regulations of municipal Emergency Commissions, regulations of the national emergency operations centre and the recommendations for emergency management plans.¹⁵⁶⁰

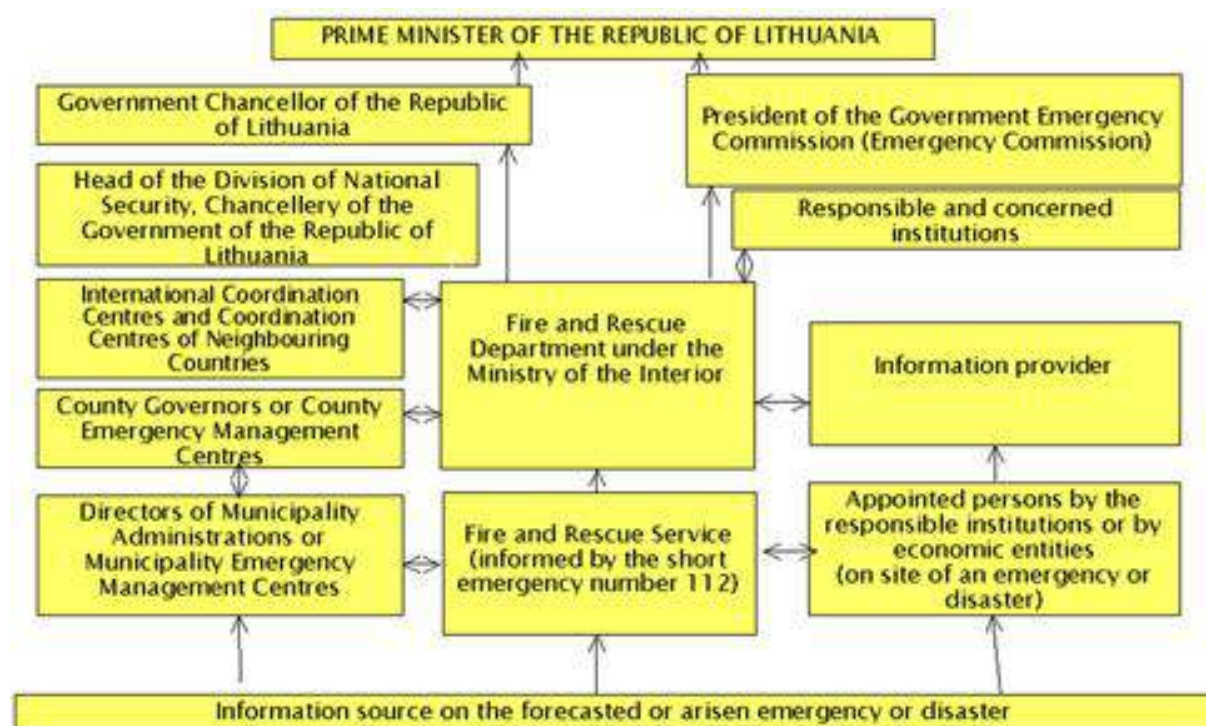

Figure 31: Lines of communication of the Lithuanian crisis management structure. (Source EC ECHO)

Lithuania has early warning systems for flooding, for an accident in case of an emergency at the Ignalina Nuclear Power Plant, for radiological pollution and others. In Lithuania there is a complex early

¹⁵⁵⁸ National Emergency Management Plan of Lithuania, Chapter I, Chapter II, Chapter III.

¹⁵⁶⁰ ANVIL Project Country Study: Lithuania, p.15.

warning system for radiological risks which uses a surveillance tool for gamma monitoring of the environment and the central monitoring server. The system is constantly operational and is fully automatic. In case the radiation reaches threshold levels, the system will automatically report to the main server at the Joint Research Centre. In addition, there are 392 measuring points manually operated at the Fire brigades.

5 Capabilities

5.1 Human resources

The State Fire and Rescue Service, as the main operational authority in crisis management, consists of the Fire and Rescue Department under the Ministry of the Interior and 17 subordinate units: 10 county Fire and Rescue Boards, 3 Fire and Rescue Services for the protection of critical infrastructure, the Specialised Fire and Rescue Service, the Fire-fighters Training School, the Fire Research Centre and the Emergency Response Centre. Altogether, the State Fire and Rescue Service employs almost 5,000 people.¹⁵⁶¹

Educational activities are mainly organised by the State Fire and Rescue Service. The Fire-fighters Training School is the main stakeholder in Lithuanian civil security education. It comprises administrative and theoretical training divisions, divers training division, civil protection training centre and practical training division. The Fire Research Centre represents the main entity in terms of CBRN education in Lithuania.

Besides the educational activities, the centre performs fire tests, technical fire exercises, fire investigations, attestations of fire equipment and construction products and takes part in the standardization processes, as well as develops various methodological documents.

However, civil security training is mainly conducted by the public institutions in Lithuania. They also establish the procedures for organizing civil protection exercises, which are implemented by the relevant responsible authorities, such as the Ministry of Interior and the Ministry of Defence.

5.2 Materiel (non-financial) resources

The State Fire and Rescue Service operates 455 vehicles - 236 fire-fighting tankers, 168 with special purpose, 202 are light operational, and 115 other types of vehicles. The State Fire and Rescue Service maintains and uses 123 building complexes.¹⁵⁶²

Lithuania plans to develop air and maritime search and rescue capabilities, using potential financing for the acquisition of helicopters and other necessary equipment from EU funds and programmes.¹⁵⁶³

The participation of the Lithuanian Armed Forces in emergency situations could be requested in case of national threat. Two helicopters and a ship are on a constant duty for search and rescue missions in the territory of Lithuania.¹⁵⁶⁴

The Fire and Rescue Department manages the public warning and information system P-160, which cover the whole country, for warning and informing the public about the risks of emergencies. It also collects and stores data in a central registry database of dangerous objects, which collects information about possible threats to the state. The Department coordinates the level of response of the

¹⁵⁶² <http://www.vpgt.lt/index.php?393254094>, last accessed 30.10.2014

¹⁵⁶³ Guidelines of the Minister of National Defence for 2014–2019, Chapter II, art. 13.5

¹⁵⁶⁴ Guidelines of the Minister of National Defence for 2014–2019, Chapter II, art. 12

county fire and rescue board with the average response time of 6-10 minutes in cities, and 14-20 minutes in rural areas.¹⁵⁶⁵

In emergency or urgent cases, the rescue manager or operations manager determines how much and what material resources are needed for emergency response, search and rescue works and for elimination of the consequences caused by the crisis situation and requests to the Director of Municipal Administration to provide them.¹⁵⁶⁶ Government resolution 1107, dated 21 July 2010, provides the definition for the use and compensation of material resources in case of emergency, search and rescue work.

The Fire and Rescue Department manages the state stockpile of the civil protection resources and in this way makes it possible for the state and municipal institutions, businesses and population to become prepared for emergencies, to maintain the sustainability of the national economy, and to protect property and environment against disasters.¹⁵⁶⁷

In case of threat the Civil Protection Department sends signals, information and recommendations to population via the “Signal” automatic warning system, which is equipped with centrally operated sirens, radio and loudspeakers, national TV and radio. The State Public Warning and Information System operates 706 centrally sirens, which cover around 2 million people. Most of these sirens are located in Ignalina and Zarasai regions. In addition the warning system has 564 local operational warning sirens.

The local operated sirens are located mostly in rural areas. In the territories not covered by the sirens special equipped vehicles are intended to be used. The police, firemen or other civil protection forces are foreseen to perform such warning and their routes are included in the plans in advance.

5.3 Training

In Lithuania, the Minister of the Interior approves the national civil protection exercises.

Training in the basics of civil protection is organised by general secondary schools and college education institutions through programmes developed by the Civil Protection Department and approved by the Ministry of Education and Science. Students are trained in higher educational institutions according to civil protection training programmes approved by the heads of higher educational institutions. The training in civil protection basics of economic entities and institutions is given in accordance with civil protection training programmes approved by the Civil Protection Department. The training of officials of emergency management centres of economic entities, the State Fire Prevention and Rescue Service and other civil protection personnel is carried in accordance with civil protection training programmes developed by the Civil Protection Department.

The Civil Protection Training Centre is the principal educational authority for civil protection and rescue activities. The Training Centre is established and its regulations are approved by the Minister of National Defence.

For testing the preparedness of the public administration institutions, local government and economic entities in emergencies and for the improvement of their civil protection management skills,

¹⁵⁶⁵ <http://www.vpgt.lt/index.php?393254094> (30 October 2014).

¹⁵⁶⁶ <http://www.vpgt.lt/go.php/lit/Materialiniu-istekliu-teikimas/724> (30 October 2014).

¹⁵⁶⁷ <http://www.vpgt.lt/index.php?400236387> (29 October 2014).

exercises and training are financed from the state budget and conducted according to the regulations set out by the Government.¹⁵⁶⁸

Universities and other public institutions provide courses and vocational training in the field of civil security and their curriculum and include courses such as natural disaster reduction and roots and causes of violent extremism.

Moreover, educational programmes related to disaster response and risk reduction are taught in the public school system for 11-18 year juveniles, in vocational schools and colleges. In addition, civil protection teachers attend trainings and seminars on civil protection. There are various training programmes available depending on the type of audience. The Government of approves the programmes as well as their duration.

5.4 Procurement

5.4.1 Procurement regulation

The purchases of the Fire Rescue Department are made in accordance with the Law on Public Procurement.¹⁵⁶⁹ The Law and implementation norms follow respective directives of the European Union, such as Directive 2014/24/EU, Directive 2014/25/EU, Directive 2009/81/EC, and Directive 2004/18/EC.

Further, Lithuania aims at developing air and maritime search and rescue capabilities using the possibility to finance the acquisition of helicopters and other equipment necessary for this function from EU funds.¹⁵⁷⁰

In Figure 5 an example of the Fire and Rescue Department contact announcement is shown. Further information on specific procurement procedures within the crisis management domain could not be obtained within the given timeframe.

5.4.2 Procurement procedures

Information on specific procurement procedures within the crisis management domain could not be obtained within the given timeframe.

5.5 Niche capabilities

Potential niche capability that could be filled by Lithuania and be potentially interesting for the EU crisis management structures could be providing expertise in the energy security domain. In the future energy security will increase in importance for crisis management.

An example of development of such research capability is the NATO Energy Security Centre of Excellence (ENSEC COE) was established in 2012 and currently operates as a widely recognised international military organization with the aim of providing qualified and appropriate expert advice on questions related to operational energy security.

The ENSEC COE assists the Strategic Commands and other NATO bodies, nations, partners, and other civil and military bodies by providing expertise on all aspects of energy security in support of NATO's capability development process, mission effectiveness, and interoperability.¹⁵⁷³

Similar centres or agencies could be established by the EU in order to provide expertise in various fields related to crisis management. Potential niche capability that could be filled by Lithuania and represent interest to EU crisis management structures is the development of expertise in the energy security domain or other relevant area.

Driving Innovation in Crisis Management for **E**uropean **R**esilience

LUXEMBOURG

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: ECORYS (Laura Birkman, Linette de Swart and Rachel Beerman)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by CSDM and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

The number of crises and disasters on the territory of Luxembourg is rather limited. Therefore, the main feature of the *crisis management* policy is that it is *case-by-case* based. National Protection in Luxembourg originates from protection of the public interests against the military threats and was mainly set up after the Second World War. When the Cold War ended, the national protection mechanism was frozen. After 11 September 2001, it was reactivated again. Currently, the mechanism is placed under the authority of the Prime Minister. Since then, several project laws regarding the restructuring of the crisis management system have been drawn up. In 2012, for example, the Draft Law (n. 6475) concerning national protection was created. It is currently under assessment of parliament. It is envisaged that in the near future the Draft Law will be passed, thus a new crisis management set-up will be created.

Therefore, the main feature of Luxembourg crisis management policy is that it is approached case-by-case. Similarly, the financing of crises takes place on a case-by-case basis. Some organisations are mobilised only once a crisis is identified, so financing them is decided after the onset of a crisis as well.

Despite this ad-hoc approach, the government of Luxembourg has adopted several plans on how to respond to Ebola, pandemic influenza, and cyber attacks. The close location of a nuclear plant in France also required a (nuclear) emergency response plan which was elaborated in October 2014. It is also applicable to nuclear accidents in other nuclear plants. The financing of the organisations involved in the crisis management is also on the case-by-case basis. Some of the organisations are formulated when a crisis is identified therefore financing of them is decided after that as well.

Currently, national protection and crisis management functions are distributed across multiple governmental organisations, largely depending on the nature of the disaster and risk involved. The Ministry of Labour Employment and Immigration, the Inspectorate of Labour and Mines, the Ministry of Interior (Ministère de l'Intérieur), the Rescue Service Agency (Administration des services de secours), the Ministry of Health, Grand Ducal Police, the Army are involved in a natural or man-made crisis management (the list is not exhaustive and can vary depending on the crisis).

The main authority lies with the Prime Minister. He is assisted by the High Commission for National Protection (Haut-Commissariat à la Protection Nationale) which is a civil authority. The Prime Minister is also assisted by the Supreme Council for National Protection (Conseil supérieur de la Protection nationale) which is a consultative body for the overall national protection in Luxembourg. The Council consists of one delegate from each Ministry and directors (or heads) of other administrations and services involved in crisis management. Depending on the nature of a crisis, the Crisis Cell (Cellule de Crise) is composed of the Supreme Council members. In addition, there are National Committees, which are created to address a specific field of national protection assisting the government in those areas. The military in general is not involved actively. However, representatives of the military are present in the national committees and Supreme Council.

As soon as a crisis or a disaster is identified, the Crisis Cell (Cellule de Crise, CC) is activated by the Prime Minister and is chaired by the High Commissioner for National Protection. The CC initiates, coordinates and monitors the execution of all measures destined to counter the consequences of a crisis and to favour recovery.

The operational lead is taken by the Rescue Service Agency (Administration des services de secours) which is subordinated to the Ministry of Interior. In case of major accidents or disasters, this agency leads rescue operations. It is also the organisation that trains the volunteers and divisions of the ASS are equipped with the corps of volunteers.

1 Policy

1.1 Risk Assessment

Luxembourg is one of the smallest countries in Europe: it is about 2,586 square kilometres in size, while being 82 kilometres long and 57 kilometres wide. Luxembourg has an oceanic climate with high precipitation, particularly in late summer. There are a number of rivers on the territory of Luxembourg: the Alzette, the Attert, the Clerve, and the Wiltz. The border between Luxembourg and Germany is formed by three other rivers: the Moselle, the Sauer, and the Our.

Natural hazards

The exposure to natural hazards together with response capacity determines the potential impact a natural hazard might have on a region. Luxembourg is exposed to a limited number of natural hazards. According to the Brussels based Centre for Research of the Epidemiology of Disasters (CRED), the most common natural disaster is a storm (see Table 1). It is also one of the most recurring natural disasters. In addition to storms, floods happen in Luxembourg as well. The last flood occurred about a decade ago and it was also one of the most costly natural hazards. Among other natural disasters occurring in Luxembourg, the year 2003 was marked by a heat wave which resulted in the loss of 170 people¹⁵⁷⁴. Between 1980 and 2010 there were 8 storms, 2 floods and 1 heat wave, where only heat wave resulted in mortality.¹⁵⁷⁵

Table 18 Top 10 Natural Disasters in Luxembourg by economic damages between 1990 and 2014.

Disaster	Date	Damage (000 US\$)
Storm	25-1-1990	90 000
Storm	3-2-1990	90 000
Storm	25-2-1990	90 000
Storm	28-2-1990	90 000
Storm	28-2-2010	31 000
Flood	20-12-1993	10 000
Storm	21-1-1995	10 000
Storm	7-2-1990	5 000
Storm	13-2-1990	5 000

Source: The OFDA/CRED International Disaster Database, www.em-dat.net.

The World Risk Report¹⁵⁷⁶ estimates that Luxembourg has a risk index of 2.52% of natural disasters where risk is understood as an interaction between a natural disaster (earthquakes, floods, cyclones, droughts, sea level rise) and the vulnerability of societies. Luxembourg is located at place 153 out of 171 countries evaluated (meaning that country 171 has the least risk). This implies that even though

¹⁵⁷⁴ The data are retrieved from The OFDA/CRED International Disaster Database, www.em-dat.net.

¹⁵⁷⁵ The data are retrieved from the website of PreventionWeb, serving the information needs of the disaster reduction community (<http://www.preventionweb.net/english/countries/statistics/?cid=102>).

¹⁵⁷⁶ Alliance Developments Work (2014), 'World risk report 2014'.

the population of Luxembourg is vulnerable to natural hazards, the country has the abilities and capabilities to cope with such hazards.

Technological hazards

In terms of technological disasters, the Brussels based Centre for Research of the Epidemiology of Disasters (CRED) reports only one technological disaster in the past hundred years. In 2002 there was an air transport accident which led to 20 people being killed with no economic damages involved. The newspapers also report a railway accident close to Franco-Luxembourg border with 6 people killed and 20 wounded.

Table 19 Top 10 Technological Disasters in Luxembourg between 1990 and 2014.

Disaster	Date	Number of people killed
Transport Accident	6-11-2002	20
Transport Accident	11-10-2006	6

Source: The OFDA/CRED International Disaster Database, www.em-dat.net;
<http://www.lesentiel.lu/fr/news/luxembourg/story/il-y-a-5-ans--la-collision-de-train-faisait-six-morts-25451005>.

Luxembourg has no nuclear installation on its own territory. There are also no facilities on the territory of Luxembourg generating radioactive substances. As a result Luxembourg does not use nuclear fuel. Thus radioactive wastes are only generated from the industries. However, there are three nuclear plants that are located nearby Luxembourg: Tihange (65 km, located in Belgium), Chooz (70 km, located in France) and Cattenom (8.5 km, located in France as well) as presented on the Figure 1. Since the nuclear plant Cattenom is located in a close range to the country, the government of Luxembourg '*...attaches great importance to the protection of the population in the event of a severe accident at the nuclear power plant at Cattenom*'¹⁵⁷⁷. The policy formulated at the national level mainly concerns the population living in the area within a radius of 25 kilometres from the nuclear site Cattenom (this area is extended, if necessary).

¹⁵⁷⁷ Information and Press Service of the Luxembourg Government (2014), 'What to do in the event of a nuclear alert?'.

Figure 33 Schematic location of three closest nuclear plants to Luxembourg¹⁵⁷⁸.

Therefore in short, the main areas of concern for civil protection in Luxembourg are:

- Floods;
- Nuclear accidents;
- Industrial and transport accidents.

Regarding other potential threats that might occur in Luxembourg, the government has prepared several plans on how to respond (in particular in case of pandemic flu and cyber attacks)¹⁵⁷⁹. Currently the risk assessment procedures are being considered to be included in the Draft Law (n. 6475) on the national protection (Projet de loi (no. 6475) relative à la Protection nationale). Formally the risk assessment will be under the authority of High Commission for National Protection (Haut-commissariat à la Protection nationale, HCPN). Though, since Luxembourg does not suffer from natural hazards very often, the risk assessment procedures take place when the threat of a disaster or a major risk is identified.

¹⁵⁷⁸ Schematic location of the location of the nuclear plants is prepared by the authors of this report. More about the nuclear plants in France and Belgium can be found here https://www.edf.fr/groupe-edf/producteur-industriel/carte-des-implantations#!field_poi_type_1=367&id=rzr-poi-behavior-filter-form, <http://www.chooz.com/En/entreprendre/centrale.cfm>, <https://www.electrabel.com/en/corporate/nuclear-power-plant-belgium/doel-tihange>.

¹⁵⁷⁹ For more details please refer to Chapter 1.2.5.

1.2 Policy and Governance

Currently, national protection and crisis management functions are distributed across multiple governmental organisations, largely depending on the nature of the disaster and risk involved. The following organisations are involved in natural or man-made crisis management:

- **The High Commission for National Protection;**
- **The Ministry of Labour Employment and Immigration, the Inspectorate of Labour and Mines;**
- **The Ministry of Interior;**
- **The Rescue Service Agency;**
- **The Ministry of Health;**
- **The Grand Ducal Police;**
- **The Army.**

Besides listed organisations, other institutions might be involved in resolving a disaster or crisis as well depending on its nature. The composition and methods of operation and organizational structure of the national protection system are determined by Grand Ducal Regulation. The approach to crisis management currently is being reconsidered and a new law is expected to be passed in the near future (see more in Chapter 2 with regard to the new law being adopted). Now the crisis mechanisms are placed under the authority of the Prime Minister.

1.2.1 Strategy scope and focus

There are a limited number of natural risks that Luxembourg is exposed to. Therefore the crisis management system mostly focuses on man-made risks.

A number of organisations are involved in shaping the strategy regarding crisis management in Luxembourg. The main feature of the policy is that it is case-by-case based, meaning that the policy is formulated when a crisis occurs.¹⁵⁸⁰ For several cases, like a pandemic flu, nuclear accident and cyber attack, the government has developed several plans on what to do in case such a disaster occurs.¹⁵⁸¹ Currently, the crisis management system in Luxembourg is in the process of changing (see more in Chapter 2 with regard to the new law being adopted). At this point, the crisis management system is mainly focused on preparedness and response activities which can be seen in the plans as well¹⁵⁸². It is envisaged that the new crisis management policy is going to focus on the prevention and planning activities as well as post-disaster assessment according to the expert interviews.

The Supreme Council for National Protection (Conseil Supérieur de la Protection nationale, CSPN) determines the mainstream policy regarding crisis management defines objectives and ensures strategic control during the policy implementation, while the authority of command and decision is in

¹⁵⁸⁰ See more details in rest of this Chapter and Chapter 2.

¹⁵⁸¹ See more details in Chapter 1.2.5.

¹⁵⁸² See more details Chapter 1.2.5.

the hands of the Crisis Cell (Cellule de Crise). Depending on the crisis or disaster happening, the Crisis Cell may be formed from different bodies as opposed to the CSPN which is always composed of the same members. For example, in case of a pandemic disease the Ministry of Health is going to take the lead together with the in the prevention and disaster resolution planning.

The High Commission for National Protection (Haut-commissariat à la Protection nationale, HCPN) develops and coordinates a national strategy in crisis management under the authority of the Prime Minister. The HCPN is responsible for the coordination amongst all the ministries, departments and services involved in civil and military crisis management. Since February 2007, the High Commissioner for National Protection (Haut-Commissaire de la Protection Nationale) is in charge of coordinating the fight against terrorism at the national level as well.¹⁵⁸³

1.2.2 Monitoring and analytical support to policy making; R&D

The Supreme Council for National Protection (Conseil supérieur de la Protection nationale, CSPN) is a consultative body for the overall national protection in Luxembourg. The main mission of the Council is to assist and advise the government. It can also issue an opinion paper on any project related to national protection. The CSPN initiates, coordinates and monitors the implementation of measures and activities to prevent and anticipate the occurrence of a crisis. The members of the CSPN meet at least two times a year¹⁵⁸⁴.

The Council consists of one delegate from each Ministry and directors (or heads) of other administrations and services involved in crisis management. Depending on the nature of the crisis, the composition of the Crisis Cell might differ consisting of the members of the CSPN that are concerned by the incident. The following parties are involved (the list is not exclusive):

- The High Commission for National Protection;
- Representative of the Ministry of Interior Affairs;
- The Director of Police;
- Chief of the Army;
- The Director of the Customs and Excises;
- The Director of the Intelligence Service;
- The Director of Information and Press;
- The Director of Health;
- The Director of the Rescue Service Agency.

Besides the CSPN, there are specific committees that consult in specific domain and are chaired by the High Commissioner for National Protection¹⁵⁸⁵.

In terms of research projects implemented in the past, the government of Luxembourg has participated in the development of the risk assessment tool Monarc¹⁵⁸⁶ for processing of sensitive

¹⁵⁸³ The information is adapted from <http://www.hcpn.public.lu/HCPN/Historique/index.html>.

¹⁵⁸⁴ The information is adapted from http://www.hcpn.public.lu/Protection-nationale/Concept_-organisation-et-fonctionnement/Conseil-superieur-a-la-Protection-Nationale/index.html.

¹⁵⁸⁵ For more information about the High Commission for National Protection see Chapter 3.

and personal information. This tool assesses the risks, determines the level of criticality for the organisation and describes the possible consequences for the organisation. If the organisation uses such a tool, it will obtain a certification of ISO/IEC 27005 standard (Information technology – Security techniques – Information security risk management).

Currently, the University of Luxembourg is also involved in a collaborative research project ‘Seamless Communication for Crisis Management for EU safety’ (SECRICOM) with the aim is to develop a reference security platform for EU crisis management operations¹⁵⁸⁷.

1.2.3 Policy for Prevention

As it has already been mentioned Luxembourg is mainly exposed to storms and floods in terms of natural disasters. With regard to that, different preventive measures have been taken by the authorities in relation to country planning and regional development: for example, dykes and retention basins have been constructed. There are also frequent automatic checks of the river levels and radiological activity performed and when needed early warning systems towards professionals are used. The following early warning systems are currently in place¹⁵⁸⁸:

- MIC- Monitoring Information Centre, CECIS network of the European Commission
- ECURIE - European Community Urgent Radiological Information Exchange for Nuclear Emergencies (Radiological/Nuclear)
- RAS BICHAT- Rapid Alert System for Biological and Chemical Agent Attacks
- EMERCON - Emergency Convention on the mutual exchange of information (IAEA)
- ENAC – Emergency Notification and Assistance Convention (IAEA)
- SELCA – System of exchange and liaison between Cattenom and authorities (dedicated information system between France, Germany and Luxembourg on events in the French PWR Cattenom)
- UNECE-IAN– Industrial Accident Notification of the United Nations Economic Commission for Europe, Convention on the Transboundary Effects of Industrial Accidents
- Commission of the Rhine (alert and mutual information in case of accidental pollution of the river Rhine): www.iksr.org
- Commission of the Moselle and Saar (alert and mutual information in case of accidental pollution of the rivers Moselle and Saar): www.iksms-cipms.org
- Commission of the Maas (alert and mutual information in case of accidental pollution of the river Maas): www.cipm-icbm.be
- Dedicated alert and information system between France, Germany and Belgium on transboundary floods: www.timisflood.net.

At the moment, there is no national agency in charge for the formulation of the policy for prevention. The policy is envisaged to be included in the new legislation regarding the crisis management system. Formally the prevention procedures will be under the authority of High

¹⁵⁸⁶ The information has been obtained through the website of CASES (www.cases.lu), that is operated by the SMILE (Security made in Lëtzebuerg GIE; this organization operates the Computer Incident Response Center Luxembourg, CIRCL).

¹⁵⁸⁷ For more information about this project please refer to the website www.secricom.eu.

¹⁵⁸⁸ http://ec.europa.eu/echo/files/civil_protection/vademecum/lu/2-lu.html.

Commission for National Protection. Since the Supreme Council for National Protection is an advising body to the HCPN, it will also play a consultative role when a policy for prevention is being prepared.

1.2.4 Policy for Preparedness

The government of Luxembourg has prepared several plans on how to respond to an emergency¹⁵⁸⁹. These plans are publicly available on the website (<http://www.infocrise.public.lu/fr/index.html>), which was launched in October 2014. This website provides up to date information in case an emergency or crisis is taking place and offers documents and plans on the procedures. This website serves as a basis for the public being prepared to respond to the crisis. The Information and Press Agency of the government is responsible for provision of the information on [infocrise.lu](http://www.infocrise.lu). The Rescue Service Agency (Administration des services de secours, ASS) also keeps the public informed on the measures to be undertaken in case of floods taking place. The information is provided on the website www.112.public.lu. In addition the ASS operates the nationwide network of electronic sirens warning the population in case an accident or crisis might take place.¹⁵⁹⁰

1.2.5 Policy for Response

As soon as a crisis is identified, the Crisis Cell (Cellule de Crise) starts to function under the authority of the Prime Minister. The Prime Minister is also assisted by HCPN which ensures the inter-ministerial communication and coordinates the measures taking place in case of a crisis. Each minister is responsible for reviewing their area of activity. For example, the Ministry of Health is responsible in case of a pandemic arises.

The Rescue Service Agency leads the rescue operations and reports to the Minister of Interior. The Agency is responsible for implementation of all the measures and means necessary for protection and supply of aid and medicines¹⁵⁹¹. The fire brigades are coordinated at local level by the municipalities. In case of a larger crisis the operational lead is in hands of the Rescue Service Agency. Currently, this set up is under discussion and subject to change. It is envisaged that the Rescue Service Agency and the fire brigades are going to be combined under authority of one governing body according to the expert interviews.

The Rescue Service Agency is also responsible for recruiting and training instructors and volunteers. The recruited volunteers then compose the brigades of ambulance-emergency-rescue workers (brigades des secouristes-ambulanciers et des secouristes-sauveteurs) which are based in the relief centres established around the country to ensure the protection and rescue of people. Figure 2 shows the location of the different relief centres.

¹⁵⁸⁹ The following plans are adopted at the moment: (1) the Influenza pandemic plan, (2) Ebola emergency intervention plan, (3) Cyber Plan and (4) Emergency Response Plan in case of a nuclear accident. See more details about the adopted plans in Chapter 1.2.5 and in Chapter 4.2.

¹⁵⁹⁰ For more information see Chapter 1.6.

¹⁵⁹¹ For more details please refer to Chapter 3.

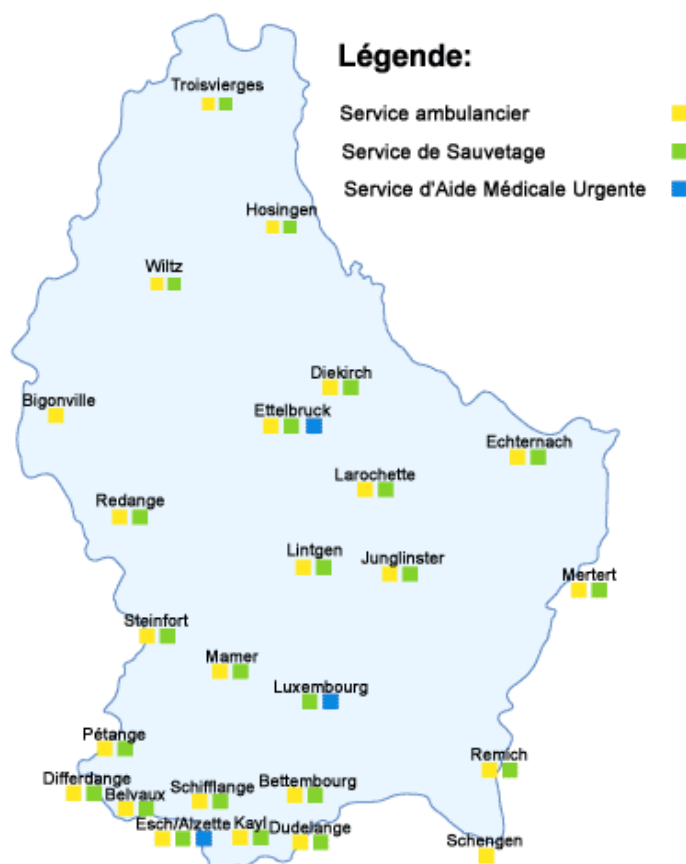

Figure 34 Location of the relief centres in Luxembourg.¹⁵⁹²

¹⁵⁹² Rescue Services Agency, www.112.public.lu.

At the moment this report was under preparation¹⁵⁹³ several plans were adopted on how to tackle different crises: (1) the Influenza pandemic plan, (2) Ebola emergency intervention plan, (3) Cyber Plan and (4) Emergency Response Plan in case of a nuclear accident. All these plans are publicly available on the new website (infocrise.public.lu) which was launched in October 2014. For more details about the plans see Chapter 4.2.

1.2.6 Policy for Relief and Recovery

As soon as the crisis is materialised, the alarming system (in case of flooding and nuclear accident), information on the website (infocrise.lu) and media informs the population about the crisis. Then begins the post-accident phase dedicated to the treatment of consequences of the accident. Since the number of disasters in Luxembourg is rather limited, at the moment the main focus of the policy is on the response activities. Therefore there is no specific policy for relief and recovery. Such policies are formulated on case-by-case basis.

1.3 Financing

1.3.1 Investing in preparedness

The Rescue Service Agency (under authority of the Ministry of Interior) and High Commission for National Protection and Computer Emergency Response Team (under authority of the Prime Minister) are funded by the state budget allocating predefined credits on a yearly basis. The Department of Radiological Protection, which is a part of the Ministry of Health, is also financed through the state budget.

The government of Luxembourg may provide additional budgetary resources through some other organisations which can be released in case of an emergency, crisis or disaster. When a crisis occurs the organisations come to live and the amounts budgeted can be enlarged with the necessary amounts (the predefined credits established on a yearly basis are not limited which allow to cover important non-foreseen and thus not predictable costs). When a crisis is identified and the Crisis Cell is activated additional financial resources are allocated. When a crisis has not been foreseen and if the crisis resolution financing can be put under a budget of the next year, it will be financed from the next year and most likely by the Ministry of State. In other cases, the decision on the financial allocation is taken after the consultation with the HCPN¹⁵⁹⁴.

One of the important elements of being prepared for a disaster is the provision of trainings in various fields of protection. The trainings are mainly given by the National School of Civil Protection and the National School for Fire and rescue Services which are both managed by the Rescue Service Agency. Most of the budgeted activities for crisis management have decreased since 2012 with the exception of the Department of Radiological Protection (see Table 1.3).

¹⁵⁹³ The report was prepared in August – December 2014.

¹⁵⁹⁴ This information is obtained via the expert interviews.

Table 20 Budgeted activities for the Rescue Service Agency, High Commission for National Protection and Computer Emergency Response Team based on the adopted budgets of 2012 – 2014 (in euros).

Budget article	2012	2013	2014
High Commission for National Protection			
Operating costs; Office expenses; Miscellaneous expenses	46.617	50.000	45.000
Office of National Protection: operating costs for crisis management. (Credit not limited)	—	1.000	35.000
Acquisition costs for crisis management. (Credit not limited)	—	1.000	1.000
Acquisition costs of special equipment, office and telecommunication	19.387	17.200	12.000
Computer Emergency Response Team			
Acquisition and installation of special equipment	94.747	150.000	75.000
Implementation and operating costs of management and prevention operations of the fight against cybercrime. (Credit not limited)	575.351	535.000	480.000
Rescue Services Agency			
Rescue Services Agency (regular budget expenditures)	16.147.449	16.291.442	16.793.967
- Including support costs arising from a disaster in the framework of bilateral agreements. (Credit not limited); and	—	100	100
- Education and training costs for volunteers of Civil Protection	124.420	128.500	125.000
Rescue Services Agency (Extraordinary expenses)	5.086.308	4.485.412	4.937.573
Division of Radioprotection of the Ministry of Health			
Costs of renting a room for interim storage of not usable radioactive sources. (Credit not limited)	3.750	3.750	3.750
Measures to reduce irradiation in Luxembourg	17.120	25.000	20.000
Costs of expertise as part of the authorization procedures and within the framework of conventions, treaties and international agreements. (Credit not limited)	—	100	100
Maintenance costs of equipment. (Credit not limited)	38.240	37.000	40.000
Radioactivity monitoring costs; miscellaneous expenses. (Credit exercise without distinction)	137.377	115.000	117.000
Acquisition, storage and distribution of stable iodine. (Credit not limited)	—	25.000	100
Quality assurance of measuring equipment in the field of radiation protection and radiation physics lab	39.949	45.000	45.000

1.3.2 Investing in consequence management

The beneficiaries of the response measures and the respective financial resources are (mainly) national authorities and municipalities. Since the crisis management policy is mostly case-by-case based, the decision on the financial resources for consequence management is also taken on case-

by-case basis. The involvement of European Union funding can be involved in consequence management. The decision on this is taken considering the nature of the crisis or disaster at stake.

Funding of the Division of Fire and Rescue Services of the Rescue Service Agency is partially provided through insurance against risk of fire¹⁵⁹⁵. At the individual level the material damages are reimbursed based on the personal insurance policies.

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

Currently there is no official framework or system in place for assessing the combating of individual emergencies and disasters. At present, the post-disaster assessment is happening at the level of the organisations that were involved in the crisis response after the disaster took place. This way the individual emergencies and disasters are evaluated on case-by-case basis.

1.4.2 Departmental Lessons Learned systems

Currently there is a Lessons Learned system at the CSPN level. The organisations that were involved in crisis handling assess the lessons learned from the specific disaster resolution and seek for the ways to improve it. Moreover, there is an exchange of the experience and techniques as a result of, for example, the international exercises. Thus the exchange of information is happening on the operational level¹⁵⁹⁶.

1.4.3 Centralised (national) Lessons Learned system

HCPN is in charge of the Centralised Lessons Learned system. In practice, there is an exchange of information on the departmental level and inter-departmental level and intra-departmental level (for more details on this please refer to Chapter 1.4.2). The experience gained from personnel deployed in EU and other international exercises is exploited in accordance to the EU guidelines¹⁵⁹⁷.

1.4.4 International exchange for Lessons Learned

Luxembourg participates in international exercises to increase the cooperation, procedures and services and capabilities of supporting members. During those exercises there is an exchange of experience and techniques happening that are later incorporated in the crisis management system of Luxembourg. For example in 2013 Luxembourg took part in TRIPLEX 2013¹⁵⁹⁸, OPEX¹⁵⁹⁹, SIMEX 'Count

Down¹⁶⁰⁰, ARF DIREX 2013¹⁶⁰¹, Exercices nucléaires 3 en 1¹⁶⁰², NATO CMX¹⁶⁰³, Cybercoalition¹⁶⁰⁴, ENISA Cyber Europe¹⁶⁰⁵.

1.4.5 Regular policy reviews

The crisis management system in Luxembourg is mainly working on case-by-case basis. Therefore, when a plan to solve the crisis is developed, it is foreseen to have a policy review by a workgroup chaired by the HCPN. Other reviews are incorporated in the functioning of the organisations and institutions involved in the crisis management. Currently, the HCPN conducts regular policy reviews.

1.5 Resilience

Since Luxembourg is not exposed to many disasters and in general the number of disasters is very limited every year, there is no official concept of resilience. The concept of resilience mainly concerns the critical infrastructure. According to the interviews, such a concept will be included in the new legislation regarding national protection in Luxembourg. Business Continuity Management is organised by organisations depending on their own risk analysis. The organisations choose by themselves whether they apply any ISO standards like ISO 22301 “Business Continuity Management – Requirements”.

1.6 Information sharing and data protection

Regarding the organisations that set the framework of the data protection, the Act of 2 August 2002 on the protection of individuals¹⁶⁰⁶ with regard to the processing of personal data, established an independent authority, the National Commission for Data Protection (Commission nationale pour la protection des données). The Commission is responsible for verifying the legal base of all files and information about identifiable individuals transmissions and must ensure that the fundamental rights and freedoms of individuals, including their privacy, are respected.

There are a number of laws that regulate the processing of personal data. The Directive 95/46/EC on data protection (Data Protection Directive) is implemented through the Law relating to the protection of individuals in relation to the processing of personal data in 2002 (the Act of 2 August 2002). This law aims to protect the freedom and fundamental rights of individuals, and notably their

¹⁶⁰⁶ Loi du 2 août 2002 relative à la protection des personnes à l'égard du traitement des données à caractère personnel.

private life, in relation to the processing of their personal data. It was further modified in 2005¹⁶⁰⁷ with regard the specific provisions in the electronic communications sector, as part of the implementation of the EU “telecom package” in Luxembourg.

The Rescue Service Agency, the emergency call centres of the police force and the fire services fall under the specific provisions of the laws when it concerns the data access of sensitive information:

The “112” emergency services centre, the emergency call centres of the Grand Duchy’s police force, and the fire and rescue services of the City of Luxembourg will have [...] automatic access on request and through the Luxembourg Institute of Regulation¹⁶⁰⁸ to the data on the identity of subscribers and users of both electronic communications operators and suppliers and the postal services and the suppliers of these services¹⁶⁰⁹.

The National Commission for Data protection will first check how secure the system is and if it can allow the remote access by electronic communication. The collected data can be transferred within the European Economic Area (EEA). There are special rules that apply to the transfer of data outside the EEA, which can be granted after the National Commission gave permission.

In case of a crisis, relevant authorities might gather personal data after the National Commission has permitted to do so. After the crisis the personal data have to be destroyed. In case of regional disasters, the Rescue Service Agency might collect information from the social media with the help of the police.

Luxembourg provides trainings to a large number of volunteers; therefore they have databases of volunteers with the relevant information stored there. This information is in hands of the organisations that train the volunteers (the Rescue Service Agency) and the relevant databases are created after the National Commission for Data Protection has granted permission.

Usage of social media

The usage of social media to gather information in times of a disaster is rather limited in Luxembourg. The crisis management authorities have several platforms to communicate to the public during the crisis; however they are not used to collect data. The Crisis Cell could decide to use social media to collect data from social media. In case of local crises, the police of Luxembourg, for example, uses social media to collect information from the public. Currently, the adopted emergency response policies (the influenza pandemic plan, the Ebola intervention plan, Emergency Response Plan in case of a nuclear accident in Cattenom, and Plan ‘Cyber’) do not plan to use the social media to gather data during the crisis¹⁶¹⁰.

2 Legislation

National Protection in Luxembourg originates from the Grand Ducal Decree of 31 December 1959 concerning the general organization of the National Protection¹⁶¹¹, adopted on the basis of the law of 22 August 1936 authorizing the government to take measures to protect public against the dangers arising from air attacks¹⁶¹².

The Grand-Ducal Regulation of 25 October 1963¹⁶¹³ is currently the statutory basis for the National Protection. 30 years later it seemed that the threat disappeared and the national protection mechanism was put on hold. Following the terrorist attacks of 11 September 2001 in the US, the Permanent Security Committee which was established by Ministerial Decree of 27 January 1975 was reactivated to take protective measures. In the end of 2001 the Office for National Protection has been reactivated. Since 2003 there were several project laws¹⁶¹⁴ regarding national protection drafted.

It is expected in the near future that a new law regarding national protection is going to be adopted which is currently being assessed by the parliament (Projet de loi (no. 6475) relative à la Protection nationale).

¹⁶¹¹ Arrêté grand-ducal du 31 décembre 1959 concernant l'organisation générale de la protection nationale.

¹⁶¹² Loi du 22 août 1936, autorisant le Gouvernement à prendre les mesures propres à protéger la population contre les dangers résultant d'un conflit armé international et notamment des dangers dus aux attaques aériennes.

¹⁶¹³ Règlement grand-ducal du 25 octobre 1963 concernant l'organisation générale de la protection nationale.

¹⁶¹⁴ For example, Projet de loi (no. 6475) which is further described in this Chapter.

2.1 Crisis (emergency, disaster) management concept

The legal hierarchy in Luxembourg is the following:

Figure 35 Legal hierarchy in Luxembourg¹⁶¹⁵

There are several main legal acts establishing provisions on crisis management in Luxembourg:

- The Grand-ducal regulation of October, 25th 1963 on the general organization of the national protection (Règlement grand-ducal du 25 octobre 1963 concernant l'organisation générale de la protection nationale);
- The Law of June, 12th 2004 on the creation of an Administration of the Rescue Services (Loi du 12 juin 2004 portant création d'une Administration des Services de Secours); and
- The "*Projet de loi (no. 6475) relative à la Protection nationale*"¹⁶¹⁶ (Draft Law (n.6475) concerning the national protection).

The Draft Law concerning the national protection (Projet de loi (no. 6475) relative à la Protection nationale) is going to set up the whole national protection structure in Luxembourg thus can also be considered as one of the main legal acts regarding crisis management. It is not legally binding yet since it has not been passed the parliament.

Following the chronological order, the Grand-ducal regulation of October, 25th 1963 on the general organization of the national protection constitutes the legal basis on which the national protection mechanism is put in place, albeit only in case of military threat. No further typology of crisis is taken into consideration in this act and the regulation itself cannot be considered a detailed conceptual document (it is only built around 12 articles). The main reason for such a narrow scope is that this regulation finds its legal foundation in the Law of 22 August 1936 authorizing the Government to take measures to protect the population against the dangers of an international armed conflict, including hazards due to air attack (Loi du 22 août 1936, autorisant le Gouvernement à prendre les mesures propres à protéger la population contre les dangers résultant d'un conflit armé international

¹⁶¹⁵ Prepared by authors of this country report.

¹⁶¹⁶ Available at:

http://www.chd.lu/wps/PA_RoleEtendu/FTSByteServletImpl/?path=/export/exped/sexpdata/Mag/148/123/114272.pdf

et notamment des dangers dus aux attaques aériennes) which back then focused only on military threats.

The second legislative act to be considered is the Law of June, 12th 2004 on the creation of an Administration of the Rescue Services (Loi du 12 juin 2004 portant création d'une Administration des Services de Secours) that abrogates the Amended Law of 18 November 1976 concerning the organisation of civil protection (Loi modifiée du 18 novembre 1976 portant organisation de la protection civile). It is worth noting that this law is based on a draft law submitted to the parliament in 1937 and considering the creation of a Civil Protection Mechanism.

The aim of the law is to organize the Rescue Service Agency (Administration des Services de Secours, ASS) whose role is to implement those acts necessary to protect and aid the people affected (by the event) and protect their goods in case of calamities, catastrophes, major incidents, fires or floods. More than a conceptual document, this law and its implementing regulations are meant to provide an administrative framework of the activities of the ASS (e.g. administrative division, tasks, career paths, roles, etc...). The ASS itself is put in place in order to group under one administrative body the coordination of all the services that would be involved in case of emergency (rescue services, fire brigade and medical support). This law however does not specify the relevant notions of calamities, catastrophes or major incidents.

The only legal document considering and developing the concept of "crisis" is the Draft Law (n. 6475). To date (consultation of LegiLux in the October 2014), the law is under reconsideration by the Commission on Institution and Constitutional Revision (since 12/12/2013) that has received the suggestions from the Council of State in terms of political responsibility of the government's members in the management of the crisis. This document provides clear definitions of a risk, a crisis, crisis management and critical infrastructure:

"Risk" the danger to which the population or the country might be exposed at due to a threat towards which they are vulnerable and that might produce a negative impact on the population or the country.

"Crisis" all event that by its very nature or effect would:

- *Threaten the vital interests or the basic need of all or a part of the country and of the population;*
- *Require urgent decisions*
- *Require a national-level coordination of the different ministries, administrations, services and organisms as well as, if needed, international coordination.*

"Crisis Management" the whole of the measures and activities undertaken by the competent authorities in order for them to ensure the fulfilment of their tasks and missions.

“Critical Infrastructure” every point, system or part of system that is fundamental for the safety of the vital interests or the basic need of a part or the whole of the country or the population and which is a source of risk or it may be the object of a particular threat¹⁶¹⁷.

Furthermore, in the section “Notes to the articles” it is specified that the activities of crisis management include the achievement of a series of complementary components, including risk analysis, preparation, prevention, monitoring, protection, communication, response, victim support, recovery and feedback. The measures under the crisis management include reduction of threats, vulnerabilities and impacts, increase in the predictability and reduction of the likelihood of a crisis.

2.2 General crisis (emergency, disaster) management law

According to the Draft Law (n. 6475) the present situation in Luxembourg is the following:

Concerning all the risks that go beyond the routine management, a wide array of the instruments necessary to cope with them is at present lacking, especially in terms of formal coordination among the public and private services meant to prevent or to tackle a possible threat. It is worth pointing out that most of these risks have an international nature and that European mechanisms are being progressively put in place to cope with them, whilst Luxembourg does not have yet an organ formally in charge of the coordination with the crisis centres from other states or international organizations¹⁶¹⁸.

The current legal national protection mechanism is based on the Grand-ducal regulation of October, 25th 1963 on the general organization of the national protection. It establishes that in case of a crisis (only defined here as coming from a military threat), the Government organizes the response by constituting the Ministerial Committee for National Protection (Comité Ministériel de Protection Nationale, CMPN).

This setup was frozen in 1994 when it became clear that the end of the Cold War had implied the end of the major military threat and thus of the usefulness of the CMNP. Nevertheless, after the 9/11 attacks, the Council of Government decided to revert its previous decision. As a result it resumed the national protection mechanism (December 2001¹⁶¹⁹) and unveiled a project to create a crisis management structure based on this setup (which is detailed in the Draft Law (n. 6475) regarding national protection). The organization and the functioning of this structure is detailed below.

As soon as a disaster is materialising in Luxembourg, the Crisis Cell starts functioning and its president, the Prime Minister, guides it. The president is assisted in this task by the National Protection Superior Committee (Conseil Supérieur de la Protection Nationale, CSPN). It used to be the case that CSPN was composed of a representative from each of the CMPN members (mostly from each Ministry as well as the Army and other organisation involved in crisis management) which

¹⁶¹⁷ Projet de loi (no. 6475) relative à la Protection nationale, Chapter 2, Article 2, Notes to the articles.

¹⁶¹⁸ Projet de loi (no. 6475) relative à la Protection nationale.

¹⁶¹⁹ Mentioned in <http://www.hcpn.public.lu/HCPN/Base-legale/index.html>

started its functioning as soon as the crisis has been identified. The CSPN also coordinates the work of the National Committees (Comités Nationaux, CONAT) that are in charge of specific functional areas.

The president is also assisted by the High Commissioner for National Protection (Haut-Commissaire de la Protection Nationale). The Commissioner assures the secretarial functions of the CSPN and chairs the High-Commissariat for National Protection (Haut-Commissariat de la Protection Nationale, HCPN). The HCPN advises the Prime Minister on:

- The preparation of the necessary national resources;
- The protection of the authorities and of the population;
- The maintaining of the public order, the provision of psychological and informational support;
- The potential financial problems¹⁶²⁰.

This complex structure linking all the actors through their functional/hierarchical relationship is presented in a Figure 4:

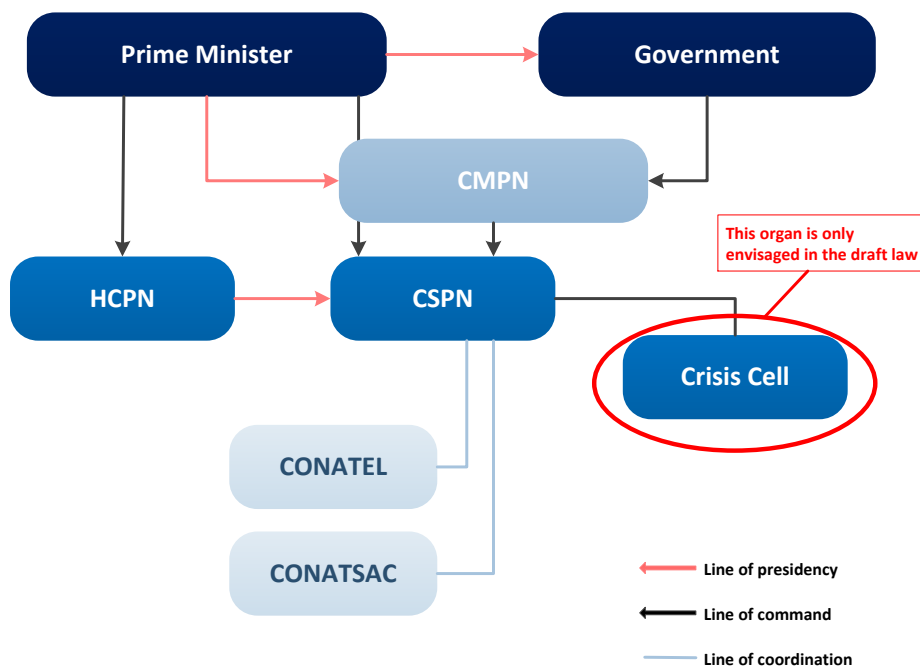

Figure 36 Structure of the crisis management in Luxembourg.¹⁶²¹

Currently, there is no formal institution that brings altogether the high-level participants of the crisis resolution in case of a disaster or major accident or incident. Because of this reason, the setup is criticised in the Draft Law (n. 6475)¹⁶²². Therefore the Draft Law envisages the existence of a body

¹⁶²⁰ Projet de loi (no. 6475) relative à la Protection nationale.

¹⁶²¹ This is a structure according to the current regulation where draft law is Projet de loi (no. 6475).

¹⁶²² Article 4 of Projet de loi (no. 6475) states that “les ministères, administrations et services publics susceptibles d’intervenir en cas d’incident ou de catastrophe disposent individuellement d’une panoplie de moyens propres. Ces moyens seront désormais, en cas de déclenchement des mécanismes de gestion de crise prévus par la loi, à la disposition de la Protection nationale. Face à une crise imminente ou pendant une crise, il

(Crisis Cell). This body will have the role of developing, coordinating, implementing and monitoring the implementation of measures with the primary goal to act and respond quickly.

In preparation of the upcoming Law, the CSPN had adopted internal rules regarding its functioning. This document has been approved by the government. It is however only available to the members of the Supreme Council.

Another legally binding document is the Law of June, 12th 2004 on the creation of the Rescue Service Agency. It covers the organizational void mentioned in the draft law (see above) in case of exceptional situations (described as calamities, catastrophes, major incidents, fires or floods) by granting the Ministry of Interior Affairs the role and the power to coordinate all the services and actors meant to organize first aid measures (mesures de secourisme). The Law states that the actors and services performing and leading the operations in case of exceptional situation are the three divisions of the ASS:

- The Division of Civil Protection, acting in case of exceptional events (calamities, catastrophes, major incidents, fires or floods);
- The Division of Fire and Rescue Services; and
- The Administrative, Technical and Medical Division.

The measures that are subject to the ASS intervention are generally defined to be as those acts necessary to protect and aid the people affected and protect their goods in case of calamities, catastrophes, major incidents, fires or floods. They are detailed in the Grand Ducal Regulation of 6 May 2010 determining the specific tasks, composition, organization and functioning of the Division of Civil Protection of the Rescue Service Agency (Règlement grand-ducal du 6 mai 2010 déterminant les missions spécifiques, la composition, l'organisation et le fonctionnement de la division de la protection civile de l'Administration des services de secours). Figure 5 presents the organizational structure of the Rescue Service Agency.

This regulation states that the ASS is responsible for the organization of the first aid, rescue and transport of victims needing medical care. It also sets up or contributes to general and individual intervention plans and organizes public training in first aid. Lastly, in case of crisis it has the duty to safeguard the national heritage and property.

Furthermore, the regulation also states that in case of a crisis an Alert group is activated. The mission of the group is to ensure in times of crisis or war the operation of the warning centres that fall under the authority of the Rescue Service Agency¹⁶²³. The alert group is guided in accordance with the guidelines and instructions laid down by the Rescue Service Agency.

est nécessaire de disposer d'un organe regroupant des délégués de haut niveau et par conséquent mandatés pour développer, coordonner, mettre en oeuvre et veiller à l'exécution des mesures destinées à agir et à réagir rapidement. A l'heure actuelle, un tel organe fait défaut. La Cellule de Crise assumera cette responsabilité" (p.4).

¹⁶²³ Loi du 12 juin 2004 portant création d'une Administration des Services de Secours, Article 11, 14.

The Rescue Service Agency is also qualified to recruit and train the instructors and volunteers of the assistance units and in the various fields of protection. In addition, it manages the National School of Civil Protection (l'Ecole Nationale de la Protection Civile, ENCP), which instructs volunteers in weekend training courses and the National School for Fire and Rescue Services (l'Ecole Nationale du Service d'Incendie et de Sauvetage, ENSIS) including training with heavy intervention equipment¹⁶²⁴.

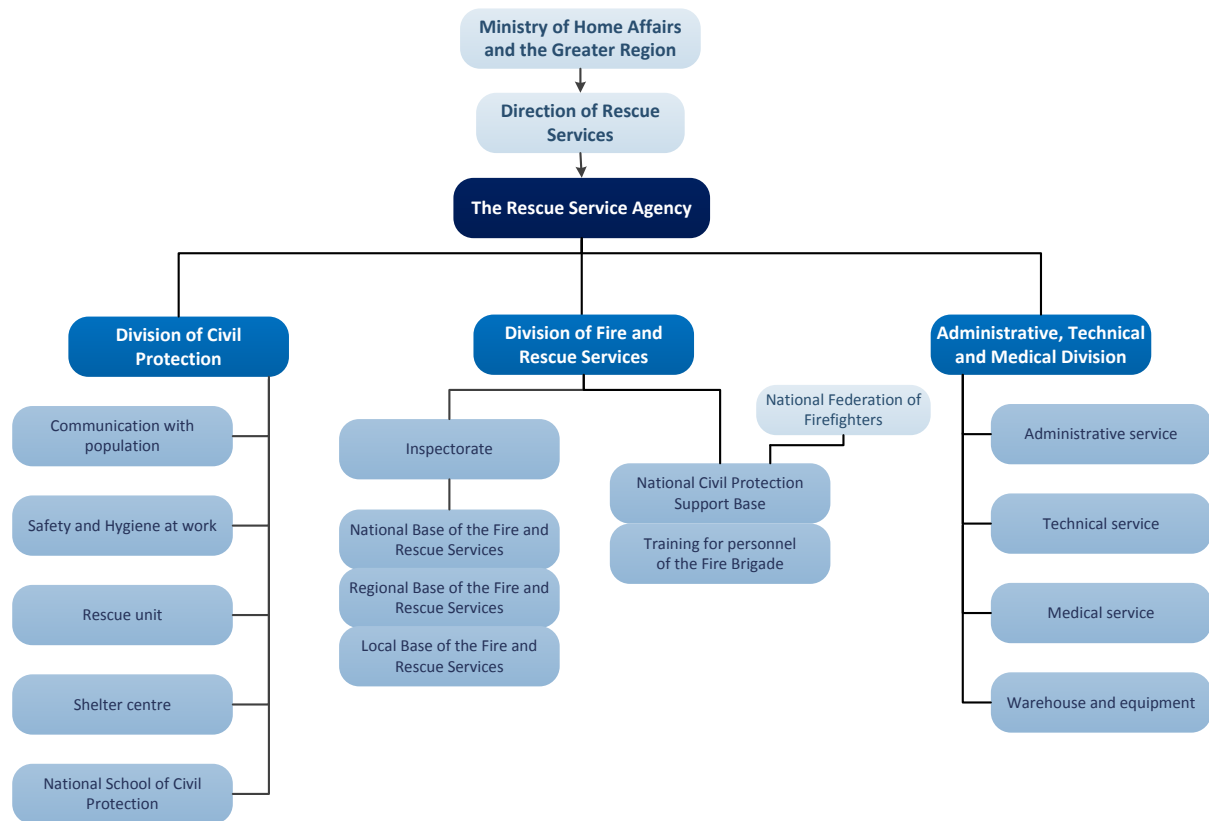

Figure 37 Organisational structure of the Rescue Service Agency¹⁶²⁵.

The Draft Law (n. 6475) regarding the National Protection

The aim of the Draft Law (Projet de loi (no. 6475) relative à la Protection nationale) is to enhance the crisis management mechanism. The draft law further details and extends the structure of the National Protection as it is actually in place. In particular, it establishes a Crisis Cell (Cellule de Crise, CC). The CC will have the responsibility of coordination during a major crisis or a disaster. Besides that, it will prepare the political decisions to be taken by the Government, implement the operational measures and control their execution. From the standpoint of its composition, it will be characterised by a variable geometry, depending on the nature of the attack. Ministries, departments and agencies that provide operational resources will thus be fully involved in the coordination process and execution. To avoid delays and inefficiencies, agencies and administrations will be required to comply with the instructions of the Crisis Cell and will report directly to it. However, they retain the responsibility in the use of their own resources.

¹⁶²⁴ Adapted from the website of the Rescue Service Agency (www.112.public.lu).

¹⁶²⁵ Adapted from the website of the Rescue Service Agency (www.112.public.lu).

The Crisis Cell initiates, coordinates and monitors the implementation of all measures to cope with the crisis and its effects to return to the normal state. Ministries, departments and services involved in the implementation of measures and activities organized as part of the crisis management by the Crisis Unit shall act in accordance with the instructions thereon and report directly to it.

If an operational intervention in the field is required, the mission of the Crisis Cell is also in charge of the coordination and monitoring of implementation. It may as well designate an authority or a service that coordinates the operations on the ground¹⁶²⁶.

The Draft also establishes that “operating and organizational procedures for the bodies of the National Protection structure can be detailed by a Grand-ducal Regulation” (Projet de loi (no. 6475) relative à la Protection nationale, Article 9). At the time that this report was under preparation, the Draft Law had not been passed by the parliament.

2.3 Emergency rule

According to the Law of June, 12th 2004 on the creation of the Rescue Service Agency, the Ministry of Interior can resort to special powers in case of exceptional situations (calamities, catastrophes, major incidents, fires or floods). Article 7 states that the Minister of Interior may assign a place of temporary residence for threatened or affected population and even restrain them from traveling or moving in case of an emergency. Recovery of the expences by the State will be executed through the Administration of Registration and Domains (l'administration de l'Enregistrement et des Domaines).

Under the Draft Law (n. 6475) no declaration of Emergency Rule (*Etat d'urgence*) is evoked. The only provisions that are considered are those on the necessary requisitions under the Law of 8 December 1981 on requisitions in armed conflict, serious international crisis or disaster (Loi du 8 décembre 1981 sur les réquisitions en cas de conflit armé, de crise internationale grave ou de catastrophe) by the Title V of the Act of 31 May 1999 establishing a body of grand Ducal police and a general inspection of the police (Titre V de la loi du 31 mai 1999 portant création d'un corps de police grand-ducale et d'une inspection générale de la police) and in Chapter 4 of the Municipality Act amended on 13 December 1988 (Loi communale modifiée du 13 décembre 1988).

The extent to which personal liberties can be limited is detailed in every one of the aforementioned acts in different articles. For instance, Article 8 in the Law of 8 December 1981 on requisitions in armed conflict, serious international crisis or disaster states that any person or entity, whether Luxembourgish or foreigner, residing in the Grand Duchy of Luxembourg, may be required to execute tasks of public interest. The government may as well requisition any business or company active on the territory of the Grand Duchy of Luxembourg.

There are several plans adopted by the government of Luxembourg regarding the emergencies and disasters (for more details please refer to 1.2.5):

- the “Influenza Pandemic” Plan;
- The Ebola emergency intervention plan;

¹⁶²⁶ Projet de loi (no. 6475) relative à la Protection nationale, Article 7.

- Emergency Response Plan in case of a nuclear accident;
- Plan 'Cyber'.

In none of the plans reference is made to the Emergency Rule in the legislation¹⁶²⁷. The dispositions concerning potential restrictions on the mobility of the people in the areas concerned are very limited. In case of an accident in a nuclear plant, the authorities may prohibit any outdoor activity. This action is taken as a precaution to protect the population against exposure to or contamination of radioactive releases. The activities of concern are sports and games for children outdoor, hunting, camping, gardening, etc. This also relates to the post-accident phase. Several countermeasures are envisaged in case of a pandemic, but none of them is concretely restrictive for the civil liberties.

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

In the present organisational setup, the national protection is assured by the Rescue Service Agency, whose legal base is the Law of 12 June 2004 on the creation of an Administration of the Rescue Services (Loi du 12 juin 2004 portant création d'une Administration des Services de Secours). This document sets up the legal framework enabling the Agency to act in case of exceptional situations (calamities, catastrophes, major incidents, fires or floods).

Also, from the point of view of specificity, the abovementioned Emergency Plans on Nuclear Accidents and Pandemic Flu can be considered under this section (the pandemic flus can be of several sorts, the specific plan was born to counter the H1N1 pandemic but is conceived as an adaptive document).

The legal bases and the plans are respectively¹⁶²⁸:

Radiologic emergency:

- Grand-Ducal Regulation of 14 December 2000 on the protection of the public against the dangers arising from ionizing radiation (Règlement grand-ducal du 14 décembre 2000 concernant la protection de la population contre les dangers résultant des rayonnements ionisants).
- Emergency Response Plan (ERP) in case of nuclear accident (Plan d'intervention d'urgence (PIU) en cas d'accident nucléaire).

Pandemic Flu:

¹⁶²⁷ The legal base is constituted by Règlement grand-ducal du 14 décembre 2000 concernant la protection de la population contre les dangers résultant des rayonnements ionisants and Plan d'intervention d'urgence (PIU) en cas d'accident nucléaire; Règlement grand-ducal du 11 mai 2006 établissant des mesures de lutte contre l'influenza aviaire, Plan gouvernemental - Pandémie grippale; Plan d'intervention d'urgence Cas probables/confirmés EBOLA au niveau national.

¹⁶²⁸ The information on the Cyber Plan (Plan d'intervention d'urgence en cas d'attaque contre les systèmes d'information ou de faille technique des systèmes d'information, Plan 'Cyber') is presented on the website of HCPN (http://www.hcpn.public.lu/plans_nationaux/Plan_-_Cyber_/index.html).

- Grand-Ducal Regulation of 11 May 2006 establishing measures against avian influenza (Règlement grand-ducal du 11 mai 2006 établissant des mesures de lutte contre l'influenza aviaire).
- Grand-Ducal Regulation of 22 October 2009 concerning the processing centres and vaccination centres under the management of an influenza pandemic (Règlement grand-ducal du 22 octobre 2009 relatif aux centres de traitement et aux centres de vaccination dans le cadre de la gestion d'une pandémie grippale).
- Government Plan - Influenza Pandemic (Plan gouvernemental - Pandémie grippale).

Ebola plan:

- Emergency Response Plan to Ebola (Plan d'intervention d'urgence Cas probables / confirmés EBOLA au niveau national, Plan EBOLA).

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

The local authorities are actively involved in the Fire and Rescue Services Division of the Rescue Service Agency. The Coordinated text of the Municipality Act of 13 December 1988 (Texte coordonné de la loi communale du 13 décembre 1988) speaks of local fire and rescue corps (Services communaux d'incendie et de sauvetage) whose management (provision of adequate structures and equipment) is delegated to the local authorities. However, the law establishes that these locally organised bodies must not hamper in any way the national and regional organisation put in place to coordinate them (i.e. it should not overlap with or disturb the work of the ASS). Article 100 of the municipality act states that without prejudice to national and regional structures of civil protection, each municipality is required to create or maintain a fire and rescue department with at least one corps of volunteers and professional firefighters and having the facilities and equipment needed.

Another division of the ASS has operational centres at national, regional and local level. The local centres are under authority of ASS and not under authority of the local municipalities. There are one national, three regional and 25 local support bases of Division of Civil Protection. This structure is established by the Law of 12 June 2004 on the creation of an Administration of the Rescue Services (Loi du 12 juin 2004 portant création d'une Administration des Services de Secours) and detailed under the Grand Ducal Regulation of 6 May 2010 determining the specific tasks, composition, organization and functioning of the Division of Civil Protection of Rescue Service Agency (Règlement grand-ducal du 6 mai 2010 déterminant les missions spécifiques, la composition, l'organisation et le fonctionnement de la division de la protection civile de l'Administration des services de secours):

The Division of Civil Protection is responsible for the implementation at national level of those measures necessary to protect and rescue the population and safeguard its properties during calamitous events as well as of the application of all those means related to this task. In order to fulfil these tasks, the Division of Civil Protection has a national base, regional bases and rescue centres, whose organization and technical functioning are determined by Grand-Ducal Regulation¹⁶²⁹.

¹⁶²⁹ Règlement grand-ducal du 6 mai 2010 déterminant les missions spécifiques, la composition, l'organisation et le fonctionnement de la division de la protection civile de l'Administration des services de secours, Article 4.

Therefore, the local authorities are not entitled with any power in what the management of an emergency situation is concerned. Figure 6 presents the organisational structure specifying the involvement of local authorities.

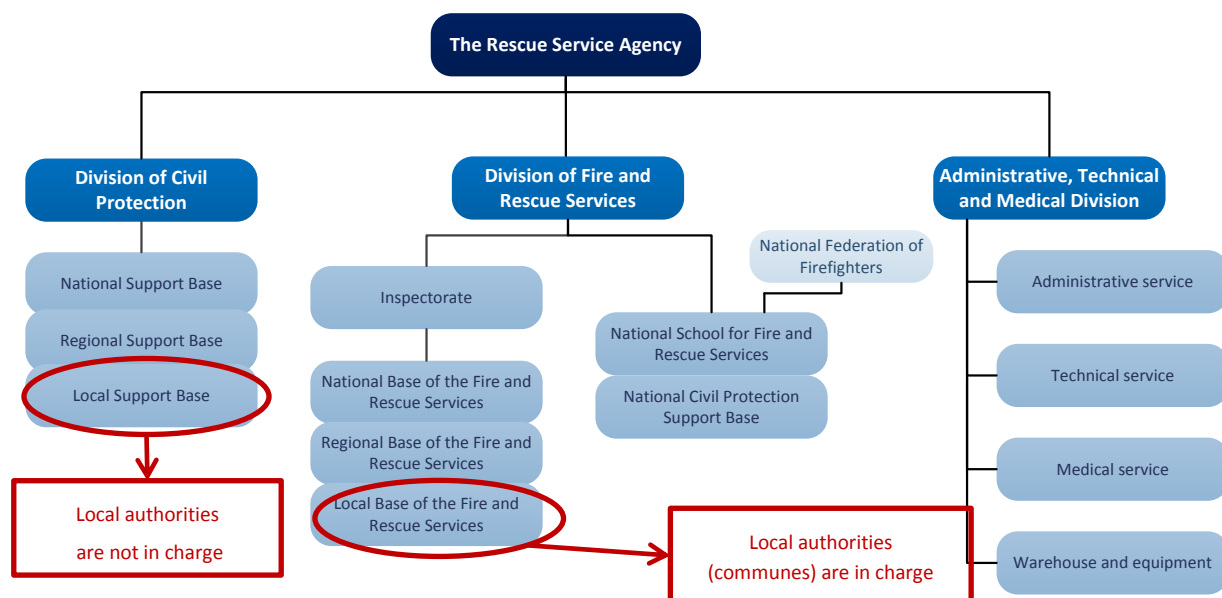

Figure 38 Organisational structure of the Rescue Service Agency with the distinction of authority levels¹⁶³⁰.

Nevertheless, the Law of 8 December 1981 on requisitions in armed conflict, serious international crisis or disaster (Loi du 8 décembre 1981 sur les réquisitions en cas de conflit armé, de crise internationale grave ou de catastrophe, Article 8) establishes that, in case of an emergency, local authorities may have some back-up functions. In the event of a disaster, the mayor (Bourgmestre) of any municipality affected or threatened is entitled to exercise provisionally, in case of emergency, the right to requisition, until the persons like government advisers, delegates of district commissioners, members of the government and delegated persons by the Council of Government (conseillers de Gouvernement et aux commissaires de district délégués par le membre du Gouvernement compétent ainsi qu'aux personnes déléguées par le Gouvernement en conseil) can intervene. In any case, the application of the requisition orders made by the government are always put into effect by the mayor (Bourgmestre).

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

The Luxembourgish administration has an official portal providing information on volunteers and NGOs¹⁶³¹. It lists all the organisations through which it is possible to volunteer as well as classifying the volunteering actions by typology. Under the typology "Secours" (rescue), it is possible to find all the opportunities related to rescuing services. Most of them fall under the authority of the ASS.

¹⁶³⁰ Adapted from the website of the Rescue Service Agency (www.112.public.lu).

¹⁶³¹ <http://www.benevolat.public.lu/fr/index.html>.

For what concerns the engagement of volunteers in different divisions of the ASS, the Law of 12 June 2004 on the creation of an Administration of the Rescue Services establishes that the personnel of the ASS may be backed by volunteers. The Grand Ducal Regulation of 6 May 2010 determining the specific tasks, composition, organization and functioning of the Division of Civil Protection of Rescue Service Agency (Règlement grand-ducal du 6 mai 2010 déterminant les missions spécifiques, la composition, l'organisation et le fonctionnement de la division de la protection civile de l'Administration des services de secours) details the rights and the requirements necessary for the volunteers. These requirements among other things include age limit, the proof of a good physical condition, a certificate of good conduct, a certificate of adhesion to the group and a certificate of having succeeded in the preparatory course. Also, the attendance to all the other courses and seminars is compulsory. Other specific requirements may be asked depending on the division and groups. Besides that, volunteers in the performance of their duties are entitled to the insurance against accidents and occupational (Article 63, Règlement grand-ducal du 6 mai 2010 déterminant les missions spécifiques, la composition, l'organisation et le fonctionnement de la division de la protection civile de l'Administration des services de secours).

The Prime Minister is authorized to subscribe an additional insurance to eventually complement the voluntary workers compensation in case of accidents. In case the volunteers are going outside of the territory of Luxembourg (international crises), the law prescribes that their employers will be reimbursed for the absence.

2.7 Legal regulations for international engagements of first responders and crisis managers

Of all the organisations Luxembourg is member of, the following are relevant for this section:

- The European Union;
- The NATO;
- Benelux.

All these organisations are active in Crisis Management and Civil Protection Mechanisms. Luxembourg is represented in these organisations by the High Commission for National Protection (Haut-Commissariat à la Protection Nationale, HCPN).

There are two main legislative acts connecting Luxembourg to these organisations:

- COUNCIL DIRECTIVE 2008/114/EC of 8 December 2008 on the identification and designation of European critical infrastructures and the assessment of the need to improve their protection transposed into the national legislation through the Règlement grand-ducal du 12 mars 2012 portant application de la directive 2008/114/CE du Conseil du 8 décembre 2008 concernant le recensement et la désignation des infrastructures critiques européennes ainsi que l'évaluation de la nécessité d'améliorer leur protection.
- The Act of 16 December 2011 approving the Memorandum of Understanding on cooperation in the field of management of crises that may have trans boundary effects between the Kingdom of Belgium, the Kingdom of the Netherlands and the Grand Duchy of Luxembourg,

signed in Luxembourg on 1 June 2006 (Loi du 16 décembre 2011 portant approbation du Mémorandum d'accord concernant la coopération dans le domaine de la gestion des crises pouvant avoir des conséquences transfrontalières entre le Royaume de Belgique, le Royaume des Pays-Bas et le Grand-Duché de Luxembourg, signé à Luxembourg, le 1er juin 2006).

Also Luxembourg has signed, in 2013, two Memoranda of Understanding as a NATO member, namely the:

- Memorandum of Understanding on cyber defence reached between the HCPN and NATO Cyber Defence Management Board (Mémorandum d'entente en matière de cyberdéfense" conclu entre le HCPN et le NATO Cyber Defence Management Board)
- Memorandum of Understanding on the Facilitation of Cross Border Transport of vital importance (Mémorandum d'entente sur la facilitation des transports civils transfrontières d'importance vitale).

In terms of the first responders and civil protection some other legal arrangements have been concluded: the mutual assistance agreements made between Luxembourg and respectively Belgium, Germany and France; Decision No 1313/2013/EU of the European Parliament and of the Council of 17 December 2013 on a Union Civil Protection Mechanism. Luxembourg also takes part in the Civil Protection Working Group of the Council (PROCIV), where the ASS is the representative of Luxembourg.

For more information about international cooperation please refer to Chapter 3.2.

3 Organisation

3.1 Organisational chart

The organisations involved and their roles in the crisis management system are outlined in the legislation of Luxembourg (see Chapter 2). Currently, the system is under discussion and most likely will change as new regulations are envisaged¹⁶³².

The main responsibilities and the main organisations involved in the crisis management are outlined in the respective legislation (For more details please refer to Chapter 2). In this Chapter we briefly describe the lines of command and the organisations responsible for certain field of crisis resolution.

The current structure of the crisis management system has been created after the Second World War. The main authority is the Prime Minister. Other players involved are the High Commission for National Protection, the Ministerial Council for National Protection, the Senior Council for National Protection (CSPN), the Crisis Cell and the National Committees, which are created to address a specific field of national protection. The military in general is not involved actively; however their representatives are present in the national committees and CSPN. The military might help with evacuation, for example, after the decision has been made by CSPN.

Once the crisis starts, the Crisis Cell starts functioning and its chairman (which is the Prime Minister) guides it and is assisted in this task by a National Protection Superior Committee (Conseil Supérieur de la Protection Nationale, CSPN), composed by a member delegated from each of the CSPN members. The CSPN also coordinates the work of the 'thematic' national committees, National Committee for Telecommunication (le Comité national des Télécommunications, CONATEL) and National Committee for Civil Aviation Safety (le Comité national de Sûreté de l'Aviation civile, CONATSAC), that are in charge of different functional areas. The composition of the National Committees is presented in Figure 7.

¹⁶³² The organisational chart presented in this report was prepared in October 2014.

National Committee for Telecommunications

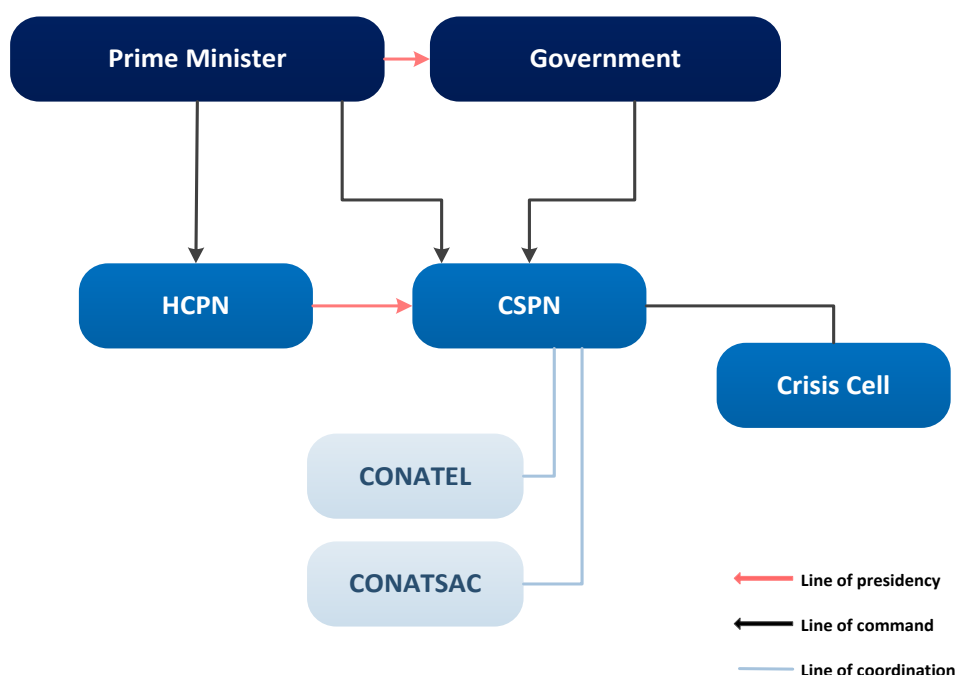

- Ministry of State;
- Communication Centre of the Government;
- Department of Media and Communications;
- Intelligence Service of the State;
- Ministry of Interior;
- Grand Ducal Police;
- The Rescue Service Agency;
- Army;
- Administration of Customs and Excise;
- Centre for Information Technology;
- Division of Radiation Protection of the Ministry of Health;
- Administration of Air Navigation;
- Luxembourg Institute of Regulation.

National Committee for Civil Aviation Safety

- Ministry of State
- Ministry of Interior
- Ministry of Sustainable Development and Infrastructure,
- The Directorate of Civil Aviation
- Administration of Air Navigation,
- The Grand Ducal Police,
- Administration of Customs and Excise,
- Society of Airport Luxembourg SA (lux-Airport).

Figure 39 Composition of the National Committees of Luxembourg¹⁶³³.

The president (Prime Minister) is also assisted by a High Commissioner for National Protection (Haut-Commissaire de la Protection Nationale) assuring the secretarial functions of CSPN and chairing the High-Commissariat for National Protection (Haut-Commissariat de la Protection Nationale, HCPN), a secretarial body. HCPN also ensures the inter-agency communication (both internal and external). The key players involved in the line of command and presidency are presented on the Figure 8.

¹⁶³³ Adapted from the website of the High Commission for National Protection (http://www.hcpn.public.lu/Protection-nationale/Concept_organisation-et-fonctionnement/Cellule-de-crise/index.html).

Figure 40 Diagram of national protection structure of Luxembourg¹⁶³⁴.

The Draft Law (Projet de loi (no. 6475) relative à la Protection nationale) is currently still under discussion. It provides further details and extends the structure of the National Protection as it is actually in place. In particular, it establishes a Crisis Cell. In the event of a large disaster potentially affecting the territory of Luxembourg the Prime Minister activates the crisis cell. Members of the cell are alerted through the HCPN. Under the authority of the Government, the crisis cell initiates, coordinates and monitors the implementation of all measures to cope with the crisis and its effects, respectively, promotes the return to normal. It also prepares the necessary decisions and submits them to the Government for approval. The crisis cell is composed of 12 permanent members and 9 topic related members¹⁶³⁵. It is envisaged that the Crisis Cell will be enlarged in the future.

¹⁶³⁴ Adapted from the website of the Rescue Service Agency (www.112.public.lu).

¹⁶³⁵ For the list of members, see Chapter 1.2.1=2.

The Crisis Cell composition is presented in Figure 9.

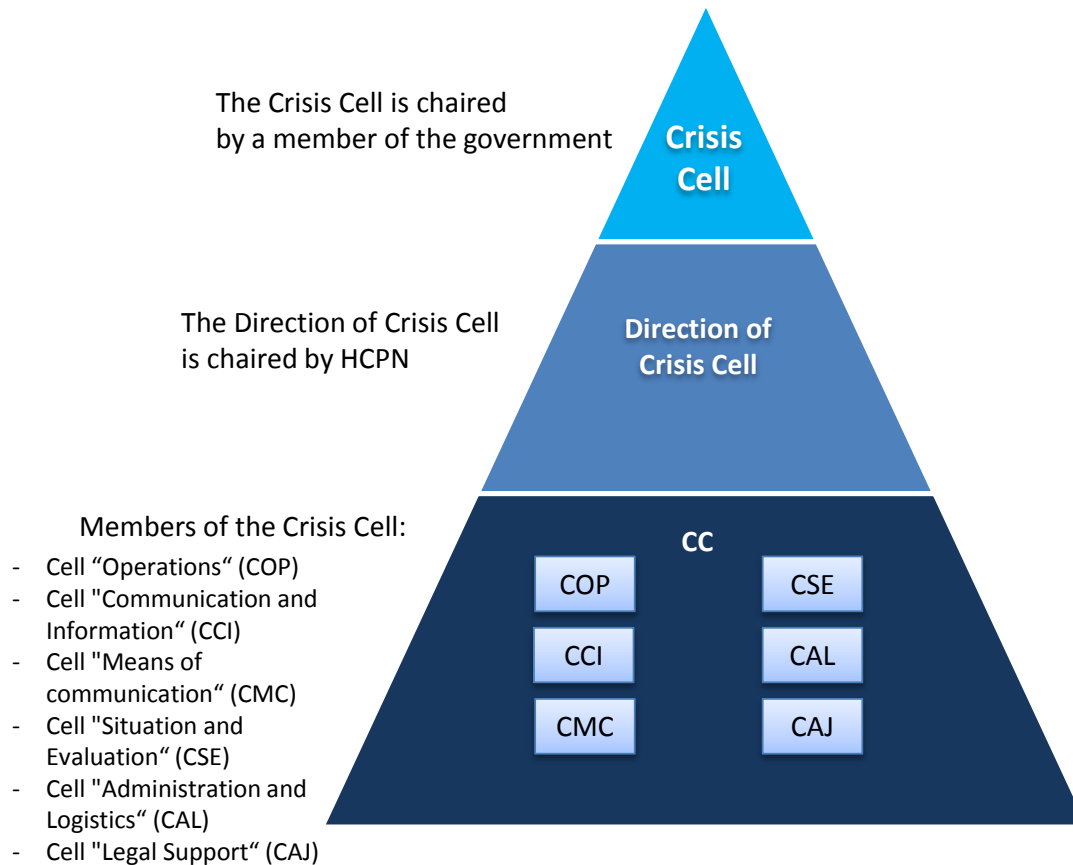

Figure 41 Composition of the Crisis Cell of Luxembourg¹⁶³⁶.

The department of Radiological Protection

In case of a nuclear emergency, the Department of Radiological Protection of the Ministry of Health (this ministry has the executive competence in the field of radiological safety and radiation protection) is also involved in the crisis management. The Department of Radiological Protection exists since its' establishment by the law of 21 November 1980 concerning the organization of the Directorate of Health. The organizational structure is presented in Figure 10.

¹⁶³⁶ Adapted from the website of the High Commission for National Protection (http://www.hcpn.public.lu/Protection-nationale/Concept_-organisation-et-fonctionnement/Cellule-de-crise/index.html).

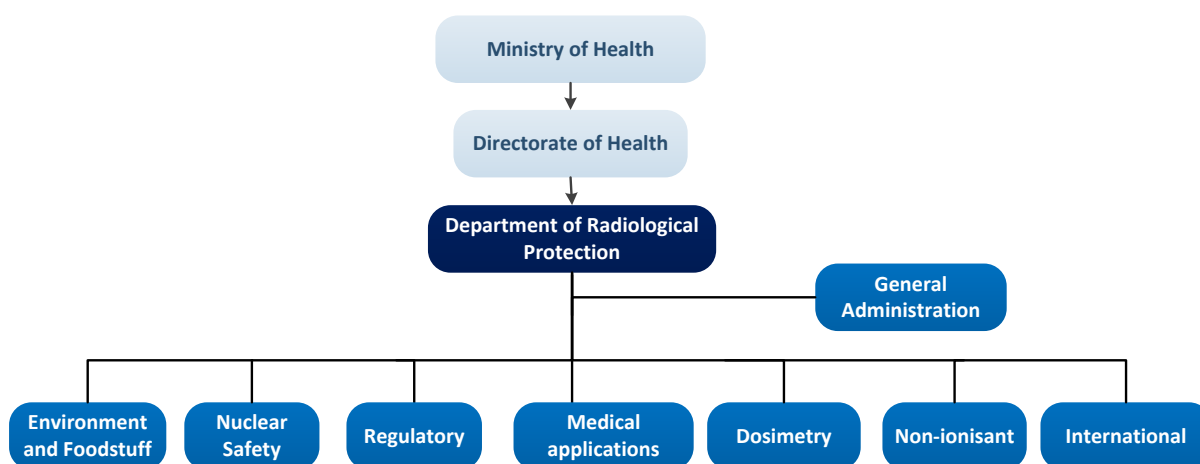

Figure 42 Organisational structure of the Department of Radiological Protection¹⁶³⁷.

The Rescue Service Agency

The Rescue Service Agency (ASS) takes the operational lead and reports to the Minister of Interior. The agency operates the national emergency phone number (112). Currently, the fire brigades are in hands of the municipalities. In case of a large crisis or disaster the ASS is taking over the operational leadership of them. It is envisaged that the new crisis management legislation will incorporate both local fire brigades and the ASS under one governing body. At the moment the organizational structure of the ASS is presented in Figure 5.

The ASS also recruits and trains instructors and volunteers in various fields of protection (for more details please refer to Chapter 5.3). There is an agency that has the mission to promote initiatives in the field of volunteerism, including the establishment and management of the agency in charge of the volunteers (the Agency for Voluntary Services). NGOs and agencies are partners of this agency like Luxembourg Red Cross and National Federation of Firefighters.

3.2 Organisational cooperation

In terms of the legal provision, the cooperation with other Member States of the European Union is regulated by several treaties and agreements. Cross-border assistance to and from Belgium and the Netherlands is facilitated by the means of bilateral agreements. These agreements are based on the Madrid Convention of 1980 offering the regional and local authorities a basis to cooperate with regard to the disaster response. Cross-border cooperation in the Benelux has a legal base in the Benelux Convention on cross-border and inter-territorial cooperation of 1991. The Senningen Memorandum concerning cooperation in the fields of police, justice and immigration was signed June 4th, 1996 in Luxembourg (Senningen) and was re-launched in 2004 with a wider scope

¹⁶³⁷ Adapted from Department of Radiation Protection (2014), National Report on the measures taken by Luxembourg to fulfill the obligations laid down in the "CONVENTION ON NUCLEAR SAFETY" to the Sixth review meeting of the contracting parties in 2014, on behalf of the Government of Luxembourg.

extending it to security, antidrug policies and trans-border cooperation regarding catastrophes and accidents.

Another treaty was concluded between Belgium, Germany, Spain, France, Luxembourg, the Netherlands and Austria in 2005 regarding intensifying cross border collaboration, in particular to fight terrorism, cross border criminality and illegal migration. There is also an international agreement, Memorandum of Understanding on cooperation in the field of crisis management that may have transboundary effects between Belgium, the Netherlands and Luxembourg, signed in Luxembourg on 1 June 2006¹⁶³⁸.

The High Commission for National Protection (HCPN) acts as a national representative of Luxembourg in the international fora (European Union, NATO and other international organisations that deal with crisis management) in terms of coordination. The HCPN is also responsible for establishment and maintenance of the contact with the similar organisations in other countries.

HCPN participates in various working groups as it is also a national contact point in the field of the protection of critical infrastructure. This includes among other things being a contact point for European Programme for Critical Infrastructure Protection driven the European Commission¹⁶³⁹. Thus HCPN contributes to the implementation and formulation of strategies.

The Rescue Service Agency has an intervention group for humanitarian missions that are conducted outside the territory of Luxembourg. This group might be involved in resolution of large crises and disasters at a request of the country or countries concerned or as part of the international assistance. Interventions outside the territory of Luxembourg are decided by the Minister of Interior.

In case of an international crisis, it is possible that firstly the national contact points are informed about the crisis. It could be a contact point that the Rescue Service Agency is in charge of. The national contact point informs the organisation in charge which in turn informs the Prime Minister. The Prime Minister then decides to formulate the Crisis Cell. Then the mechanism described in previous chapters starts functioning.

In case of a simultaneous occurrence of disasters and emergencies, the Crisis Cell will decide on the priorities and main responsibilities to handle crises. There are no prescribed instructions in case of such events thus the decision is taken case-by-case.

¹⁶³⁸ Loi du 16 décembre 2011 portant approbation du Mémorandum d'accord concernant la coopération dans le domaine de la gestion des crises pouvant avoir des conséquences transfrontalières entre le Royaume de Belgique, le Royaume des Pays-Bas et le Grand-Duché de Luxembourg, signé à Luxembourg, le 1er juin 2006. Available at www.legilux.public.lu/leg/a/archives/2011/0263/a263.pdf.

¹⁶³⁹ Directive 2008/114 / EC of 8 December 2008 on the identification and designation of European Critical Infrastructure and the assessment of the need to improve their protection.

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

Currently there are no formal standing operation procedures for civil protection. At present the legislative set up of the crisis management system is under revision and new laws are envisaged to come into force, therefore it is possible that the SOPs and guidelines will be established as well.

Currently there exist rules on the internal functioning of the CSPN which are only available to the members of the CSPN. Departments and agencies responsible for certain area of disasters also participate in national and international exercises, that later on might be applied in the field. With regard to the nuclear safety for example Luxembourg has established mechanisms with the neighbouring countries that allow the exchange of information on a regular routine basis. Also the adopted plans (for more details please refer to Chapter 1.2.5 and Chapter 2) and the respective legislation have detailed instructions for the organisations involved in crisis management.

4.2 Operations planning

The policy of Luxembourg with regard to crisis management is mainly case-by-case based; therefore the plans are being formulated when a disaster is identified. Nevertheless, there are several plans already adopted by the Government of Luxembourg. At the moment this report was under preparation, there were four plans elaborated and communicated to the population: the “Influenza Pandemic” Plan, the Ebola emergency intervention plan, Emergency Response Plan in case of a nuclear accident in Cattenom, Plan ‘Cyber’. Below briefly we present the description of those plans.

The “Influenza Pandemic” Plan¹⁶⁴⁰

This plan was adopted by the Governing Council of 21 July 2006¹⁶⁴¹, which serves as a basis for the preparation and management conduct of an influenza pandemic. The government plan describes more specifically the government's response to the risk of pandemic influenza, including avian influenza in animals and humans.

The plan contains a catalogue of 187 measures applicable before, during and after an influenza pandemic. These measures reflect the six phases set by the World Health Organization (WHO) as part of the evolution of a pandemic. They cover the whole of the organization and functioning of the company in the socio-economic health plan, social, transport, security, international relations, etc.

¹⁶⁴⁰ Adapted from <http://www.infocrise.public.lu/fr/grippe-pandemie/index.html>

¹⁶⁴¹ Legislation is available here <http://www.gouvernement.lu/708654/21conseil>.

The Ebola emergency intervention plan

Published by the Government of Luxembourg in October 2014¹⁶⁴², this plan aims to set up the structure for the response to an eventual Ebola epidemic in Luxembourg. It has been elaborated by the HCPN and determines the bodies in charge of managing the crisis, the different possible scenarios, the emergency measures to be taken and the procedures to be followed.

In case the plan is started, the Crisis Cell (Cellule de Crise) is activated by the Prime Minister and starts monitoring the different actions in response to the crisis. The CC is composed by members from the ministries of health, of foreign affairs, of home affairs and of infrastructures backed by representatives from the Army, the Police, the ASS and the Administration of Duties and Excises.

The plan identifies four main scenarios entailing a likely/confirmed case of Ebola:

- a. landing in Luxembourg,
- b. detected in Luxembourg (elsewhere than the airport),
- c. who is a Luxembourgish national/resident that must be brought back to Luxembourg,
- d. detected on a Luxembourgish ship.

In all of the abovementioned situations, the structure in charge of the hospitalisation is the CHL (Centre Hospitalier de Luxembourg) or, in the hospitals of Dusseldorf, Strasburg and Nancy.

The published plan does not detail all the measures and the schedules prepared for the abovementioned scenarios.

Emergency Response Plan in case of a nuclear accident in Cattenom¹⁶⁴³

The new Emergency Response Plan (ERP) in case of nuclear accident or incident has been adopted and made enforceable by the Governing Council in October 2014.

The ERP includes four key measures of prevention and protection of the population: the sheltering, the absorption of potassium iodide tablets, evacuation and food restrictions. It also distinguishes different phases of the accident, the emergency phase and the post-accident phase which are based on International Nuclear Events Scale (INES). To facilitate the implementation of the plan the country is divided into two areas. The first area is within a radius of 15 km from Cattenom – people living in this area are going to be evacuated in case of an accident in Cattenom. Most of the measures concern this area and if necessary it is extended further to 25 km. In case the accident is rather severe, the rest of the country is also alerted and measures are taking place for the whole country. In case of an incident, a Crisis Cell (Cellule de Crise) will be activated at the national level by the Prime Minister or his delegate. A Cell of radiological assessment (Cellule d'évaluation radiologique) can be activated as well and it will be composed of experts from the Radiation Protection Division of the Department of Health and members of the Rescue Services Agency (ASS).

Plan 'Cyber'¹⁶⁴⁴

In case of an information attack the 'Cyber' plan is adopted since March 2014. This plan has been updated as part of the implementation of the national strategy on cyber security. It defines the

¹⁶⁴² Adapted from: "Plan d'intervention d'urgence - Cas probables / confirmés EBOLA au niveau national ("Plan EBOLA")".

¹⁶⁴³ 'Plan d'intervention d'urgence (PIU) en cas d'accident nucléaire'.

¹⁶⁴⁴ The information was assessed from: http://www.hcpn.public.lu/plans_nationaux/Plan-_Cyber_/index.html.

action of the government in the event of large-scale attack against information systems in the public and / or private sector, which may cause a major malfunction or unavailability of these systems, which threatens the interests vital or essential needs of all or part of the country or the population of Luxembourg. Routine incidents are managed by the CERT (Computer Emergency Response Team).

4.3 Logistics support in crises

During the crisis the Rescue Service Agency provides the transportation (mainly ambulances and fire brigades if the crisis is rather large). Usually military and private logistics providers are not involved in crisis resolution. The decision of their involvement is made by the Supreme Council for National Protection. Article 8 in the Law of 8 December 1981 on requisitions in armed conflict, serious international crisis or disaster states that any person or entity, whether Luxembourgish or foreigner, residing in the Grand Duchy of Luxembourg, may be required to execute tasks of public interest. Therefore it is possible that the private logistics providers will have to be involved in crisis resolution.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

As soon as a crisis is identified and the relevant organisation comes in force, the information is also transferred to the public. Depending on the disaster and crisis, the information is delivered by the competent ministry or agency involved in the response to the crisis. For example, if the crisis concerns the health policy, the Ministry of Health will take the lead in informing the public. Generally, the Information and Press Agency (Service Information et Presse du gouvernement luxembourgeois, SIP) of the Ministry of State (Présidence du Gouvernement, Ministère d'État) is coordinating the information contents and the information flow.¹⁶⁴⁵

While the external communication lies with the Information and Press Agency, the inter-agency and inter-ministry communication is ensured by the High Commissioner for National Protection. For all the parties that are involved in crisis management in Luxembourg, the exchange of the information occurs via so-called 'Log files' which are transferred to the Crisis Cell. This way it is ensured that the flow of information is continuous keeping the involved parties updated with all the decisions made as well as the bodies that made it.

The information to the public is transferred through the official government website dedicated to crisis communication, www.infocrise.lu, which came to live in October 2014. The main rationale to create such a website was to increase the awareness of the action and conduct to adopt as well as of the protective measures taken by the authorities thus making the crisis easier to manage. This website provides the most up-to-date information on the status of the crisis as well as the brochures that inform and prepare the

¹⁶⁴⁵ This information is obtained via the expert interviews.

population for a certain disaster. All government emergency plans, the information related to national authorities with emergency situations¹⁶⁴⁶ are also available on this site.

¹⁶⁴⁶ At the moment this report was under prepared there were emergency response in case of a nuclear accident or incident, pandemics and Ebola presented on the website (see Chapter 4.2).

5 Capabilities

5.1 Human resources

The Department of Radiological Protection which is under authority of the Ministry of Health is composed of 14 people. Following the nuclear accident in Fukushima, the department has increased the number of staff. HCPN is comprised of 11 employees¹⁶⁴⁷.

The Rescue Service Agency consists of 94 permanent employees. The Agency is also responsible for training volunteers. In 2013 the pool of volunteers consisted of 8.184 active people from civil protection and fire brigades. The number of volunteers differs per division/department of the ASS.

According to information provided by the National Federation of Firefighters (la Fédération Nationale des Corps de Sapeurs-Pompiers, FNSP), the fire department was comprised of 8.123 volunteers (including young firefighters and non active members) spread across 148 municipal bodies in 2013¹⁶⁴⁸.

With regard to other organisations, there is no permanent disaster management staff available. Since some organisations are formed when a crisis occurs, people that also get involved in those organisations do have other tasks as well, which they carry out in time of no crisis or disaster. For some of the actors involved the tasks they carry out during a crisis are similar to their regular work like firefighters.

5.2 Materiel (non-financial) resources

Since most of the organisations that are involved in crisis management have also other responsibilities or are involved in responding to local crises, their equipment is not only used in case of large disasters, but also during the daily execution of their tasks. Thus the fire brigade has in its possession the fire trucks and ambulance services have ambulance cars, stretchers and medicines. The Rescue Service Agency also has medicines necessary to be protected from nuclear release. According to the expert interviews, it is expected that there is going to be a national crisis centre build which will be specifically dedicated to the crisis management.

In general, the military is not involved in the crisis response (due to the fact that the number of disasters and crises in Luxembourg is rather limited), however they might be involved. The CSPN decides upon the contribution. Therefore it is possible that military assets might be involved in crisis resolution.

¹⁶⁴⁷ This information is obtained via the expert interviews. According to them, the staff of the HCPN will be enlarged in the near future.

¹⁶⁴⁸ Ministère de l'Intérieur (2013), Rapport d'activité 2013.

5.3 Training

In Luxembourg trainings are organised for volunteers, for trainers and for the staff involved in the crisis management. Besides this nationally available exercises, Luxembourg largely participates in the international exercises as well.

Trainings

There are two schools in Luxembourg that provide trainings for volunteers which are managed by the Rescue Service Agency: the National School of Civil Protection (l'Ecole Nationale de la Protection Civile, ENPC) and the National School for Fire and Rescue Services (l'Ecole Nationale du Service d'Incendie et de Sauvetage, ENSIS). The latter provides trainings for firefighters which is located in Niederfeulen. These training are given by foreign specialists as well. The National School of Civil Protection (l'Ecole Nationale de la Protection Civile, ENPC) exists since 1962 and provides courses in various centres across the country. There are courses that focus on basis skills essential for effective emergency services and courses with heavy equipment). The courses cover all the areas of civil protection (first aid, rescue services, nuclear, biological and chemical incidents and accidents). Trainings of paramedics are also held at ENPC.

The ASS also trains the trainers that themselves are able to give trainings to businesses and volunteers also at ENPC and ENSIS. The trainings are also offered to the workers of the relief centres.

Exercises: national and international

Given the fact that Luxembourg is not exposed to many risks and the number of disaster in the past years was rather limited, Luxembourg focuses its efforts on participating in international exercises. *'Such simulations of emergency situations have the advantage to face a higher degree of complexity and are thus more realistic'*¹⁶⁴⁹. The international exercises are also used in practice afterwards and allow a mutual learning effect at all levels of participation.

With regard to nuclear incidents and accidents, the Rescue Service Agency together with the Department of Radiological Protection regularly organises national exercises or they participate in international exercises. For the past twenty years, they have organised twice per year small-scale national exercises in order to train the specialized intervention teams¹⁶⁵⁰. Focused on a nuclear emergency at the Cattenom nuclear plant, the exercises are organized every three years between Germany (two German federal States: Sarreland and Rhineland-Palatinate), Luxembourg and France.

¹⁶⁴⁹ Department of Radiation Protection (2014), National Report on the measures taken by Luxembourg to fulfill the obligations laid down in the "CONVENTION ON NUCLEAR SAFETY" to the Sixth review meeting of the contracting parties in 2014, on behalf of the Government of Luxembourg.

¹⁶⁵⁰ Department of Radiation Protection (2014), National Report on the measures taken by Luxembourg to fulfill the obligations laid down in the "CONVENTION ON NUCLEAR SAFETY" to the Sixth review meeting of the contracting parties in 2014, on behalf of the Government of Luxembourg.

Luxembourg has participated in INEX exercises¹⁶⁵¹, organized by the NEA of the OECD, CONVEX exercises¹⁶⁵² launched by the AIEA, as well as in INEX¹⁶⁵³.

The staff of the Rescue Service Agency regularly participates in international exercises. For example, in 2013 they partook in TRIPLEX 2013, OPEX Bravo, SIMEX “Count Down”, ARF DIREX 2013, Cold Conditions Exercise, BelModex (Modex1)¹⁶⁵⁴, Exercise OSOCC/RDC¹⁶⁵⁵.

5.4 Procurement

5.4.1 Procurement regulation

European regulations

The procurement of public contracts needs to be in line with the principles of European treaties and especially with the free movement of goods services, capital and people. Furthermore the procurement needs to comply with the principles of equality, proportionality etc. For some types of procurement additional regulations are codified in directives. Within the European legislation, three different procurement directives apply. These directives are mutually exclusive meaning only one of the directives apply to the public procurement. Directive 2014/25/EU (on procurement of utilities) and Directive 2009/81/EC (on procurement in the defence and security industry) are topic specific. If these specific directives do not apply, Public Sector Directive 2014/24/EU is applicable, which is the replacement of Directive 2004/18/EC. The aim of the new Directive is to simplify the rules on public procurement; improve the participation of SMEs and stimulate cross border joint procurement.

Stimulation of cross border joint procurement is helpful in case of a major internal crisis or a cross border crisis. The Directive states in the preamble that contracting authorities should be able to choose to jointly provide their public services in cooperation with other authorities, without being obliged to use any legal form. These services don't have to be identical. The cooperation does not require all participating authorities to fulfil the obligations of the contract, as long as there is a commitment to contribute to the cooperative performance. The preamble points out that there are difficulties in cross border joint procurement. Therefore new rules have to be made. In these rules, the conditions for cross border procurement have to be clarified, as well as the applicable regulations. In addition, contracting authorities should be able to set up joint entities established under national or EU law. The new rules are specified in article 39 of the regulations.

If the procurement is executed by a centralised purchasing body located in another MS, the procurement shall be conducted in accordance with the national regulations of the MS where the purchasing body is located. In addition, several contracting authorities from different MS may jointly award a public contract, conclude a framework agreement or operate a dynamic purchasing system. Participating contracting authorities will then conclude an agreement that determines all

¹⁶⁵¹ <https://www.oecd-neo.org/rp/inex/>.

¹⁶⁵² <http://www-ns.iaea.org/downloads/iec/convex-3.pdf>.

¹⁶⁵³ <https://www.oecd-neo.org/rp/inex/>.

¹⁶⁵⁴ <http://www.securitecivile.be/en/content/european-civil-protection-modules-exercises>.

¹⁶⁵⁵ <http://www.insarag.org/en/global-structures/news-archive-global/211-osocc-course-in-uae-was-conducted.html>.

responsibilities of the parties and the internal organisation of the procedure. As said before, the contracting authorities can set up a joint entity. The parties shall decide on the applicable rules on procurement. They can choose the rules of the MS where the entity has its registered office or where the entity carries out its activities.

This project evolves around the procurement related to crisis management, for example the procurement of ambulances, emergency packs or trainings. The Utilities Directive applies to gas and heat, electricity, water, transport services, ports and airports and postal services (article 8-13). The Directive on defence and security applies to supply of military equipment and sensitive supplies. The majority of procurement in crisis management will be procured by normal NCCs and local authorities like the fire department or police and will not be secret. So in most cases the Public Sector Directive (2014/24/EU) is applicable. This chapter will therefore focus on this directive. Other directives can also be applicable, for example if the army is used to solve a major crisis. The directive is addressed to Member States and has no direct effect on the national regulations. The directive needs to be implemented first.

Scope of the Public Sector Directive

The Public sector directive applies to procurement by contracting authorities with respect to public contracts as well as design contests whose value is estimated to be not less than (article 4):

- € 5.186.000 for public works contracts;
- € 134.000 for public supply and service contracts and design contests, awarded by central government;
- € 207.000 for public supply and service contracts or design contests awarded by sub-central contracting authorities.
- € 750.000 for public service contracts for social and other specific services listed in Annex XIV.

This directive should not apply to certain emergency services where they are performed by non-profit organisations or associations, since the particular nature of those organisations would be difficult to preserve if the service providers had to be chosen in accordance with the procedures of the directive. Furthermore the directive does not apply to public contracts with the purpose of providing public communication networks or electronic communication services; public contracts organised pursuant to international rules; several types of service contracts, e.g. rental, legal services and employment contracts and service contracts based on exclusive rights; and last, public contracts between entities within the public sector (articles 8-12).

Award procedures

On a European level, procurement is executed by the European Commission. The public sector directive contains several award procedures:

- open procedure,
- restricted procedure,
- competitive procedure with negotiation,

- competitive dialogue,
- negotiated procedure without prior publication.

The *open procedure* applies when no other procedure is chosen. In the open procedure, the contracting authority submits a call for tenders. Interested companies may submit a tender. The best offer is chosen, based on the selected award criteria (article 27).

The *restricted procedure* consist of two phases. In the first phase a call for expression of interests is set out. Interest candidates may submit an invitation to tender. The contracting authority will then invite the most suitable candidates to submit a tender. The contracting authority will award the contract to the best tender, based on the selected award criteria (article 28).

In the *competitive procedure* with negotiation any interested candidate may submit a request to participate in the negotiations, in response to a call for competition. In this call for competition, the contracting authority has provided a description of their needs and the characteristics of the works or services to be procured. Only the interested candidates that are invited may submit an initial tender, which will be the basis of the negotiations (article 29). In several cases the negotiation procedure can be used without prior publication, for example when the public contract contains a creative achievement; when there is no competition; when intellectual property rights need to be protected, or when there are reasons for extreme urgency (article 32).

In the *competitive dialogue* any interested candidate can submit a request to participate in response to a contract notice given by the contracting authority. The contract notice provides the information on and the needs and requirements of the contracting authority, as well as the chosen award criteria. The selected interested candidates will join the competitive dialogue, in which the means best suited for satisfying the contract will be defined (article 30).

A new procedure within this directive is the *innovation partnership*. In this procedure, any economic operator may submit a request to participate in response to a contract notice, by providing information for qualitative selection that is requested by the contracting authority. The innovation partnership can be set up with one partner or several partners. Only the economic operators invited by the contracting authority participate in the procedure. After each phase, the contracting authority may decide after each phase to terminate the partnership or reduce the number of partners within the partnership, based on the targets.

According to article 26, the open procedure and restricted procedure are the standard procedures to apply in case of procurement. The other procedures can be used in a limited number of situations, for example when the service is innovative, or when the technical specifications can't be determined (art. 26, sub 4.).

Contracting authorities can use framework agreements, provided that they apply the procedures in this directive. The agreement can not exceed four years. Contracts within the agreement will be awarded according to the rules in article 33.

In most procedures the candidates are chosen with the use of selection criteria. The selection criteria may relate to suitability to pursue the professional activity; economic and financial standing and technical and professional ability. All criteria need to be related and proportionate to the matter of the contract (article 58).

National regulations

Luxembourg still has to implement the public sector directive 2014/24/EU abrogating directive 2004/18/CE. In the Report on the transposition of European Directives and Application of EU Law 16 May 2014 (Rapport sur la Transposition des Directives Europeennes et L'application du Droit de l'Union), the Ministry of Sustainable Development and Infrastructure (Ministère du Développement durable et des Infrastructures (Travaux publics) warns that the transposition of this directive in the national law will engender deep changes in the present legislative framework due to extensive modification in or abrogation of the present law on Public Procurement, the Act of 25 June 2009 on public procurement (Loi du 25 juin 2009 sur les marchés publics). The Ministry also states that the process of transposition will need to take into account all the considerations made by the entities concerned (other ministries as well as the professional organisations (Chambres Professionnelles)).

5.4.1.1 Scope

Therefore, for the time being, the regulatory framework for the procurement procedures in the public sector is the Act of 25 June 2009 on public procurement. This law is structured in three parts (Livres), the last two of which are the transposition in the national law of the previous European directives on procurement (2004/18/CE and 2004/17/CE respectively).

The first part (Livre I) addresses the national specificities in terms of procurement. It starts by stating that “without prejudice to specific provisions of sections II and III, the provisions of this section apply to all contracts awarded by public contracting authorities”, so that at present the provisions do not fully comply with the present European legal framework.

The scope of the national legislation is defined as all those contracts awarded by public contracting authorities that are not reaching the thresholds for the amounts to be contracted that are specified by the European directives¹⁶⁵⁶.

The law is applied under the specifications of the Grand Ducal Regulation of 3 August 2009 implementing the Law of 25 June 2009 on public procurement and amending the threshold provided for in Article 106 point 10 of the amended municipal law of 13 December 1988 (Règlement grand-ducal du 3 août 2009 portant exécution de la loi du 25 juin 2009 sur les marchés publics et portant modification du seuil prévu à l'article 106 point 10° de la loi communale modifiée du 13 décembre 1988).

¹⁶⁵⁶ Retrieved from the Portail des marchés publics du Luxembourg
(<http://www.marches.public.lu/fr/principes-generaux/structuration/index.html>).

5.4.2 Procurement procedures

The law

Before describing the typologies of procurement procedure, art. 4 states that the contracting authorities (*pouvoirs adjudicateurs*) shall apply the principles of equality, non discrimination and transparency. Also, they shall take into consideration the environmental and sustainability issues that may arise, in line with what is stated in each contract specification (*cahier des charges*). Finally, in case of electronic procedure, further and specific modalities are explained in the a regulation.

As for the possible procedures, the law lists three typologies, the “open procedure”, the “restricted procedure” (with or without a tender notice) and the “negotiated procedure”, the first one being the norm and the others the exception.

The exceptions are determined by thresholds concerning the contracted amounts, the nature of the works or services to be contracted and of the contracted authority, as under art. 7-8.

For what Crisis Management is concerned, albeit there is no direct mention of it, under art.8 the negotiated procedure is made possible when the contracting authority is the Army, the Police, the Customs and Excise Administration or the Rescue Services (the terms used are the vague “services de secours”), in case of requirements for the standardization of the equipment and intervention material or of personal belongings necessary for the safety and protection of the members of the intervention unit.

The regulation

The regulation applies to all the Public Procurement Procedures and the contracting authorities listed in Section I of the Act of 25 June 2009 on public procurement. This regulation abides by the principles stated in the European directives 2004/18/EC and 2004/17/EC, thus it will have to be modified or abrogated according to the transposition and implementation procedure

5.4.2.1 Selection criteria

The law

Art. 11 of the Act of 25 June 2009 on public procurement lists the selection criteria to be used in case of Public Procurement Procedure. Those can be either the principle of the most economically advantageous regular offer or the regular offer at the lesser price, where a regular offer is every offer that after evaluation is deemed formally and technically compliant and that fulfils all of the qualitative selection criteria that may be listed in the terms of reference (*cahiers spéciaux des charges* – see below).

The article also lists the requirements that are to be used to evaluate if a proposal is or not economically advantageous. The contracting authority may decide to use one or more of the listed criteria.

Art. 18 lists the only exception to the aforementioned selection criteria in case of Public Procurement carried out by municipalities or analogous authorities. In detail, “notwithstanding the provisions of Article 11, the Board of Mayor and Aldermen or the body entitled to engage for the public institution placed under the supervision of the municipality may, where the total amount excluding the VAT does not exceed 20.000 euros (...) award the contract to a competitor residing in the municipality,

provided that the price offered by the local competitor does not exceed by more than five percent the one of the economically most advantageous regular offer or that of regular offer at the lesser price”.

The regulation

As for the specifications, these are stemming from the regulation Grand Ducal Regulation of 24 March 2014 on the establishment of special sections of standardized charges for public procurement and the amendment of Article 103 of the Grand Ducal Regulation of 3 August 2009 implementing the Law of 25 June 2009 on the public markets (Règlement grand-ducal du 24 mars 2014 portant institution de cahiers spéciaux des charges standardisés en matière de marchés publics et portant modification de l'article 103 du règlement grand-ducal du 3 août 2009 portant exécution de la loi du 25 juin 2009 sur les marchés publics) that details the requirements to insert in all the terms of reference for the different possible procurement objects.

5.5 Niche capabilities

The niche capabilities are those in which a Member States or an associated country specialises and it is ready to provide them to other countries in case of a crisis or a disaster, while other countries recognise their quality and are or may be willing to use them. With regard to that, in the beginning of 2014 the revised legislation on the Civil Protection Mechanism of the European Union has come into force¹⁶⁵⁷. As a result a European Emergency Response Capacity (EERC) has been set up, moving from the previous ad hoc arrangement to a more predictable and reliable system that allows for better planning and coordination. It takes the form of a voluntary pool of pre-committed response assets from the Member States. Therefore the European Union is aware of the niche capabilities of the Member States and can make use of those capacities as well as experts that are available for immediate deployment. This capacity will be covered with regard to “costs of obligatory training courses, exercises and workshops necessary for the certification of Member States' response capacities for the purposes of the EERC ("certification costs"). The certification costs may consist of unit costs or lump sums determined per type of capacity, covering up to 100 % of the eligible costs”¹⁶⁵⁸. Among the niche capabilities, the government of Luxembourg has mentioned in the voluntary pool Technical Assistance Support Team (together with International Humanitarian Partnership), Search and Rescue team's, water purification unit and wild water rescue unit and MEDEVAC (transport ambulances and repatriation by air).

The MEDEVAC unit of Luxembourg has been incorporated into the European Civil Protection Mechanism since 2012. The MEDEVAC unit ensures the repatriation of patients and stakeholders involved in aid missions in countries affected by Ebola. Before MEDEVAC can be deployed, the Luxembourg Air Rescue (LAR) will perform a risk analysis.

¹⁶⁵⁷ The decision has been taken in the end of 2013 regarding the new Civil Protection Mechanism in the EU (Decision of the European Parliament and of the Council, 9 December 2013, PE-CONS 97/13).

¹⁶⁵⁸ Decision of the European Parliament and of the Council, 9 December 2013, PE-CONS 97/13, p.54.

The MEDEVAC module will be available as long as the Grand Duchy of Luxembourg may reserve the right to refuse to accept an assignment to deploy the module in specific cases and after consultation with the European Commission:

- If a national emergency when the Luxembourg should repatriate a person, resident or border infected by Ebola, a collaborator of NGOs under contract with the Department of Cooperation and Humanitarian Action;
- in cases of force majeure such as technical problems of the plane, unstable weather conditions, etc.;
- in case of any serious situation, especially when the risk analysis on a case by case basis by the LAR would prove detrimental to an evacuation¹⁶⁵⁹.

On 27 November 2014 Luxembourg also held a large-scale exercise for all the stakeholders that will intervene in case of an Ebola alert. The exercise was held by the High Commission for National Protection, the Rescue Service Agency, the Health Directorate, the Government Information and Press Service, the Ville de Luxembourg Fire and Ambulance Service, the Luxembourg Hospital Centre, as well as Luxair and Lux-Airport.

Figure 43 Ebola Emergency Simulation Exercise¹⁶⁶⁰

Among other capabilities, it is worth mentioning the integrated platform, emergency.lu. It includes applications, end devices and communication technologies and consists of satellite infrastructure and capacity; communication and coordination services; satellite ground terminals for long term as well as rapid deployment; and transportation of equipment to the disaster area within the first 12 to 20 hours. The main supporters of the platform are the World Food Programme, the Emergency Telecommunication Cluster and the Rescue Service Administration.

Management for

MALTA

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: ECORYS (Laura Birkman, Linette de Swart and Rachel Beerman)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by CSDM and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

Malta is assessed as being one of the safest places in the world according to the United Nations University World Risk Index where Malta scores 0.62, ranking as the second safest country in the world after Qatar. This very low risk ranking stems to a large extent from the very small exposure of the country to natural disasters rather than from the organisational capacity of the domestic risk management system that rarely has to step up to tackle major risks.

Malta is equipped with a rather centralised, one-level system for civil protection which is due to the small scale of the country that allows for no distinction between the local, regional and national levels of crisis management. The whole crisis management system is based on a single, higher-level legislative act, the Civil Protection Act, which describes the key functions of the system but does not go into detail regarding the organisation of the system. Although the Civil Protection Act of 1999 aimed at restructuring and consolidating the disaster management system is under the overview of a sole authority, the Civil Protection Department (CP Department); some fragmentation of processes and responsibilities still exist due to the appointment of alternative competent authorities such as the Armed Forces of Malta (AFM), the Transport Malta authority of the Ministry of Transport and the Ministry of Energy and Health for the specific risks areas such as maritime search and rescue (SAR), maritime pollution and health emergencies respectively.

The civil protection system is placed under the supervision of the Minister of Home Affairs and National Security, who is responsible for the strategic orientation of the system, closely consulted by the Civil Protection Council – consisting of representatives of the key actors of the crisis management system. A large part of the relevant functions and decisions of the involved stakeholders runs on informal procedures based on the institutional knowledge built over the years by the different stakeholders. This informal approach combined with the low base risk contributes to the relevant negligence of formally and regularly updating risk assessments and producing defining policy document. This in turn makes the disaster management system more reactive than proactive.

The backbone of the disaster management mechanism consists of the CP Department that is tasked with coordinating the actions of the other governmental, non-profit, volunteer and private organisations and providing the relevant infrastructure during emergencies. It proposes legislation and policy adjustments, focuses on preparedness of the system by providing training courses and organising exercises and promotes international cooperation and knowledge exchange, activities taking place especially within the framework of the EU and limited bilateral agreements.

In any case, the Maltese system is highly dependent on the contribution of the volunteer sector, either as emergency units within the ranks of government bodies, or as independent organisations such as the Red Cross, or the St. John's Ambulance.

All together, the key limitations of the crisis management mechanism, such as the limited permanent personnel, the lack of specialised administration for specific types of emergencies and the lack of an updated institutional framework with document providing a clear policy orientation, indicate that the Maltese system might reach its limits in the event of a major crisis.

1 Policy

The definition used for a disaster in Malta, in accordance to the Civil Protection Act of 1999, is:

“Disaster means an unforeseeable event which causes or threatens to cause damage to the lives and health of a significant number of people, or to property or to vital supply resources of the population or to the environment, and the urgency of the situation requires the co-operation of authorities, institutions, and organisations for prompt remedial action”¹⁶⁶¹

Until the establishment of the Civil Protection Department in 1999, crisis management and civil security were in the hands of the police force and the national security services. Since the Civil Protection Act of 1999, a Minister is appointed as head of the country’s civil protection services. Currently the Minister of Home Affairs and Security (HAS) and in specific the Civil Protection Department of Malta, take up the lead role in civil protection services and the coordination of all relevant stakeholders. Exceptions to this rule are the lead role in crisis response for incidents related to maritime pollution belonging to the Transport Malta authority, maritime search and rescue (SAR) falling under the responsibility of the Armed Forces of Malta (AFM) and that for pandemics where the lead role in the crisis response belongs to, the Ministry of Energy and Health. In all these cases, the CP Department complements their efforts.

The Civil Protection Council, which resembles a crisis management task force (the members of which are appointed by the Prime Minister), acts as an advisory to the government body regarding civil protection issues, while it is also responsible for approving the national contingency plans.

Due to the small size of the country, there is no separation between local, regional and national level in matters of crises management¹⁶⁶². Crisis management is seen as a national effort to which the military is a major contributor. Amongst its secondary roles, the AFM are tasked with providing emergency protection support, while it maintains the lead role in research and rescue in the territorial waters of the country.

Continuing the long-standing tradition of Malta in social solidarity, the Maltese crisis management concept is heavily based on the participation of volunteer bodies. Volunteer organisations such as the Malta Red Cross, the St. John’s Ambulance and the SPIDER volunteer unit (Specialised Personnel In Disaster and Emergency Response) of the CP Department are substantial contributors to the preparedness, response and relief effort of the national disaster system, focusing especially on the provision of trainings to the public and first response services.

¹⁶⁶¹ Article 2, Civil Protection Act, 1999

¹⁶⁶² The Civil Protection Act does not indicate different approaches in assigning responsibilities to authorities for national, regional or local level of crisis management. In this Act national and regional level of disaster management are specifically mentioned while no reference to the local level of crisis management is present.

1.1 Risk Assessment

The **Civil Protection Department (CP Department)** is, according to Maltese legislation, responsible for the preparation of vulnerability and risk assessment studies. In principal, in Malta there is only one overall national-level Risk Assessment (RA) study with no separate, sector-specific RAs being developed. However, in areas where the lead responsibility does not lay with the CP Department as specified in the CP Act, separate risk assessments may be drawn. The CP Department additionally checks and inspects the RA plans prepared by individual organisations and departments, because the CP department is responsible for the coordination at a national level in case of such incidents.

The current national RA plan of the CP Department dates from just after its establishment in 1999 and is considered largely outdated. The CP Department is therefore in the process of procuring the revision of the current Master Plan for natural disasters, including an update of the RA plans. A tender is planned as part of this procurement process.

According to the ANVIL¹⁶⁶³ country report for Malta, the Maltese risk assessment approach is mainly incident-based with limited focus on performing further exercises of national risk assessments that would assist in preparing more efficient emergency plans. Nevertheless, according to the United Nations University World Risk Index which is defined as:

*“the risk of becoming the victim of a disaster resulting from an extreme natural event”*¹⁶⁶⁴

Malta is assessed as being one of the safest places in the world with risk rated at 0.62%, which ranks Malta as the second safest country in the world after Qatar. Table 1-1 present the rating of Malta for each of the composing elements of this indicator. In this index, the susceptibility, coping capacity and adaptive capacity of each country is assessed and multiplied with its population’s exposure to natural disasters to derive the risk for each country.

Table 1-1: Malta World Risk Index Scoring

Malta World Risk Index	Exposure	Vulnerability	Susceptibility	Lack of coping capacities	Lack of adaptive capacities
0.62%	1.65%	37.67%	15.28%	59.58%	38.16%

Source: UNU-EHS, World Risk Report 2014

Malta is considered minimally exposed to natural disasters, making up for a very low exposition rating. Nevertheless, the Maltese civil protection system is steered towards countering the main areas of concern with high possibility and impact of incidents¹⁶⁶⁵:

- Flash floods;
- Industrial and transport accidents; and
- Large scale pollution from hydrocarbon spill.

¹⁶⁶³ ANVIL - Analysis of Civil Security Systems in Europe - <http://anvil-project.net/>

¹⁶⁶⁴ UNU-EHS, World Risk Report 2014

¹⁶⁶⁵ ANVIL - Analysis of Civil Security Systems in Europe; Country Study Malta, 2013

Flash floods are the most frequent disasters occurring in Malta. They usually take place in early autumn and cause mainly damage to infrastructure, while also human casualties have been reported in some cases. Under the EU Flood Directive 2007/60/EC, Malta has been committed to prepare a Preliminary Flood Risk Assessment (PFRA) study to feed a flood risk management plan.

Almost as frequent are transport, especially maritime, accidents occurring usually in the summer months. During the last decade, also a couple of industrial incidents related to firework factories have been classified as disasters. Finally, with the increasing maritime traffic through and nearby the Maltese territorial waters, and especially after the Deep Horizon incident in the Mexican Gulf, the need to assess the risk of a large-scale hydrocarbon spill to prepare an efficient response has aroused.

Classified as less likely, but bearing significant impacts are the risks deriving from the possibility of:

- A high intensity earthquake;
- A terrorist attack;
- Transport isolation due to an eruption of Mount Etna.

Despite the main threats recognised in the risk assessment mentioned above, according to Malta's prime Minister Lawrence Gonzi, the most challenging incident regarding national security in recent Malta's history, did not come out of any of the areas above, but was rather the recent Libyan crisis of 2012. This crisis posed a challenge on multiple levels to Malta ranging from the management of civil war refugee flows, to the coordination of regular, emergency and military flights over the country's Airspace and to the evacuation of Maltese and other nationals from Libya. The first time the national contingency centre was ever used was during the Libyan crisis in 2012.¹⁶⁶⁶

Analytically, Table 1-2 presents a list of incidents classified as civil security crises in Malta for the period 2000-2012 according to the ANVIL project and based on the *International Disaster Database*¹⁶⁶⁷ and publications on the Maltese press.

1.2 Policy and Governance

1.2.1 Strategy scope and focus¹⁶⁶⁸

Crisis management in Malta is centralised as no distinction between local, regional and national level of civil protection is made. Due to the country's size, every type of crisis event unavoidably mobilises the national crisis management mechanism since there is local crisis management level of response. The small size of the country and especially the small size of the disaster management system in combination with the absence of highly impactful disasters in the recent history of Malta have led to a large part of the processes in place being on an informal basis and relying on institutional memory with limited documentation of processes.

The government receives advice on the civil protection policy direction and the approval of risk assessments and disaster management master plans from the **Civil Protection Council (CP Council)** of Malta. This is comprised of high ranked government officials from relevant government authorities. Moreover, the **Civil Protection Scientific Committee**, consisting of University and private sector representatives provides the government with advice regarding scientific issues of civil protection policy and especially on topics related to fields where state expertise is limited (e.g. water purification and waste management).

¹⁶⁶⁸ There is no documentation publicly available on the strategy scope and focus of the Disaster Management system of Malta. Thus, this section is to a large extent based on the interview conducted with the CP Department of Malta.

The CP Department of the Ministry of Home Affairs and National Security is the centrepiece of the disaster management system of Malta and has the responsibility for the coordination of all stages of disaster management, stretching from prevention and preparedness to response and recovery for all types of incidents with the exception of maritime SAR, maritime pollution and pandemics where it is tasked to support the assigned competent authorities in crisis management:

- The AFM of the Ministry of Home Affairs and National Security for maritime SAR;
- The Transport Malta authority of the Ministry of Transport for maritime pollution;
- The Health Department of the Ministry of Energy and Health for pandemics.

All other relevant governmental authorities and organisations (i.e. the Police, the AFM, and the Health Department etc.) can be summoned by the CP department to support the disaster management effort.

Alongside the central role of the state in crisis management, there is also a strong societal support to the disaster management cause. Volunteer organisations take up a significant role especially in disaster response and the relief, either under independent entities such as the Red Cross and the St. John's Ambulance or contributing as emergency personnel of state organisations such as the CP Department and the AFM.

Altogether, given the very good overall safety assessment of Malta, the civil protection system is steered more towards the disaster management phases of preparedness and response adopting a rather reactive approach to disaster incidents. With the disaster management system stripped from an updated general or a sector specific risk assessment, preventive actions could be misdirected and areas of potential risk neglected.

Relatively more weight is placed towards the phase of preparedness where trainings and exercises occur regularly and relevant material and equipment is stockpiled. However, the coordination of the preparedness phase for crisis management could be even more efficient at a central level as currently each potentially involved organisation defines its strategy to preparedness and retrospectively coordinates with the CP Department which is minimally, if at all, involved in the preparedness design.

The response phase is probably the phase on which the most attention is placed in the Maltese system. This is clearly coordinated by the CP Department or any other competent authority in accordance to the scope of the incident with clear roles and lines of communication for the parties involved. Finally, the absence of large and unmanageable disaster incidents in the recent Maltese history has led to less attention steered towards developing a detailed recovery and relief policy.

An exception to the disaggregated and incomplete general disaster management policy cycle is the area of flash-floodings prevention. The frequency of the occurrence of this type of disaster, combined with the provision of the EU Flood Directive, prescribing the need for a Storm Water Master Plan (SWMP) followed by a sector-specific, scoping Preliminary Flood Risk Assessment (PFRA). (In Figure 1-1 the areas of the island that have experienced previous surface water flooding are indicated. The PRFA indicates the direction of flood-related disaster management policy identifying

the focus areas, while the SWMP identifies measures and projects that could be undertaken to mitigate the consequences of flash-floodings in the long run. These measures and projects include: flooding prevention, protection, preparedness and early warning systems aiming in enhancing the resilience of the system.

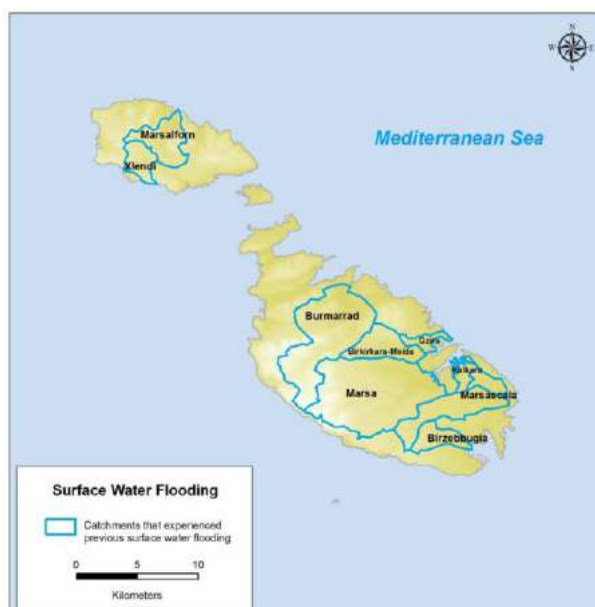

Figure 1-1: Past surface water flooding areas in Malta¹⁶⁶⁹

1.2.2 Monitoring and analytical support to policy making; R&D

The CP Department is tasked with performing the disaster risk assessments and providing views and suggestions on the direction of civil protection policy to the CP Council which consults the Minister on the options suggested. However, the main institution linking scientific research with policy decisions is the CP Scientific Committee that advises the government and the CP Department on scientific issues, especially in knowledge areas where state knowledge is limited such as water purification and waste treatment and management.

Beyond the consultations with the CP Scientific Committee, there are a few research cooperation projects taking place, with the most significant scientific partner to the government in this being the University of Malta. One of the most significant research projects relate to modelling potential hydrocarbon pollution dispersion in sea. This research is performed in cooperation with the Oceanographic Department of the University of Malta under the SIMED¹⁶⁷⁰ project.

1.2.3 Policy for Prevention

The Civil Protection Department works with other governmental and non-governmental actors in order to reduce and eliminate the risks of emergency situations occurring, thus protecting the

¹⁶⁶⁹ Source: Malta Resources Authority (MRA), Preliminary Flood Risk Assessment (PFRA), 2013

¹⁶⁷⁰ SIMED: Modelling of circulation and marine ecosystems of the Mediterranean Sea with NEMO-MED12

population, the environment and the property of Malta. The CP Department is also responsible for awareness raising of the public regarding civil security crisis and risks.

However, the concept of prevention is not explicitly laid down in the Maltese civil protection system and the only sector-specific master plan with an explicit prevention orientation is that regarding water flooding. Under the EU Floods Directive 2007/60/EC, which Malta has adopted in its national regulation¹⁶⁷¹, Malta has committed to prepare a PFRA study and a subsequent flood risk management plan to manage and reduce risks in areas identified as running significant flood risks. The existing SWMP targets the economic, social and environmental consequences of floodings in Malta and puts forward a strategic, objective-driven approach to manage storm water in the long-term. This plan consists of:

- a) alternative engineering proposals for storm water management and reuse;
- b) a strategic approach for selecting the preferred alternatives;
- c) a maintenance programme;
- d) implementation measures including organisation, legislation, training, financing and monitoring.

1.2.4 Policy for Preparedness

The Civil Protection Department is part of the Maltese network responsible for maintaining safety and security of the general public. They take up the lead role in the country's preparedness policy the main objective to organise civil protection services by coordinating the capabilities and resources available to other ministries and departments such as the Police, the AFM and the health authorities. Moreover, the CP Department aims to reduce the risks from man-made disasters and prepare the response to natural disasters that may occur. The CP Department is therefore required to prepare contingency plans to be put in action in case of crises. These plans are approved by the CP Council consulting body. Additionally, the CP Departments is responsible for arranging the infrastructure necessary to provide smooth interdepartmental coordination when tackling a civil security incident. Currently contingency plans exist for the events of earthquakes, floods and wars in the neighbourhood.

To secure a high level of preparedness of its staff, the CP Department organises a number of training courses for both its permanent members and the volunteers of the CP Department. Furthermore, part of the CP Department contribution to the preparedness policy, is its task to organise training courses and safety exercises for fire-fighting, basic rescue and first aid for both the general population as well as for the civil forces expected to contribute in crises management (Police, Fire Brigade etc.). The volunteer organisations of Red Cross Malta and the St. John's Ambulance Malta also contribute to the preparedness aim by organising first aid training courses for the public, which are coordinated with the CP Department's training cycle. Finally, the CP department itself participates in EU training programmes as it also designs to offer a SAR module in Malta for its European counterparts. Additionally, bi-lateral cooperation in providing training to staff members is arranged with Italy through the Memorandum of Understanding signed by the Italian *Gruppo Operativo della Protezione Civile Edelweiss*. Under this agreement members of the Maltese Civil

¹⁶⁷¹ Assessment and Management of Flood Risks Regulations, L.N. 264 of 2010

Protection provided training to the Italian civil protection team, while a number of volunteers and members of the Civil Protection Department had the opportunity to perform training in the region of Calabria.¹⁶⁷² Also the SPIDER Unit has established a similar cooperation with the between the SPIDER Unit and the German Federal Agency for Technical Relief (THW).

Additionally, disaster management simulation exercises form a fundamental part of the Maltese system policy for preparedness. These exercises may be performed by the CP Department alone, or in combination with other state or volunteer organisations. One of the objectives of these training exercises is to test the interoperability techniques among agencies in events of disasters.

Furthermore, the CP Department oversees the preparations of the contingency plans of all organisations and authorities in Malta. Then, based on an annual plan, inspections take place to test the preparedness of all organisations and authorities to execute their contingency plans.

1.2.5 Policy for Response

The CP Department takes in principal the leading role in emergencies, in case the safety of the public is concerned. The CP Department, under the headship of the Ministry for Home Affairs and National Security and supported by a group of experts from various governmental departments, is responsible for the effective response of the civil protection system to any disaster by coordinating all necessary and available resources in case of any major disaster.

During emergency situations, the Rescue and Assistance Force (RAF), which is set up under the umbrella of the CP Department, operates with the purpose of maintaining an adequate service for prompt intervention in case of an emergency, whether occurring on land or at sea. Throughout the whole disaster response duration, the CP Department has the leading role (except for the instances described in 1.2.1 where it supports other leading state authorities) and an CP Department officer is nominated as **Incident Site Commander** by the Director of the CP Department. The Incident Site Commander is granted authority to request the assistance of other government departments as well as from the private sector, as he sees necessary, to stem possible dangers for civilians and to resume public safety.

The AFM holds a major role in the provision of emergency protection support especially responding to the emergencies related to explosives, marine pollution and floods, but also beyond these aspects the organisation provides trained personnel and equipment to support the response effort of the CP Department. They also take the lead in incidents of marine SAR. In their effort, they are supplemented by the Emergency Volunteer Reserve Force (EVRF) of the AFM. Other organisations that may be summoned to support the CP Department are the Health Department, the Police and volunteer NGOs.

The limited public sector response capacity is largely complemented by the all-society response culture in the event of major crisis events adopted by the Maltese society. An important role in

¹⁶⁷² E.F.R.U. volunteers back from overseas training in 'Swift Water Rescue'

mobilising response capacity for emergency events is located among volunteer organisations and the private sector. This is mirrored by the important role enjoyed by volunteer organisations in cases of crises management. The EVRF are not the only volunteer organisation contributing to disaster management. Volunteer organisation such as the Malta Red Cross, the St. John's Ambulance and the Specialised Personnel In Disaster and Emergency Response (SPIDER) take up a critical role in when response to emergency situations is required.

Additionally, the private sector can be recruited by public authorities to contribute to the emergency response effort. The cooperation between private enterprises and the public authorities is mainly based upon informal arrangements.

1.2.6 Policy for Relief and Recovery

Again, the leading role in the phase of recovery and relief lays in principal with the CP Department which is responsible for providing humanitarian aid and mobilises the contribution of other government authorities and volunteer organisations if needed. Exceptions to this are the cases of maritime pollution, and pandemics where the lead is hold by the Ministry of Transport and the Emergency Healthcare Department respectively. In case of maritime SAR that is performed by the AFM, the CP Departments takes over as soon as the rescued people are onshore. Nevertheless, especially in cases where a large number of people are affected, the humanitarian aid cannot be handled by the CP Department exclusively, which has to rely considerably on the support it receives from the other governmental departments and the volunteer organisations.

1.3 Financing

1.3.1 Investing in preparedness

The funding of the CP Department stems predominantly from the government budget, with only a small part of the budget coming from alternative money streams. These originate mostly from EU funds. An example of the utilisation of EU funds to invest in preparedness is the co-funding of the SWMP by the EU Cohesion fund. Through the 2014 Budget¹⁶⁷³, the Government of Malta announced its intention to further invest in preparedness by initiating an investment programme for emergency vehicles and examining the need and spread of fire fighting stations while planning to transfer the Departmental Headquarters to a new location at Mosta also upgrading their facilities.

The funding of volunteer units that operate within public authorities such as the SPIDER team of the CP Department and the EVRF of the AFM originates from public funding as well. On the other hand, independent volunteer organisations rely to a lesser extend on government financing and draw their financial resources through a variety of private means (such as contributions of the volunteers themselves, donations from the general public and private sector sponsors). Additionally, the CP Department cited that they apply for funding of specific events (such as international collaboration and training) and procuring necessary equipment to EU funds earmarked for such activities.

¹⁶⁷³ Ministry of Finance of Malta, Budget Speech 2014, 4th November 2013

1.3.2 Investing in consequence management

In principal, the CP Department and consequently the Ministry of Home Affairs and National Security, should have budget available to cover the cost of recovery from disasters. However, in case extraordinary expenses are needed to offset the consequences of a disaster, the central government provides this additional funding. There are also EU specific funds contributing to recovery of specific types of disasters. The CP Department cited as relevant examples the application of the Asylum and Migration Fund and the Internal Security Fund of the EU which contribute to the better management of migration flows and border security, partly overlapping with scope of activities of the CP Department.

1.4 Policy review, Evaluation & Organisational Learning

There is no legal or policy document stipulating the process for lessons learning regarding civil security. However, exploitation of past events in order to improve the responsiveness of the disaster management system is implicit in a number of practices.

1.4.1 Post-Disaster Assessment and Lessons Learned

Due to the size of the Maltese disaster management system and the lack of different vertical layers of organisation, the post-disaster assessment is an undistinguishable part of the lessons learned process. Thus, in this section, these elements of policy review are examined simultaneously.

While there is no formally established system for assessing lessons learned, probably also due to the less frequent occurrence of major challenges for the Maltese crises management mechanism, national authorities are opting for the improvement of the overall system. Following any large-scale incident dealt by the CP Department, a de-briefing process takes place usually led by the CP Department to examine the facts leading to a crisis situation and the response of the agency. The involvement of additional organisations or authorities in the de-briefing process is arranged based on the type of incident addressed. Moreover when the incident type falls under the competence of other organisations (e.g. the AFM or the Ministry of Health), the leading role of the post-disaster assessment is transferred to the relevant actor and the CP department supports the activity.

The whole process is currently not a formalised one, nonetheless its findings feed in the update of existing standing operational procedures with changes to the procedures followed in case of emergencies, the issuing of new standing orders or the development of the guidelines used for the planning of future Civil Protection exercises. Past experience is especially utilised for updating the design of possible scenarios. The updated as well as the new documents produced are available within the CP Department and shared with other relevant organisations, but they cannot be considered as official documents.

An example of the system described is the aftermath of the *Libyan Civil War* crisis, and although Maltese authorities assessed the response to the crisis as successful, they formulate to derive some lessons for improving the overall disaster management system. One of the lessons learned was that more flexibility to take action was required at the level of individual agencies which would result from transferring some responsibilities held by executive bodies.¹⁶⁷⁴

After a de-brief process, the CP Department is responsible for putting forward proposals for the regulations required to respond better to disasters or emergencies. This is in line with the CP Department's task to continuously assess past disaster events and cope for the continuous improvement of the disaster management system as reported in the interview with CP staff.

1.4.2 International exchange for Lessons Learned

Malta participates in a number of international exchange programs, especially in the context of the EU programmes. Additionally it participates at bilateral training exchanges with authorities from the southern regions of Italy in an attempt to exchange best practices, learn from one another and bring knowledge back to improve the domestic system. Such bi-lateral collaborations contributing to international exchange of lessons learnt are those set up between the CP Department and the Italian *Gruppo Operativo della Protezione Civile Edelweiss* as well as the ones between the SPIDER Unit and the THW.

Specifically, the experience gained from the personnel (either permanent members of the CP Department or volunteers) deployed in EU and international exercises is exploited in accordance to EU guidelines and the participants in such exercises are required to write reports proposing improvements in existing procedures.

1.4.3 Regular policy reviews

A consequence of the risk assessment of the Maltese disaster management system is the absence of a regular process of policy review. The official policy to disaster management is described in the *Master Plan for Disaster Management*. With this document adopted more than 15 years ago it can be considered largely outdated. The CP Department is currently engaging into the preparation of its update to bring it in line with more recent developments with this process expected to end within 2015.

The CP Council comprises of representatives from the CP Department (in charge of preparing policy), the Minister of Home Affairs and National Security (responsible for approving policy), other relevant governmental organisations (as mentioned earlier) and a representative of other volunteer organisations. This guarantees the participation of all relevant stakeholders in the process of Master Plan preparation by consulting the Minister over the policy directions as well as specific elements of the Master Plan. Additionally, the CP Scientific Committee brings in the process the views of the

¹⁶⁷⁴ <http://www.independent.com.mt/articles/2012-09-14/news/learning-from-the-libyan-crisis-315959/>

industrial and scientific stakeholders, with emphasis in knowledge areas with limited governmental expertise.

1.5 Resilience

Although the implementation of the concept of resilience is currently discussed within the CP Department in view of the upcoming update of the Master Plan for *Disaster Management*, there is still no reference to the implementation of this concept within the policy framework of the Maltese civil protection system. The only exception to this is the SWMP which adopts a more systematic approach to tackling potential risks investing also into the resilience concept for flood protection.

1.6 Information sharing and data protection

The CP Department maintains a central database containing information of the registered volunteers. This includes their contact information, address and phone number, occupation and trainings followed contact information and training followed with the CP Department in order to be able to more appropriately match them with the occurring needs. Based on these data, the volunteers are notified in case of emergencies.

These data regarding volunteers are kept for internal use of the CP Department only, as the Data Protection Act of 2001 makes it very difficult to justify transfer or sharing of personal data with other organisations. Similarly, the CP Department has no access to information collected by the AFM regarding the EVRF corps, or similar databases of other relevant stakeholders.

Using social media

Currently there is no plan in place to utilise data collected by social media or other sources, probably also due to the low base risk factor of Malta.

2 Legislation

2.1 Crisis (emergency, disaster) management concept

The Civil Protection Act Chapter 411 (Act No. XV of 1999) is the sole official document arranging the main institutional aspects of civil protection and it provides for the establishment of a Civil Protection Department and an Rescue and Assistance Force Unit (RAF) within it. There, “disaster” is described as:

“...an unforeseeable event which causes or threatens to cause damage to the lives and health of a significant number of people, or to property or to vital supply resources of the population or to the environment...”

This broad definition blurs the boundaries of civil security and national security engagement which is not clear in all cases. Nevertheless, a working agreement, described by an internal document, has been achieved between the CP Department, the AFM, the Police and the other relevant governmental authorities, bringing a rather seamless cooperation and understanding of the division of responsibilities.

Amongst other provisions, the Civil Protection Act (CP Act) defines the responsibilities of the Minister of Home Affairs and National Security regarding Civil Protection in the country and sets the foundations for the CP Council, the CP Department and the Rescue and Assistance Force while defining the scope of their activities.

According to Article 5 of the CP Act, the CP Council is composed of the following *ex officio* members:

- the Minister for Home Affairs and National Security (Council Chairman);
- the Permanent Secretary of the Ministry for Home Affairs and National Security (Council Deputy Chairman);
- the Director of Civil Protection;
- the Commissioner of the Police;
- the Armed Forces Commander.

and up 7 members appointed by the Prime Minister, which are:

- up to 5 senior officers from the ministries responsible for issues relevant to civil protection (i.e. public works, environment, telecommunication and transport, health, economic affairs, energy and Gozo affairs);
- a member chosen after consultation with NGO representatives;
- a member nominated from the Local Councils Association.

The CP Council comes together in regular meetings every 3 calendar months and can be considered as the main consultative body to the competent Minister, both in times of emergency as well as

during its regular consultation sessions. According to Article 6 of the CP Act The CP Council is responsible for:

- formulating, directing and coordinating national civil protection policies and practices;
- directing and coordinating preparations of civil protection tasks required in case of disasters or emergencies;
- advising the Minister on the selection of the national overall Incident Site Commander to deal with particular emergency events or disasters;
- approving emergency and disaster contingency plans, guidelines and codes;
- monitoring the CP Department operation;
- advising the Minister on measures for the protection of the public;
- encouraging and supporting emergency preparedness; and
- coordinating the development of civil protection volunteer organisations.

Complementary to the role of the CP Council, is that of the CP Scientific Committee. This Committee is formed by representatives of the industry and academics and its role is to consult the Minister and the CP Department on scientific aspects, especially in the areas where limited government capacity is to be found.

However, the organisation that comprises the backbone of the disaster management system is the CP Department. The CP Department was established with the Civil Protection Act of 1999 as the evolution of the Fire Brigade service. Upon its creation it got staffed with experts from various governmental departments in order to be able to prepare for and coordinate the response to any major disaster. The CP Department is placed under the headship of the Ministry for Home Affairs and National Security of Malta and according to Article 4 of the Civil Protection Act, it retains responsibility for the:

- preparation of contingency plans to respond to natural or man-made disasters;
- organisation and co-ordination of training facilities and courses for the personnel that is required to respond to disasters;
- establishment of the necessary infrastructure for the coordination of the organisations involved in emergency response;
- preparation of risk and vulnerability assessment studies;
- promotion of public awareness in civil protection issues;
- preparation of regulations required to respond to disasters or emergencies under the Civil Protection Act and the Emergency Powers Act;
- perform any other functions related to civil protection assigned by the responsible Minister;
- maintenance of an assistance and rescue force.

The last is achieved through the establishment of the RAF according to Article 8 of the CP Act. The RAF is tasked with:

- maintaining an adequate service for prompt intervention in the case of natural or man-made disaster situation which requires the immediate assistance of a public force or special equipment;
- intervening in any emergency or disaster;
- carrying out any of the duties assigned to it by the Director of Civil Protection.

2.2 General crisis (emergency, disaster) management law

The CP Act is the legislative document that also defines the hierarchy of command during emergency events and disasters. According to the Article 9 of the Act; in case of an event, the Minister, after consulting with the CP Council can appoint an Incident Site Commander who acts as a national coordinator for the response effort. This Commander can consult, for the better performance of his tasks the CP Council and the CP Scientific Committee, while he coordinates the response efforts of the CP Department and of any other state authority he has summoned for support in tackling the crisis events.

Other management procedures are arranged via the internal standing operating procedures or other administrative documents of the authorities involved.

Complementary to the provisions of the CP Act, and arranging specific aspects of the disaster management system are:

- the Emergency Powers Act in combination with the CP Act defines the aspects relevant to the declaration of Emergency rule (as explained in detail in the following section);
- the Voluntary Organisations Act defines the framework for the operation of volunteer organisations, allowing them to support the government also in the field of civil protection;
- The Data Protection Act sets the underlining conditions for the operation of the collection and management of personal data of the individuals involved in the disaster management system.

However, the two latter documents do not make explicit reference to the disaster management effort, but rather continue to apply also in this occasion.

2.3 Emergency rule

In case of emergency, Article 9 of the Civil Protection Act prescribes that the Incident Site Commander, the Director of the CP Department or the highest ranking official of the Rescue and Assistance Force has, according to his judgement and if indispensably necessary for the operations relevant to emergency response the power, to:

- order immediate requisition of any property necessary for the operations,
- order the evacuation of persons from any premises,
- enter any premise without the need of a warrant,
- cause damage to any private property to prevent life threats and spreading of any event effects.

Even more far-reaching are the provisions of Article 4 of the Emergency Powers Act which are applied when the President of Malta, acting in accordance with the advice of the Prime Minister, declares that a public emergency exists. Then, the President of Malta, aiming to *“ensure public safety...and for maintaining supplies and services essential to the life of the community.”* may proclaim the entry into force of emergency powers. This wording allows for the activation of the emergency powers also in response to disasters hitting Malta. Amongst others, the emergency

powers bring limitations to individual rights and liberties. The emergency powers confer extended powers to the President of Malta, which amongst others concern:

- making provision for the detention of persons;
- authorizing on behalf of the Government the taking of possession or control of any undertaking or property with the exception of land property;
- authorizing the entering and search of any premises;
- providing for amending any or suspending the operation of any law, and for applying any law with or without modification;
- providing for payment of compensation and remuneration to persons affected by the regulations.

Any regulatory change brought into effect under the emergency power provisions will cease to have any effect after 2 months from the day it comes into operation except in case the change is approved by the House of Representatives in the meantime.

Additionally, Article 10 of the Malta Armed Forces Act of 1982, sets the framework for extending the service of soldiers in the event of a great emergency, while Article 32 of that same Act foresees the callout of reserved forces (whether they belong to Malta's regular or territorial force): *'If it appears to the president of Malta that national danger is imminent or that a great emergency has arisen...'*

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

Due to the size of Malta and its CP Department, no division between departmental and national government level legislation is introduced. Regarding the involvement of local level actors, the only field that they form part of the disaster management system is in the field of environmental pollution.

In this case, local councils form part of the surveillance system while they are responsible also for risk management at schools and the local industry.

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

In Malta there are no lower than national level legal arrangements and regulations in the Maltese civil protection system. See paragraph 2.4.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

As mentioned earlier, the civil protection system of Malta relies heavily on the involvement of volunteer organisations. For the involvement of volunteer units that operate within the organisations

and authorities participating in crisis management, such as the CP Department SPIDER unit and the EVRF volunteer unit of the AFM, the same legal provisions (see CP Act), internal rules and processes apply as to the involvement of their regular staff members.

The legal act prescribing the functioning of independent volunteer organisations and NGOs in Malta is the Voluntary Organisations Act of 2007. However this act only sets the legal status of volunteer organisations engaged in civil protection amongst the possible purposes for their foundation. There are no specific legal acts with provisions on the involvement of volunteers and specialised NGOs in disaster management as the CP Act only prescribes the responsibility of the CP Council to coordinate and encourage the development of voluntary organisations.

On a strategic level, the representative of voluntary organisations on the CP Council advise the Minister on the capacity and possibilities of volunteer organisations to support the CP Department or other public institutions in crisis management. Their operational coordination is informally arranged with the CP Department.

2.7 Legal regulations for international engagements of first responders and crisis managers

EU regulations

As an EU Member State, Malta has implemented the EU regulations regarding crisis management. This legislation comes mainly in the form of European Council Decisions that set out the general rules and conditions for cooperation. The main legislative acts regulating first responders and crisis managers are:

- Council Decision 2007/779/EC/Euratom of 8 November 2007 establishing a Community Civil Protection Mechanism; and
- Council Decision 2008/617/JHA of 23 June 2008 on the improvement of cooperation between the special intervention units of the Member States of the European Union in crisis situations.

The Council Decision 2007/779/EC/Euratom of 8 November 2007 was issued to set up an effective cooperation mechanism to coordinate rapid exchange of information and arrange assistance through an European network of civil protection resources. The Community Civil Protection Mechanism is based on establishing amongst others: an inventory of possible assistance and intervention teams at an EU level, a common training programme, a Monitoring and Information Centre (MIC) that forwards requests for assistance by affected Member States to a network of national contact points, a Common Emergency Communication and Information System (CECIS) and the provisions for facilitating the sharing of information on the resources available within the network.

The Council Decision 2008/617/JHA of 23 June 2008 aims to set a framework for the cooperation between Member States' special intervention units in crisis situations. The Decision establishes the general rules and conditions for the provision of assistance by special intervention units to any requesting Member State. According to the provisions of this Decision, the units from countries that

provide assistance take up an assisting role and act only within the limits and powers as defined by their own national law. To ensure that experience, expertise and information on managing crisis situations are exchanged joint trainings and exercises between Member States are promoted and may be funded from Community financial programmes.

Bilateral agreements

The CP department reported that Malta used to have bilateral agreements in place with its neighbouring countries for provision of assistance in crisis situations. Relevant agreements were signed with Italy and the Italian region of Sicily, Greece, Tunisia and Libya. The cooperation with Italy focuses on organising expert visits for exercises and their participation in training programmes on emergency response. The cooperation with Greece covers a broader range of civil protection activities such as: exchange of technical information, cooperation in pre-empting natural disasters and in tackling cross-boundary crisis.

Additionally, the Malta CP Department had developed cooperation with Algeria and Tunisia within the framework of the Euromed project where joint seminars and exchanges of best practises were organised. With the exception of the cooperation with Italy and Greece, the other bilateral cooperation projects have, in the aftermath of the Arab Spring, been rendered inactive.

Currently, cross-border activities of the Maltese authorities are focused on activities within the EU framework and regard mainly cooperation with the southern regions of Italy, and especially Sicily. During cross border incidents, the crisis centre is established in the Prime Minister's office, and the Ministry of Foreign Affairs gets involved in the operational decisions.

3 Organisation

Malta has no administrative divisions; all administration is based in Valletta. The crisis management system of Malta is, in a similar way, centralised with only one, national, level of organisation. The main contributors to the disaster management effort are the state organisations; however the system relies to a great extent on the support of volunteers and volunteer organisations.

3.1 Organisational chart

3.1.1 Government organisations

Policy-making and planning for civil protection in Malta takes place at a ministerial level and is at the hands of the Minister of Home Affairs and National Security. The **Civil Protection Council** (CP Council) is a consultative body to the Minister (and headed by himself) responsible of, amongst others, the formulation, direction and coordination of national policy issues, approval of contingency plans, guidelines and codes prepared by the CP Department, and providing advice to the Minister on measures for the protection of the public also during emergency incidents and to support emergency preparedness capabilities.

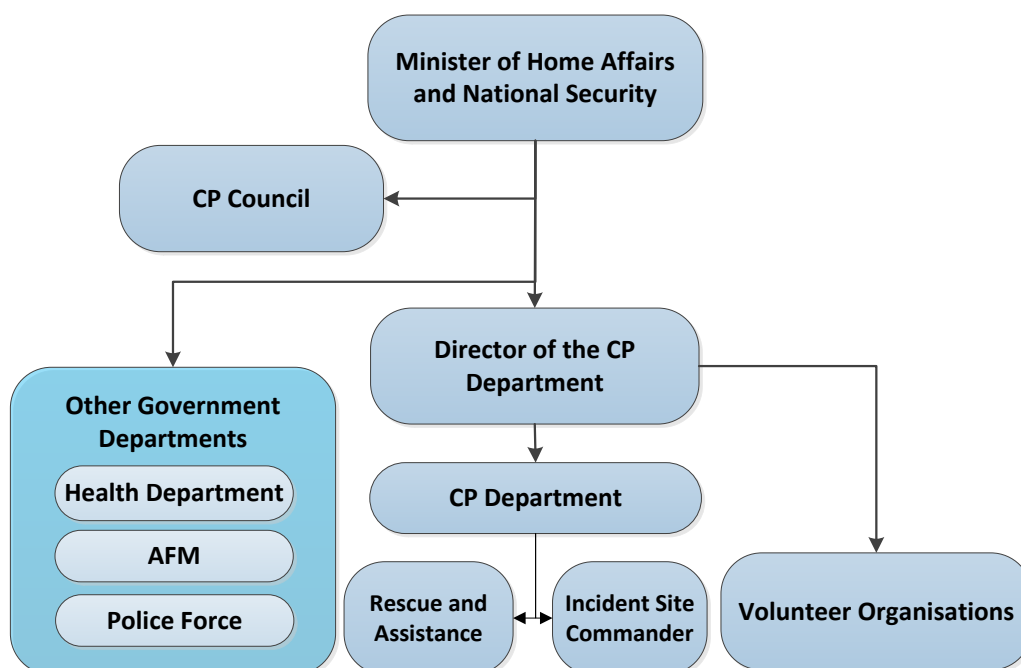

Figure 3-1: Organisational chart of the Maltese Civil Protection system ¹⁶⁷⁵

As presented in Figure 3-1, the cornerstone of the Maltese disaster management system, is the **Civil Protection Department** (CP Department). The CP Department is the national-level authority assuming the leading role in emergencies, where the safety of the public is concerned. This

¹⁶⁷⁵ Own design

organisation evolved from the Fire Brigade authority after the CP Act of 1999 and is the governmental body tasked with the preparation of the strategic, tactical and operational planning and its implementation. It is supervised by the CP Council which is headed by the Minister for Home Affairs and National Security. Most important, in accordance with the CP Act, the CP Department is responsible for the:

- preparation of contingency plans to respond to disasters and risk and vulnerability assessment studies;
- organisation and co-ordination of training facilities and courses for the personnel that is required to respond to disasters;
- preparation of regulations required to respond to disasters or emergencies;

Additionally, the CP Department takes the lead in the event of emergency incidents regarding the organisation of the response and the coordination of all other involved organisations under the guidance of the **Incident Site Commander** as appointed by the Minister.

The **Rescue and Assistance Force (RAF)**, is set up under the umbrella of the Civil Protection Department and operates with the sole purpose of maintaining an adequate service for prompt intervention in case of an emergency, whether occurring on land or sea. This Force, which is made up of about 110 staff members, operates from six different stations in Malta and one in Gozo. The members of this Force have to deal with everyday operations, ranging from domestic fires and rescue interventions to specialised tasks, such as hazardous substance control and technical diving operations.

Other key contributors to the Maltese disaster management system are government organisations that complement the competencies of the CP Department. The Police, the Armed Forces of Malta and the Health Department of the Ministry of Energy and Health are also significant parts of the system. These actors are all represented in the CP Council due to their role in crisis management. Additionally, during crisis events, these organisations all appoint a representative to coordinate with the Incident Site Commander, the same goes for the volunteer organisations that appoint a joint representative.

The **Department of Health** of the Ministry of Energy and Health is responsible for health-related services during emergency events. The Department of Health also takes the lead role in tackling crises predominantly related to health issues such as pandemics.

The **Armed Forces of Malta (AFM)** are tasked with providing emergency protection support to the CP Department as one of its secondary roles. Additionally, the AFM is appointed as the competent national SAR agency in Malta as it maintains the lead role in SAR operations related to disaster management within the territorial waters of the country. In case of emergencies, the military cooperates with the CP Department under the supervision of the Ministry for Justice and Home Affairs. Following SAR operations and when the need to provide civil protection services is transferred onshore, the responsibility is passed over the CP Department or other competent authorities.

During emergencies a representative of the AFM is in direct contact with the Incident Site Commander or other officials of the CP Department. Should the need appear to use special military assets; the AFM representative explains what can be made available from the side of the AFM regarding machinery, equipment, AFM premises or human resources. Then the Incident Site Commander decides what is needed for the disaster management operations and requests it to be made available.

The **Police** force of Malta is part of the civil protection system of the country charged with maintaining order, in matters of containing rioting and performing crowd control when needed in case of emergencies. Up to date, the utilisation of the Police force in disaster management operations has been seldom due to the limited impact of disasters to date.

Other public authorities may also become involved in crisis management depending on the scope of the incident, their availability of resources necessary for organising an efficient response to the crisis. Most notable example is that of the involvement of the **Ports and Yachting Directorate** of the **Transport Malta Authority** in incidents involving marine pollution since Transport Malta is the competent authority regarding the prevention and control of maritime pollution and relevant incident response.

Another public authority that is often involved in the activities of the CP Department is the **Cleansing Directorate**, providing - when requested by the CP Department - emergency cleansing services by making available the machinery and human resources necessary to remove debris and other obstacles when needed.

Figure 3-2: Oil spill control exercise performed by Transport Malta¹⁶⁷⁶

3.1.2 Volunteer organisations

The role of **volunteer organisations** in the Maltese crisis management system is especially important since they are complementing the limited public capacity to provide response, recovery and relief during and after disaster events. The RAF unit and the CP Department are supplemented in their efforts to disaster management by the **SPIDER** volunteer unit that provide first response in cases of emergencies. The SPIDER unit counts around 115 fully trained volunteers, which given the size of the

¹⁶⁷⁶ EEA grants; <http://eeagrants.org/News/2014/Keeping-oil-away-from-Maltese-shores>

Malta disaster management system consist a considerable addition to the existing disaster management capacity.

Another volunteer group operating within the ranks of a public organisation is the **Emergency Volunteer Reserve Force** (EVRF) that supplement the AFM in cases of emergency situations, the EVRF soldiers will perform in the event of disasters, amongst other military tasks, civil emergency duties in support of the civil administration as well as key point security guarding duties.

Figure 3-3: Volunteers serving in the EVRF (left)¹⁶⁷⁷ and the SPIDER team (right)¹⁶⁷⁸

Regarding independent volunteer organisations, a great variety of organisations operate in Malta and amongst their functions, support also the state authorities in disaster management. The main volunteer groups, mobilised in emergency events are: the Red Cross the St. John Association and the Emergency Fire Rescue Unit (EFRU).

The Malta branch of the **Red Cross** has been recognised by Act of Parliament¹⁶⁷⁹ as an autonomous voluntary Relief Society that acts auxiliary to the Public Authorities in accordance with the rules and principles of the International Red Cross movement. The mission of the organisation is to *“prevent and alleviate human suffering, improving the situation of the most vulnerable people with absolute impartiality and without discrimination as to race, nationality, gender, class, religious beliefs or political opinions”*. The Red Cross operates a small fleet of Ambulances in Malta to assist public authorities in providing first aid and humanitarian relief.

The **St. John** organisation assists the CP Department providing auxiliary services during disasters by providing a rescue team as well as a first aid and ambulance service. Additionally, both the Red Cross and the St John Ambulance organisations provide trainings to the general public on first aid, while a more complete training set is provided to their registered volunteers.

The **Emergency and Fire Rescue Unit** (EFRU) has been established by Maltese volunteers aiming to provide an unit of organised and fully trained rescuers to assist public authorities in the event of disasters such as earthquakes, airplane crashes, floods and similar occurrences.

¹⁶⁷⁷ <https://afm.gov.mt/en/forcestructure/afmunits/evrf/Pages/evrf.aspx>

¹⁶⁷⁸ <http://www.usar-spiders.com/?m=gallery>

¹⁶⁷⁹ <http://www.redcross.org.mt/aboutus.php>

Other volunteer organisations are not totally focused on disaster management relevant activities, but often contribute also to the Maltese disaster management system. An example of that is the **Malta Amateur Radio League (MARL)**. MARL initiated as a representative body for Amateur Radio in Malta aiming in promoting a specific interest group. It has now developed into an Emergency Communication Team that sets up back-up communication facilities during major events in cooperation with the CP Department, to be used in the event of a major system failure.¹⁶⁸⁰

3.1.3 Private sector cooperation

The public authorities may rely on the private sector for support when dealing with emergencies. This is done in an informal basis and is mostly relevant for the areas where no or limited public sector capacity and knowledge exists, for example in case water carrier vehicles are needed. Sometimes the CP Department engages in framework agreements on the terms of recruitment of relevant private sector entities, however, in most cases there appears to be no need to do so, since the small size of the country allows to deal with emergency incidents with the standing informal agreements.

In any case, as described by the CP Act, the Incident Site Commander, the Director of the CP Department or the highest ranking official of the Rescue and Assistance Force has, according to his judgement, and if indispensably necessary for the operations relevant to emergency response, the power to order immediate requisition of any property necessary for the operations.

3.1.4 Lines of communication and command

The first line of contact in case of emergencies in Malta is the 112 system. This phone centre is operated by the Police who channels the requests to the relevant authorities depending on the characteristics of the reported emergency. In case of a crisis or threat of a crisis the call is diverted to the communication centre at the CP Department Headquarters. There also the civil protection operational control room is located, that takes over the coordination of the actions in response to the incident.

As mentioned by the CP Department staff, the employees of the CP communication centre are trained to follow an undocumented yet strict routine when receiving an emergency call for each different type of incident. This routine dictates which organisations, officials and other government departments need to be mobilised to respond to the emergency incident. Respectively the CP Department mobilises first its personnel from the nearest out of the 7 regional stations in Malta and Gozo to handle the incident, followed by appropriate reinforcements from the rest of the CP Department force if deemed necessary.

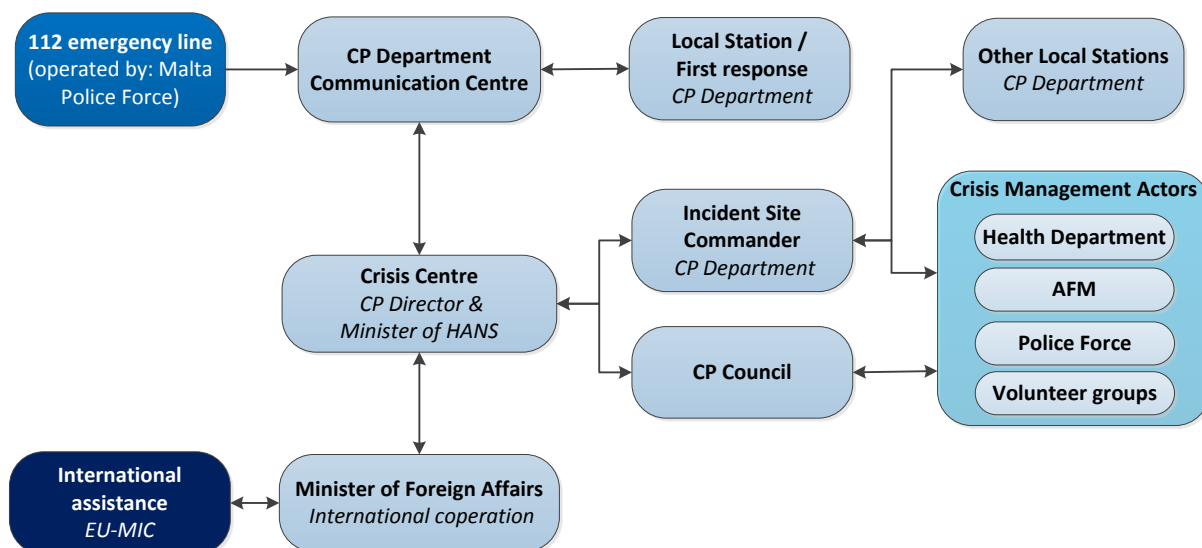

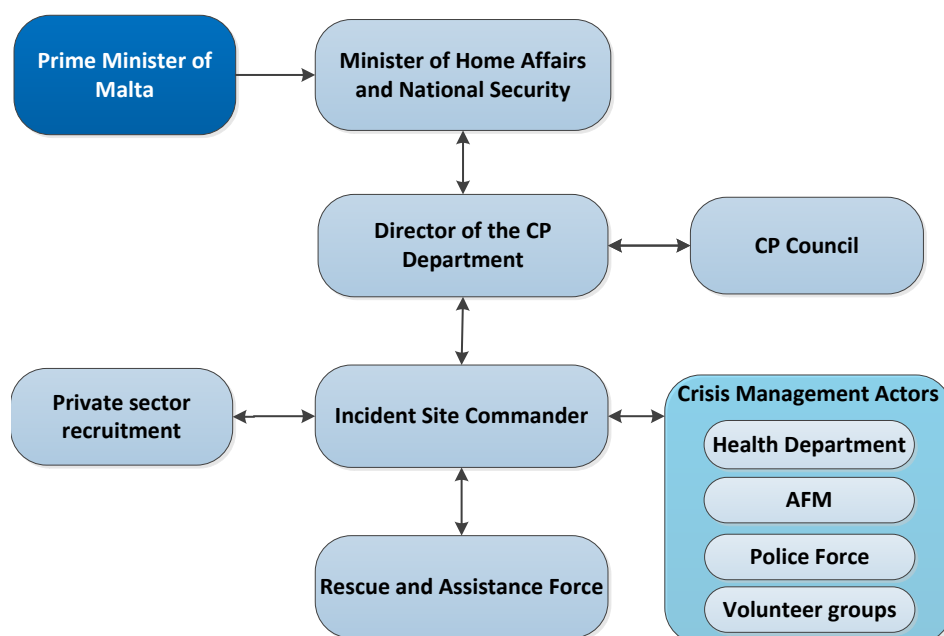

¹⁶⁸⁰ <http://www.9h1mrl.org/>

In case of more serious events, the CP Department Director informs the Minister of Home Affairs and National Security and the CP Council. The Minister in turn appoints, after consultation with the CP Council, the Incident Site Commander, who has control of the response effort. In turn the Incident Site Commander coordinates with the representatives of relevant public and private entities, volunteer groups and local councils on the best available means and manners to deal with the incident. The coordination of the response effort is performed from the control room of the CP Department in the Civil Protection centre. The representatives of the organisations in contact with the Incident Site Commander indicate to him their capacity to assist the efforts of the CP Department, as well as advice him based on their expertise during the incident response effort.

Based on these information, the volunteers are notified if needed to contribute in the response to emergencies, although usually, and due to the small size of the Maltese islands, they might be mobilised and present to the spot of the incident even before being notified by the CP Department. In the Maltese crisis management system, the AFM and the Police are the last to be called upon to support the response to the disaster.

Should the scale or type of the event call for bilateral cooperation, the Minister of Foreign Affairs gets involved and the bilateral coordination processes as set in international agreements are put in motion. On the other hand, if a domestic crisis escalates to the point that the Maltese disaster management system cannot handle it with its own capacity, then the Common Emergency Communication and Information System (CECIS)

European Civil Protection notification mechanism is activated as described in the following subsection. In these cases the Minister of Foreign affairs is involved in the coordination with the partner and assisting countries. Figure 3-4 and Figure 3-5 depict the described lines of command and command respectively during emergencies.

Figure 3-4: Lines of communication¹⁶⁸¹Figure 3-5: Lines of command¹⁶⁸²

3.2 Organisational cooperation

3.2.1 Domestic organisational cooperation

The coordination of the crisis management response effort at a national level is at the hands of the **Incident Site Commander** who is placed in charge of tackling a specific emergency incident. Operational cooperation between the organisations involved is performed at a national level, since this is the only level of crisis management in the Maltese system. The CP Council, where all involved

¹⁶⁸¹ Own design

¹⁶⁸² Own design

organisations are represented, coordinates with the Incident Site Commander regarding the strategic and operational design of the emergency response and the role of the specific organisations in that.

A major aspect of the Maltese crisis management system reported by the CP Department to influence the efficiency of its performance is the fact that the availability of only one level of crisis management reduces the operational decision-making flexibility. Even in case of local only minor emergency incidents, a whole government mechanism needs to be mobilised. On the other hand, the small size of the crisis management system and the country overall, facilitates communication as most of the actors involved know each other and it is easy to establish and functionally maintain informal communication norms.

3.2.2 Cooperation with foreign countries

Forming part of a wider European network of civil protection, the CP Department is committed to provide assistance to other EU Member States and third countries. This network facilitates the solidarity process that exists between Member States to assist any particular EU country affected by a disaster. Moreover Malta participates in a number of regional arrangements for mutual crisis management support. Malta is a member to the Regional Environmental Centre for Central and Eastern Europe (REC), of the Programme for the Prevention Preparedness and Response to Natural and Man-Made Disasters (PPRD-South), of the Euro-Mediterranean Partnership (EUROMED) and of the EUR-OPA Major Hazards Agreement.

However the country is more active in international support, through its participation in the EU's Civil Protection Mechanism. When emergencies appear, the Emergency Response Coordination Centre (ERCC) is activated to forward to an European network of national contact points the request for assistance of the affected Member State.

In order to file a request for assistance on behalf of Malta, this decision is made at a minister level and the CP Director notifies the ERCC system to inform the other Member States. The ERCC is one of the main means utilised to facilitate international humanitarian assistance to any struck country.

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

The CP Department reports that the different organisations and departments involved in the provision of crisis management services in Malta make all use of their own internal guidelines and SOPs to regulate their work and responses to crisis events. SOPs exist for all organisations and for the incident types each organisation is involved at. The SOPs are perceived as a document describing the exact procedure of the developed practice of response to each type of disaster. Although the level of detail of these documents may vary between organisations, they are perceived by employees as being detailed enough to avoid confusion or misinterpretations.

Although these documents are not available to the public, there is an established practice of exchanging SOPs between the organisations of the crisis management system in order to exchange views and provide mutual suggestions for improvement, while aligning them for better cooperation. A most elaborate cooperation in exchanging and co-developing SOPs is reported to exist between the CP Department and the Health Department, while the AFM and the Police are more reluctant to share their exact procedures. Similar to this approach of SOP exchange is what happens in case of cooperation with voluntary units. Overall, this is considered to enhance the robustness of the operational communications and understanding. These SOPs are tested annually in the joint exercises performed between public and private sector organisations of the crisis management system.

4.2 Operations planning

There are no operations strategic plans developed for Malta. Probably due to the very rare occurrence of high impact accidents, the CP Department reports that it relies mostly on the SOPs and the higher level master plan for civil protection.

4.3 Logistics support in crises

In principal the CP Department conducts the necessary logistics for its operations using its own means. Additionally the assisting volunteer groups provide their own vehicle and equipment. In case the existing equipment does not suffice for tackling the crisis event, the CP Department may request other government departments to provide logistical support to the best of their capacity. Two of the most significant public-sector contributors to the CP Department are the AFM, for provision of transportation services and the Cleansing Directorate contributing significantly to removing heavy obstacles like heavy plants that may fall on the roads surface and block traffic.

Support from the private sector is also relevant and has happened occasionally, but is mainly restricted to specialised fields where the government has little or no background. Such is the case for example when heavy vehicles and cranes might not be available in sufficient quantities.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

In the past, the notification of public was done through specific announcements broadcasted by the television and the radio and additionally press releases where issued. Nowadays, the CP Department has been equipped with an automated platform that generates notifications to the public through national public and private TV and radio channels. The existing perception in the CP department, the general public is informed fast enough regarding an existing threat.

A trial with an SMS platform for notifying the general public was abandoned as there were problems encountered with the proper functioning of the server used. Nevertheless, according to the CP Department, automated SMS notifications are the case for informing volunteers and staff out of duty at the moment.

Regarding international cooperation, the systems of the European Civil Protection Mechanism:

ECURIE and MIC/CECIS systems were used to obtain early warnings and achieve situational awareness for operations. The later has been now replaced by the ERCC. During an emergency, a mobile control unit from the civil protection is on site and all emergency entities are controlled from it. Additionally, a back-up communication system is set up during events and exercises by the MARL-emergency communication team – a volunteer group of radio amateurs.

5 Capabilities

5.1 Human resources

Overall, there is a very limited number of human resources devoted to civil protection by public authorities. According to information from the CP Department, with a few more than 110 permanent staff members, the Rescue and Assistance Force of the CP Department is expected to respond to a large variety of types of accidents whether occurring on land or at sea. At the same time, the CP Department with an overall headcount of 180 permanent personnel needs to cope with providing training and exercises for preparedness and taking on also a large part of the relief effort and manage humanitarian aid. In their efforts they are supplemented by the permanent staff of the other governmental departments involved in the crisis management system, who however have a broader remit that just providing crisis management services.

At the same time, the limited size of both the system and the country make mobilisation of personnel a relatively easy task. Staff members are notified, when off service, via SMS (as mentioned in section 4.4) if needed to participate in the crisis management effort and there have been no reported problems in the that direction according to the CP Department.

As the public sector capacity to provide sufficient preparedness, respond, and recovery and relief capacity is limited; the contribution of the volunteer sector is of great significance for the crisis management system. With a total capacity of mobilising 300 of their own members (110 of which within the SPIDER team of the CP Department), the volunteer organisations provide additional capacity in activities such as first aid SAR (in urban areas, land or sea) and humanitarian aid. Additionally NGOs (such as the Red Cross and SPIDER) are major contributors of emergency training to the general public as well as to their own personnel assisting in the preparedness of the system.¹⁶⁸³

Finally, the CP Department reported on the contribution received from the private sector to the human resources mobilised in emergency events is rather limited, mostly restricted to the specialised machinery and vehicle users, when such resources are obtained from the private sector.

5.2 Materiel (non-financial) resources¹⁶⁸⁴

According to the CP Department, each of the involved organisations is responsible for maintaining their own material resources. The CP Department stores the specialised equipment used by its personnel in the 6 local stations and the headquarters of the organisation (see Figure 5-1). This includes specialised equipment for (urban) SAR as well as chemical suits, helmets and other protective cloths to deal with al kind of emergency situations.

¹⁶⁸³

<https://www.gov.mt/en/Services-And-Information/Business-Areas/Law%20Enforcement/Pages/Community-Involvement-in-Malta.aspx>.

¹⁶⁸⁴ This section is based on the interview conducted with the CP Department of Malta.

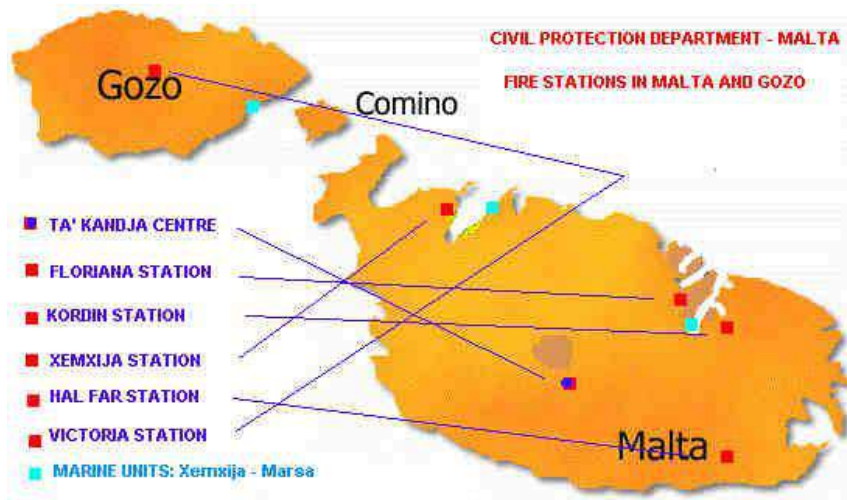

Figure 5-1: The Civil Protection Department local stations in Malta and Gozo¹⁶⁸⁵

The other public organisations involved in the crisis management system are responsible of maintaining their own equipment for disaster response. The AFM as well as the Health Department and the Transport Malta authority hold the relevant specialised equipment for dealing with emergencies in their sphere of competence. Especially relevant are the sea SAR (Search and Rescue) equipment of the AFM comprising of two SAR launches (Melita I and Melita II – see Figure 5-2). These are equipped at the Maltese Government's request also with a small fire-fighting pump to extinguish fires on speed boats, cabin cruisers and small yachts. Additionally the Cleansing department provides specialised heavy machinery and heavy vehicles, when necessary to complement the crisis management effort and remove heavy obstacles (such as large plants from the road or debris) on request. While any additional specialised machinery that may be needed is recruited from the private sector in the case of an emergency.

Figure 5-2: SAR vessel of the AFM¹⁶⁸⁶

¹⁶⁸⁵ <http://steno.webs.com/112/cpd/cpdorg.htm>

¹⁶⁸⁶ <http://afm.gov.mt/en/equipment/maritimevessels/sarmelita/Pages/melitai-ii.aspx>

Similar to the public authorities, the NGOs involved in crisis management procure and maintain their own necessary equipment consisting mainly of land and sea SAR, first aid equipment and personnel transport vehicles. The St. John Rescue team can also mobilise two Fire trucks while the Red Cross, except for the ambulances it can make available, is currently converting an old bus into a mobile clinic, capable of hospitalising 6 patients at the same time. Moreover, the MARL makes available emergency communication equipment in case the standard system fails.

However no central register of the combined available material resources exists and especially considering the equipment of the AFM, there is very limited information provided to the other actors of the system before the outbreak of a disaster incident.

As far as humanitarian aid and other important stocks necessary for the post-disaster relief effort for the general population is concerned, the CP Department maintains the main reserve stock in its headquarters in Ta' Kandja. This stockpile consists of all basic provisions for humanitarian aid such fuel, food, tents, blankets, etc. while medicine-related stocks are kept by the Health Department. Additional stockpiles are kept by the NGOs which contribute to the collection, maintenance and provision of humanitarian aid with their own resources.

Figure 5-3: humanitarian aid collection by EFRU volunteers¹⁶⁸⁷

5.3 Training

One of the main objectives of the CP Department is to organise training courses and exercises in fire-fighting, basic rescue and first aid for its own personnel, but also for the civil forces involved in crisis management and emergency response. For that reason, the CP Department maintains one training centre where, except training their own personnel, courses are provided to company and governmental personnel responsible for safety and security.

Once a year exercises take place involving all emergency-related entities. The guidelines used for planning the exercises are based on past experience, possible scenarios and training experience

¹⁶⁸⁷ http://www.efru.org/?page_id=887

gained from personnel deployed to EU and international exercises according to EU guidelines. Table top exercises and field exercises are held before every full-scale exercise.

Additionally, the CP Department reported that it supervises the exercises held once every 2 years in industrial sites as part of their obligation. There an annual schedule of exercises prepared and enterprises are notified 3 months in advance of their obligation to prepare for the exercise.

The volunteer organisations and NGOs provide training to their own personnel in accordance to their competence building needs, while also providing first aid and emergency response trainings to the general public. Trainings for both the government and volunteer organisations also take place under the EU framework for civil protection as well as under the bilateral cooperation agreements with specific countries as mentioned in earlier examples. Within the EU, amongst the objectives of these training exercises is to test the interoperability techniques among agencies in event of disasters.

Moreover, the volunteer organisations mobilise their own networks to train their personnel in international best practices. An example of this is the training provided by the Bulgarian and Spanish Red Cross section to the Malta branch to assist it in the building of competence in the field of maritime research and rescue or the training of the SPIDER team in urban SAR by the German THW.

5.4 Procurement

5.4.1 Procurement regulation

European regulations

The procurement of public contracts needs to be in line with the principles of European treaties and especially with the free movement of goods services, capital and people. Furthermore the procurement needs to comply with the principles of equality, proportionality etc. For some types of procurement additional regulations are codified in directives. Within the European legislation, three different procurement directives apply. These directives are mutually exclusive meaning only one of the directives apply to the public procurement. Directive 2014/25/EU (on procurement of utilities) and directive 2009/81/EC (on procurement in the defence and security industry) are topic specific. If these specific directives do not apply, public sector directive 2014/24/EU is applicable, which is the replacement of directive 2004/18/EC. The aim of the new directive is to simplify the rules on public procurement; improve the participation of SMEs and stimulate cross border joint procurement.

Stimulation of cross border joint procurement is helpful in case of a major internal crisis or a cross border crisis. The directive states in the preamble that contracting authorities should be able to choose to jointly provide their public services in cooperation with other authorities, without being obliged to use any legal form. These services don't have to be identical. The cooperation does not require all participating authorities to fulfil the obligations of the contract, as long as there is a commitment to contribute to the cooperative performance. The preamble points out that there are difficulties in cross border joint procurement. Therefore new rules have to be made. In these rules, the conditions for cross border procurement have to be clarified, as well as the applicable regulations. In addition, contracting authorities should be able to set up joint entities established under national or EU law. The new rules are specified in article 39 of the regulations.

If the procurement is executed by a centralised purchasing body located in another MS, the procurement shall be conducted in accordance with the national regulations of the MS where the purchasing body is located. In addition, several contracting authorities from different MS may jointly award a public contract, conclude a framework agreement or operate a dynamic purchasing system. Participating contracting authorities will then conclude an agreement that determines all responsibilities of the parties and the internal organisation of the procedure. As said before, the contracting authorities can set up a joint entity. The parties shall decide on the applicable rules on procurement. They can choose the rules of the MS where the entity has its registered office or where the entity carries out its activities.

This project evolves around the procurement related to crisis management, for example the procurement of ambulances, emergency packs or trainings. The utilities directive applies to gas and heat, electricity, water, transport services, ports and airports and postal services (article 8-13). The directive on defence and security applies to supply of military equipment and sensitive supplies. The majority of procurement in crisis management will be procured by normal NCCs and local authorities like the fire department or police and will not be secret. So in most cases the Public Sector Directive (2014/24/EU) is applicable. This chapter will therefore focus on this directive. It is worth keeping in mind that the other directives can also be applicable, for example if the army is used to solve a major

crisis. The directive is addressed to Member States and has no direct effect on the national regulations. The directive needs to be implemented first.

Scope of the Public Sector Directive

The Public Sector Directive applies to procurement by contracting authorities with respect to public contracts as well as design contests whose value is estimated to be not less than (article 4):

- € 5.186.000 for public works contracts;
- € 134.000 for public supply and service contracts and design contests, awarded by central government;
- € 207.000 for public supply and service contracts or design contests awarded by sub-central contracting authorities.
- € 750.000 for public service contracts for social and other specific services listed in Annex XIV.

This directive should not apply to certain emergency services where they are performed by non-profit organisations or associations, since the particular nature of those organisations would be difficult to preserve if the service providers had to be chosen in accordance with the procedures of the directive. Furthermore the directive does not apply to public contracts with the purpose of providing public communication networks or electronic communication services; public contracts organised pursuant to international rules; several types of service contracts, e.g. rental, legal services and employment contracts and service contracts based on exclusive rights; and last, public contracts between entities within the public sector (articles 8-12).

Award procedures

On a European level, procurement is executed by the European Commission. The Public Sector Directive provides the provisions for several award procedures:

- open procedure,
- restricted procedure,
- competitive procedure with negotiation,
- competitive dialogue,
- negotiated procedure without prior publication.

The *open procedure* applies when no other procedure is chosen. In the open procedure, the contracting authority submits a call for tenders. Interested companies may submit a tender. The best offer is chosen, based on the selected award criteria (article 27).

The *restricted procedure* consist of two phases. In the first phase a call for expression of interests is set out. Interest candidates may submit an invitation to tender. The contracting authority will then invite the most suitable candidates to submit a tender. The contracting authority will award the contract to the best tender, based on the selected award criteria (article 28).

In the *competitive procedure* with negotiation any interested candidate may submit a request to participate in the negotiations, in response to a call for competition. In this call for competition, the contracting authority has provided a description of their needs and the characteristics of the works

or services to be procured. Only the interested candidates that are invited may submit an initial tender, which will be the basis of the negotiations (article 29). In several cases the negotiation procedure can be used without prior publication, for example when the public contract contains a creative achievement; when there is no competition; when intellectual property rights need to be protected, or when there are reasons for extreme urgency (article 32).

In the *competitive dialogue* any interested candidate can submit a request to participate in response to a contract notice given by the contracting authority. The contract notice provides the information on and the needs and requirements of the contracting authority, as well as the chosen award criteria. The selected interested candidates will join the competitive dialogue, in which the means best suited for satisfying the contract will be defined (article 30).

A new procedure within this directive is the *innovation partnership*. In this procedure, any economic operator may submit a request to participate in response to a contract notice, by providing information for qualitative selection that is requested by the contracting authority. The innovation partnership can be set up with one partner or several partners. Only the economic operators invited by the contracting authority participate in the procedure. After each phase, the contracting authority may decide after each phase to terminate the partnership or reduce the number of partners within the partnership, based on the targets.

According to article 26, the open procedure and restricted procedure are the standard procedures to apply in case of procurement. The other procedures can be used in a limited number of situations, for example when the service is innovative, or when the technical specifications cannot be determined (art. 26, sub 4.). Contracting authorities can use framework agreements, provided that they apply the procedures in this directive. The agreement can not exceed four years. Contracts within the agreement will be awarded according to the rules in article 33.

In most procedures the candidates are chosen with the use of selection criteria. The selection criteria may relate to suitability to pursue the professional activity; economic and financial standing and technical and professional ability. All criteria need to be related and proportionate to the matter of the contract (article 58).

National regulations

In Malta, there are two regulations regarding the procurement of goods and services: Public Procurement Regulations (Legal Notice 296 of 2010, as amended by Legal Notices 47, 104, 255 and 312 of 2012, 65 and 397 of 2013, and 55, 132, 293 of 2014) and the Public Procurement of Entities operating in the Water Energy, Transport and Postal services Sectors Regulation (Legal Notice 178 of 2005). Malta has not implemented the new directive of the EU yet. For the public procurement of goods and services related to crisis management, most the time, the first regulation applies.

Scope

The regulation applies to public contracts, which is defined as: ‘ any contract for pecuniary interest concluded in writing between one or more economic operators and one or more contracting authorities and having as their object the execution of works, the supply of products or the provision of services as defined in this regulation.

Some of these contracts are excluded from these regulations, for example public contracts awarded pursuant of an international agreement; public contracts which are secret, which are about telecommunication or arbitration and so on. The extensive list can be found in article 17. The regulation has no threshold value from which the regulations apply. However, different rules apply based on the value of the contract.

5.4.2 Procurement Procedures

In Malta, procurement is executed by the central government and all the ministries. Within the ministries, the different agencies are authorized for procurement. The extensive list of all authorized contracting authorities is published in Schedule I of the Public Procurement regulations.

In general, the contracting authority shall ensure that there is no discrimination between economic operators and that all operators are treated equally and transparently. The confidential nature of all information of economic operators needs to be respected. The specific award procedures depend on the value of the contract. When the contract has an estimated value less than € 120.000, the contract is subject to Part II of the regulation. If the estimated value exceeds € 120.000 but is below the European threshold, Part III and Part IV of the regulations apply. Finally, if the estimated value exceeds the European threshold, Parts IV, V VI (A-C) and VII are applicable (article 15). These provision are further presented below.

Procurement of a public contract below € 120.000.

The procurement procedure depends on the value of the public contract. Public contracts with a value below € 2.500 may be procured at a department level either after obtaining quotations or directly from the open market. Contracts with a value between € 2.500 and € 6.500 may be procured departmentally after a call for tenders, after obtaining quotations or direct from the open market. The total estimated value of these two categories cannot exceed € 25.000 within six months. The last category within Part II is contracts with an estimated value between € 6.000 and €120.000. They may be procured after a departmental call for tenders, or after publishing a call for quotations in the Gazette (article 20). The restricted procedure can only be used with prior consent of the Director of Contracts and is open to international participation.

Procurement of a public contract with a value between € 120.000 and the European thresholds.

In case of a contract with a value between € 120.000 and the European threshold, Part III and IV apply to the procurement procedures. All public contracts with this value shall be subject to regulatory and other functions of the Department and Director of Contracts. In some cases the Department of contracts shall act on behalf of the contracting authority.

According to Part IV, the standard award procedures applicable to these public contracts are the open procure or the restricted procedure. Only in specific circumstances, stated in article 48, the

competitive dialogue can be used. This procedure will be explained in the next paragraph. The negotiated procedure after prior publication can be used in case of irregular tenders, exceptional cases when the nature of the services or the risk involved do not permit prior overall pricing; when the nature of the procurement is such that contract specifications cannot be established (article 59, 66 & 72). The negotiated procedure without prior publication can be used: when no suitable tender is submitted; when the service can only be provided by a single operator; when the time-limits of the other procedures cannot be respected for reasons of extreme urgency etc. (article 60, 67 & 73). A last possibility for procurement is the use of the framework agreement (article 26), which is in line with the European directives.

Contracts will be awarded according the selection criteria codified in the regulations. These criteria are the most economically advantageous offer or the lowest price offered, compliant with the tender specifications (article 28). When the award is made to the economically most advantageous offer, the following criteria are taken into consideration: price, delivery date and period, running costs, costs effectiveness, quality etc. The criteria the contracting authority intends to apply in the determination of the award, including the relative weight of each criteria, need to be indicated.

Procurement of public contracts with a value exceeding the European threshold

The procedures explained in the previous paragraph also applies to procurement of public contracts with a value exceeding the European threshold. These contracts shall be awarded using the open procedure, the restricted procedure, or in the exceptional cases mentioned above, the negotiated procedure (article 37). In case of particularly complex contracts, where the use of open or restricted procedure will not allow the award of the contract, the competitive dialogue alternative can be used (article 48). The aim of the dialogue is to identify and define the means best suited to satisfy the needs of the contracting authority. The solution offered by participants other than the winning party as well as other confidential information cannot be revealed. The dialogue will continue until the contracting authority can identify the proposals capable of meeting their needs. The contracting authority shall indicate the objective and non-discriminatory criteria they intend to apply. Then, the participants will submit their final tenders, based on the solutions presented. The contract will be awarded to most economically advantageous tender. The selection criteria for awarding the contract then are the same as in the previous section.

Procurement in practice

In practice, while the procurement is relatively easy when smaller amounts (up to €6.500) are concerned, for larger amounts there are strict protocols that apply and the procurement process might take very long to conclude.

Initially, the Director of the CP Department needs to indicate to the supervising Ministry of Home Affairs and National Security the need for procurement. Then depending on the Ministry's approval, a request for funding is send to the Ministry of Finance, while the CP Department needs to notify the Ministry of Finance as well and reason the application. At this point the procedure is split into the two directions that might be followed.

Should the CP Department have sufficient funds for the procurement, then the approval is easy to get and a tender is prepared and issued. Otherwise, the process is dependent on the Ministry's decision to fund the procurement. Usually a request is filed for EU contribution through the Structural funds, when the request regards large amounts. In any case the application as prepared by the CP Department has to be approved from the Ministry of Finance. Practice shows that the EU procedure may be 2 months longer than when procurement is done based on national funds.

Finally, cross-border procurement is not a vehicle used often (or preferred) by the Maltese authorities. This need has seldom occurred to the CP Department.

5.5 Niche capabilities

Due to its small size and location at one of the safest countries, the Malta crisis management system has had little room to gain experience in major disaster events. The Maltese crisis management system managed to cope without international help, with a profound influx in size (compared to the size of the country) influx of refugees during the Libyan crisis. This event strained the Maltese systems to its limits. The crisis was eventually managed with a significant support from the volunteer sector.

Driving Innovation in Crisis Management for **E**uropean **R**esilience

THE NETHERLANDS

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: ECORYS (Laura Birkman, Linette de Swart and Rachel Beerman)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by CSDM and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

The **crisis management structure** in the Netherlands is complex. The operational side is organised locally and so the local fire brigade, police force and medical team are the first responders to a crisis. These emergency response services fall under the responsibility of the different Security Regions, which form the back bone of the Dutch crisis management system. The Security Regions the local crisis plan are responsible for organising trainings and exercises and formulating adequate (response) policies.

On the national level a distinction between the general crisis management system (the so-called general chain) and the specific crisis management system (the so-called functional chain) can be made. For each crisis in the general chain (affecting the public order and safety) the Ministry of Security and Justice will be the main responsible ministry. If only the public order and safety are affected, the Ministry of Security and Justice is the sole responsible ministry. If the crisis affects more than the public order and safety, the functional chain(s) will become active as well. Depending on the type of crisis, the ministry responsible for this task becomes the main responsible ministry, supported by the Ministry of Security and Justice. Besides the official actors, **many other stakeholders** can play a role. The role of the Dutch Red Cross is explicitly laid down in the law, but also with the vital partners (e.g. energy companies, telecom and drinking water suppliers), covenants have been concluded laying down their part in crisis management.

If an **international disaster** happens, the main responsible ministry is the Ministry of Foreign Affairs. The Ministry will decide on the appropriate action to be taken. Decisions are made in cooperation with the National Coordination Centre (NCC), other Ministries, Embassies and international organisations. To file a request for **humanitarian aid** the NCC is the competent authority. To this end, the NCC will start the procedure, evaluating whether or not the Netherlands is able to provide the support needed and/or requested. Often, the NCC will also contact the Ministry of Foreign Affairs in order to jointly decide upon the request.

Financing preparedness is a responsibility predominantly of the Ministry of Security and Justice. Although it is difficult to find the exact amount spend on crisis management, it is estimated that this Ministry spends around € 238 million per year on crisis management. In addition to these contributions of the Ministry, the municipalities need to contribute to preparedness. In 2013 they spend approximately € 1 billion. **Financing recovery** is done both by the governments and the private sector. The **main niche capability** of the Netherlands that could be of interest for EU crisis management is the country's experience with flood response and water management. Since the Dutch Watersnood flood in 1953, the Netherlands has developed an extensive prevention program which is applied on a global scale. Similarly, Dutch flood experts are active all around the world to provide guidance on flood prevention.

SME	Small or Medium sized Enterprise
SOP	Standing Operating Procedure
UN	United Nations
UNDAC	United Nations Disaster Assessment and Coordination
USAR	Urban Search and Rescue

1 Policy

In the Netherlands three types of crises are distinguished: the national crisis, the regional crisis and the municipal crisis. Although Driver focuses on national crises, in the Dutch crisis management system it is difficult to differentiate between the three types as they can easily turn from one form of crisis into another. For example, a municipal crisis can easily turn into a regional crisis (e.g. the smoke of a local fire drifts to surrounding municipalities and thereby affects their citizens as well). The crises are defined as follows¹⁶⁸⁹:

- National crisis is an event
 - Which affects the national security, and
 - Where regular structures and/or resources no longer are sufficient in order to maintain stability.
- Regional crisis is an event:
 - Which causes a severe disruption of public order and safety and which affects more than one Security Region, and
 - Where regular structures and/or resources no longer are sufficient in order to maintain stability.
- Municipal crisis is an event:
 - Which causes a severe disruption of public order and safety and which affects only a Security Region or a municipality, and
 - Where regular structures and/or resources no longer are sufficient in order to maintain stability.

Twice a year the Dutch population is asked about their perception of 'feeling safe'. A randomly selected group is asked to participate in the Risk and Crisis barometer. The most recent one was carried out in June 2014. In this last barometer 816 Dutch people, all over the age of 15, were asked if they feared certain crisis or disasters. The table below shows which incidents were most feared by Dutch people¹⁶⁹⁰.

Table 1.1: Percentage of people fearing a certain incident between 2012-2014

	June 2014	November 2013	June 2013	November 2012	June 2012
Economic crisis	62%	64%	75%	76%	78%
International crisis	51%	43%	45%	50%	49%
Cyber attack ¹⁶⁹¹	49%	52%	58%	-	-
Terrorist attack	48%	43%	49%	38%	44%
Incident with dangerous goods	39%	40%	41%	47%	43%
Extreme weather conditions	39%	37%	33%	34%	33%

¹⁶⁸⁹ Source: Infopunt Veiligheid (2012)

¹⁶⁹⁰ Source: IPSOS (2014)

¹⁶⁹¹ This category was added since 2013.

	June 2014	November 2013	June 2013	November 2012	June 2012
Pandemic	36%	40%	42%	42%	41%
Disturbance in large crowd	35%	41%	47%	47%	45%
Traffic accident	35%	37%	36%	39%	40%
Large fire	30%	30%	31%	36%	37%
Nuclear incident	29%	30%	34%	31%	27%
Electricity, gas, water or phone failure	29%	32%	34%	31%	31%
Flooding	29%	32%	30%	30%	26%

Source: IPSOS (2014), edited by authors.

According to the Risk and Crisis Barometer an economic crisis is the most feared (62%), followed by an international crisis (51%). Striking is that most Dutch citizens do not fear flooding. Only 29% of the people indicated that they fear (severe) flooding, although this is one of the most severe risks the Netherlands is facing.

1.1 Risk Assessment

1.1.1 Key risks and former disasters

Based on its location the main natural risk identified for the Netherlands is a flood. The total area that is part of the Dutch jurisdiction is 41,543 km² of which 7,814 km² consists of sea. The total length of the coast line is 523 km. Of the remaining 33,729 km² (land use), 19% consists of internal waters, equalling 6,408 km². In total the country has 14,222 km² of water. On top of that 25% of the inhabited land lies below sea level. The largest parts of land below sea level are located in the West of the country, where also the four biggest cities are located. Especially, large parts of The Hague and Rotterdam are located below sea level. The total population of the Netherlands is estimated at 16, 8 million of which 7,1 live in the densest populated area (Randstad), and are at a constant risk of flooding¹⁶⁹².

Since the large flood of 1953 which killed 1863 Dutch people (2,395 in total), The Netherlands has a very strong focus on flooding prevention. One of the largest programmes introduced is the so-called 'Deltawerken programma'. For more information on this program, please refer to paragraph 5.5. In addition to the program the Netherlands is heavily investing in dyke maintenance and improvement throughout the whole country. Dyke investment is crucial for the protection of the Dutch population. In 2014 the Minister of Infrastructure and Environment promised to invest half a billion Euro per year to ensure the dykes are properly maintained and the risk on a severe flood can be reduced¹⁶⁹³.

¹⁶⁹² Source: European Commission, DG ECHO, Vademecum.

¹⁶⁹³ Source: <http://www.bnr.nl/nieuws/996322-1408/nederlandse-dijken-niet-op-orde-investeren-van-15-miljard>

Besides flooding other threats have been identified. The main threats categorized by their probability and impact are¹⁶⁹⁴:

- High probability, but low impact: several forms of extremism, large scale electricity black-out, extreme heat and dryness;
- High probability and substantial impact: Influenza pandemic, geopolitical oil crisis;
- Low probability, but high impact: flooding, targeted attack on electricity infrastructure.

A threat recently identified which has a considerable impact on Dutch society is a large-scale IT hazard.

In the World Risk Report 2014¹⁶⁹⁵ the Netherlands has a risk index of 8.25%, where risk is understood as the interaction between a natural disaster (earthquakes, floods, cyclones, droughts, sea level rise) and the vulnerability of the society. The Netherlands is ranked on the 51st place out of 171 countries (nr. 171 is facing the lowest risk). For each of the countries not only the overall risk, but also the exposition, vulnerability, susceptibility, lack of coping capabilities and lack of adaptive capacities have been assessed. In the separate list on exposition, the Netherlands is placed in the top-15 most exposed countries, ranked on the 12th place.

Table 1.2: Comparison of risk per category between the Netherlands and neighbouring countries

Rank	Country	World risk index	Exposition	Vulnerability	Susceptibility	Lack of coping capabilities	Lack of adaptive capacities
51	Netherlands	8.25%	30.57%	26.98%	14.84%	42.15%	23.96%
136	UK	3.54%	11.60%	30.49%	16.57%	47.08%	27.82%
139	Belgium	3.41%	11.66%	23.23%	15.59%	42.38%	29.70%
147	Germany	3.01%	11.41%	26.37%	15.41%	37.73%	25.97%
152	France	2.69%	9.25%	29.08%	16.13%	43.29%	27.83%

Source: Alliance Developments Work (2014), edited by authors.

In the table above the position of the Netherlands is compared to the situation of its neighbours. As the table shows the Netherlands has a much higher risk than Germany, Belgium, France and the UK. This higher risk is mainly caused by the high exposition the country faces. The report defines exposition as the exposition of a country towards natural hazards, such as earthquakes, cyclones, flooding, drought, and sea level rise. Especially flooding and sea level rise are major points of concern for the Netherlands due to its geographical location.

During the last fourteen years the following crises happened in the Netherlands, which can be divided in four categories; I) natural disasters and infectious diseases, II) industrial/transport accidents, III) infrastructure failures and IV) terrorism. For each of the crises the number of persons, killed, injured or affected, is indicated where possible¹⁶⁹⁶.

Table 1.3: Crisis in the Netherlands between 2000-2014¹⁶⁹⁷

Year/month	Crisis description	Crisis category	Damage		
			# of persons killed	# of persons injured	# of people affected
2012 Apr	Train crash	II	1		117
2011 Apr	Shooting at a mall	IV	6	17	
2011 Jan	Fire at chemical plant	II			?
2009 Apr	Start influenza H1N1 pandemic	I	62		
2009 Apr	Attack Royal family	IV	8	10	
2009 Feb	Airplane crash near Schiphol	II	9	86	
2007 Oct	Electricity breakdown (2 days) due to helicopter crash	III			100,000
2005 Nov	Electricity breakdown (2 Days)	III			25,000
2005 Apr	Fire at Schiphol Airport	I	11		15
2004 Oct	Assassination of Van Gogh	IV	1		
2001 May	Assassination of Fortuyn	IV	1		
2001 Jan	Café Fire on New Year's Eve	I	14		180
2000 May	Fireworks factory explosion in Enschede	II	22	1,000	3,000

Source: ANVIL, country study: The Netherlands (2013)

According to the Brussels based Centre for Research of the Epidemiology of Disasters (CRED), the most costly natural disaster in the Netherlands is a storm that caused a lot of damage in 1990. The number of flood cases by flooding in this list is limited, only two flooding have been reported, compared to seven storms. The table below shows the top-10 disasters since 1900, measured in their financial impact¹⁶⁹⁸.

Table 1.4: Largest natural disasters between 1900-2014, measured in economical impact

Type of disaster	Date	Damage (000US\$)
Storm	25 January 1990	1,200,000
Storm	21 January 1995	1,180,000
Storm	18 January 2007	550,000
Flood	12 September 1998	530,000

¹⁶⁹⁷ It should be noted that attacks by Animal liberation front, unclaimed attacks that have been prevented and heat/cold waves are excluded from this list.

¹⁶⁹⁸ Source: <http://emdat.be/>

Type of disaster	Date	Damage (000US\$)
Flood	31 January 1953	300,000
Storm	26 October 2002	300,000
Storm	3 February 1990	180,000
Storm	25 February 1990	180,000
Extreme temperature	25 November 2005	100,000
Storm	7 February 1990	70,000

Source: <http://emdat.be/>

CRED also collected data on technological disasters. The following table presents the major technological disasters since 1900, measured in their economic impact. As the table shows the largest economic damage result from industrial accidents (4 in total) and miscellaneous accidents (3 in total). In number of people killed or affected transport accidents are mainly dominating the top-10 (9 out of 10 for people killed and 7 out of 10 for people affected).

Table 1.5: Largest technological disasters between 1900-2014, measured in economical impact

Type of disaster	Date	Damage (000US\$)
Miscellaneous accident	13 May 2000	256,000
Industrial accident	7 January 1993	39,000
Industrial accident	13 December 1991	38,000
Industrial accident	25 February 1990	33,800
Miscellaneous accident	30 August 1993	31,000
Industrial accident	23 August 1990	28,300
Miscellaneous accident	12 August 1992	27,600

1.1.2 Risk assessment methodology

The methodology for the Dutch risk assessment is laid down in the guide book 'Working with scenario's, risk assessment and capacities'¹⁶⁹⁹. This guide book indicates how the national risk assessment (abbr. NRB) should be carried out and updated. The book also provides additional guidance for scenario development. The method is developed by a working group consisting of governmental experts, knowledge institutes and industry partners.

The risk assessment is updated once a year in order to have a good overview of possible threats and their respective impacts on Dutch society. The outcomes are laid down in the national risk

¹⁶⁹⁹ Source: Ministry of the Interior and Kingdom Relations (2009)

assessment ('Nationale risicobeoordeling') which is published on the website of the Ministry of Security and Justice¹⁷⁰⁰. In the risk assessment the following steps are followed:

- Starting point is the scenario development. Each scenario describes a specific threat, e.g. flooding, pandemics etc. The threats need to be described in a systematic way in order to increase the comparability between the threats.
- Secondly all descriptions are checked to see if the necessary information is included to ensure a good comparability between the threat scenarios on their impact and likeliness of occurrence.
- Based on the descriptions the impact of each scenario on Dutch society is assessed.
- After assessing the impact on Dutch society an assessment of the likeliness that a scenario will actually occur is carried out.
- Based on the impact and likeliness of a scenario the scenarios are brought together in a risk diagram (see description below). This diagram provides an overview of all risks, their impacts and likeliness as well as their mutual relationships.

In the risk assessment all scenarios developed are brought together in the risk assessment diagram. On the horizontal axis the scenarios are ranked by likeliness of occurrence. If a scenario is placed on the left hand side of the diagram it is quite unlikely that the scenario will occur, while scenarios placed on the right hand side will almost certainly arise. On the vertical axis the impact of the scenario on Dutch society is depicted. If a scenario is placed at the bottom the impact of the threat on Dutch society is limited, while scenarios located at the top are catastrophic. It should be noted that each scenario is assessed, on impact and likeliness, relatively to the other scenarios.

Based on this diagram Dutch crisis prevention focuses on the scenarios placed in the right hand upper corner of the graph, as these scenarios have a huge impact on Dutch society and the chance that they will happen is very high. In some diagrams published the threats of the coming as well as the past year are presented, to indicate if a change in the likeliness or impact of the threat has occurred. An example of the diagram made, without a yearly comparison, is shown in the figure below.

¹⁷⁰⁰ The 'nationale risicobeoordeling' can be downloaded from the following website: <https://www.nctv.nl/onderwerpen/nv/strategie-nationale-veiligheid/>. It should be noted that the document is only available in Dutch.

Figure 1.1: Risk assessment diagram 2012¹⁷⁰¹

According to the figure above the main threats for the Netherlands are cyber espionage, mineral scarcity and a severe pandemic. For all threats identified in the risk diagram a so-called findings report (Bevindingenrapportage in Dutch) is made for each individual scenario. This report also contains an action plan to prevent this threat from really happening as well as a strategy to minimize the impacts once the threat becomes reality¹⁷⁰².

1.2 Policy and Governance

1.2.1 Strategy scope and focus

Dutch crisis management is organised locally and in case of an emergency the local level will be the starting point of the crisis management system. The system is divided in several GRIP (coordinated regional incident management procedure = gecoördineerde regionale incidentbestrijdings procedure) levels. For each of these levels a dedicated crisis management system has been developed with its own responsible team, as well as the competent authority(ies) and the coordination between the national crisis management system and the competent authorities¹⁷⁰³.

¹⁷⁰¹ Source: Nationale risicobeoordeling 2012, edited by authors

¹⁷⁰² Source: Analistennetwerk Nationale Veiligheid (2013)

¹⁷⁰³ Source: National Centre Terrorism and Security (2013)

The GRIP system is divided in six levels where the so-called GRIP 0 refers to the day-to-day situation in which no special crisis management system is in place and the emergency services perform their usual tasks. GRIP 0 applies in cases of car accidents, small fires etc. Relevant levels for the DRIVER project are GRIP 5 and GRIP national. GRIP 5 refers to interregional emergencies. This can relate to different regions within the Netherlands as well as to cross border interregional emergencies. GRIP national relates to the largest crises where the coordination is done by the Ministry of Security and Justice, in case of emergencies affecting the public order and security, or another Ministry, in case it affects the responsibilities of this particular Ministry. It should be noted that the GRIP structure is not fixed and depending on the specific crisis the GRIP system used, can differ. The mayor is free to choose to upgrade the system or not. Upgrading can also be regulated by the local crisis plan, which lays down the upgrading rules and responsibilities¹⁷⁰⁴.

At national level therefore the crisis management framework is rather complicated as often more than one Ministry is involved. Depending on the crisis a specific crisis management system applies and often more than one Ministry is involved as the crisis affects different areas of competences (see chapter 3). From the perspective of the national government not all crisis management aspects are covered with the same level of detail. This is due to the locally organised response capacity. Main focus of the national government is on prevention/preparedness and recovery. Prevention and preparedness are mentioned jointly as no clear distinction is made between the two (see below).

1.2.2 Monitoring and analytical support to policy making; R&D¹⁷⁰⁵

Since 2012 the National Centre Terrorism and Security (NCTV) is responsible for the dedicated research programme 'Safe by innovation' (Veilig door Innovatie). This programme is broader in scope than crisis management and focuses on general safety issues in the Netherlands. Through this programme public bodies involved in security and safety issues can obtain financial support to develop innovative solutions to improve safety. The innovations do not only have to relate to state of the art technology development, but can also focus on organisational or social (aspects of) innovations.

To obtain financial support the public body needs to submit a proposal to the NCTV. Twice a year the NCTV will review the proposals received and proposals that best match the security goals set by the national government, will be awarded the funding. Preferably the possible outcome of the research should be usable for several bodies involved in the field of security. For these bodies it should be important that their efficiency and/or effectiveness are improved. The public body does not have to be the only partner submitting the proposal. The body can decide to involve partners from the golden triangle (government, knowledge and industry) in their team. However, the two other partners of the golden triangle cannot submit a proposal on their own.

The NCTV also facilitates the R&D efforts of SMEs in the area of security/safety. The NCTV has two R&D programmes that are solely open for SMEs. The first one is the annual programme for the Safety Innovation Competition (Veiligheidsinnovatie competitie). The competition was first held in 2014.

¹⁷⁰⁴ Ibid.

¹⁷⁰⁵ This section is based on: Nationaal Coördinator Terrosisme bestrijding en Veiligheid (2013 #1)

The winner of the competition receives a financial contribution (€ 200,000.-) which allows him to develop a prototype that will be used in the crisis management system. The second programme already exists longer and is called the 'Small Business Innovation Research Programme (SBIR). This programme is organised every two years and small companies can submit their innovative research ideas. During several rounds the group of possible winners is diminished and finally one or two winners are awarded a financial 'prize' which should enable them to further develop their idea.

In addition the NCTV stimulates the cooperation between the partners in the golden triangle. In order to have a good overview of the research needs of public bodies involved in crisis management the NCTV makes an overview of those needs. The needs feed into the demand driven programme 'safe society' (veilige maatschappij) which is managed jointly by the NCTV and the Ministry of Economic Affairs. Content related coordination is done by TNO who needs to set up the research projects. TNO also carries out the so-called technology radar that provides an overview of all technological related research carried out in a specific period of time.

1.2.3 Policy for Prevention and preparedness¹⁷⁰⁶

The policy for prevention and the policy for preparedness in the Netherlands are closely linked and no clear distinction is made between the two. Therefore they are jointly described in this report. The main institution making policy for prevention and preparedness is the national government. Especially policies to prevent/prepare for the large scale events are made on this level. The general policy is made by the Ministry of Security of Justice as they act as national crisis coordinator through the NCTV, which consist of a part focusing on terrorism and a part focusing on crisis management through the national coordination centre (NCC). More specific policies are made by the Ministries responsible for the specific topic, e.g. the Ministry of infrastructure and Environment is the main Ministry developing policies related to flooding.

The Dutch government has introduced a National Security Strategy (2007) that aims to assess whether or not Dutch society is well prepared for a crisis. In case that the conclusion of this assessment is that the Netherlands is not prepared well enough, the government can take additional measures or develop new policies to improve the prevention and preparedness of the country.

Through national campaigns the government aims to make citizens and companies aware of what they can/need to do to be better prepared. Citizens are strongly encouraged through (previous) campaigns such as 'Think Ahead' (Denk Vooruit) to prepare themselves. The government expects that citizens are able to save themselves for a while, so that they are not in need for immediate help. Companies can use tools, developed by the NCTV to become better prepared. The NCTV has developed several e-learning modules that aim to educate companies on how to improve their security systems. One of these modules focuses on espionage while another relates to making employees more aware of possible threats and encourages them to look out for possible disruptions¹⁷⁰⁷.

¹⁷⁰⁶ This section is based on Nederlands Instituut voor de Veiligheid (2013)

¹⁷⁰⁷ Source: <https://www.nctv.nl>

To ensure that vital infrastructure can still be used during a crisis, the Ministry of Security and Justice encourages companies to develop continuity plans that are focused on a specific topic in the field of crisis management¹⁷⁰⁸. For example, since the end of 2009 most hospitals, energy companies and governmental bodies have continuity plans in place that indicate what needs to be done when a pandemic occurs. Besides plans relating to pandemics, research done by the Dutch government showed that companies should also have plans in place relating to ICT and electricity. Developing continuity plans in these areas is compulsory. The Dutch vital infrastructure consists of 12 sectors covering 31 products.

Table 1.6: Overview of critical sectors and products in the Dutch vital infrastructure system

Sector	Products
Energy	Electricity, natural gas and (fossil) oil
Telecommunication & ICT	Mobile phones & land lines; radio, broadcasting and internet
Drinking water	Ability to supply drinking water
Food	Food provision and food security
Health	First aid services and other health care
Financial sector	Ensuring financial payments as well as payments to the government
Surface water management	Water quality and water quantity
Public order and safety	
Legal system	Justice, detention and law enforcement
Public governance	Diplomacy, information provision governments, armed forces and decision making
Transport	Schiphol Airport, Port of Rotterdam, main roads, main inland waterways and rail
Chemical and nuclear industry	Transport, storage, production and processing of substances

Source: Nederlands Instituut voor de Veiligheid (2013)

In order to ensure enough capacity in case something happens the civil authorities have improved the cooperation with the Army. In principle the capacity of the Army can be fully used during times of crisis, however the Army cannot agree on full availability, e.g. in case some of the troops are on a peace mission. The Army has guaranteed that at least 4,600 soldiers are permanently available to help in needed. The Army can assist by:

- Structural capacity → Coast guard, Royal military police, Special support units, Explosive Ordeal Disposal teams (EOD) and the emergency hospital.
- Random capacity → needs to be requested by the administrative powers, e.g. security and surveillance during evacuation, transport for evacuation, fire fighting helicopters, and decontamination capacity¹⁷⁰⁹.

¹⁷⁰⁸ Source: <https://www.nctv.nl>

¹⁷⁰⁹ Source: Ministry of the Interior and Kingdom Relations (2007)

More detailed policies, which are additional to the national ones, can be developed by the Security Regions. These policies are laid down in the policy plans of the Security Regions, which need to be updated once every four years (see chapter 4).

1.2.4 Policy for Preparedness

See paragraph above.

1.2.5 Policy for Response

As response is organised locally, the main policies for response are made on a local level as well. Each Security Region is obliged to make a risk profile, a policy plan and a crisis management plan (see chapter 4). These documents together should provide all necessary guidance needed to properly respond to an incident. Especially the policy plans of the Security Regions provide information with regard to arrival times of emergency services, communication strategies between emergency services & communication to the public and operational guidelines on how to act in certain situations.

The Inspection of Security and Justice, which is part of the Ministry of Security and Justice, is responsible for monitoring on a yearly basis if Security Regions have implemented these required plans and profiles. The results of these monitoring activities are laid down in the 'Staat van de rampenbestrijding', a report that extensively assesses the status quo of the crisis management for a three year period. The most recent one was published in 2013 and describes the status of the crisis management system for the years 2010, 2011 and 2012. Currently the Inspection is preparing the report for 2016, including the years 2013, 2014, 2015¹⁷¹⁰.

In the 2013¹⁷¹¹ report the Inspection mainly assessed whether or not the required documents were in place and if each Security Region had followed the basic rules, e.g. if the plans were mutually adapted. The Inspection also assessed if the Security Region organised an exercise and if this exercise was evaluated. The 2013 assessment was the first assessment since the introduction of the Security Regions in 2010. In the upcoming report the assessment will be further extended and will contain more details. Also some specific themes will be assessed, e.g. crisis communication and interregional exercises.

On the national level few disaster response policies have been formulated. Based on the assessment of the Inspection, the Minister of Security and Justice can adapt the legislation in place or he can urge Security Regions to undertake certain actions, however this is rather uncommon. The main actors are the Security Regions themselves and they need to feel enough urgency to prepare and respond properly.

¹⁷¹⁰ Based on interviews

¹⁷¹¹ Source: Ministry of Security and Justice (2013)

1.2.6 Policy for Relief and Recovery

The policy for relief and recovery is also mainly developed at a national level. Therefore after each crisis a similar set of options become available. These options can be non-financial (often permanently available) or financial (available on ad hoc basis).

Non-financial recovery¹⁷¹²

The national government has introduced several organisations and measures to provide relief to citizens. The main ones are:

- Impact (see below)
- Slachtofferhulp Nederland
 - Professional organisation that helps victims, sufferers and survivors after crises and severe incidents. The organisation does not charge for the help offered as they receive funding from the Ministry of Security and Justice, municipalities and the victims fund.
- Sensoor
 - Professional organisation that allows people to tell their story and ask their questions. The organisation can be reach 24/7 and people can phone or send an email. It is a life line organisation.
- Korrelatie
 - Professional organisation that offers physiological help to people in general, but can also assist after a crisis. Advice can be asked by phone or online.
- Algemeen Maatschappelijk werk
 - General support institution that aims to offer support to all people that are not able to solve their own problems any more. This does not include financial compensation.

Impact does not only focus on the victims involved in a disaster, but also offers professional help to the professionals that were on the scene. The organisation is 24/7 available for professional (police officers, fire fighters and psychologists) and governmental bodies (municipalities and provinces) to offer advice on disasters and large incidents. The organisation also supports municipalities and health care institutions to improve their physiological care, they develop guidelines for decent care after disasters and they have a database on offer providing scientific knowledge on recovery.

Financial recovery

For citizens, companies, governments or associations that have suffered damages the national government offers two possibilities to get some (financial) compensation. It should be noted that not the entire damage will be compensated and for the remaining part citizens should turn to their insurance company.

In the Act on compensation of disasters (Wet tegemoetkoming bij rampen, 1998), is laid down that every person or company who has suffered damage can ask the government for compensation. To receive compensation a crisis or other large event should have happened:

¹⁷¹² This section is based on <https://www.nctv.nl>

- Whereby the life and health of many people, the environment or major material interests have been seriously harmed or threatened, **and**
- Where a coordinated deployment of services from different disciplines or organizations was required to eliminate the threat or reduce the harmful effects.

In order to be able to claim compensation both requirements need to be fulfilled. However it is not enough to claim compensation straightaway. The following conditions need to be fulfilled as well in order to get some compensation (the Act does not allow for full compensation):

- Non-culpable: for example flooding caused by an exceptional storm.
- Uninsurable: no contribution will be made if you could reasonably insure yourself against the damage.
- Non-recoverable: there is no one else who pays the costs.

The government does not often pay compensations based on this act. Since its introduction in 1998, only 5 times the government has paid compensation.

The second act is the Security Regions Act which allows payments from the national government to the Security Regions or municipalities:

- Costs for a **municipality** resulting from actual combating a disaster and the consequences of that fight (emergency response costs). In addition, the costs for which reimbursement is requested need to be unforeseeable. Finally, only the emergency response costs incurred during the period of crisis could be reimbursed. Only a municipality can apply for this type of compensation. The own contribution of the municipality is € 3, - per capita (which is thus deducted from the compensation paid by the national government).
- Costs for a **Security Region** arising from the provision of (fire) assistance (assistance costs). This compensation does not only apply to disasters, but can also be requested for other incidents where assistance is provided by one or more Security Regions. Only Security Regions can apply for this type of compensation. The own contribution for the region per incidents is € 4,500,- (which is thus deducted from the compensation paid by the national government).

1.3 Financing

1.3.1 Investing in preparedness

Dutch crisis management and civil protection is changing rapidly and this influences the procedures for investing in preparedness. In the Netherlands the operational side of crisis management is organised locally. Based on the Security Regions Act each of the 25 Security Regions, combining the efforts of the fire brigade, police and public health institutions, is mainly responsible for the operational mitigation of a crisis. So the equipment of the actors can be used in all sorts of crisis. There is no national crisis equipment available. However in very severe crisis the military can be asked for assistance.

Investing in the fire brigade

As crisis management is organised through the Security Regions it means that investing in preparedness is investing in Security Regions. Each Security Region has a budget to finance general

assistance and emergency response. The budget is partly received from the national government, i.e. the Ministry of Security and Justice, who contributes through the 'Brede Doeluitkering Rampen' (BDUR), a general contribution for crisis management. The largest part, however, is paid by the municipalities that contribute based on the Municipality Fund (Gemeentefonds).

Although the Security Regions combine the expertise of the fire brigade, policy and public health institutions, the largest share of the budget goes to the fire brigade as the fire brigade has the largest role in the emergency response. Both the police and public health institutions receive their budgets through different channels (see below) and in the crisis management system they have a supportive role. Accounting wise the financing of the fire brigade and crisis management are always presented together. Following table shows the yearly contributions of the municipalities to the fire brigade and crisis management since 2005.

Table 1.7: Expenses of municipalities for fire brigades and crisis management (2005-2012)

		2005	2006	2007	2008	2009	2010	2011	2012
Total expenses	X m€	724	819	913	1017	1094	1125	1102	1126
Expenses per inhabitant	X €	44	50	56	62	66	68	66	67

Source: CBS (2013), Brandweerstatistiek 2012

As said the Ministry of Security and Justice is contributing to the Security Region through the BDUR. In 2013 the Ministry contributed € 128,379 thousand to the Security regions (National Budget 2014, article 36). According to the same budget the contribution will rise to € 176,770 thousand in 2014 and from 2015 onwards around € 175 million is available on a yearly basis.

As indicated the municipalities contribute the largest share to the Security Regions' budgets, however during recent years both the contributions of municipalities and the national government have increased, as the following graph shows. The blue line indicates the payments made by the Municipality Fund (in connection with left axis) and the green line indicates the payments made by the national government (in connection with the right axis).

Figure 1.2: Developments crisis management and emergency response¹⁷¹³

Investing in the police

Since 2012 the Dutch police force is structured in a different way. Before 2012 18 different forces existed each with their own budgets and policies. Since 2012 there is only one force, consisting of 18 units. The National Police has to have one policy and receives one overall budget that needs to be divided over the 18 units. The Ministry of Security and Justice is responsible for this budget. According to the National budget (art. 31) the police force received € 4,980 million in 2013¹⁷¹⁴. It should be noted that this is the total budget for the police, and other tasks than crisis response need to be covered with this budget as well.

Table 1.8: Estimated budget for the National Police, x1000

	2013	2014	2015	2016	2017	2018
National Police	4,980,842	4,882,090	4,775,744	4,727,684	4,701,528	4,677,334

Source: National Budget for the Ministry of Security and Justice (2014)

Besides investing in the Fire Brigade (through the BDUR) and the National police, the Ministry of Security and Justice invests in other parts of crisis management as well. The following contributions are made:

- Contributions:
 - Institute for Physical Security (Instituut Fysieke Veiligheid) → responsible for training and educational programmes related to crisis management;
 - Other activities within national security and terrorism.
- Subsidies

¹⁷¹³ Source: Anderssons Elferris Felix (2013), Evaluatie Wet Veiligheidsregio's

¹⁷¹⁴ Source: National Budget for the Ministry of Security and Justice (2014)

- Dutch Red Cross → largest volunteers organisation involved in crisis management. To help them organise their emergency response (buying necessary supplies, e.g. blankets, water etc.) the Ministry subsidises them;
- Education Security Region → to help developing educational programmes for fire fighters;
- Other activities within national security and terrorism → Support for NCTV to carry out the yearly risk assessment analysis.
- Projects:
 - NL-Alert → Development of crisis management communication tool (see chapter 4);
 - National Cyber Security Centre → institute focusing on policies for and impacts of cyber security;
 - Other activities within national security and terrorism → Projects focusing on R&D in crisis management as well as OTOTEL (see chapter 5).

Taking into account all these posts as well as the contribution to the National Police and the BDUR the Ministry of Security and Justice invested around € 5 billion in security related activities in 2013. However, as is indicated in the table, the largest share consists of the police budget that also is used for many other activities than crisis management, e.g. crime investigation.

Table 1.9: Estimated budget for crisis management related activities, x1000

	2013	2014	2015	2016	2017	2018

Source: National Budget for the Ministry of Security and Justice (2014)

1.3.2 Investing in consequence management

Several actors are involved in investing in consequence management. If objects belonging to the public domain have been damaged, e.g. buildings and roads, the 'government' has to pay. If the object belongs to the national government it will be the responsible ministry that needs to pay. If the objects fall under the responsibility of the regional or local government, these governments will bear the costs. If budgets are tight, the national government can provide assistance. Each of the governments has a budget available for un-expected expenses and these budgets can be used to cover the costs to repair, for instance public roads and buildings, if needed.

If a citizen is affected and his property or health is damaged, he can file an insurance claim. In the Netherlands it is compulsory to have a health insurance. Depending on the extensiveness of the insurance, citizens do need to contribute to treatment by spending their so-called own contribution (Eigen bijdrage). However for all citizens, their own contributions are (legally) limited and once the limits have been exceeded, the insurer will pay the remainder of the costs.¹⁷¹⁵

Also most Dutch citizens have insurances that cover damages related to property. According to a Lloyd's report the insurance penetration in 2011 was 9.5% (premiums as a % of GDP). In the list of 42 reviewed countries the Netherlands was number one, followed by New Zealand (5.2%) and South Korea (4.6%). It should be noted that the penetration rate is not related to the relative risks people are likely to face. The report also calculated if a country is over or under insured by calculating the 'benchmark insurance coverage'. Also here the Netherlands is number 1, with a benchmark of 8.01, indicated that the country is very well insured. Citizens are even better insured than they strictly need to be.

Compared to citizens the different industries are relatively poor insured. The Lloyd's report calculated the insurance penetration rated per industrial sector compared to the Gross Value added (GVA) of this particular sector to the national Gross Domestic Product (GDP) (see table below). Taking all sectors into account the overall insurance penetration for Dutch industry is less than 0.3%, ranking the Netherlands 11th amongst 18 reviewed countries. Frontrunner is the US with a penetration rate of almost 1%, followed by Ireland (0.87%) and the UK (0.75%).

Table 1.10: Penetration rate and GVA contribution per sector (2011)

Sector	Insurance penetration	GVA contribution
Wholesale and retail	0.65%	13.19%
Transportation and Storage	0.64%	4.48%
Agriculture, forestry and fishing	0.51%	2.08%
Real estate activities	0.34%	8.27%
Professional and administrative services	0.32%	13.70%
Arts, entertainment and recreation	0.30%	1.35%
Accommodation and food service activities	0.26%	1.84%

¹⁷¹⁵ Based on interviews.

Sector	Insurance penetration	GVA contribution
Financial and insurance activities	0.24%	3.78%
Manufacturing	0.20%	14.10%
Education	0.16%	4.24%
Human health and social work activities	0.14%	8.64%
Construction	0.12%	5.55%
Utilities	0.12%	1.95%
Information and communication	0.09%	2.46%
Public administration and defence	0.08%	6.81%
Mining and Quarrying	0.04%	3.08%

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment¹⁷¹⁶

Larger disasters are evaluated. Since 2005 a permanent body for evaluating crisis has been established, the so-called Research Council for Safety (Onderzoeksraad voor Veiligheid). The Council was introduced by the Act on the Research Council for Safety (Rijkswet Onderzoeksraad voor Veiligheid). And this act was accompanied by several Royal Decrees laying down the operational procedures followed by the Council. Before the introduction of the Council each crisis was evaluated by an ad-hoc commission, which often had not enough administrative powers to carry out a full research.

In comparison to the ad hoc commission the Research Council does have administrative powers that are laid down in the Act as well. Members of the Council are allowed to enter all buildings to gather information, they can collect radar images, recordings of interviews with possible suspects, and they are allowed to confiscate databases, audio & visual material, and wrecks. The act also regulates that everyone is obliged to cooperate with the Council in order to help the Council gathering all information to carry out a proper investigation.

The Council will investigate disasters in the following areas: inland shipping, construction and service, crisis management and assistance, defence, health care, industrial accidents, aviation, rail transport, water, road transport and maritime transport. In some case the Council is also authorized to carry out an investigation abroad, e.g. after the recent air crash in the Ukraine. Since its establishment in 2005 the Council has carried out 60 large investigations and dozens of smaller ones.

Everyone can ask the Council to start an investigation; however the Council will only carry out an investigation if they believe an incident is caused by a structural governmental failure. If the Council concludes that this might indeed be the case they will start collecting information as soon as possible

¹⁷¹⁶ This section is based on Onderzoeksraad voor veiligheid (2013)

and often they will visit the incident scene. They interview relevant stakeholders to find out what really happened. Based on the information gathered the Council will assess if there was a structural failure. Based on this information they can decide to further investigate the incident. In this investigation the Council is assisted by an advisory committee which exists of experts in that specific field. Jointly they draft a report which provides an overview of what has happened, what went wrong and what needs to be done to prevent a similar incident from happening.

The Council has three basic values:

- **Independent:** the judgement of the Council needs to be objective, impartial and independent. The Council needs to be critical with respect to all parties involved.
- **Transparent:** the council needs to be transparent about the choices they make and they need to underpin why they use certain methodologies.
- **Professional:** to ensure a decent report the Council needs to look for the right expertise and involve a sufficient number of external experts.

In case the conclusion is that the responsible authority has made severe mistakes it could lead to political consequences. For example, in case of a large pandemic with many fatal deaths, it could be concluded that the Minister responsible for public health made such severe mistakes that he should no longer carry out his function. He could be asked to resign his post.

Examples of recently performed evaluations are:

- The crash of an aircraft of Turkish Airlines;
- The fire at Chemie-Pack, a Dutch chemical factory;
- The shooting in Alphen a/d Rijn.

1.4.2 Departmental Lessons Learned systems

In the Netherlands the main actors involved in operational crisis management are the Security Regions. According to the Royal Decree on Security Regions (art. 2.5.1) each region should organise at least one exercise per year and they are obliged to evaluate the strengths and weaknesses of their own performance. Once a year each region needs to send the information to the Inspection for Security and Justice (Part of the Ministry for Security and Justice). The Inspection combines the information and writes an overall report titled 'Status quo of the Dutch crisis management system'. This report contains the main lessons learned and Security Regions are encouraged to implement the lessons learned in their procedures. Based on article 57 of the Security Regions Act the Inspection is entitled to monitor the performances of the regions.

In order to help each Security Region to perform the exercise and ensure that the results of the different exercises are comparable the Inspection has drafted a handbook describing how the self assessment needs to be carried out. The handbook describes the different roles of the Security Regions and the Inspection in an exercise, the preparation steps to take, as well as the execution &

evaluation steps. Every year the Inspection will evaluate whether or not the Security Region has implemented the lessons learned from the year before¹⁷¹⁷.

The self evaluation by the Security Regions is seen as a very important instrument for implementing lessons learned. According to an extensive research carried out by the Inspection it is shown that the effects of self evaluation have much more effect on the performance the Security Regions than reports made by third parties. Therefore the main lessons learned are based on the own experiences of the Security Regions during their daily operation as well as the exercises.

1.4.3 Centralised (national) Lessons Learned system¹⁷¹⁸

Incidents are evaluated on an individual basis and often only the actions taken by Security Regions are assessed as they are the main bodies involved in crisis management. Only a limited number of larger crises involving the national government occurs and so experiences in evaluating very large disasters is limited. The incidents can be evaluated by the Research Council for Safety or the Inspection for Security and Justice. In principle the Research Council can investigate all incidents it would like to investigate, based on legislation. In case the Research Council indicates that it would like to investigate an incident, no other body is allowed to conduct an investigation into the same incident. However in practise, the Research Council involves many other bodies during their investigations. These bodies can look into specific topics, e.g. victim identification or communication. They can also provide general support, e.g. by free up capacity.

During their investigations, the Research Council will always consider recommendations provided in earlier investigations carried out by themselves or others. The research Council will analyse whether or not the recommendations provided have been followed. In case they have not been followed the Research Council often concludes that no lessons were learned. The Inspection for Security and Justice on the other hand does not very often consider earlier provided recommendations and for them it is more difficult to assess whether or not lessons have been learned. They intend to change this procedure and evaluate more often if recommendations have been implemented so that they are better able to assess if lessons have been learned. Both organisations focus their investigation on local incidents and their check on lessons learned there for is also often local. However it is possible that their recommendations are more general and therefore can be applied to other Security Regions as well.

1.4.4 International exchange for Lessons Learned

The Netherlands holds exercises with its neighbours, Belgium and Germany, on a regular basis. With both countries at least once a year a cross border exercise is done and each exercise is evaluated. The things learned during these exercises are included in the handbooks and guidelines used in the daily crisis management¹⁷¹⁹.

¹⁷¹⁷ Source: Zelfevaluatie instrument – Handreiking evaluatie systeem oefeningen en GRIP 3/4 incidenten

¹⁷¹⁸ Based on interviews,

¹⁷¹⁹ Source: Nationaal Coördinator Terrorisme bestrijding en Veiligheid (2014 #3)

Between the Netherlands and Germany, the Netherlands and Belgium and between the Benelux countries several treaties and agreements related to crisis management and the way each country should respond have been signed. These treaties and agreements also include provisions on mutual exchange of information and early warning in case of major disasters (see chapter 3).

1.4.5 Regular policy reviews

To improve policies especially policy evaluations are important. On a national level recently the evaluation of the Security Region was carried out. This evaluation assessed if the Security Regions Act, which introduced this new administrative structure of Security Regions, had reached the desired effects. The evaluation was carried out on behalf of the Ministry of Security and Justice by an independent consultancy firm¹⁷²⁰. Based on the recommendations done it is possible that the Minister decides to change the policies taken so far. If really necessary the Minister can decide to change the law or accompanying Royal Decrees as well.

Also the policy plans made by the Security Regions are evaluated. These plans are evaluated by the Inspection of Security and Justice. The Inspections does not only evaluate the policy plans, but will also consider the risk profile and the crisis plan. In additional the Security Regions need to carry out exercises which need to be evaluated. Based on all the evaluations done the Inspection can advise a certain Security Region to change its policy plan. The Inspection does not have any powers and so cannot force a Security Region to change its policy plan or procedures. In case the Inspection establishes that severe points are falling behind they can try to conclude an improvement agreement with the Security Region in question. In this agreement the Security Region promises to improve their performance and plans. However, also in this case the Inspection cannot give the Security Region penalties in case they do not stick to the agreement. If a situation is really improper the Inspection can try to ask the Minister to urge the Security Regions to improve their performance. Up till now this never was an issue and it is unclear which procedures will be followed.

National policies are mainly tested and therefore reviewed, during a national exercise. Disadvantage of the national exercise is that it has a long preparation time and often turns into a demonstration showing the public that the system works and what it can do. Some stakeholders fear that the national exercises do not fully reflect the day-to-day situation and they place question marks whether or not the system is actually working that way. It remains a question if the system would work in the same way when something unexpected happens¹⁷²¹.

1.5 Resilience

The concept of resilience in civil protection, in terms of country's capacity to withstand shocks due to natural and other disasters, to rebuild itself with efficiency, and to improve on the pre-existing state wherever, has not been explicitly established by law or another normative act. However in the Netherlands several large awareness campaigns were set up in order to increase societal resilience.

¹⁷²⁰ Source: Andersson Elffers Felix, (2013)

¹⁷²¹ Based on interviews.

The campaign called Think Ahead (Denk vooruit¹⁷²²) encouraged citizens to prepare for possible disasters, by buying survival kits and be aware what they need to do in case a crisis happens. They also need to understand the need to ensure to save themselves first and should not solely rely on the emergency services. The campaign is finished, but the information can still be found on-line. Currently no plans are in place to launch a new awareness campaign.

Based on the Security Regions Act some companies are obliged to prepare a crisis management plan. The Act lays down that companies falling under the Royal Decree Risks severe accidents 1999 (Besluit Risico's Zware Ongevallen) and airports need to have crisis management plans in place. Mainly chemical plants are required to have a crisis management plan in place. These plans will increase the resilience of these companies in case a crisis happens.

1.6 Information sharing and data protection

Information sharing during times of crisis

The Royal Decree Information in connection to disasters and crisis (Besluit informatie inzake rampen en crisis, 1994) provides an extensive overview who and when information needs to be exchanged in case of emergency. The Royal decree describes amongst others when information from the government should be transferred to the population and when another country should be informed of possible threats. The Decree does not explicitly refer to the sharing of sensitive information with other states. Whether or not sensitive information is shared will depend whether or not the Netherlands has concluded a treaty with the other state agreeing to share such information in case of a crisis.

With regard to personal data the public authority is, in principal, required to obtain explicit and unambiguous permission to use personal data (based on the Wet bescherming persoonsgegevens, article 8 sub a). However article 8 sub e of that act states that a public authority can use personal data (without consent) if the public authority needs the personal data in order to fulfil its public duty in a good and sufficient manner. According to the explanatory memorandum accompanying the act this applies in case of an emergency where medical care is required. The public authority is allowed to share personal information without the explicit consent of the people involved, because in an emergency situation it would be undoable to obtain consent of everyone. In that case providing medical care and combatting the emergency take precedence over individual consent to use personal information.

Registration of volunteers

In the Netherlands the level of voluntarism is high. The largest group of volunteers is working for the fire brigades, being 70-80% of all volunteers. The share of volunteers assisting the police is relatively low (only 4%). Both volunteers assisting the fire brigades and the police receive a monetary compensation for their work. Other volunteer groups are volunteers 'working' for the Dutch Rescue Service (patrolling the inland waterways and providing life guard services) and the Dutch Red Cross. All these 'official' volunteers are registered as they need to obtain certificates and are required to

¹⁷²² Source: <http://www.crisis.nl/wees-voorbereid.aspx>

follow trainings in order to be able to execute their task. One of the compulsory trainings they all follow, each in their own organisation, is the First Aid Training¹⁷²³.

Besides these groups of official volunteers, which have dedicated training and are registered, a group of unofficial volunteers, people that would like to assist because they feel socially responsible to do this, is available. These people are neither registered nor trained. Currently no clear policy is in place how to deal with these volunteers. However, such a policy is urgently required, as situations where untrained volunteers are involved occur more and more¹⁷²⁴.

Using Social Media

The usage of social media to gather information in times of crisis is still limited in the Netherlands. Although public authorities have several fora at their disposal to communicate in case of a crisis, the usage of these fora to collect data is still limited. In a vision paper on social media and crisis communication published by the NCC it is stated that the public authorities should always listen to messages placed on social media. There is no clear strategy yet how to deal with message placed on Facebook, Twitter or Flickr. The main problem is to filter the correct information. Much information is posted on social media, but not all of the information is reflecting to the true situation. Therefore communication employees need to filter the information found and verify whether or not the information is correct. The Dutch government is currently working on methods how to verify information collected via social media¹⁷²⁵.

¹⁷²³ In case of an emergency the assistance of these volunteers can be required by the competent authority. Normally volunteers fall under the authority of their fire brigade, police force or dedicated department within the Red Cross, but if the crisis is large and one of the ministries is the competent authority, that Ministry can involve the volunteers itself. The official volunteers are available on a permanent basis and if something happens they can be quickly mobilised to assist.

¹⁷²⁴ Based on interviews.

¹⁷²⁵ Source: Infopunt Veiligheid (2013), 'Sociale media: informatiebron en communicatiekanaal'

2 Legislation

2.1 Crisis (emergency, disaster) management concept

The framework for national crisis management is laid down in the national guide for crisis decision making¹⁷²⁶. The guide is established by the council of ministers and can therefore be qualified as a Royal Decree. The Handbook is legally binding and actors involved need to comply with the rules laid down in this guide. The guide is regularly updated. The current Handbook was adopted in 2013, replacing the previous version which was adopted in 2009. The procedures laid down in this national guide apply to all (possible) crisis situations that require broad intervention. Main coordinating Ministry is the Ministry of Security and Justice. This Ministry is the main responsible Ministry in case the crisis affects the public order and security. The Ministry has a more coordinating role in all other types of crises. In such cases the Ministry under whose responsibility the crisis normally falls is the main responsible Ministry. The Handbook covers the following topics:

- Crisis-related decision making on an official level (within a Ministry/department);
- Crisis-related decision making on a political-administrative level (between Ministries through their Ministers);
- The National Crisis Centre (NCC);
- The National operational coordination centre (LOCC) and the National Operational Staff (LOS);
- The National Core team Crisis Communication (NKC);
- Relevant legal aspects, focusing on emergency law;
- International crises, relating to how assistance is provided or asked for;
- Recovery phase, once the crisis has happened;
- Evaluation, to come to lessons learned.

This Handbook applies to the largest crises possible that are inter-regional or even cross border. In case a crisis relates to the competence of one specific Ministry or a specific topic, e.g. large pandemic, the national guide is extended and at some points replaced by a specific national crisis plan (NCP). In these plans the procedures to be followed are described as well as the specific competences of the different actors (see chapter 4).

If the crisis affects a Security Region, which is a smaller geographical part, the leading plan is the crisis plan of the Security Region. The provisions and actions laid down in this plan are based on the national handbook and guidelines given by the Minister of Security and Justice and need to be incorporated as well.

Additional policies relating to crisis management can be made by the Ministry of Security and Justice. The Minister needs to send the new policy to Parliament, which has the right to adopt, amend and eventually decide on the proposal of the Minister of Security and Justice.

¹⁷²⁶ Source: National Centre Terrorism and Security (2013), 'Nationaal Handboek Crisisbesluitvorming

2.2 General crisis (emergency, disaster) management law

Wet Veiligheidsregio's 2010

The main Act regulating crisis management is the Act on the Security Regions (Wet Veiligheidsregio's), which was adopted in 2010. This act has replaced the Fire Service Act of 1985, the Disaster Act and the Act on Medical Assistance in Times of Disaster. The Act on Security Regions has harmonised all disaster management and within the Netherlands the 25 Security Regions are now responsible for crisis management in their own geographical area. In case the crisis is larger than their own area, the regions are obliged to join efforts in order to mitigate the effects.

Dutch operational crisis management is in principally organised locally. Based on the Security Regions Act, article 2, the Mayor and Aldermen are still the main responsible body for the fire brigade, the disaster control and management as well as the medical assistance. Article 5 indicates that the mayor is the chief-in-commander in case of a crisis. Everyone that provides assistance needs to follow the commands given by the mayor. This also holds for the Army if they are asked to provide assistance during a crisis at local level. Furthermore, the mayor can give orders to the regional ambulance services if this is needed from a public order point of view (article 6). The mayor also needs to provide information to the population relating to the cause, size and consequences of the disaster (article 7).

Although the mayor is the chief-in-commander during a crisis certain tasks have been transferred from the individual municipalities to the Security Regions. According to article 10 the following responsibilities have been transferred to the Security Regions:

- Making an inventory of the risks on fire, disasters and accidents;
- Advising the competent authority on the risks of fire, disasters and accidents that have laid out in regulations or the policy plans;
- Advising the mayor and aldermen about how the fire brigade (which falls under their responsibility) could be best organised and operated;
- Prepare for firefighting and organising the crisis control and management;
- Setting up and maintaining a fire brigade;
- Setting up and maintaining the GHOR (= emergency health care);
- Provide an emergency control room;
- Purchasing and managing the common equipment needed;
- Organize and maintain the information exchange between the Security regions, fire brigade, GHOR and the control room.

The Security Regions Act does not only provide an overview of the responsibilities of the mayor/aldermen and the Security Region, but also describes the tasks of the fire brigade and the GHOR in case of an emergency. The role of the police in case of a crisis is laid down in another Act, the Act on the police force (Politiewet, 2012).

The Minister of Security and Justice can determine national goals for the Dutch crisis management system (articles 37 and 38). Each Security Region needs to ensure that the national goals are transferred to their own policy plan. Not incorporating the national goals can lead to administrative

sanctions. Whether or not the goals are implemented, is checked every year. National goals relate to crises that are likely to affect large parts of the country, e.g. pandemic, flooding, or crisis that affect the national or international interests. Through the national goals, priority can be given to certain aspects of preparedness, e.g. multi-disciplinary practise.

The act also indicates how the responsibilities are transferred entirely to the head of the Security Region in case the disaster affects more than one municipality. As a crisis becomes more complex and more partners become involved it is more important to have simple structures. According to article 39 the Head of the Security Region can take over all responsibilities of the mayor. In the articles 40-44 some additional requirements are laid down. If the crisis concerns more than one Security Region or the national government finds that they should be in control of the crisis, they can take over the responsibilities of the head of the Security Region or the mayor, based on the articles 52 to 54. In this case the national structure will be in place (see chapter 3.1 for the organisational structure).

Besluit Veiligheidsregio's 2010

The Act on Security Regions is a formal act established by Parliament, and therefore is difficult to change. The more practical rules, the specific details and clarifications, e.g. handling specifications for dangerous goods, are laid down in an accompanying Royal Decree (Besluit Veiligheidsregio's). This Decree was adopted in 2010 and can be easily updated when needed. The decree lays down quality measures that need to be adopted by the different organisations mentioned in the act.

A set of minimum criteria has been set out, including the estimated arrival time of the fire brigade at the incident scene. The measures aim, on the hand, to improve the uniformity and comparability both within and between the involved organisations and on the other hand they are used to make the performance of the Security Regions more transparent. In the end the assistance procedures between the regions and the supra regional/national should become more efficient and effective.

Besluit personeel veiligheidsregio's 2010

Another Royal Decree based on the Security Regions Act is the Decree relating to the personnel of the Security Region (Besluit personeel veiligheidsregio's). In the decree the different functions within the fire brigade, GHOR, the multi-disciplinary functions and industry fire brigade functions are mentioned. For all functions the maximum possible job levels are indicated and training possibilities are mentioned. All personnel need to keep up their experience by actually being involved in the crisis management, practise and training. Aim of the minimum requirements is to ensure uniformity between the different regions.

2.3 Emergency rule

2.3.1 Emergency powers on national level¹⁷²⁷

In case of an emergency the starting point is the legislation and regulation currently in force. So each authority will have, in principle, the same competences as it has without a crisis. However legislation and regulation specifically applicable to the crisis takes precedence over other regulation. An extensive overview of the competences currently in place can be found in a handbook called 'Crisis en recht: schema's bevoegdheden en verplichtingen tijdens crises' (2008). The handbook describes for 27 specific areas who is the competent authority for taking certain measures and what the legal basis is for this competence.

For example the mayor of each city has the obligation to inform the citizens, emergency services, Commissioner of the King and Ministry of Interior Affairs on the current water levels, in case water levels are extremely low or high compared to usual water level. However the authorities responsible for the water quality (Waterschappen) provide specific information relating to water management. Rijkswaterstaat, the Dutch fairway authority, is responsible for the communication to inland vessels. Together these authorities need to prepare for a possible crisis and need to ensure that if the crisis emerges their response is appropriate.

Emergency law can only come into force, when the regular legal powers and competences are not sufficient to overcome the extraordinary event. In that case dedicated competences can come into force, however only in a well-balanced and flexible way. Several acts are in place providing the legal basis for these dedicated competences. These acts also indicate when and how these dedicated competences come in force. The acts are:

- Coordination Act extraordinary events (Coördinatiewet uitzonderingstoestanden, 1996);
- Act extraordinary powers civil authority (Wet buitengewone bevoegdheden burgerlijk gezag, 1996);
- War Act for the Netherlands (Oorlogswet voor Nederland, 1996).

Each of these three acts can ensure that emergency law will be used. Dedicated emergency laws will come into force, depending on the severity of the emergency. Examples are the Emergency Act on Rationing (Hamsterwet, 1962), Emergency Act on financial transactions (Noodwet financieel verkeer, 1978) and Emergency Act on transportation (Vervoersnoodwet, 1962)¹⁷²⁸.

The emergency law or parts of it can only take effect when the state of emergency ('noodtoestand') is proclaimed. The state of emergency has two phases; the limited state of emergency or the overall state of emergency. The proclamation of a state of emergency as well as the extraordinary competences is done by Royal Decree. The Royal Decree is issued by the Prime Minister, who is also

¹⁷²⁷ Source: National Centre Terrorism and Security (2013), 'Nationaal Handboek Crisisbesluitvorming'

¹⁷²⁸ All emergency acts are: Noodwet rechtspleging, Wet verplaatsing bevolking, Wet militaire inundatiën, Kaderwet dienstplicht, Inkwartieringswet, Vervoersnoodwet, Havennoodwet, Hamsterwet, Distributiewet, Vorderingswet, Noodwet voedselvoorzieningen, Noodwet arbeidsvoorziening, Noodwet geneeskundigen, Noodwet financieel verkeer, Vaarplichtwet.

the Minister of General Affairs. Continuation of extraordinary competence needs to be approved by the Parliament, consisting for both Chambers.

Based on the acts mentioned above it is possible to limit the rights of civilians and institutions in a case of emergency. However civil rights can only be limited if a general state of emergency is proclaimed and the limitation should not last longer than strictly necessary. For example, in case of a possible dike breach the Waterschap (responsible for water management in its appointed area) can decide to strengthen the dyke and other relevant parts of the waterway without asking the consent or even informing the owners of the property on which actions they are going to take.

2.3.2 Emergency powers for mayors and heads of Security Regions

Also at a local level emergency law is in place. Based on the Municipality Act (Gemeentewet, 1992) the mayor of a city has the following emergency powers: the emergency command and the emergency regulation. The emergency demand can be used for specific persons or industries, e.g. a high risk chemical plant, while the emergency regulation applies to all, e.g. disaster tourists. In addition to the emergency command and emergency regulation the mayor is during crisis the commander-in-chief of the emergency services, including parts of the Army, if they provide support. It is important as these services normally do not fall under the responsibility of the mayor and no hierarchal cooperation relations are in place. Only exception is the police force, as the mayor has the responsibility of the police force in cases of public (dis) order. This is based on the Act on the Police force (Politiewet, 2012).

The Head of the Security Region can take over all the administrative powers of the mayor, including the responsibility for the police force, if the crisis exceeds the competences of one mayor only.

For both the mayor and the head of the Security Region it is regulated that they cannot use their emergency powers under all circumstances. Emergency powers can only be used if they fulfil the two basic principles of proportionality and subsidiarity. Proportionality refers to the severity of the emergency powers in relation to the size of the crisis. Subsidiarity is only allowed if the usual competences are no longer sufficient to handle the crisis situation. Normally the mayor or the head of the Security Region are not allowed to interfere in the functional chain (see chapter 3). However, they can interfere if the public order or safety is at stake, but it needs to be the last possible remedy. This is based on the principle of subsidiarity. In case of an emergency they can more easily interfere¹⁷²⁹.

It should also be noted that in some cases even the emergency powers are no longer sufficient enough to handle the crisis, this holds both for the local as well as the national crisis management. In these cases the unwritten emergency powers can be used. These norms are not laid down in any act, but can be used based on common understanding. The Dutch judicial power has accepted this phenomenon. Once the crisis is remedied a democratic justification needs to be given¹⁷³⁰.

¹⁷³⁰ Source: National Centre Terrorism and Security (2013), 'Nationaal Handboek Crisisbesluitvorming'

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

In the Netherlands two types of crisis management systems are distinguished. On the one hand there is the general crisis management system related to public safety and national security. Competent Ministry to undertake action is the Ministry of Security and Justice and the relevant practises are laid down in the National guide for crisis decision making (see above). On the other hand there is specific crisis management, which can relate to a specific threat which was identified in the risk assessment. For a specific crisis the Ministry under who's competence the topic falls, is responsible and if needed a dedicated NCP is made, e.g. the NCP for high water levels and flooding. In case the Minister of Infrastructure and Environment will be responsible and needs to draw the plan¹⁷³¹.

For each crisis area a map (Bestuurlijke netwerkkaart) has been developed¹⁷³². These maps are legally binding and the indicated authorities need to follow the structures and responsibilities laid down in this document. The map provides information on the types of crises expected in this specific field, the competent authorities, the administrative powers available and guidance on how to act. The map also shows a diagram of the interrelations between the different actors and the general chain. The maps are regularly updated in order to ensure their effectiveness in crisis management. First an example of a summary table is presented, showing the main information, i.e. type of crisis, competent authorities and types of measures. Secondly, an example of the map used to show interrelations between the competent authorities and the emergency services is provided. Both examples presented relate to pandemics and apply to the Ministry of Health care, Welfare and Sport.

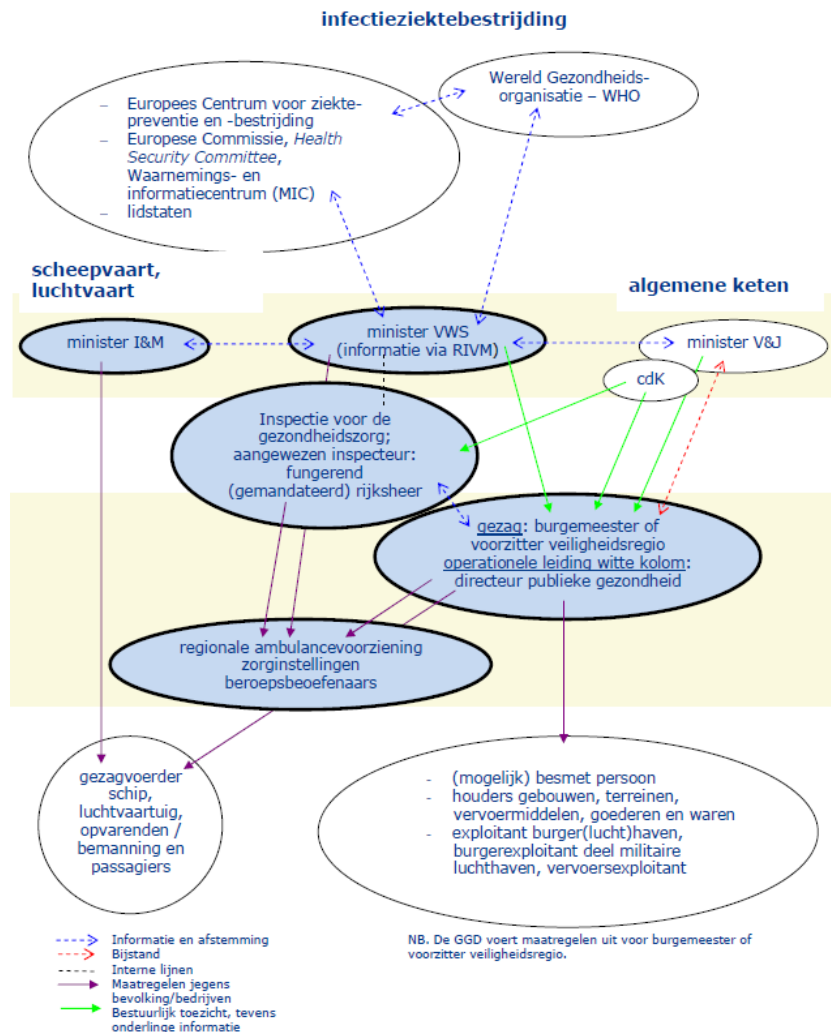

Table 2.1: Summary table is presented, showing the main information

Type of crisis	(threatening) diseases, including diseases transferable between humans and animals)
Competent authority	<ul style="list-style-type: none"> • Mayor • Chairman Security Region • Minister of Health • Minister of Infrastructure and Environment • Minister of Economic Affairs
Types of measures	<p>General:</p> <ul style="list-style-type: none"> • Measures with respect to individuals • Measures with respect to buildings, terrains and goods • Distribution of vaccines and therapeutic pharmaceutical products • Measures at EU inner and outer borders, vessels and aircrafts & airports • Measures with respect to vessels and aircrafts • Measures with respect to individuals and goods after arrival vessels and aircrafts • Measures with respect to port and airport operators • Measures to suppression, prevention and fighting zoonosis

Figure 2.1: Overview map of relations between the different actors¹⁷³³

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

As described in paragraph 2.2 the Dutch crisis management system is locally organised, hence through the Security Regions. For more information on the legal scope and status of local crisis management arrangements, please see paragraph 2.2.

With the introduction of the Wet Veiligheidsregio's each Security Region is required to draft a regional crisis plan (article 16), joint by a policy plan and a risk profile (see chapter 4). The Netherlands consist of 25 Security Region and therefore 25 separate regional crisis plans need to be in place. The regional crisis plan describes how the regional crisis management will be organised and what the role and responsibilities of the police, fire brigade, and medical assistance are. To help each

¹⁷³³ Source: Nederlands Instituut voor de Veiligheid (2013)

Security Region to draft their regional crisis plan and to ensure similarity between the 25 different plans, the reference guide for a regional crisis plan was published in 2009 (Referentiekader Regionaal Crisisplan 2009). The reference guide aims to structure the regional processes by using similar definitions and applying national standards¹⁷³⁴.

The regional crisis plans are not only guidance for the different actors involved in crisis management, but are legally binding. Deviation from the guidance given by these regional plans is seen as undesired behaviour, however if the mayor or the Head of the Security Region decides deviation is absolutely necessary, he needs to explain why the deviation took place.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

The fire brigade

Most volunteers are part of the fire brigade (see chapter 1). As these volunteers assisting the fire brigade, are entitled to a monetary compensation for their work, they have a contractual agreement with the fire brigade. Based on the Civil Servants Act (Ambtenarenwet, 1929) the volunteers have their own legal position and are partly covered by the CAR-UWO (College of Employment Matters). In case of an emergency the volunteers can be easily asked for help as they are available on a permanent basis. Each local fire brigade is insured for personal injuries or deaths and this insurance also apply to volunteers. It is reasoned that volunteers suffering damage during the execution of their job or suffering other damages, are insured by lump sums¹⁷³⁵.

Table 2.2: Example of damages to be claimed by voluntary fire fighters in Rotterdam (2012)

Type of damage	Compensation
Death	Capital repayment → € 110,000 Widow repayment → € 17,500
Permanent disability	Capital repayment → € 200,000 Interest payment (wage labour) → € 17,500 Interest payment (self employed) → € 35,000
Medical expenses	Secondary payment with a maximum of € 18,2000
Predisposition	€ 23,000

Source: Brandweer Rotterdam Rijnmond (2012)

The Dutch Red Cross

The role of the Red Cross has been laid down in the Royal Decree Red Cross 1988 (Besluit Rode Kruis 1988). The core tasks of the Red Cross are to provide medical assistance at the incident location by sending a Quick Response Medical Assistance Team, support the municipal government to provide shelter and relief for the evacuated population and to support the municipal government in registering and tracing missing persons. In addition the Red Cross provides services to supply

¹⁷³⁴ Source: <http://www.infopuntveiligheid.nl/Publicatie/Dossier/80/regionaal-crisisplan.html>

¹⁷³⁵ Source: <http://www.car-uwo.nl/onderwerpenindex/brandweervrijwilligers/algemene-bepalingen/werkingsfeer>

bandages, mattresses, blankets and so on. They also have to communicate with all their volunteers. In organisational structure the Red Cross volunteers align with the Security Region and they need to answer to the Regional Emergency coordinators. Each volunteer is risk insured, so in case the volunteer is injured during the execution of his tasks, the Red Cross will ensure compensation.

2.7 Legal regulations for international engagements of first responders and crisis managers¹⁷³⁶

EU regulation for assistance

The Netherlands, as member of the EU, has implemented the EU regulation with respect to crisis management. Some of the legislation comes from the Council, and other procedures and forms of cooperation have been concluded in a treaty. The treaty of Prum mainly focuses on increased cooperation between the signing countries¹⁷³⁷ in the field of terrorism, illegal migration and cross border criminal activities, while the Council Decisions regulate some aspects of cross border assistance. The decisions focus on the procedural side of assistance indicated how requests should be filled, when countries need to respond and how the teams provided are coordinated. The following decisions and treaties have been implemented:

- Council Decision 2008/617/JHA of 23 June 2008 on the improvement of cooperation between the special intervention units of the Member States of the European Union in crisis situations.
- Council Decision of 8 November 2007 establishing a Community Civil Protection Mechanism
- Prum Convention of 27 May 2005 on the stepping up of cross-border cooperation, particularly in combating terrorism, cross border crime and illegal immigration.

Bilateral and regional agreements between the Netherlands and Germany

Beside the multilateral agreements, the Netherlands has concluded agreements and plans with Germany. The agreements and plans lay down how the Netherlands can provide assistance to accidents on German soils and vice versa. Also some more structural support is regulated. Especially the plans relating to the fire brigades provide the opportunity to help each other on a daily basis. So for a fire in the border region both the Dutch and German brigades are warned and often they jointly go to the incident scene to mitigate the effects. The main agreements and plans currently in place are:

- Agreement between the Netherlands and Germany on mutual assistance in combating disasters, including serious accidents of Bonn 1988
- Agreement between the Netherlands and Germany on cross border police action and the cooperation in criminal matters of Enschede 2006
- Euroregional disaster plan for the Euroregion Maas-Rhine-North
- Understanding on cross border support for health, fire brigade, technical and specific assistance in the Euroregion Maas-Rhine
- Cross border cooperation plan by disasters and severe accidents between the regions Noord and Oost Gelderland, Twente, Grafschaft Bentheim and the district Borken

¹⁷³⁶ This section is based on ANVIL, country study: The Netherlands (2013)

¹⁷³⁷ Signing countries where: the Netherlands, Belgium, Luxembourg, Germany, France, Spain and Austria

- Cross border assistance plan of Technisches Hilfswerke, Landesverband Nordrhein-Westfalen, for support in the Netherlands at daily activities in the fire brigade regions Twente, Noord and Oost Gelderland, Gelderland Midden, Limburg Noor den Zuid Limburg

Bilateral and regional agreements between the Netherlands and Belgium

Also between the Netherlands and Belgium additional agreements have been made. Some of the agreements are more formal than the ones made with Germany as treaties have been concluded. Beside the treaty some additional agreements have been made that focus on cross border assistance and cooperation between the relevant regions. Also here the procedures of providing assistance on each others territory have been included. Main legislation is:

- Treaty between the Kingdom of the Netherlands and the Kingdom of Belgium on mutual assistance in combating disaster accidents of the Hague 1984
- Bilateral agreement between the Provinces of Luik (Belgium) and Limburg (the Netherlands)
- Bilateral assistance plan between the Provinces Noord-Brabant (the Netherlands) and Limburg (Belgium) of Den Bosch 1992
- Disaster protocol and handbook disaster protocol Euroregion Scheldemond

Multilateral agreements

Closely located to the Netherlands and Belgium is Luxembourg that is part of the Benelux. Within the Benelux main additional agreements have been and also for cross border assistance in case of disasters and accidents additional agreements are concluded:

- Memorandum of understanding between the Netherlands, Belgium and Luxembourg to cooperate in the area of emergencies with possible cross border effect of Senningen 1996
- Treaty between the Kingdom of Belgium, The Kingdom of the Netherlands and the Grand Duchy of Luxembourg on cross border police action
- Benelux 2009, Ordination of the Committee of the Benelux with respect to cross border first response ambulance services.

3 Organisation

3.1 Organisational chart

The operational crisis management is organised locally. On a national level there is hardly any operational capacity available. From an operational perspective the municipality or the Security Region (collection of several municipalities) is the main body to organise crisis management as they are also involved in daily incident management. The Netherlands consists of 403 municipalities, divided over 25 Security Regions. In the Dutch crisis management the general idea is that the organisation responsible for incident management is also the starting point in case of an emergency. When a small incident or crisis emerges the decisive power lies with the municipalities or the Security Region (depending on the size of the crisis). If the crisis affects more than one Security region the national government needs to be informed and if needed can take over the coordination of the crisis. In that case the national crisis management system is activated.

Figure 3.1: Location of the 25 Security Regions in the Netherlands¹⁷³⁸

The national crisis management in the Netherlands is split in two. On the one hand there is general crisis management, which focuses on public order and safety. This procedure is called the general

¹⁷³⁸ Source: www.imergis.nl

chain and in every larger crisis this chain plays a role, however the size of the involvement can differ. On the other hand there is functional crisis management system, which concentrates on crisis in a specific functional area, e.g. electricity, pandemics or terrorist attacks. This procedure is called the functional chain.

3.1.1 General chain: violence of public order or safety¹⁷³⁹

In case a crisis emerges that is larger than strictly local the general chain will be started. The responsible Minister is the Minister of Security and Justice, assisted by one or several of the King's Commissioner(s) (CdK), the highest public servant of a province¹⁷⁴⁰. Depending on the geographical location and the size of the crisis this group is extended by the relevant heads of the Security Regions and/or the mayors. These bodies can take measures that will affect the people and enterprises. The figure below shows the structure of the general chain.

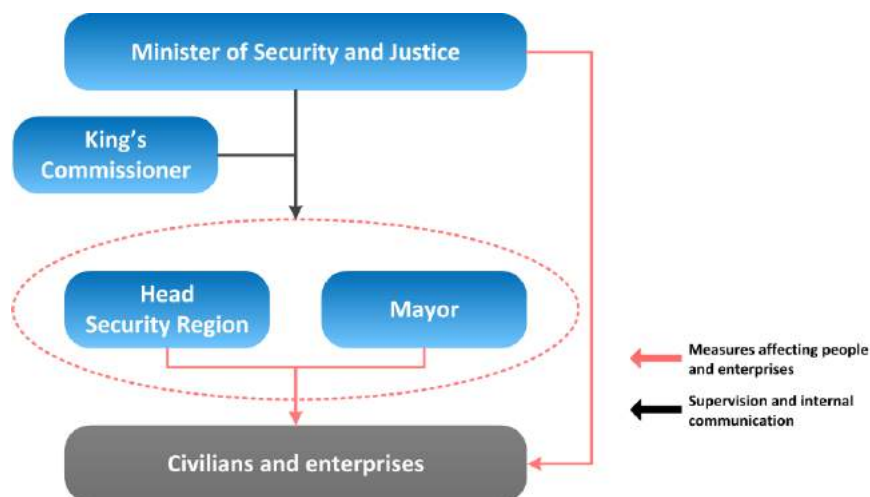

Figure 3.2: Organisation chart of general crisis management in the Netherlands¹⁷⁴¹

In the general chain crisis management is often bottom up. If the public order is violated the mayor or the head of the Security Region is the first body to act and take (counter-) measures. Depending on the geographical scope of the crisis one or more mayors and / or heads of the Security Region are involved and jointly they need to mitigate the effects of the crisis. The CdK can provide guidance to heads of Security Regions and the mayors if needed.

If the crisis turns out to be larger and the impacts are more severe the competence to manage the crisis can be transferred the Minister of Security and Justice. This can be done in a two-step approach. The first step allows the Minister to provide guidance that preferably needs to be followed-up by the mayor or head of the Security Region. In the second step the Minister will take over the competence and is sole responsible public body. In this case the regional crisis becomes a

¹⁷³⁹ This section is based on Infopunt Veiligheid (2012). De bestuurlijke aansturing van de crisisbeheersing

¹⁷⁴⁰ The Netherlands consist of 12 provinces, so in total there are 12 King's Commissioners. Depending in the location of the crisis, one or more commissioners will need to assist the Minister of Security and Justice.

¹⁷⁴¹ Source: Infopunt Veiligheid (2012). De bestuurlijke aansturing van de crisisbeheersing, edited by authors

national crisis. Example could be a large evacuation. The Minister is assisted by the National Crisis Centre (NCC) which is part of its Ministry.

The NCC has permanent staff available that guides the crisis management process. The NCC prepares the input for the interdepartmental decision making on civil servant level (for the ICCb) as well as on ministerial level (for the MCCb). The tasks can be divided over four themes:

- Information: collecting the factual information to establish what actual happened;
- Measures: translate the factual information in concrete actions that need to be undertaken;
- Communication: decide which communication strategy will be followed to inform the public;
- Scenario's: assess what might happen in the near future.

In case the crisis exceeds the competences of the Ministry of Security and Justice, and other Ministries are involved, the NCC will ensure communication between the Ministry of Security and Justice and the other ministries. They will contact all relevant departmental (crisis) coordination centres (DCC). The NCC is the main point of contact for all governmental bodies, including the Security Regions as well. If an emergency has occurred the NCC receives the requests for support and expertise. It should be noted that the NCC is not an additional layer in the organisational structure, but aims to be the central point of contact to ensure quick response from the national government.

3.1.2 Functional chain: specific crisis¹⁷⁴²

A crisis often relates to a specific functional area, e.g. flooding or a terrorist attack, and then the functional chain will act as well, next to the general chain. The public body that is able to take decisions is the Ministry responsible for that specific function. In case of a pandemic, the Ministry of Health, Welfare and Sport will be the main responsible Minister, beside the Ministry of Security and Justice that will handle the general crisis management. Mayors and the Heads of the Security Regions are only involved if they are part of that specific functional chain. If they are not, they do not become part of the crisis management system. The exact structure as well as the procedures followed can differ per functional chain. A set of functional chain maps (bestuurlijke netwerkkaarten) has been developed and is regularly updated. The complete set can be found at the Dutch website: <http://www.infopuntveiligheid.nl> which covers 22 specific maps.

Table 3.1: Overview of functional chain maps in the Netherlands

Functional chain maps crisis management			
1	Crisis management general and violation of public order	12	Emergency drinking water and emergency water
2	Medical assistance general	13	Food

Source: <http://www.infopuntveiligheid.nl>

Contrary to the general chain, crisis management in a functional chain is top-down. The responsible Minister needs to take mitigating measures and the activities are managed by the relevant Departmental (Crisis) Coordination Centre (DCC). In case of a disaster the relevant Minister can obtain emergency powers after consultation with the Minister of Security and Justice. In this case the role of the Minister of Security and Justice is more limited and he mainly needs to be informed about the size of the crisis and the procedures taken. He will inform the Heads of the Security Regions as well as the mayors. The Minister of Security and Justice will only undertake more action if the crisis cannot be handled by the responsible Ministry only or once more functional chains become involved.

3.1.3 Coordination between the chains

If complex crisis occur more chains can be involved. The coordination becomes more complex and in this case the role of the Ministry of Security and Justice becomes larger. The general chain will be activated as well as the relevant functional chains. In this case there will be coordination on two levels. First of all, on the national level, i.e. between the relevant Minister and the Minister of Security and Justice. Secondly, coordination on regional level is needed, i.e. between mayors, heads of the Security Regions and other relevant organisations. Who is involved depends on the specific functional chain(s).

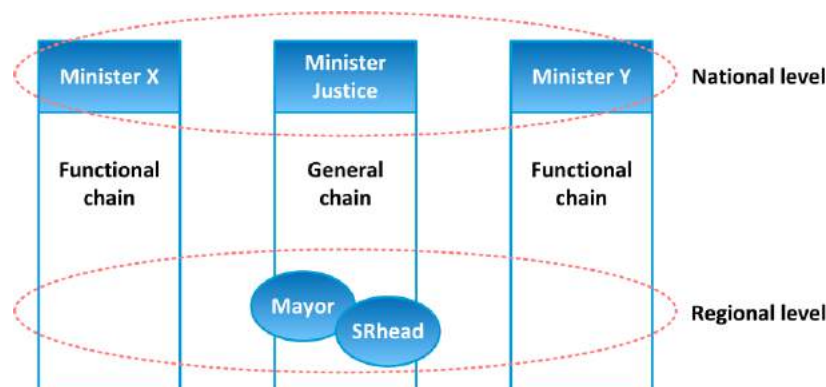

Figure 3.3: Organisational chart of complex crisis management in the Netherlands¹⁷⁴³

¹⁷⁴³ Source: Infopunt Veiligheid (2012). De bestuurlijke aansturing van de crisisbeheersing, edited by authors

The figure above shows the interaction between the two different types of chains and the coordination at both national and regional level. However this picture is not complete as it still mainly focuses on crisis coordination in one of the pillars, i.e. the functional chain for a specific crisis and the general chain in case of violation of public order. If the crisis becomes bigger the different chains need to cooperate and actions need to be coordinated. This coordination is done by the Interdepartmental Commission Crisis Management (ICCb) which is supported by the NCC (coordination in the general chain). The involved Ministries are part of the ICCb and jointly they decide how to handle the crisis. In case the national security is at stake crisis management is done by the Ministerial Commission Crisis Management (MCCb) where the involved Ministers come together under the chairmanship of the Minister of Security Justice. If the impacts of the crisis are so large, the Prime Minister will take over the chairmanship of the MCCb. Examples could be terrorist attacks and cases of war.

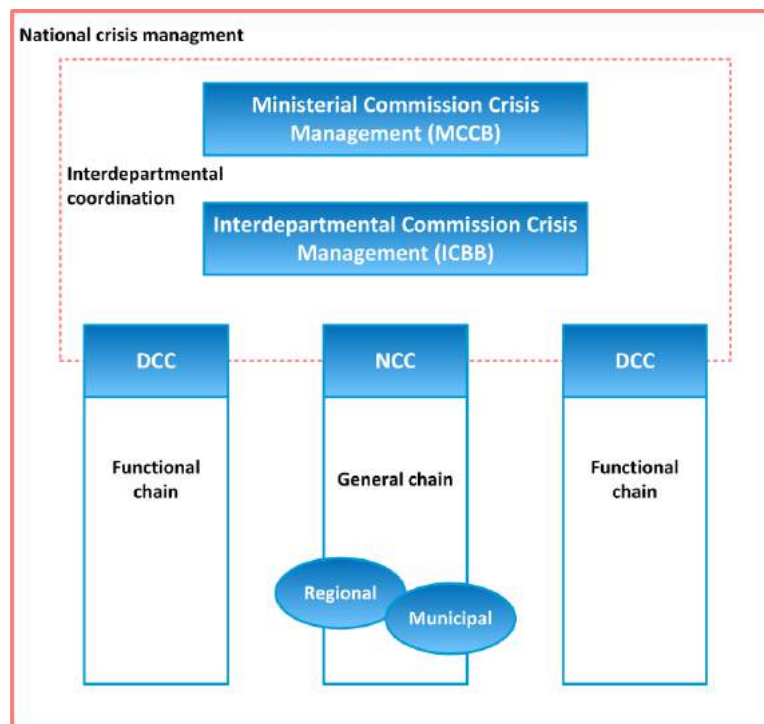

Figure 3.4: National crisis management and its actors in the Netherlands¹⁷⁴⁴

The actual operational guidance will be provided by the National Operational Coordination Centre (LOCC). The LOCC is also part of the Ministry of Security and Justice and can carry out its tasks 24/7 in case of threats and actual incidents, emergencies, disasters and large scale events. Some tasks of the LOCC are, amongst others:

- During a national upscaling of coordination:
 - Develop the national multidisciplinary operational overview;
 - Evaluate operational feasibility for administrative dilemma's and actions;
 - Develop national operational advice.
- The coordination of national and international support requests.
- Form, prepare and maintain the National Operational Staff (LOS).

¹⁷⁴⁴ Source: Infopunt Veiligheid (2012). De bestuurlijke aansturing van de crisisbeheersing, edited by authors

The National Operational Staff (LOS) is activated upon request by the chairman of the MCCb. The LOS is basically an up-scaled LOCC, including representatives of the police, fire brigade, health care, MOD and municipalities. The LOS needs to provide advice regarding the availability of people and equipment for national disaster and crisis management. The advice is based on the operational feasibility and consequences. The chair of the LOS could become part of the ICCb and MCCb if needed to explain the given advice.

Volunteers

Under all circumstances, irrespective if the general chain or the functional chain applies, the assistance of the volunteers can be requested. This holds especially for the volunteers of the Dutch Red Cross. They can provide first aid or supplies needed, e.g. blankets, clothes etc. It should be mentioned that the professional aid workers have the main responsibilities and should be able, under all circumstances to carry out their tasks. The support of the Dutch Red Cross is additional and if the emergency services indicate that the assistance of the volunteers is not needed, the volunteers need to comply with this request.

3.2 Organisational cooperation¹⁷⁴⁵

Dutch crisis management in a foreign crisis, with Dutch victims

If a crisis abroad occurs which affects Dutch citizens and requires measures to be taken **in the Netherlands** the Dutch crisis management system as described above is activated. So the Dutch Ministry of Security and Justice is the main responsible Ministry to take measures that will apply in the Netherlands. The Ministry is supported by the relevant Ministries depending on the specific sectors where measures need to be taken.

If a foreign crisis affects Dutch citizens **outside the Netherlands** and action in that foreign country is needed, the responsible Ministry is the Ministry of Foreign Affairs. The Ministry can offer local support to Dutch citizens or evacuate them if needed. In case of a large evacuation of Dutch citizens, the Ministry of Foreign Affairs is assisted by the NCC and competent Ministers, depending on the topic and crisis at hand. The Minister of Foreign Affairs is responsible for the evacuation process and bringing back citizens to the Netherlands. Once the citizens are back, the responsibility of the Ministry of Foreign Affairs is transferred. The Ministry of Security and Justice becomes responsible for generally managing the crisis, while specific ministries become responsible for everything that needs to be arranged that is part of their policy area. For instance, victims of a pandemic will be broad back to Dutch soil by the Ministry of Foreign Affairs. Once in the Netherlands, the Ministry of Health, Welfare and Sport needs to take appropriate measures ensuring that the victims are cured and the diseases not spread. The Ministry of Security and Justice has needs to keep the general overview. In all operations the leading criterion to assess the size of the support needed is not determined by the number of victims, but the societal impact the crisis has on Dutch society.

¹⁷⁴⁵ This section is based on Infopunt Veiligheid (2013), 'Internationale rampenbestrijding'

Humanitarian support in foreign crisis, no Dutch victims

Not in every crisis Dutch citizens become a victim. In case a crisis in a foreign country requires Dutch assistance, and humanitarian aid is required, the main responsible Minister is the Minister of Foreign Affairs. In joint cooperation with the NCC, other Ministers, the Embassies, the international organisations concerned and the authorities in the affected country, the Minister of Foreign Affairs decides on the type, amount and process of the offered humanitarian support. In the whole process the Minister of Foreign Affairs has the lead and is responsible for the coordination and communication.

General crisis support in foreign crisis

The Netherlands can also assist in general crisis management, without offering direct humanitarian support. In case the emergency occurred in the European Union the Minister of Security and Justice is responsible to organise international support, while the Ministry of Foreign Affairs is responsible for intervention in all non-EU countries.

If the request for help relates to civil protection it needs to be send to the NCC, which in this cases is the single point of contact. Both the request of the European Union Monitoring and Information Centre (EU-MIC) and the Euro-Atlantic Disaster Response Coordination Centre (EUDRCC) need to be addressed to the NCC. The NCC will inform the Ministry of Foreign Affairs as well as the LOCC (the national operational coordination centre). Also the requests of the United Nations (UN) need to be addressed to the NCC, however only the Ministry of Foreign Affairs will be informed. The NCC will indicate the period of time available for the Ministry and the LOCC to prepare the Dutch answer. The process followed to provide an answer is depicted in the figure below.

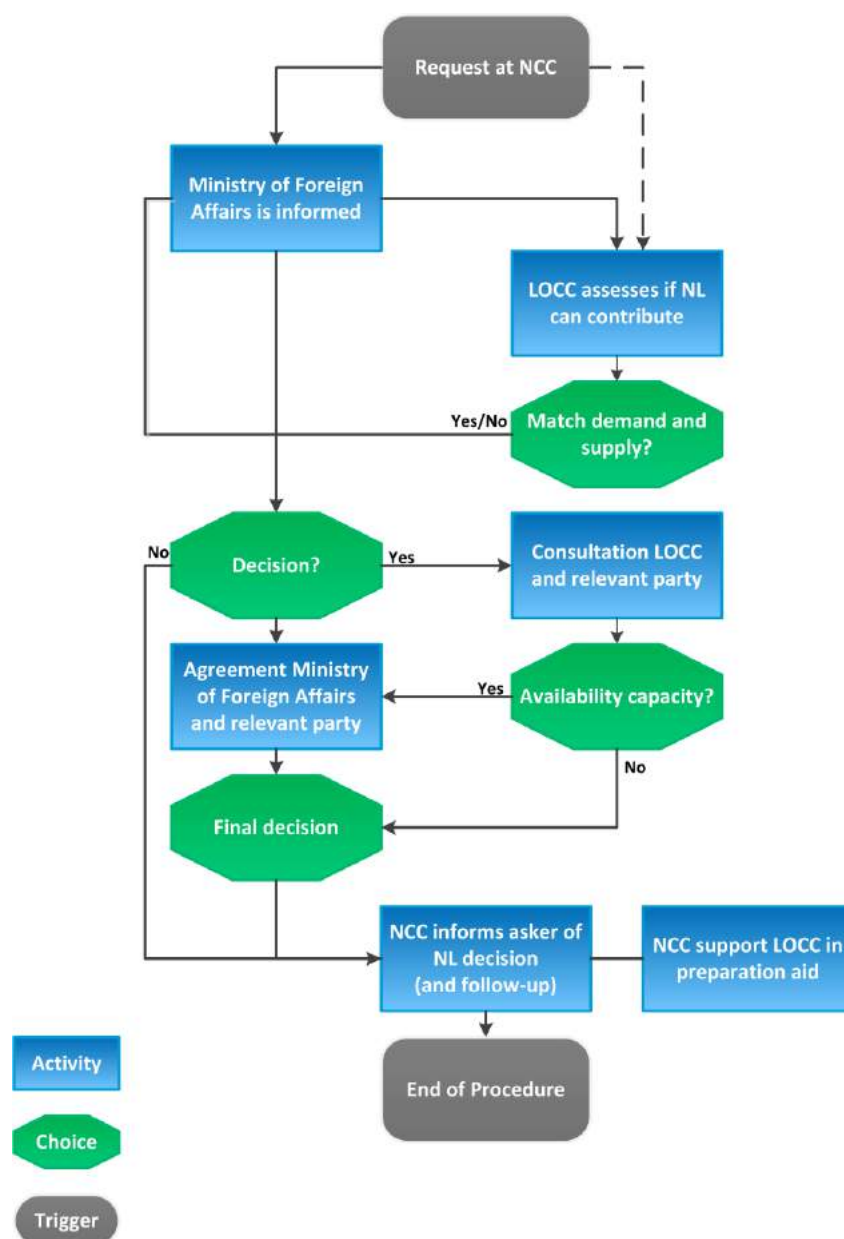

Figure 3.5: Decision making process to offer international support if requested¹⁷⁴⁶

Dedicated support to the United Nations

The UN can request support from the Netherlands in case of disasters happening in other countries. To activate the support the request needs to be addressed to the NCC and the framework presented above is followed. The main types of support that can be requested are UNDAC and USAR.

UNDAC¹⁷⁴⁷

The Netherlands is Member to UNDAC – United Nations Disaster Assessment and Coordination - since 1993. Experienced emergency managers are available for UNDAC to assist during a crisis. Depending on the type of crisis a manager is appointed. Since 2000 the Netherlands has provided assistance 18 times, for example in the 2010 flooding in Pakistan, the 2009 earthquake in Indonesia and 2008 flooding in Nepal.

¹⁷⁴⁶ Source: Nationaal Handboek Crisisbesluitvorming (2013), edited by authors

¹⁷⁴⁷ Source: UNDAC (2011), 'Emergency response missions'

USAR

The Netherlands also has an urban search and rescue team available. The team was added to the USAR list in 2003 and since 2007 the team is qualified as 'heavy'. This means that at least 55 experts are available (the Dutch team consists of 60 people) and the team can carry out complex technical search and rescue operations in collapsed or failed structures, with special attention for top steel structures. The team can assist in five fields: management, search, rescue, medical and logistic. The heavy team can assist during national crises, but on request can be deployed abroad as well. Requirements for the team are¹⁷⁴⁸:

A Heavy USAR Team:

- *Is required to have the equipment and manpower to work at a Heavy technical capability at two separate work-sites simultaneously. A separate work-site is defined as: any area of work that requires a USAR team to re-assign staff and equipment to a different location all of which will require separate logistical support. Generally an assignment of this sort would last greater than 24hrs.*
- *Is required to have both a search dog and technical search capability;*
- *Is required to have the technical capability to cut structural steel typically used for construction and reinforcement in multi-story structures;*
- *Must be able to conduct heavy rigging and lifting operations; and*
- *Must be adequately staffed and logistically sufficient to allow for 24 hour operations at 2 independent sites (not necessarily at the same two sites; the sites may change) for up to 10 days.*

¹⁷⁴⁸ Based on OCHA – INSARAG External classification/reclassification manual 2014

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

In the Netherlands the Handbook Support ('Handboek bijstand') has been published. Aim of the Handbook is twofold; to provide insight in the national crisis management system and to stimulate unambiguous handling of requests for support and assistance. The Handbook is managed by the National Operational Coordination Centre (LOCC), which has the obligation to check if the Handbook still complies with the current legislation and regulation and if the procedures described still reflect the current crisis management operations. The Handbook consists for four volumes each with its own scope:

1. Volume I: National support
2. Volume II: Support in cross-border crisis
3. Volume III: Incoming foreign support
4. Volume IV: Support in the Caribbean part of the Netherlands¹⁷⁴⁹

The content of the Handbook is evaluated on a yearly basis and during this evaluation it is checked whether or not the procedures, the legislation or other issues are still up-to-date. In case the Handbook no longer suffices, the Handbook needs to be revised. The head of the LOCC needs to monitor the evaluation process and needs to decide if a new version of the Handbook has to be published. The advisory board is responsible for the content and its revision. The Minister of Security and Justice needs to approve the new version. Once the revision is approved the LOCC needs to distribute the new version to as many different stakeholders as possible.

Volume I: National support¹⁷⁵⁰

After a general introduction in the first chapter, the second chapter of this volume defines the main terms (e.g. support and assistance) and indicates the main stakeholders, both on an administrative as well as an operational level. Also some general aspects, which apply to all assistance and support procedures, are explained. One of them is the division of the costs. General rule is that the stakeholder asking for assistance needs to pay for the costs made by the aid provider. However based on article 55 of the Security Regions Act the national government can also pay part of the costs if the Security Region files the request.

After Chapter 2 the different procedures are described in detail. Each chapter relates to a specific kind of support, often based on a specific act, e.g. support based on the Act for the police force or military support in case of the public interest. Each chapter has the same structure, starting with an introduction, which is followed by an overview of the current legal framework. Then the request procedures are described on a very detailed level, including an organogram, examples and an overview of the possible exceptions in the request procedures. If more than procedure is possible each procedure is described in this detailed manner. The descriptions are followed by an explanation

¹⁷⁴⁹ Not adopted yet, so no further information is provided.

¹⁷⁵⁰ Source: 'Handboek bijstand' – Volume I

In the Annexes the different Acts are included as well as the request forms and a list of products that could be used to file a better request.

Volume II: Support in cross border Crisis¹⁷⁵²

Also volume II starts with two more theoretical chapters. Chapter 2 and 3 provide an overview of the applicable treaties between the Netherlands, Belgium and Germany as well as agreements and legal provisions that form the basis of the cross border assistance procedures between the countries. These chapters describe the administrative organisations and the relevant border regions in the three different countries.

Chapters 4 and 5 describe the operational side of the assistance. The chapters focus on the crisis management between the Netherlands and Germany. Both chapters relate to the situation where Germany is asking the Netherlands for assistance and vice versa. Chapters 6 and 7 describe the same

¹⁷⁵¹ Source: 'Handboek bijstand' – Volume I

¹⁷⁵² Source: 'Handboek bijstand' – Volume II

for the situation between the Netherlands and Belgium. Also here both situations are described separately. Both chapters provide detailed information for the police, fire brigades, and emergency health care. Schematic overviews are presented as well.

In the Annexes to the volume some examples of request forms are presented as well as the texts of the main treaties between the Netherlands & Germany and the Netherlands & Belgium.

Volume III: Incoming foreign support¹⁷⁵³

This volume is the shortest one of the three volumes currently in force. This volume describes under which conditions foreign emergency services can provide assistance in the Netherlands. It describes how the different Dutch actors in crisis management should request assistance, how the coordination and communication with the foreign units should be organised, what happens to the responsibilities of the Dutch actors in the crisis management system and how the details, e.g. cost allocation, need to be arranged.

4.2 Operations planning

4.2.1 National crisis plans

In the Netherlands several specific national crisis plans are in place. Each national crisis plan (NCP) is based on the national guide for decision making (see chapter 2) and incorporates at least the structures set out in the Security Regions Act and the Act on the police force. Each NCP relates to a specific topic that requires additional planning. Examples are the NCP for ICT, the NCP for high water levels & flooding, the NCP for Electricity and the NCP for radiation incidents.

Not for all specific topics a NCP is made. NCPs are often written when the general structures described in the national guidance and the ‘bestuurlijke netwerken’ are not detailed enough. All plans written follow more or less the same structure. They start with defining the exact scope of the document to indicate which emergencies do fall under the scope of the plan and which do not. The document also defines for whom the document is written. This description is followed by an overview of the applicable legislation (other than the Security Regions Act and the Act on the police force) or an overview of the authorities and actors involved. For each of the actors their roles in the crisis preparedness, response and recovery are described as well as a detailed description of their relationships. For each of the actors also their legal justification, why are they allowed to take certain measures, is given.

After this description an overview of the crisis management structure is provided. This description often only mentions the additional actors in the crisis management process. The general actors, as described in chapter 3 of this report, are often not mentioned in detail. The NCP really focuses on the additional actors and their tasks. The additional structure of crisis management is also visualised. In the description not only attention is paid to the operational responsibilities, but also the decision making process is elaborated on.

¹⁷⁵³ Source: ‘Handboek bijstand’ – Volume III

In the more recent versions also guidelines with regard to communication, both risk communication (before a crisis has happened) and crisis communication, are provided. These plans also provide guidance on quality management, focusing on the updating of the current plans and they provide guidance for training and educational programmes.

4.2.2 Departmental crisis plans

During the desk research and interviews no link to the existence of departmental crisis management plans has been found. This is not very surprising, considering the structure of the Dutch crisis management system. As explained in several other parts of this country study, the main operational crisis management is organised on a local level, through the Security Regions. These regions to have crisis plans in place (see next paragraph).

If a crisis concerns more than one Security Region the national system is activated. Depending on the type of crisis only the general chain or both the general chain and specific chain(s) become operative. As described in the paragraph above the specific chains to have their own NCPs in place, which give a detailed account of the procedures to be followed. There is no need to further develop plans on a departmental level, as they would more or less copy the content of the NCPs¹⁷⁵⁴.

4.2.3 Regional / Local crisis plans

Based on the Security Regions Act each Security Region needs to have three documents in place that are used in their crisis management system:

1. Their risk profile (art. 15);
2. Their policy plan (art. 14);
3. Their crisis plan (art. 16).

In the risk profile the management of the Security Region, led by the Head of the Security Region, an overview of the most risky situations is made. It provides an overview of all possible fires, disasters and crisis that can occur in the region and an assessment is made regarding the possible risks. The final profile is made after discussion of the profile in the individual municipal councils. Also the head of the police force, representatives of the Waterschappen and other relevant crisis partners are asked to provide their insights. The risk profile is the basis for the policy plan and needs to be made at least every for years.

Secondly, the management of the Security Region needs to establish a policy plan based on the above mentioned risk profile. The policy plan needs to be updated at least once every four years (article 14.1) and the plan needs to describe to proposed operational performance of all actors involved, including fire brigade, police force, health care and municipalities, in case a disaster or emergency occurs (article 14.2a). The performance relates to the number of people, equipment and time available. The plan should also indicate if national guidelines are followed and how this is done as well as an informative paragraph for all operational actors involved. The plan should contain an

¹⁷⁵⁴ Based on interviews held.

exercise/training plan describing how the yearly, compulsory exercises look like and how they will be evaluated. A last point that needs to be included is a description of the non-legal advice function and coverage plan for arrival times of the fire brigade. The policy plan needs to be tuned with neighbouring Security Regions, the police force and the relevant Waterschappen.

The third document that needs to be established by the management of the Security Region is the actual crisis plan. Also this plan needs to be established at least every four years. The plan needs to contain a description of the organisation, the tasks, the responsibilities and the powers which apply in disaster mitigation and crisis management. Also the additional agreements made with the relevant municipalities are included in the plan. Agreements with neighbouring Security Regions with regard to support, cooperation and adjustment with crisis management actors are included. Finally the agreements with neighbouring countries, if applicable, need to be added to the plan as well.

During the evaluation of the Security Regions, in 2013, it was concluded that all 25 regions have risk profiles, policy plans and crisis plans in place. All policy plans are based on the risk profiles made. Although all Security Regions have these documents in place, the content of the documents is not always of the required level. Most risk profiles are not yet fine tuned with neighbouring regions and some are not actual enough. Overall the policy plans more or less comply with all requirements laid down in the Security Region Act, however only four comply fully. The requirements for the crisis plans are more or less fulfilled by all¹⁷⁵⁵.

4.3 Logistics support in crises

During the desk research as well as the interviews no clear indications have been found that private logistical providers are often used in crisis management. They do not form a clear part of the crisis management chain.

*Military logistical support*¹⁷⁵⁶

Traditionally the Dutch Army was the back-up option in the Dutch crisis management system. However this has changed since the signing of a Covenant between the Army and the government in 2005, which was rapidly extended in 2006. The Covenant Civil-Military Administrative Agreements (CMBA) has been concluded between the Ministry of Interior, the Ministry of Defence and the Ministry of Security and Justice.

One of the outcomes of the Covenant is, is that in principle the capacity of the Army can be fully used during times of crisis, however the Army cannot agree on full availability, e.g. some of the troops are on a peace mission. The Army has guaranteed that at least 4,600 soldiers are permanently available to help if needed. The Army can assist by:

- Structural capacity → Coast guard, Royal military police, Special support units, Explosive Ordeal Disposal teams (EOD) and the emergency hospital.

¹⁷⁵⁵ Source: Ministry of Security and Justice (2013)

¹⁷⁵⁶ Source: Ministry of the Interior and Kingdom Relations (2007)

- Random capacity → need to be requested by the administrative powers, e.g. security and surveillance during evacuation, transport for evacuation, firefighting helicopters, and decontamination capacity.

The Army can assist in transport during crisis. They have different modes on offer, e.g. boats, planes and trucks, which can be used to transport people, but also animals. In case of an evacuation of citizens the Army can, within 48 hours, provide 350 tracked and wheeled vehicles. With this capacity the army is able to move 3,000 evacuees together with their luggage, move 40 tonnes of cargo and 200 evacuees at the same time through inaccessible areas.

As stated earlier the government needs to request these transport services from the Army. In the Handbook Support, Volume I is laid down how this procedure works (see par. 4.1).

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

4.4.1 Crisis communication¹⁷⁵⁷

In case of a national crisis concerning public safety the National Core team Crisis Communication (Nationaal Kernteam Crisiscommunicatie = NKC) is responsible for the communication, both to the press and public. The NKC decides what the communication strategy will be for the specific crisis at hand. The NKC is led by the Director Communication of the Ministry of Security and Justice, who is assisted by the Director of the Communication unit of the NCC and the press & public communication team, led by an appointed coordinator. The press & public communication team consists of speech writers working for the Ministry of Security and Justice (for content related information) as well as dedicated crisis communication experts working for the NCC (for knowledge on how to communicate in times of crisis)

If the crisis does not only concern public safety and so other Ministries are involved in the crisis management as well, the press & public communication team is extended with speech writers of the other involved Ministries for additional content related information. The Communication Directors of the other Ministries will assist the Communication Director of the Ministry of Security and Justice to ensure that the relevant and correct information is communicated.

It can happen that a crisis not only affects the Netherlands, but also other Member States. In that case the NKC will be extended with civil servants of the Ministry of Foreign Affairs, as the Ministry of Foreign Affairs is the competent Ministry for cross-border crisis. In that case the press & public communication team will consist of speech writers of the Ministry of Foreign Affairs and their Director of Communication will be involved as well. Jointly the NKC will inform the Dutch public and will ensure communication with foreign authorities.

¹⁷⁵⁷ Source: National Centre Terrorism and Security (2013), 'Informatie Nationaal Kernteam Crisiscommunicatie (NKCC)'

Tasks executed by the NKC in case of a crisis are:

- Determine the communication strategy on a national level;
- Advising the AT, ICCB and the MCCB on the consequences of the chosen communication strategy as well as the communicative consequences of decisions;
- Develop, coordinate and (partly) executing the communication towards the press and public;
- Inform other public bodies about the communication activities of the Central Government and to coordinate the communication between the Central and regional/local government;
- Monitor and analyse media, internet and public perception.

The NKC is only active once a crisis emerges. NKC start activities if the National Centre Terrorism and Security (Nationaal Coördinator Terrorismebestrijding en Veiligheid = NCTV) request the NKC to take up activities again, or the Communication Director of the Ministry of Security and Justice deems it necessary to do so. The NKC can also be activated if a competent Minister requests the re-activation, taking into account the scope of the crisis. The actual decision to reactive the NKC is made by at least the Head of the Coordination unit of the NCC and the Communication Director of the relevant Ministry.

4.4.2 Public information and warnings

Incidents related to national security are monitored continuously. On the website of the NCTV the actual level of threat can be found. The NCTV is constantly updating the status and explaining why the status has been changed. Additional information on that current status and the implications for the individual can be found on their website, as only for that level of threat additional information is available in order to reduce confusion¹⁷⁵⁸.

For other types of emergencies no continuous communication is used. However if the responsible Ministry feels the need to start communicating on a specific topic they can do this by a press release.

*Risk and crisis barometer*¹⁷⁵⁹

A more general instrument to inform the public on crisis situations is the risk and crisis barometer. To fill the barometer interviews with Dutch citizens are held to ask them if they feel safe, what type of threats they fear and so on. The outcomes are published on the website of the NCTV. The barometer is held twice a year on a national level, but it is possible to create a barometer for another level as well. A request should be submitted to the NCC (please refer to chapter 1 for more information).

4.4.3 Alert systems

Several instruments can be used to inform the public in case of a crisis. The main instruments are:

- The air raid;
- The website www.crisis.nl;

¹⁷⁵⁸ Source: <https://www.nctv.nl/>

¹⁷⁵⁹ Source: National Centre Terrorism and Security (2014)

- The phone number: 0800-1351;
- NL-Alert.

Air raid

The instrument is used to warn the public directly of any disaster or emergency is the air raid. Once something has happened the competent authority can request that the air raid is used and citizens are requested to go inside as soon as possible, and to close all doors and windows in their building. They are also advised to turn on radio or TV, to receive further instructions and be updated on the current situation. The air raid was, for example used, during a large fire in a chemical plant in Moerdijk in January 2013. People in the direct surrounding of the plant were warned that something was wrong. To ensure that people know what to do when the air raid goes, the national government held an extensive campaign informing people and the procedures and the aims of the air raid. To make sure that the system works in case of an emergency the system is monthly checked by sounding the air raid throughout the country. During the public campaign it was announced that every first Monday of the month at 12.00 AM the air raid system is tested.

www.crisis.nl¹⁷⁶⁰

The website is only active if there is a severe risk that a crisis will occur or once a crisis has emerged. To start the website the authority responsible for managing the crisis, i.e. local, regional, ministerial or national, should request the usage of the website by the NCC. The launching of the website in case of a specific crisis depends on the time the requesting authority needs to provide the web editor with the specific content. The website can only be used to inform the public during times of crisis and cannot be used as a permanent tool to inform the public on crisis related topics. This information needs to be published on other websites.

The website is linked to social media and updates on the website can be transferred to the dedicated Twitter account (@crisisupdate_NL) or Facebook page (www.facebook.com/crisis.nl). The website can also show Twitter messages which are preselected. For example messages from the Twitter account of the mayor of the town in which a large emergency takes place can be shown on the website.

0800-1351¹⁷⁶¹

The NCC can also open, upon request, the dedicated phone number in case of an emergency. The phone number aims to relieve the pressure of municipalities, regions and Ministries by answering the general questions on their behalf. The number can be reached 24/7. During office hours it is possible to activate the number within an hour; outside office hours it will take two hours before the phone number is activated. Before opening the lines the requester needs to submit standard answers to the personnel answering the questions, in order to ensure harmonized answers and one signal to the public. Although the NCC does not write the standard answers they can provide advice and examples. They also advise on the number of staff needed to answer the phones.

NL Alert¹⁷⁶²

¹⁷⁶⁰ Source: Factsheet www.crisis.nl

¹⁷⁶¹ Source: Factsheet 0800-1351

NL-Alert is a text messaging service which can be used once a disaster has occurred. All mobile phones located in a certain area around the place where the emergency has happen and which have installed the NL-Alert app will be contacted. The owner of the phone receives a text message telling him/her what has happened and what he/she can do best, for instance going inside a building and close all doors and windows. The system always works, even when the network is over compensated. The service is provided free of charges. The app is installed automatically at more and more phones, however on some phones the owner still needs to install it. This can be done through the website nl-alert.nl

Figure 4.2: Screen shot of the NL-alert website¹⁷⁶³

¹⁷⁶² Source: <https://www.nl-alert.nl/>

¹⁷⁶³ Source: <https://www.nl-alert.nl/>

5 Capabilities

5.1 Human resources

The Netherlands does not have any permanent disaster management staff available. All people involved in crisis management do have other tasks as well, which they carry out in case no emergency occurs. For some of the actors involved the tasks they carry out during a crisis are more or less similar to their regular work. This holds for police officers, firemen and people working in health care. For others, especially civil servants, their regular activities differ from activities they need to carry out during a crisis.

The only institute with permanent staff is the NCTV, which is led by the national coordinator Terrorism prevention. The NCTV has a small staff available that daily monitor the level of threat and that could easily respond in case a threat is identified. Apart from the NCTV no other organisation is permanently focused on crisis management¹⁷⁶⁴.

Although no permanent emergency staff is available, people can be easily mobilized as the operational actors do have staff permanently available to execute the tasks assigned to these actors, irrespective crisis management activities. Fire brigades, police forces and health care institutions, have divided their employees in day and night shifts and these employees can be called-up when if necessary.

The Dutch Rescue Brigade consists of around 5,000 volunteers¹⁷⁶⁵, which can be easily mobilized. The Dutch fire brigade consisted of 25,983 fire fighters in 2012 of which 20,804 are volunteers¹⁷⁶⁶. Also the Dutch Red Cross has many volunteers available, around 35,000¹⁷⁶⁷. If these three categories are added up around 61,000 volunteers are presented in the Netherlands. Besides those registered volunteers, many more citizens want to be involved, the so-called civilian aid (in Dutch: burgerhulp). Depending on the disaster and its size many people are willing to help.

Besides the professional actors and volunteers also the private sector could be involved in crisis management. The actors in the private sector are very diverse and range from electricity companies to telecom providers as well as from transportation companies and chemical industry. According to the Vademecum DG ECHO the following private actors could be involved:

Table 5.1: Large private industry players to involve in crisis

5.2 Materiel (non-financial) resources

Non-financial resources

Crisis management is in principal organised at a local level. As the operational responsibilities lie with the Security Regions they have the equipment needed in place. According to the Security Region Act, article 10, each Security Region needs to purchase and manage the common equipment needed. However, the emergency services themselves will purchase the equipment they need. The equipment they use is not only used in case of large disasters, but can also be used during their daily execution of their tasks. So the fire brigade needs to buy, e.g. the ladder trucks and the fire hoses, while the medical health care needs to purchase the ambulances, stretchers and medicines.

The national government does not have specific resources available as they have hardly any operational responsibility. During larger crisis the national government can take over the coordination and decision making role, however they will not provide the actual help. This will still be done by the emergency services and if necessary accompanied by the Army¹⁷⁶⁸.

Permanent reserve stock

The permanent reserve is also not managed by the national government. Some of the reserve stock needed belongs to the Army, e.g. tents. Main actor in the crisis management system that has permanent reserves available is the Dutch Red Cross. In the Royal Decree Red Cross 1988 it is fixed that the Dutch Red Cross has emergency supplies available and in case of an emergency they can provide tents, blankets and medicines.

Besides professional organisations, citizens are also advised to have their own reserve stock available. On the website www.denkvooruit.nl each citizen can find the relevant information on reserve stock. The websites advises to have at least the following products at hand: radio with batteries, additional batteries, torch, first aid kit with handbook, matches, tea lights, warming blanket, emergency whistle and a toolbox. Also fresh water and canned food should be in the house. Citizens can choose to buy the individual parts of the advice permanent stock, but they can also

¹⁷⁶⁸ Based on interviews.

order packages on-line. The national government has certified one website (www.hetnoodpakket.nl) where each citizen can buy an approved emergency package. The site offers pre-selected small, basic and extra large emergency packages, but it is also possible to select the items that you want to have included.

Involvement of military assets¹⁷⁶⁹

Traditionally the Dutch Army was the back-up option in the Dutch crisis management system. If the civilian emergency services were no longer able to provide the aid needed, the Army could be involved. Since the century this has been changing and the Army has become more and more one of the partners that always responds to a national or large crisis. In 2005 Covenant Civil-Military Administrative Agreements (CMBA) has been concluded between the Ministry of Interior, the Ministry of Defence and the Ministry of Security and Justice.

In 2006 the Covenant was extended with the additional agreements with regard to specialist defence capabilities. After extensive research the CivMil cooperation (ICMS) has been established. In the ICMS the Army guarantees the support of at least 4,600 soldiers in case of emergency as well as the availability of goods. In the catalogue Civil Military Agreements (2007) an extensive overview is provided of all support the Army can provide during a crisis as well as which assets can be used. The catalogue is jointly published by the Ministry of Interior and the Ministry of Defence.

Possibility to commandeer private goods

Under 'normal' conditions the national government has not the ability to commandeer or use private goods and the national government should make use of the goods currently owned by the emergency services. However if the state of emergency is proclaimed the national government might have the ability to commandeer the goods. The government can choose to only use the goods or become the owner.

In the state of emergency some of the dedicated emergency laws become active. For the commandeering private goods the Claim Act (Vorderingswet, 1962) needs to come into force. After the proclamation of the state of emergency, the Prime Minister needs to issue a Royal Decree stating that this specific act is re-activated. After adopting the Royal Decree he needs to inform the Parliament about the expected duration and he needs to send them a law in which this is included. The Parliament needs to adopt this law. If they reject the Royal Decree is annulled. If the law is adopted private goods could be commandeered (article 3).

The Claim Act only allows Ministers to claim goods. All other public bodies do not have the competence to claim any goods. If they need private goods they need to ask the responsible Minister, depending on the type of goods and for what they are needed, to claim the goods for them (article 3a). Based on the Claim act both physical goods, e.g. cars, houses etc., as well as property rights, as long as they do not belong to foreigners (article 1).

¹⁷⁶⁹ Source: Ministry of the Interior and Kingdom Relations (2007)

5.3 Training

5.3.1 Exercises for crisis management

Local, departmental and national

Main reason to practise every year is based on the fact that the people involved in crisis management are carrying out other activities during their 'normal' work. They are not dedicated to crisis management only. For some of the organisations and persons involved the tasks carried out during a crisis are connected to the activities carried out during their day-to-day work, e.g. police, fire brigade and health care. This does not hold for all, e.g. civil servants perform other activities that are not directly linked to crisis management. They need to be well prepared to respond adequately in case of a crisis. Based on the Act establishing the Security Regions each Security region is obliged to practise once every year. The exercise should focus on the entire disaster management chain and after each exercise should be extensively evaluated. Beside this legal obligation to practise, especially between the main crisis partners, covenants have been closed between the Security Regions and vital actors that might play a crucial role in crisis management. These covenants also introduce the obligation to practise with each vital private partner as well. Depending on the number of covenants and partners the number of exercises can increase considerable.

Based on an agreement between the Security Regions and the national government each two years a training exercise is organised involving several Security Regions and the national government. Aim of these trainings is to develop the relevant skill set for larger crises and disasters. Overall the number of exercises carried out by Security Regions is quite intense.

Also each department is obliged to have a yearly exercise. The exercise needs to fall with the scope of the relevant department and needs to follow the so-called 'netwerkkarten' (see Chapter 1). So each of the 22 functional chains is practising once a year. Also once a year a dedicated exercise is organised aiming to test the procedures within several departments. The exercise has a specific theme and the whole scenario is acted out.

Cross-border exercises¹⁷⁷⁰

The Netherlands also partakes in cross-border training exercises. Most frequently potential disasters and crisis are practiced with neighbouring countries; Belgium and Germany. Between the Netherlands and Belgium an agreement has been made to hold an exercise every year. The entire training cycle is three years and consists of three different exercises: a table top exercise, an alerting exercise and an operational exercise. Before the actual exercise is held a crisis scenario is written and the different stakeholders are informed that an exercise will take place. The main outlines of the fictive disaster are communicated, however the details remain secret. The exercises focus both on the operational and administrative level. After each exercise the exercise is evaluated and the SOPs are updated if needed.

5.3.2 Centralised training in crisis management¹⁷⁷¹

National crisis management falls under the responsibility of the Ministry Security and Justice. The Minister needs to ensure that the right people are appointed to the crisis where they can assist best and everyone needs to be aware what to do and when. This assumes that civil servants working for the NCC, the several departments, but also other important public organisations and private parties are adequately trained. The National Academy for Crisis management (NAC), which is part of the NCTV, is the responsible actor to ensure sufficient education and training of all the people and parties involved in national crisis management. The program has been intensified during recent years, as crises become more complex and diverse.

In all trainings provided by the NAC the main thought is that all people involved in crisis management need to be educated, trained and have to practise in the same way. They also need to think in similar ways, adopted the same principles and apply the same rules in order to understand each other and minimise possible misunderstanding between actors involved in preventing or mitigation a disaster. The common understanding will enable the Dutch crisis management system to operate as a flexible system, where all actors can perform other tasks as well (outside the crisis situation), but are familiar enough with each other and each other's working procedures to be able to respond to a crisis effectively.

The training program offered by the NAC is provided at different levels:

- **Individual:** educational programmes to obtain knowledge of and develop competences for different roles within the crisis management system.
- **Team:** educational programmes and training for a specific team aiming to improve cooperation, processes and methods.
- **Teams within internal chain:** exercises and training within the internal chain (i.e. functional chain), focused on cooperation, substantive connection and the usage of each other's output and products.
- **The external chain:** exercises with vital public and private partners both home and abroad.

All four training types follow the so-called OTOTEL-cycle¹⁷⁷² (Educate, train, practise, test, evaluate and lesson's learned) as depicted in the figure below. The goals of each training are focused on information exchange (between the national government, departments and vital public and private partners), crisis communication, providing advice and decision making. Each training is formed around a specific theme that is important at that specific moment. Recent trainings relate to the change of rule in 2013 or the Nuclear Security Summit in 2014 to be held in The Hague.

¹⁷⁷¹ This section is based on <https://www.nctv.nl/onderwerpen/crisisbeheersing/nac/>

¹⁷⁷² opleiding, trainen, oefenen, testen, evalueren en leren van lessen

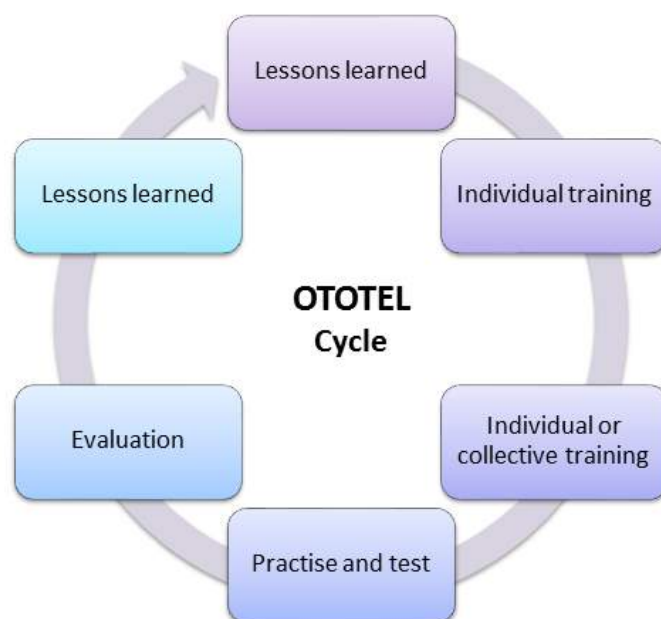

Figure 5.1: Steps in the OTOTEL cycle¹⁷⁷³

5.3.3 Training of volunteers

The registered volunteers receive their basic training from the organisation they are assisting. Depending on the organisation the numbers of trainings differ. Volunteers registered at the Dutch Red Cross often only have to follow the compulsory first aid training, for which they obtain a certificate of completion. Red Cross volunteers are obliged to renew their certificate every 2 years in order to be aware of the most relevant and newest knowledge available¹⁷⁷⁴.

Volunteers at the Dutch rescue service get training through the Dutch Rescuing Brigade (Reddingsbrigade Nederland). The organisation has dedicated trainings in place and depending on the position for which the volunteer has signed up he will receive a package of trainings. Also the knowledge needs to be regularly renewed. For example, the organisation offers one-week training to become a life saving beach guard. During the trainings the most common situations are practised and swimming trainings are delivered. Most volunteers need to partake regularly in condition and swimming trainings¹⁷⁷⁵.

The training requirements for volunteers joining the fire brigade are more extensive and strict. Besides a first aid training volunteers need to following trainings to get acquaintance with the usual procedures within the fire brigade. Also several tests need to be carried out and by failing these tests the person cannot become a volunteer. Examples are a swimming test, a psychological test and medical assessment. The performance of the volunteers is evaluated on a yearly basis. In order to get promoted the volunteers need to succeed for national exams, e.g. a more extended swimming

certificate and obtaining additional skills. The requirements are quite severe as the volunteers get a compensation for their work done¹⁷⁷⁶.

5.4 Procurement

5.4.1 European regulations

The procurement of public contracts needs to be in line with the principles of European treaties and especially with the free movement of goods services, capital and people. Furthermore the procurement needs to comply with the principles of equality, proportionality etc. For some types of procurement additional regulations are codified in directives. Within the European legislation, three different procurement directives apply. These directives are mutually exclusive meaning only one of the directives applies to the public procurement. Directive 2014/25/EU (on procurement of utilities) and directive 2009/81/EC (on procurement in the defence and security industry) are topic specific. If these specific directives do not apply, public sector directive 2014/24/EU is applicable, which is the replacement of directive 2004/18/EC. The aim of the new directive is to simplify the rules on public procurement; improve the participation of SMEs and stimulate cross border joint procurement.

Stimulation of cross border joint procurement is helpful in case of a major internal crisis or a cross border crisis. The directive states in the preamble that contracting authorities should be able to choose to jointly provide their public services in cooperation with other authorities, without being obliged to use any legal form. These services don't have to be identical. The cooperation does not require all participating authorities to fulfil the obligations of the contract, as long as there is a commitment to contribute to the cooperative performance. The preamble points out that there are difficulties in cross border joint procurement. Therefore new rules have to be made. In these rules, the conditions for cross border procurement have to be clarified, as well as the applicable regulations. In addition, contracting authorities should be able to set up joint entities established under national or EU law. The new rules are specified in article 39 of the regulations.

If the procurement is executed by a centralised purchasing body located in another MS, the procurement shall be conducted in accordance with the national regulations of the MS where the purchasing body is located. In addition, several contracting authorities from different MS may jointly award a public contract, conclude a framework agreement or operate a dynamic purchasing system. Participating contracting authorities will then conclude an agreement that determines all responsibilities of the parties and the internal organisation of the procedure. As said before, the contracting authorities can set up a joint entity. The parties shall decide on the applicable rules on procurement. They can choose the rules of the MS where the entity has its registered office or where the entity carries out its activities.

This project evolves around the procurement related to crisis management, for example the procurement of ambulances, emergency packs or trainings. The utilities directive applies to gas and heat, electricity, water, transport services, ports and airports and postal services (article 8-13). The directive on defence and security applies to supply of military equipment and sensitive supplies. The

¹⁷⁷⁶ Source: Brandweer Rotterdam Rijnmond (2012)

majority of procurement in crisis management will be procured by normal NCCs and local authorities like the fire department or police and will not be secret. So in most cases the public sector directive (2014/24/EU) is applicable. This chapter will therefore focus on this directive. Keep in mind that the other directives can also be applicable, for example if the army is used to solve a major crisis. The directive is addressed to Member States and has no direct effect on the national regulations. The directive needs to be implemented first.

Scope of the public sector directive

The public sector directive applies to procurement by contracting authorities with respect to public contracts as well as design contests whose value is estimated to be not less than (article 4):

- € 5.186.000 for public works contracts;
- € 134.000 for public supply and service contracts and design contests, awarded by central government;
- € 207.000 for public supply and service contracts or design contests awarded by sub-central contracting authorities.
- € 750.000 for public service contracts for social and other specific services listed in Annex XIV.

This directive should not apply to certain emergency services where they are performed by non-profit organisations or associations, since the particular nature of those organisations would be difficult to preserve if the service providers had to be chosen in accordance with the procedures of the directive. Furthermore the directive does not apply to public contracts with the purpose of providing public communication networks or electronic communication services; public contracts organised pursuant to international rules; several types of service contracts, e.g. rental, legal services and employment contracts and service contracts based on exclusive rights; and last, public contracts between entities within the public sector (articles 8-12).

Award procedures

On a European level, procurement is executed by the European Commission. The public sector directive contains several award procedures:

- open procedure,
- restricted procedure,
- competitive procedure with negotiation,
- competitive dialogue,
- negotiated procedure without prior publication.

The *open procedure* applies when no other procedure is chosen. In the open procedure, the contracting authority submits a call for tenders. Interested companies may submit a tender. The best offer is chosen, based on the selected award criteria (article 27).

The *restricted procedure* consists of two phases. In the first phase a call for expression of interests is set out. Interest candidates may submit an invitation to tender. The contracting authority will then

invite the most suitable candidates to submit a tender. The contracting authority will award the contract to the best tender, based on the selected award criteria (article 28).

In the *competitive procedure* with negotiation any interested candidate may submit a request to participate in the negotiations, in response to a call for competition. In this call for competition, the contracting authority has provided a description of their needs and the characteristics of the works or services to be procured. Only the interested candidates that are invited may submit an initial tender, which will be the basis of the negotiations (article 29). In several cases the negotiation procedure can be used without prior publication, for example when the public contract contains a creative achievement; when there is no competition; when intellectual property rights need to be protected, or when there are reasons for extreme urgency (article 32).

In the *competitive dialogue* any interested candidate can submit a request to participate in response to a contract notice given by the contracting authority. The contract notice provides the information on and the needs and requirements of the contracting authority, as well as the chosen award criteria. The selected interested candidates will join the competitive dialogue, in which the means best suited for satisfying the contract will be defined (article 30).

A new procedure within this directive is the *innovation partnership*. In this procedure, any economic operator may submit a request to participate in response to a contract notice, by providing information for qualitative selection that is requested by the contracting authority. The innovation partnership can be set up with one partner or several partners. Only the economic operators invited by the contracting authority participate in the procedure. After each phase, the contracting authority may decide after each phase to terminate the partnership or reduce the number of partners within the partnership, based on the targets.

According to article 26, the open procedure and restricted procedure are the standard procedures to apply in case of procurement. The other procedures can be used in a limited number of situations, for example when the service is innovative, or when the technical specifications can't be determined (art. 26, sub 4.).

Contracting authorities can use framework agreements, provided that they apply the procedures in this directive. The agreement can not exceed four years. Contracts within the agreement will be awarded according to the rules in article 33.

In most procedures the candidates are chosen with the use of selection criteria. The selection criteria may relate to suitability to pursue the professional activity; economic and financial standing and technical and professional ability. All criteria need to be related and proportionate to the matter of the contract (article 58).

5.4.2 *National regulations*

Member States need to implement directive 2014/24/EU before 18 April 2016. In the Netherlands, part of the new directive is already implemented in the new act on procurement (in Dutch:

‘Aanbestedingswet’) and the regulations on procurement (in Dutch: ‘Aanbestedingsreglement’), which is implemented in 2013.

Act on procurement

The scope of the procurement law is first defined by the value of the works. The law refers to the values as stated in the public procurement directive. The law refers to the old public procurement directive, but states that a change in the articles in the directive has priority over the national law (section 2.1.1).

Not all types of public contracts need to be procured. Public contracts to which the defense directive applies are excluded. Moreover, contracts are excluded: if it is secret; if it is about telecommunication or if other procedures apply, based on international agreements. (article 2.23). Besides these types of public contracts, the procurement law excludes several public contracts, based on the content of the contract (article 2.24)¹⁷⁷⁷.

Procedures

In the Netherlands, procurement is executed by the central government and all the ministries. Within the ministries, the different agencies are authorized for procurement. The extensive list of all the bodies is codified in Appendix I of the directive.

Section 1.2.2 of the procurement law notes several special principles for European procurement. This section also states that the procurement should take place without discrimination of the interested candidates and that the contracting authority needs to act transparent. Furthermore the procurement needs to be in line with the principles of proportionality and subsidiarity. The law explicitly states that the selection criteria for candidates in other countries have to be equal to the selection criteria of national candidates. These principles are then repeated in the section on national procurement.

Just as in the public procurement directive, the act states that the standard procedures for procurement are the public procedure and the restricted procedure (article 2.25). Both procedures are in line with the procedures in the directive.

In case the open and restricted procedure are not suitable for a complex public contract, the contracting authority can use the procedure of competitive dialogue. The procurement is expected to be complex when the contracting authority is not able to define the technical measures that are necessary, or can not specify the legal or financial terms of the contract. This is only a limited number of options compared to the EU directive. For the other criteria named in article 26 of the EU directive, the act determines the competitive procedure with negotiation should be used (article 30). According to the act, the negotiation procedure without publication applies in the same situations as stated by the EU directive (article 2.32 – 2.36).

¹⁷⁷⁷ For example legal services and rental services

Since the new EU directive is not yet implemented in the Netherlands, the act still makes a distinction between II-A and II-B services. For B services, a different procedure can be used. This is based on the list of services in annex II of the old direct 2004/18/EG.

All procedures are explained more precisely in the regulations on procurement, which is in line with the European directive.

The selection criteria are stated in article 2.90 of the procurement law. These criteria are comparable to the criteria in the EU directive. The only difference is that the minimum turnover the economic operators are required to have shall not exceed three times the contract value, while this is two times according to the directive.

5.5 Niche capabilities

One of the focus points of the Netherlands which could be interesting for EU crisis management is the experience with flooding. The Netherlands has a long history of flooding as large parts of the country are located below sea level and the four largest cities of the country are located in these areas. Since the large flooding of 1953 which killed 1863 Dutch people (2,395 in total), The Netherlands has worked on an extensive prevention program, the so-called Deltawerken programme.

In the first years after the flooding the main focus was directed towards physical prevention matters. Many dykes were raised in order to protect the land located nearest to the sea and many sea entrances were permanently or temporarily closed. In the Eastern Schelde a permanent bridge containing several locks has been built. The locks allow vessels to sail between the inland waters and the sea, however if the sea level tends to rise too high, the locks can be closed to keep the water out. An example of a temporary solution is the Maeslandkering near Rotterdam (the last major physical structure of the Deltawerken, completed in 1997). This construction consists of two big lock doors that are located at the left and right bank of the River Maas. Normally the doors are open and vessels can use the waterway freely. In case water levels are expected to rise and form a threat for Rotterdam the lock doors can be closed.

Figure 5.2: Impression of the works in the Eastern Schelde (left) and the Maeslandkering (right)¹⁷⁷⁸

¹⁷⁷⁸ Source: pictures taken from wikipedia

After completion of this large physical works in 1997 the focus on the protection of the people against the sea remained. Frequently, often once a year, the height of all dykes is assessed and if dykes fall under a certain height the dykes need to be raised. The Deltaworks and the dyke management are mainly carried out in the West of the country. However the Netherlands has also many rivers that might cause sufficient flooding. In order to manage the water levels throughout the country, many water installation pumps (in Dutch: *gemaal*) have been build. If the Water Agency (In Dutch: *waterschap*) measures higher water levels then desired, they can use the pump installations to redistribute the water amongst rivers, lakes and eventually the sea.

The expertise developed during the years is not only used for the own protection, Dutch experts are also exporting their knowledge to other countries that face similar flooding issues. A recent example is the team of Dutch experts advising the US on how to better protect their coastal regions, after the devastating hurricane Kathrina. A group of experts visited the US to assess which measures can be taken and to advise the competent US authorities. Also a site visit in the Netherlands had been organised to the US team the possibilities.

Expert interviews

Please only mention here the organisation and month of the interview. Only refer to "expert interview" in the text.

- Inspection for Security and Justice, part of the Ministry of Security and Justice
 - *Interview held: November 2014*
- National Centre Terrorism and Security (NCTV), spoken to the National Coordination Centre (NCC), part of the Ministry of Security and Justice
 - *Interview held: December 2014*

Driving Innovation in Crisis Management for European Resilience

POLAND

Policy, Legislation, Organisation,
Procedures & Capabilities (PLOPC) in
crisis management and disaster response

Responsible Partner: CSDM (Vesselin Petkov, Todor Tagarev)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by ECORYS and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

- Poland is a country in the eastern part of Central Europe with an area of almost 312 000 sq. km. Poland is an almost unbroken plain reaching from the Baltic Sea in the north, to the Carpathian Mountains in the south.
- The Polish crisis management system is a complex architecture which is still under construction. The heavy floods of 1997, 2001 and 2010 exposed significant shortcomings in the Polish crisis management system and prompted a series of legal and institutional reforms.
- In Poland, there is no single authority dealing with disaster management. The structure of the Polish emergency management has five levels: state, ministry (central government body), province (voivodeship), county (powiat) and district (commune, gmina). The national fire-fighting and rescue efforts are the pivotal part of the crisis management system of the country. The Chief Commandant of the State Fire Service, under the supervision of the Minister of the Interior, is the central body of the state administration responsible for the organisation and management of those activities.

Figure 4: Symbol of the Polish State Fire Service.

- Several services and structures also support or make part of the wider Polish crisis management system, including (but not limited to): the Police; the Border Guard; the State Inspection for Environment Protection; the Institute for Meteorology and Water Management; the National Atomic Energy Agency; the mining rescue stations; the maritime search and rescue service; the naval rescue service; NGOs, e.g. Mountain Volunteer Rescue Service; Tatra Mountains Volunteer Rescue Service; Water Volunteer Rescue Service; Mazurian Rescue Service and others.
- The role of the private sector in the civil security system is limited, while NGOs are important and cooperate closely with the state institutions. The Volunteer Fire Service is the biggest part of the volunteer sector in Poland.

1 Policy

1.1 Risk Assessment

In 2007 the Joint Research Centre's Institute for the Protection and Security of the Citizen published a report on "Risk Mapping in New Member States,"¹⁷⁸⁰ a result of research carried out within the 5th and 6th Framework Programmes, aiming, among others, at examining the existing situation in the 10 PECO (standing for Pays d'Europe Centrale et Orientale; French for Countries of Central and Eastern Europe) countries for mapping of eight priority natural (floods, forest fires, storms, earthquakes, landslides) and technological hazards (industrial installations, transport of dangerous goods and contaminated lands).

According to the report, qualitative self-evaluation by Polish experts shows that the eight hazards have been classified, as follows:

- Carrying high risk - floods, forest fires and transport of dangerous good;
- Carrying medium risk - chemical, contaminated lands, pipelines, transboundary pollution, storms; and
- Carrying low risk - landslides and earthquakes.

Figure 2 below provides a graphic representation of the risk mapping.

Countries	Floods	Indust. Install.	Transport of Dang. Goods	Forest Fires	Contaminated Lands	Storms	Earthquakes	Landslides
Romania	HIGH	MEDIUM	MEDIUM	MEDIUM	MEDIUM	HIGH	HIGH	HIGH
Bulgaria	MEDIUM	HIGH	HIGH	HIGH	LOW	MEDIUM	HIGH	MEDIUM
Czech Republic	HIGH	MEDIUM	HIGH	MEDIUM	HIGH	MEDIUM	LOW	MEDIUM
Poland	HIGH	MEDIUM	HIGH	HIGH	MEDIUM	MEDIUM	LOW	LOW

Figure 5: Risk Mapping of Poland.

¹⁷⁸⁰ "Risk Mapping in the New Member States," JRC Scientific and Technical Reports, available at: http://www.preventionweb.net/files/5455_JRC38184.pdf.

From a methodological point of view, the JRC project relates “high risk” with a hazard that is present within the vast majority of the country (more than 2/3 of it) or, alternatively, when the hazard is confined only to particular areas but in case of an accident, the effect could be significant for at least one major population centre or an important economic resource.

Table 2: Classification of Risks

Type of risk	Territory	Population/resource affected
High risk	HR>2/3	Major population centre
Medium risk	1/3<MR<2/3	Minor population centre
Low risk	LR<1/3	No population centre affected

Floods

As evident from statistical data tabled below (Table 2), floods have been the most affecting in terms of financial damage to the country's economy.

Table 3: The most affecting (in terms of financial damage) disasters in Poland for the period 1900 – 2014.

Disaster	Date	Damage (000 US\$)
Flood	3/7/1997	3500000
Flood	17/05/2010	3080000

White Book

Elements of strategic risk assessment related to natural disasters could be found in the White Book on National Security of the Republic of Poland,¹⁷⁸¹ which has been published in 2013. The White Book represents the outcome of the Polish National Security Strategic Review. The Book assesses the state of Poland's security system, and provides policy recommendations. The White Book defines the challenges related to disasters caused by the man or natural catastrophes as an element that shapes the internal security landscape in Poland. According to the document, areas of high-risk human activity, such as power engineering and extracting industry, and environmental interferences, increase the chance of occurrence of events with disastrous effects.¹⁷⁸²

As regards disasters caused by natural factors, the White Book expects "ever more frequent violent weather phenomena." The document specifically mentions the risk of extensive floods, adding that their frequency may grow in the next 5-10 years, which – "given deficiencies of the protection infrastructure" – would cause even more significant losses to the state and the citizens.

National Crisis Management Plan

The National Crisis Management Plan (NCMP, latest version as of 2013)¹⁷⁸³ is elaborated and updated by the Government Security Centre (GCS) and it is publicly available in Polish language. Pursuant to the Act on Crisis Management, Part I of the Plan identifies threats to Polish security and provides a risk assessment, as well as on critical infrastructure. The following threats are assessed in the Plan (in order of listing):

- Floods
- Disease outbreaks
- Chemical contamination
- Interruption of electricity supply
- Interruption of liquid fuels supply
- Interruption of gas deliveries
- Severe frosts
- Storms
- Forest fires
- Epizootic
- Mass plant diseases
- Collapse of buildings
- Landslides
- Drought
- Radioactive contamination
- Social unrest
- Terrorist threat

¹⁷⁸¹ Website of White Book on National Security of the Republic of Poland, www.spbn.gov.pl/sbn/english-version/5043,English-version.html.

¹⁷⁸² Website of White Book on National Security of the Republic of Poland, www.spbn.gov.pl/sbn/english-version/5043,English-version.html.

¹⁷⁸³ Krajowy Plan Zarządzania Kryzysowego (National Crisis Management Plan), in Polish, http://rcb.gov.pl/?page_id=302.

- Cyber threats

Information on potential threats in Poland are sent daily from the local level to the regional and the ministerial crisis management centres, which forward them to the GCS. The collected and processed data is prioritised, catalogued and aggregated into daily and problem-specific reports by the GCS.

Report on Threats to Security

In addition to that, in July 2013 a report (classified as confidential) on the threats to national security was adopted, identifying the most significant threats to national security and to risks stemming from them.¹⁷⁸⁴ The document also includes strategic objectives and projects to be implemented to minimise potential risks and their consequences. The report of 2013 identified 53 risks and scenarios that could affect the security and the international status of the country. The report analysed risks related to terrorism, major risks of natural or industrial origin (e.g. floods, epidemics, epizootics, chemical pollution, drought, reduction of the supply of electricity, reduction of the supply of liquid fuels). On the basis of the report, a national plan for emergency management is adopted.

On the basis of the list and description of threats in the plan it is possible to determine the most frequent threats in Poland, their location, probability of occurrence and potential effects on the population, environment and infrastructure.¹⁷⁸⁵

Also in terms of risk assessment, a national project called ISOK deserves mention, which is aimed at ensuring an efficient system for the country's protection against extreme hazards (supporting local planners), with focus on flood risk management. The products of the project carried out by the National Water Management Authority, the Institute of Meteorology and Water Management, the Head Office of Geodesy and Cartography at the National Research Institute, the National Institute of Telecommunications, and the government security centre, include the following:

- flood hazard maps and flood risk maps;
- IT system of ISOK;
- report on identification of national information systems;
- preliminary flood risk assessment;
- meteorological hazard maps;
- other hazard maps;
- Topographic Objects Database (BDOT);
- Digital Terrain Model (DTM) and Digital Surface Model (DSM);
- Digital Elevation Model Management System;
- digital orthophotomap;
- map of hydrological division of Poland in the scale 1:10 000.

Overall, national risk assessment is aimed at achieving forecasting accuracy of time and location as well as intensity of unfavourable or severe natural phenomena with enough lead time for prevention activities to eliminate or reduce threat.¹⁷⁸⁶

¹⁷⁸⁴ "Raport o zagrożeniach bezpieczeństwa narodowego," Website of the Government Security Centre, in Polish, http://rcb.gov.pl/?page_id=3702.

¹⁷⁸⁵ Paulina Pajkiert Vela, "Strengthening the Legal and Policy Framework for International Disaster Response in Poland," Website of the Polish Red Cross, http://www.ifrc.org/docs/IDRL/Poland-%20Strengthening%20the%20Legal%20and%20Policy%20Framework%20for%20International%20Disaster%20Response_09%20APR%202014.pdf.

In terms of assessing transboundary risks, Poland cooperates actively with neighbours and other countries in the region along legal, organisational, technical aspects lines to identify relevant institutions; to exchange information about threats in border areas and such concerning relief and recovery measures of the effects of extreme hazards; and to prepare effective and simple procedures for co-ordinated response. The cooperation takes the form of bilateral agreements and of international agreements under the auspices of the United Nations. Examples of the latter include the United Nations Economic Commission for Europe, the Council for the Baltic Sea States, the Central European Initiative and the UN Office for the Coordination of Humanitarian Affairs (which includes INSARAG – International Search and Rescue Advisory Group).

The cooperation is coordinated by the Ministry of the Interior and the Ministry of Foreign Affairs, with key participation of the fire service and the Institute of Meteorology and Water Management.¹⁷⁸⁷

Societal perceptions

Despite the positive assessment of the role of institutions in ensuring Poland's security, the prevailing conviction is that the country is not prepared adequately to act in emergency and unforeseen situations – whether caused by the forces of nature or negligence on the part of people, or planned and organised by forces hostile to Poland. Such situations include e.g. floods, which were experienced by Poles several times in recent years. This is probably the reason for the particularly severe criticism of the state's preparedness to encounter natural disasters (61 per cent of negative answers, and 23 per cent of the positive ones).¹⁷⁸⁸

1.2 Policy and Governance

1.2.1 Strategy scope and focus

The national firefighting and rescue efforts are the pivotal part of the crisis management system of the country. The Chief Commandant of the State Fire Service, under the supervision of the Minister of the Interior, is the central body of the state administration responsible for the organisation and management of those activities.

The system involves state firefighting and rescue units, volunteer firefighting units, industrial fire service units, industrial rescue service units, hospitals in major Polish cities, national experts specialising in different types of rescue operations.

Several services¹⁷⁸⁹ and structures also support or make part of the wider Polish CM system, including (but not limited to):

- the Police;
- the Border Guard;

¹⁷⁸⁶ Poland: National Progress Report on the Implementation of the Hyogo Framework for Action (2009-2011) – Interim, available at http://www.preventionweb.net/english/hyogo/gar/2011/en/bgdocs/hfa/15978_pol_NationalHFAprogress_2009-11.pdf.

¹⁷⁸⁷ Poland: National Progress Report on the Implementation of the Hyogo Framework for Action (2009-2011).

¹⁷⁸⁸ White Book on National Security of the Republic of Poland, <http://www.spbn.gov.pl/sbn/english-version/5043,English-version.html>.

¹⁷⁸⁹ A list of the so-called Ministry of Interior group is available at <https://msw.gov.pl/en/ministry/mi-group>, while the website of the Polish State Fire Service refers to organisations supporting the CM system <http://www.straz.gov.pl/page/en.php>.

- the State Inspection for Environment Protection;
- the Institute for Meteorology and Water Management;
- the National Atomic Energy Agency;
- the mining rescue stations;
- the maritime search and rescue service;
- the naval rescue service;
- NGOs, e.g. Mountain Volunteer Rescue Service; Tatra Mountains Volunteer Rescue Service; Water Volunteer Rescue Service; Mazurian Rescue Service and others.

Volunteer fire brigades within the rescue and firefighting system traditionally carry out fire fighting and prevention activities. Their functions, however, have evolved in recent years. The brigades have become more commonly involved in other types of rescue operations, including primarily technical or road incidents, where various rescue methods and measures are applied. Quite often volunteer firefighters are the first to appear at the site of an accident and take measures to save people's life, health, and property.

In April 2013, the Polish Council of Ministers adopted a Strategy of Development of the National Security System of the Republic of Poland 2022.¹⁷⁹⁰ In its part on challenges, development trends and development vision of the national security system of the Republic of Poland, the Strategy defines "the possibility of crisis situation, occurring as a consequence of natural disasters, human activity or of various global processes and phenomena" as challenge to national security. Thus the Strategy notes "it is crucial to maintain the highest level of response capability for such kind of occurrences, fast minimisation of their consequences, as well as their prevention, if only possible. It is particularly significant to provide appropriate resilience of critical infrastructure to crisis situations."

The Strategy contains specific texts regarding the capabilities of the Polish Armed Forces to carry out missions in crisis situations – section 2.1.3. on the provision of military support to government bodies during crisis situations of a non- military character envisage "preparation and readiness to use means and powers to clear areas off explosives and other dangerous materials, perform ice breaking and flood management actions and liquidate the consequences of natural disasters," while section 2.2.4. on the establishment of the National Reserve Forces calls for a reinforcement of the professional armed forces by the reserve forces in "a situation of intensified, military or non-military, threats, related to the necessities of crisis management, including natural disasters and liquidation of their effects, antiterrorist actions, protection of property, search and rescuing or protecting human life and health."

1.2.2 Monitoring and analytical support to policy making; R&D

Early warning

A Central Reporting Application (CAR) system is being developed in Poland – at the request of the Ministry of Administration and Digitalisation by the Podlasie Voivodeship Office in cooperation with the Government Security Centre (GCS) – to enable collection of comprehensive information on

¹⁷⁹⁰ Strategy of Development of the National Security System of the Republic of Poland 2022, Ministry of National Defence, http://mon.gov.pl/z/pliki/dokumenty/rozne/2014/01/ENGLISH_SRSBN_RP_do_pobrania.pdf.

threats from the local level up to the central level and to reduce the amount of data being duplicated by officers on duty in the crisis management centres.¹⁷⁹¹

In the event of a disaster, the GCS uses an interactive tool: the Geographic Information System, which allows access to the appropriate information, like the availability of rescue equipment and of rescuers, which results in a shortening of the dispatch time.¹⁷⁹²

Early warning is implemented pursuant to a regulation of the Council of Ministers of 2013 concerning contamination detection and notification systems and the competence of authorities. The regulation provides the legal base for unification and replacement of the previous warning signal system based on mechanical sirens with two signals: to announce and call-off an alarm with an option of broadcasting voice announcements. The second way of informing involves mass media. Work is in progress on enhanced threat notification systems and the use of hybrid TV as well as text messages.

A system of systems, the National Contamination Detection and Alerting System (KSWSiA)¹⁷⁹³ was established pursuant to the aforementioned regulation. The system is supervised and coordinated by the Minister of National Defence with the support of the Contamination Analysis Centre of the armed forces. KSWSiA has communication and information elements subordinated to five ministries (national defence, interior, environment, health and infrastructure), which include Contamination Detection System of the armed forces, the systems that monitor epidemics and communicable diseases; the system of early detection stations and of radiation monitoring points; detection, alert and early warning systems (supervised by voivodes); detection and alert system, organised as per the Plan for Combating Environmental Threats and Maritime Pollution (of the Maritime Search and Rescue Service).

Other systems

The responsibilities of relevant authorities related to monitoring and early warning are also supported by the following systems:

3. Monitoring and National Protection System (System Monitoringu i Ostrony Kraju (SMOK) of the Institute of Meteorology and Water Management – monitoring of hydrological and meteorological hazards;
4. System for Acquisition and Processing of Hydrogeological Data of the Polish Geological Institute (<http://www.psh.gov.pl/en/>); and
5. System Ostrony Przeciwośuwiskowej (SOPO) PIG-PIB – monitoring of landslides.

1.2.3 Policy for Prevention

Actions are carried out mostly to prevent from meteorological and flood hazards problems, for which information is supplied via the ISOK.

1.2.4 Policy for Preparedness

Poland's National progress report on the implementation of the Hyogo Framework for Action (2013-2015), hereinafter Hyogo 2013-2015, states that there has been substantial achievement as regards disaster preparedness plans. According to the report, Disaster Reduction operational plans exist at

¹⁷⁹¹ Paulina Pajkiert Vela, "Strengthening the Legal and Policy Framework for International Disaster Response in Poland."

¹⁷⁹² Paulina Pajkiert Vela, "Strengthening the Legal and Policy Framework for International Disaster Response in Poland."

¹⁷⁹³ Government Security Centre, <http://rcb.gov.pl/wp-content/uploads/2011/02/kswsia.pdf>.

each level of administration, but still their Preparedness part is the weakest of all.¹⁷⁹⁴ In addition to that, preparedness at the local community level needs to be improved.

Overall, Hyogo 2013-2015, reports a shift in Poland's attitude towards hazards to an integrated approach that includes research, legislation, control and measurement, economic, technical, educational, social and insurance problems aspects in parallel and ensures that they are equally treated.

1.2.5 Policy for Response

With respect to response, the authors of the Hyogo 2013-2015 note that the local institutions, village committees, communities, volunteers or urban resident welfare associations are properly trained for response. However, businesses are still not a proactive partner in the planning and delivery of response.¹⁷⁹⁵

1.2.6 Policy for Relief and Recovery

According to Hyogo 2013-2015, mechanisms and tools are being adopted for the implementation of environmental management and post-disaster recovery programmes and institutionalised at the various levels.¹⁷⁹⁶

1.3 Financing

1.3.1 Investing in preparedness

The Rescue and Civil Protection Program (PRiOL)¹⁷⁹⁷ for the period 2014-2020 details the complex structure of the total budget for rescue and civil protection activities, as follows:

- annual subsidy (section 42/754/75409 of the State Budget) for the State Fire Service HQ for the implementation of tasks of the NFRS – PLN 70.716 mln¹⁷⁹⁸ for 2013¹⁷⁹⁹
- support to volunteer fire brigade, at the discretion of the Minister of Interior – PLN 31.247 mln for 2013
- reserve of the state budget – for preventing and dealing with the consequences of natural disasters – PLN 1.411 bln. for 2013
- based on an agreement between the Minister of Environmental Affairs and the Minister of Interior and Administration, signed on 25 March 2011, for annual funding under a special reserve created, at the disposal of the Minister of Environment for the purchase of specialised

¹⁷⁹⁸ Approximately EUR 16.33 mln according to current exchange rate (1 PLN = 0.23 Euro).

¹⁷⁹⁹ Current figures could be obtained by the State Budget for 2014 (Ustawa budżetowa na rok 2014 z dnia 24 stycznia 2014 r. - podpisana przez Prezydenta RP 29 stycznia 2014 r. (Dz. U. z 2014 r., poz. 162)), Website of the Ministry of Finance, in Polish, <http://www.mf.gov.pl/ministerstwo-finansow/dzialalnosc/finanse-publiczne/budzet-panstwa/ustawy-budzetowe/2014/ustawa>

rescue equipment for the relationship Volunteer Fire service and NGOs performing rescue tasks in mountains and in water – PLN 11.429 mln.

- for re-equipping of rescue services – PLN 11.429 mln. for 2013
- state expenditure on civil defence as per section 42/754/75414 (civil defence, carried by the Head of the National Civil Defence) and section 85/754/75414 (budgets of provincial governors for civil defence and 85/750/75011 (budgets of provincial governors for provincial offices of the public administration) – PLN 26.786 mln. for 2013
- funding by the European Regional Development Fund, European Social Fund, the Cohesion Fund, the Internal Security Fund, European Investment Bank, European Solidarity Fund.

The average annual increase cost improvement projects in the field of civil defence planned for the years 2013-2022 is:

- at the central level (ministries) – PLN 870 000
- at the central level (central government bodies) – PLN 24 000
- at the provincial level – PLN 16.453 mln

1.3.2 Investing in consequence management

International Aid

Created as a reaction to the heavy floods in Central Europe in the summer of 2002, European Union's Solidarity Fund (EUSF) is aimed at responding to major natural disasters and express Europe's solidarity to region suffering the consequences of disasters. Since then, it has been activated on 60 occasions, including floods, forest fires, earthquakes, storms and drought in 23 European countries. As of September 2014, the Fund has provided funding of over Euro 3.6 bln. Poland has received a total of EUR 105.6 mln. of aid for the floods in May 2010 – covering only a small percentage of the total estimated damage of almost EUR 3 bln.¹⁸⁰⁰

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

No specific information could be obtained.

1.4.2 Departmental Lessons Learned systems

No information could be obtained.

1.4.3 Centralised (national) Lessons Learned system

No information could be obtained.

¹⁸⁰⁰ European Commission, The Funds, http://ec.europa.eu/regional_policy/sources/thefunds/doc/interventions_since_2002.pdf.

1.4.4 International exchange for Lessons Learned

Under the auspices of the Ministry of the Interior and the Ministry of Foreign Affairs through the State Fire Service HQ and the Institute of Meteorology and Water Management extensive international cooperation is realised, incl. on lessons learned with

- United Nations Economic Commission for Europe
- Council for the Baltic Sea States
- Central European Initiative
- The Visegrad Group (V4)
- Office for the Coordination of Humanitarian Affairs (INSARAG International Search and Rescue Advisory Group).
- Central European Disaster Prevention Forum Platform (CEUDIP)
- European Forum for Disaster Risk Reduction
- European Network of National Platforms (ENNP).

1.4.5 Regular policy reviews

In Poland, a strategic review of the whole national security system was performed. One of the outcomes was a White Book providing, among other things, strategic guidance for the crisis management system.

The document proposes a comprehensive approach to be taken within the framework of the National Firefighting and Rescue System (NFRS), with strategic tasks being risk analysis and identification of threats, the elaboration of emergency plans (incl. rules on the use of force, inter-agency cooperation, means of communication, etc.), monitoring, informing, warning and alarming people and institutions, services and other entities performing tasks related to civil protection about threats, educational activities, organisation of rescue exercises, and international cooperation.

In terms of actions to be taken to achieve the operational strategy, the White Book advises the issues related to civil defence to be regulated in a comprehensive manner with a separate statutory act, to properly place the protection of population tasks within the state security system and divide the roles of involved public administration bodies, leading to harmonisation of applicable laws and to streamline responses. The above-described act and related laws should prepare the groundwork to improve public education and determine the rules for civilian involvement.¹⁸⁰¹

In operational terms, the regulations should streamline inter-agency cooperation, adjust control mechanisms, put in place adequate mechanisms for coordination of rescue operations and provide the basis for the functioning of rescue dispatch centres. The White Book makes a note that the Ministry of Interior has initiated such a systematisation of the existing rules regarding the protection of the population and civil defence by means of preparing a draft law on protection of the population. However, it further argues that the draft's scope could be extended to cover the rescue element to achieve greater coherence and functional integration within the crisis management system, as well as to take out non-defence issues contained in the current act on the general defence duty and transfer them to the proposed act.¹⁸⁰²

¹⁸⁰¹ Website of White Book on National Security of the Republic of Poland, www.spbn.gov.pl/sbn/english-version/5043,English-version.html.

¹⁸⁰² White Book on National Security of the Republic of Poland, <http://www.spbn.gov.pl/sbn/english-version/5043,English-version.html>.

The document deems it necessary that the National Firefighting and Rescue System be transformed into a National Rescue System, functioning according to unified rules, pertaining to: notification; “the alerting system; the organization and coordination of rescue operations; the procedures applicable to emergency rescue operations; the system of rescue training; communications systems for all rescue entities; the unification of equipment used by rescue entities; the documentation of events; the information exchange and database systems and the criteria of the efficiency of their operation.”¹⁸⁰³ The national rescue system should be centred around providing emergency response at district level and on coordination and support at provincial and national levels.

1.5 Resilience

The term “resilience” could be translated into Polish as “odporności”, or immunity. Along the many avenues of international cooperation, it could be observed that resilience is de facto tackled in Poland’s crisis management efforts.¹⁸⁰⁴

1.6 Information sharing and data protection

Information could not be obtained.

¹⁸⁰³ White Book on National Security of the Republic of Poland, <http://www.spbn.gov.pl/sbn/english-version/5043,English-version.html>.

¹⁸⁰⁴ For example, see the Hyogo 2013-2015.

2 Legislation

2.1 Crisis (emergency, disaster) management concept

In Poland there is no single document that conceptualises crisis management.

2.2 General crisis (emergency, disaster) management law

The general crisis management law in Poland is the Act on Crisis Management ¹⁸⁰⁵ of 26 April 2007. It gives definitions of basic terms, and specifies the authorities responsible for crisis management, their tasks and the general principles for crisis management.

Art. 2 of the Act defines crisis management as “activity of public administration authorities as an element of managing national security management system, which consists of preventing crisis situations, preparing to take control over them by way of planned activities, responding in case of emergencies, removal of their effects and the reconstruction of the resources and critical infrastructure.”

The Act also stipulates the procedures pertaining to civil planning, understood as “overall organisational projects aimed at preparing the public administration to manage crisis,” and critical infrastructure protection.

Article 8 of the Act provides the legal base for the establishment of a Government Crisis Management Team “under the Council of Ministers as a body issuing advice and opinions for the issues of initiating and coordinating activities related to crisis management” and further details its composition.

In addition to that, the Act stipulates the set-up of a Government Security Centre (GCS) with the aim to “increase the ability of competent services and public administration authorities to cope with difficult situations” and to “form a capable response system for crisis situations, when routine resources and operational procedures prove insufficient.” The Act also defines the mission and the tasks of the GCS.

As noted above, work on a draft Act on Protection of the Population has commenced.

2.3 Emergency rule

The legal base of the crisis management in Poland is formed by the Constitution of the Republic of Poland, ¹⁸⁰⁶ which was adopted on 2 April 1997.

Chapter XI stipulates the rules concerning extraordinary measures, namely martial law, a state of emergency or a state of natural disaster. Extraordinary measures may be introduced only by regulation, issued according to the statutes, and are required to be publicised. Separate acts determine the principles for activity of organs of public authority and the degree to which the freedoms and rights of persons and citizens may be subject to limitation.

¹⁸⁰⁵ Act on Crisis Management, Website of Government Security Centre, <http://rcb.gov.pl/eng/wp-content/uploads/2011/03/ACT-on-Crisis-Management-final-version-31-12-2010.pdf>.

¹⁸⁰⁶ The Constitution of the Republic of Poland, <http://www.sejm.gov.pl/prawo/konst/angielski/kon1.htm>.

As far as functioning of the state is concerned, art. 228, p. 7 stipulates that during a period of introduction of extraordinary measures, the following shall not be subject to change: the Constitution, the Acts on Elections to the Sejm, the Senate and organs of local self-governments, the Act on Elections to the Presidency, as well as statutes on extraordinary measures. Moreover, during a period of introduction of extraordinary measures, as well as within the period of 90 days following its termination, the term of office of the Sejm may not be shortened, nor may a nationwide referendum, nor elections to the Sejm, Senate, organs of local self-government nor elections for the Presidency be held, and the term of office of such organs shall be appropriately prolonged. Elections to organs of local self-government shall be possible only in those places where the extraordinary measures have not been introduced.

A state of martial law is declared by the President in the case of external threats to the State, acts of armed aggression against the territory of the Republic of Poland or when an obligation of common defence against aggression arises by virtue of international agreement. According to art. 230, a state of emergency may be introduced in the case of threats to the constitutional order of the State, to security of the citizenry or public order. Art. 232 of the Polish Constitution stipulates that in order to prevent or remove the consequences of a natural catastrophe or a technological accident exhibiting characteristics of a natural disaster, the Council of Ministers may introduce, for a definite period no longer than 30 days, a state of natural disaster in a part of or upon the whole territory of the State.

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

Three acts, on a State of Martial Law and (...), on a State of Emergency, and on a State of Natural Disaster, provide definitions, codes of conduct for involved authorities and the scope of limitations of human rights and freedoms in each of the three extraordinary cases. However, the aim of the acts, all adopted in 2002, was mostly to clarify the responsibilities for action in case of an emergency, as the floods of 1997 exposed ambiguities in the interpretation of the regulations.

Two acts of 24 August 1991, on the State Fire Service and on Fire Prevention, form the legal basis for the organisation and functioning of the State Fire Service.

The Polish legal framework also includes an Act of 21 November 1967 on universal obligation to defend the Republic of Poland, which regulates the so-called “civil defence” system. Pursuant to the abovementioned Act, the main government administration authority in the field of civil defence is the Chief of the National Civil Defence, who is appointed by the Prime Minister on the request of the minister competent for internal affairs. The Chief of the National Civil Defence shall report to the minister competent for internal affairs. At present, the Chief Commandant of the State Fire Service, is also the Chief of the National Civil Defence.¹⁸⁰⁷

Executive civil defence authorities are the starostes, commune heads, mayors and city presidents. Civil defence chiefs in relevant provinces, counties and communes shall manage and coordinate preparation and realisation of projects in the area of civil defence by state institutions, entrepreneurs and other organisational units and social organisations acting on their territory.

However, Art. 140 of the Act on universal obligation to defend the Republic of Poland, “a statutory basis for issuing regulations by the Government in respect of specification of duties and rights of

¹⁸⁰⁷ Website of the National Civil Defence, http://www.ock.gov.pl/english/civil_defence_structure.

institutions in the field of civil defence, matters of civil defence formations and signals of common warning and alarming” was cancelled with the abolishment of the civil defence system, creating a legal vacuum in some areas of civil defence, which is expected to be filled with the act on protection of population.

The tasks of the organs of government and self-government administration, implemented within crisis management, were included in following legal acts:

- Act dated 23 January 2009 on Provincial and Government Administration in a Province;
- Act dated 5 June 1998 on Provincial Self-Government;
- Act dated 5 June 1998 on County Self-Government;
- Act dated 8 March 1990 on Commune Self-Government;
- Ordinance of the Council of Ministers of 20 February 2003 on the detailed principles of participation of sub-branches and branches of Polish Armed Forces in preventing or eliminating effects of natural disaster;
- Ordinance of the Minister of Economy of 8 November 2002 on the requirements of action plan in the event of human life, health, property or environmental threat;
- Ordinance of the Council of Ministers of 30 April 2010 on the plans of critical infrastructure protection;
- Regulation no. 86 of the Prime Minister of 14 August 2008 on organisation and code of conduct of the Government Team for Crisis Management;
- Ordinance of the Council of Ministers of 30 April 2010 on the Report on threats to national security;
- Ordinance of the Council of Ministers of 15 December 2009 determining which government authorities shall establish emergency management centres and defining their methods of operation;
- Ordinance of the Prime Minister of 10 July 2008 on organisation and activity of Government Security Centre.¹⁸⁰⁸
-

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

The tasks of the organs of regional and local authorities could be found in a number of legal acts, more specifically:

- Act dated 23 January 2009 on Provincial and Government Administration in a Province;
- Act dated 5 June 1998 on Provincial Self-Government;
- Act dated 5 June 1998 on County Self-Government;
- Act dated 8 March 1990 on Commune Self-Government.

¹⁸⁰⁸

A comprehensive list of relevant legislation could be found in the White Book.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

The involvement of NGOs and volunteers in rescue services and civil protection is regulated by numerous pieces of legislation – both laws and administrative acts, including:

- Act dated 24 April 2003 on Public Benefit and Volunteer Work;
- Act dated 7 April 1989 on Associations;
- Act dated 6 April 1984 on Foundations;
- Act dated 16 November 1964 on the Polish Red Cross;
- Act dated 27 October 2010 on the Public Utility Activity and Volunteer Activity;
- Act dated 18 August 2011 on the Safety And Rescue in the Mountains and Organised Ski Areas;
- Act dated 18 August 2011 on the Safety of Persons in Water;
- Regulation of the Minister of the Interior and Administration of 14 September 1998 on the scope, detailed conditions and mode of including fire protection units in the NFRS;
- Regulation of the Minister of the Interior and Administration of 18 February 2011, concerning the detailed principles of organisation of the NFRS.

2.7 Legal regulations for international engagements of first responders and crisis managers

In Poland regulations concerning crisis management are adapted to European Union requirements. EU Legal acts influencing Polish legislation in this field are:

- Treaty establishing a Constitution for Europe;
- COM (2010) 673: Objective 5: Increase Europe's resilience to crises and disasters - Action 2: An all hazards approach to threat and risk assessment;
- Council Directive 82/501/EEC of 24 June 1982 on the major-accident hazards of certain industrial activities (Seveso);
- Council Directive 96/82/EC of 9 December 1996 on the control of major accident hazards (Seveso II);
- Council Decision 91/396/EEC of 29 July 1991 on the introduction of a single European emergency call number;
- Directive 2007/60/WE of the European Parliament and of the Council of 23 October 2007 on the assessment and management of flood risk;
- Council Directive 2008/114/EC of 8 December 2008 on the identification and designation of European critical infrastructures and the assessment of the need to improve their protection;
- Council Decision 2008/617/JHA of 23 June 2008 on the improvement of cooperation between the special intervention units of the Member States of the European Union in crisis situations;
- Council Framework Decision 2002/475/JHA of 13 June 2002 on combating terrorism;
- Council of Europe Convention on the prevention of terrorism, adopted on 16 May 2005 in Warsaw;

- Convention on the physical protection of nuclear material, including annex I and II, opened for signature in Vienna and New York on 3 March 1980;
- International Convention for suppression of acts of nuclear terrorism, adopted by the General Assembly of the United Nations on 13 April 2005.

It is also a signatory of the Convention on the Transboundary Effects of Industrial Accidents.

Poland has signed 11 bilateral agreements with European countries: Belarus, Croatia, Czech Republic, France, Germany, Hungary, Lithuania, Russian Federation, Slovakia, Slovenia and Ukraine, as well as with the Ministry of Interior of Brandenburg, the Ministry of the Interior of Free State of Saxony, and the Ministry of the Interior of Mecklenburg-Western Pomerania. An agreement with Estonia is currently being negotiated.

List of the agreements is available below:

- Agreement between the Republic of Poland and the Federal Republic of Germany on Mutual Assistance during Technological and Natural Disasters and Other Serious Accidents, signed in Warsaw on 10 April 1997;
- Agreement between the Ministry of the Interior and Administration of the Republic of Poland and the Ministry of Interior of Brandenburg on Cooperation and Mutual Assistance During Technological and Natural Disasters and Other Serious Accidents, signed in Slubice on 18 July 2002;
- Agreement between Ministry of the Interior and Administration of the Republic of Poland and the Ministry of the Interior of Mecklenburg-Western Pomerania on Cooperation and Mutual Assistance During Technological and Natural Disasters and Other Serious Accidents, signed in Slubice on 18 July 2002;
- Agreement between the Ministry of the Interior and Administration of the Republic of Poland and the Ministry of the Interior of Free State of Saxony on Cooperation and Mutual Assistance During Technological and Natural Disasters and Other Serious Accidents, signed in Slubice on 18 July 2002;
- Agreement between the Government of the Republic of Poland and the Government of the Russian Federation on Cooperation in Prevention of Technological and Natural Disasters, and in Relief of Their Consequences, signed in Warsaw on 25 August 1993;
- Agreement between the Government of the Republic of Poland and the Government of the Lithuanian Republic on Cooperation and Mutual Assistance in Case of Technological and Natural Disasters and Other Serious Accidents, signed in Warsaw on 4 April 2000;
- Agreement between the Government of the Republic of Poland and the Government of the Slovak Republic on Cooperation and Mutual Assistance during Technological and Natural Disasters and Other Serious Accidents, signed in Bratislava on 24 January 2000;
- Agreement between the Republic of Poland and the Republic of Hungary on Cooperation and Mutual Assistance in Prevention of Technological and Natural Disasters and Other Serious Accidents, and in Relief of Their Consequences, signed in Warsaw on 6 April 2000;
- Agreement between the Republic of Poland and the Czech Republic on Cooperation and Mutual Assistance in Case of Technological and Natural Disasters and Other Emergencies, signed in Warsaw on 8 June 2000;
- Agreement between the Government of the Republic of Poland and the Cabinet of Ministers of Ukraine on Cooperation and Mutual Assistance in Prevention of Technological and Natural

Disasters and Other Emergencies, and in Relief of Their Consequences, signed in Warsaw on 19 July 2002;

- Agreement between the Government of the Republic of Poland and the Republic of France on Cooperation in the Field of Internal Affairs, signed in Warsaw on 12 September 1996;
- Agreement between the Government of the Republic of Poland and the Republic of Croatia on Cooperation in Protection against Technological and Natural Disasters, and in Relief of Their Consequences, signed in Zagreb on 17 September 2003;
- Agreement between the Government of the Republic of Poland and the Government of the Republic of Belarus on Cooperation in the Field of the Prevention of Technological and Natural Disasters and Other Emergencies, and in Relief of Their Consequences;
- Agreement between the Government of the Republic of Poland and the Government of the Republic of Slovenia on Cooperation in the Prevention of Natural Disasters and Other Accidents, and in Relief of their Consequences;
- Agreement between the Government of the Republic of Poland and the Government of the Republic of Estonia on Cooperation in the Field of Civil Protection (first round of negotiations).

3 Organisation

3.1 Organisational chart

In Poland, there is no single authority dealing with disaster management. The structure of the Polish emergency management has five levels: state, ministry (central government body), province (voivodeship), county (powiat) and district (commune, gmina).¹⁸⁰⁹

Coordination (see Table 5) at the five levels is carried by the Government Crisis Management Team, the Ministry/ Body CM Team, Provincial CM Team, the County CM Team and District CM Team, with the management responsibilities assigned to the Prime Minister and the Cabinet, the respective Minister/Head, the provincial governors, the county administrators, and the mayors, respectively.

Table 6: Crisis Management Levels in Poland

Level	Management	Coordination
State	Prime Minister, Cabinet of Ministers	Government CM Team; Government Security Centre
Ministry/Government Body	Minister/ Head	CM Team
Province / Voivodeship	Provincial Governor	Provincial CM Team; Provincial CM Centre
County / Powiat level	County Administrator (starost)	County CM Team, County CM Centre
District / Commune level	District/Borough Administrator or Mayor	District CM Team, District CM Centre (if needed)

National Crisis Management Plan

Part II of the NCMP defines the tasks related to monitoring of risks carried by the ministers, heads of central government bodies and provincial governors, the operational mode for the allocation of the forces and resources for crisis management purposes, the mechanism for national authorities to request and receive international assistance (including by more than one organisation; and the Polish institutions, acting as POC for the relevant international structures), and the operational mode for the Polish Armed Forces providing assistance in case of emergency.

Importantly, in accordance with art. 21 of the Act on Crisis Management, the NCMP defines a general procedure for reaction in case of a crisis, distinguishes between four levels of danger, and details specific procedures for interaction among national authorities for levels 2, 3 and 4:

¹⁸⁰⁹ Website of the Government Security Centre, http://rcb.gov.pl/?page_id=489, and Piotr Matczak and Grzegorz Abgarowicz, "Country study: Poland," Analysis of Civil Security Systems in Europe.

Table 7: Levels of Crisis Management with Responsible Actors

Level	Definition	Responsible
1	Crisis at the provincial level	Voivoda
2	Crisis at a ministry level	Minister
3	Crisis at a multi-ministry level	Council of Ministers
4	Crisis calling for extraordinary measures	As per relevant law(s)

Part II of the Plan further describes the crisis management centres architecture in Poland:

21. CM centres of Ministry of Interior services (Fire service, Police, Border Guard, Government Protection Bureau);
22. CM centres of the MI, the Ministry of National Defence, and the Ministry of Foreign Affairs
23. CM centres of special services;
24. CM centres of other ministries;
25. CM centres at provincial level.

Government Crisis Management Team

The Act on Crisis Management stipulates the set-up of a Government Crisis Management Team under the Council of Ministers as an advisory body regarding issues of initiating and coordinating crisis management activities. The Team shall be composed of the Prime Minister (acting as the Team's the chairperson), the Minister of Defence and the Minister of Interior (deputy chairpersons), and the Minister Coordinating Special Services (if appointed). Government administration authorities participate, if necessary, in the Team's meetings, as members. These could be ministers, the Chief Geodetic Inspector of Poland, the Chief Inspector of Environmental Protection, the Chief Sanitary Inspector, the Chief Veterinary Officer, the Chief Commandant of the State Fire Service, the Commander in Chief of Police, the Chief Commander of Border Guard, the Head of the National Water Management Board, the Head of the National Atomic Energy Agency, the Head of the Civil Aviation Office, the Head of the Internal Security Agency, Head of the Intelligence Agency, the Head of the National Civil Defence, the Head of the Military Counter-Intelligence Service, the Head of the Military Intelligence Service.

State Fire Service

The State Fire Service (Państwowa Straż Pożarna, PSP) is a professional service, originally established to fight fires. However, the Service's role has been extended to cover the coordination and implementation of rescue operations in crisis situations, caused by disasters and or by transport, construction, or chemical accidents. Outside its response core, the tasks of the fire service also include prevention, identification of hazards, and education, research and development. Moreover, the Service cooperates with the head of the National Criminal Information Centre.

The service functions under the supervision of the Ministry of Interior, and is the main part of the National Firefighting and Rescue System (NFRS), with the Chief Commandant of the State Fire Service being the head of the NFRS (acting as the Chief of the National Civil Defence and as the Director General for Civil Protection). The Rescue and Civil Protection Department of the Ministry of Interior is the entity that is tasked to collect and analyse information about the NFRS.

The organisational structure of the State Fire Service consists of the National Headquarters of the SFS, 16 Regional (voivodeship) Headquarters of the SFS, 353 Municipal (county-level) Headquarters of the SFS and 499 Fire and Rescue Units. The five specialised schools educating country's firefighters are also subordinated to the PSP headquarters. These include the Main School of Fire Service in Warsaw, Central School of the State Fire Service in Czeszochowa, two Fire Service Colleges, located in Krakow and Poznan, and NCO School of the State Fire Service in Bydgoszcz.

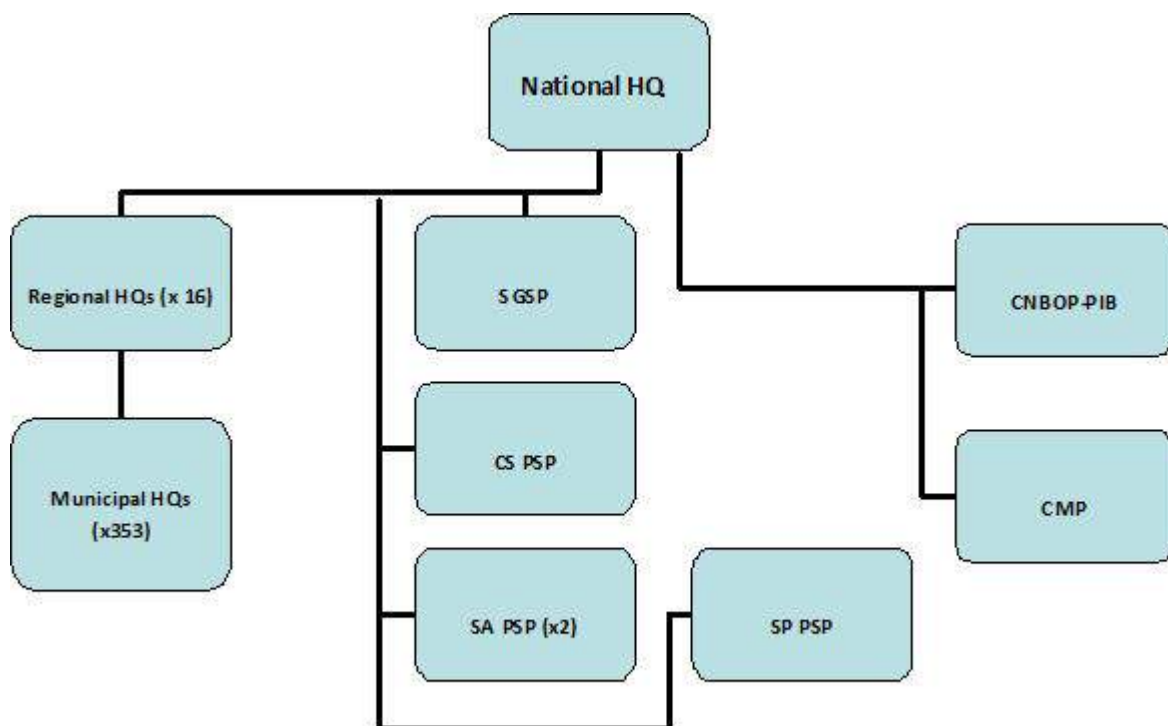

Figure 6: Structure of the PSP.¹⁸¹⁰

The Scientific and Research Centre for Fire Protection (CNBOP-PIB), responsible for testing, certification and validation of the equipment used in the State Fire Service, technical fire protection systems, as well as the expertise concerning fire protection systems, including design and installation, and the Central Museum of Fire Service (CMP) are also part of the PSP structure.

The National Centre for Rescue Coordination and Civil Protection, part of the PSP structure, serves as Poland's contact point for the EU Emergency Response Coordination Centre (previous Monitoring and Information Centre (MIC)¹⁸¹¹, the NATO Euro-Atlantic Disaster Response Coordination Centre (EADRCC) and the UN Office for Coordination of Humanitarian Affairs (OCHA) civil protection and humanitarian aid operations, the UN Economic Commission for Europe (UNECE) Convention on the Transboundary Effects of Industrial Accidents. The service cooperates in various formats – the Organisation for Economic Co-operation and Development (OECD), the Council of the Baltic Sea State, Salzburg Forum, Visegrad Four, International Association of Fire and Rescue Service (CTIF), Federation of the European Union Fire Officer Associations (FEU), European Fire Academy (EFA), etc., as well as bilaterally.

¹⁸¹⁰ Source: <http://www.straz.gov.pl/english/management>.

¹⁸¹¹ The ERCC, operating within the European Commission's Humanitarian Aid and Civil Protection department replaces and upgrades the functions of the previous Monitoring and Information Centre.

Nearly 30 thousand officers serve in the PSP. In recent years, the Service underwent technical modernisation. Its vehicles and rescue and firefighting equipment have been systematically replaced with new ones.

Poland's fire service cooperates closely with the Volunteer Fire Service (OSP), which comprises nearly 17 thousand units with approximately 500 thousand active volunteer firefighters (of which 3 815 units with 126 thousand firefighters make part of the NFRS).

Overall, the NFRS includes:

- 499 state firefighting and rescue units;
- 3 815 volunteer firefighting units;
- 5 industrial fire service units;
- 2 industrial rescue service;
- 11 hospitals in major Polish cities;
- 201 national experts specializing in different rescue types.

Government Security Centre

The Director of the Government Security Centre ¹⁸¹² (GCS) acts as a secretary of the Team. GCS is a supraministerial structure, a key component of the Polish crisis management system, established with the aim to augment the capabilities of the competent services and public administration authorities to cope with difficult situations, and to help organise the functioning of the services responsible for crisis management.

The GCS was established under the Act on Crisis Management and has been operating since 2 August 2008. Currently, the organisational structure and operating mode of the Centre is regulated by a Regulation of the Prime Minister of 11 April 2011. The structure of the GCS is graphically represented in Figure 4 below.

Conducting a comprehensive risk assessment, based on data obtained from within the structures of public administration and from international partners, is considered to be the main task of the GCS.

Other tasks of the GCS include:

- compiling a threat catalogue;
- monitoring of threats and hazards in the country and abroad;
- initiating emergency management procedures on the national level;
- implementing planning and policy objectives concerning crisis management;
- supervising consistency of response procedures;
- organising training and exercises in emergency management;
- implementing objectives concerning prevention, control and mitigation of situations resulting from incidents of terrorist nature;
- international cooperation in emergency management, especially with NATO and EU structures.

¹⁸¹² Website of the Government Security Centre, http://rcb.gov.pl/eng/?page_id=212.

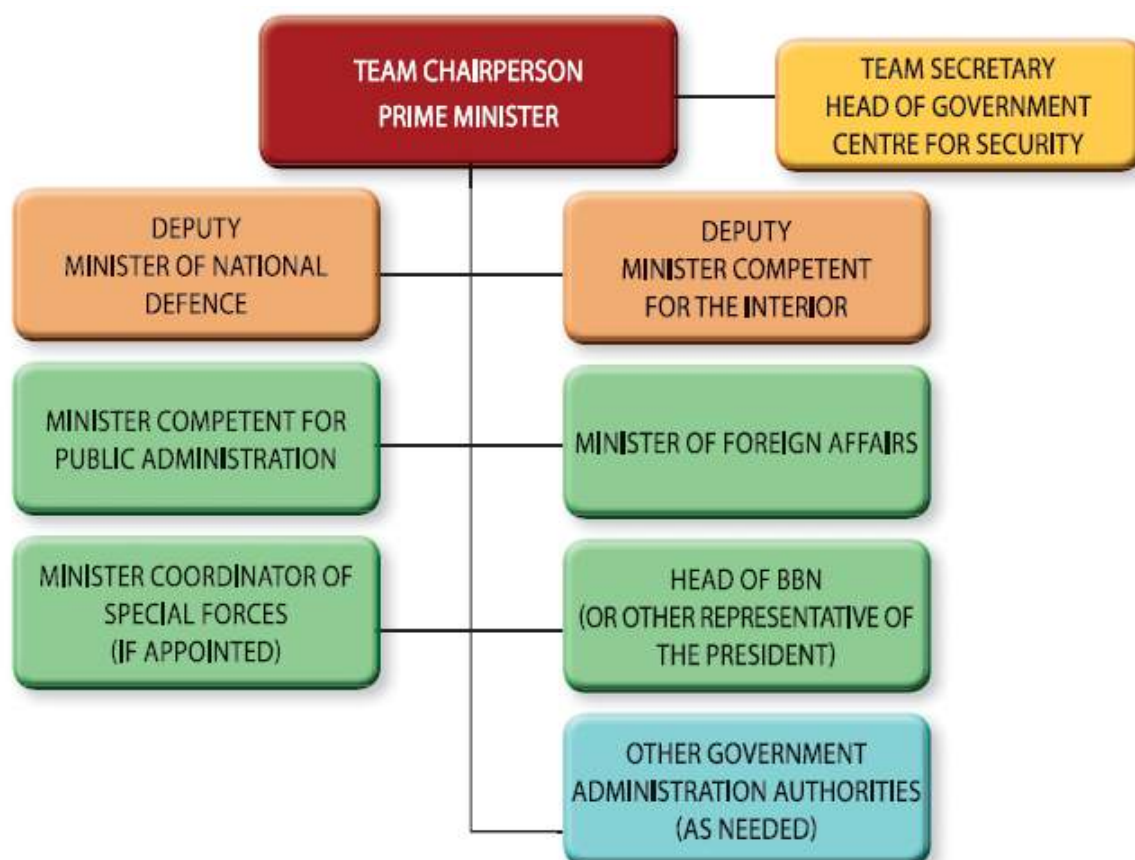

Figure 7: Organisation of the Government Crisis Management Centre.

National Platform for Disaster Risk Reduction

In 2009, Poland formally established its National Platform for Disaster Risk Reduction (NPDRR) from what was formerly the International Decade for Natural Disaster Reduction Committee that had been established in 1991 by the Institute of Meteorology and Water Management. Diverse actors are represented within Poland's NPDRR, including government agencies, scientific institutes and the Polish Red Cross.

3.2 Organisational cooperation

International cooperation

The PSP of Poland participates in the international operations on the basis of bilateral agreements with certain European countries, as well as in missions coordinated by the UN OCHA, the EU ERCC (previous MIC), the NATO EADRCC.

Polish involvement in international rescue operations includes:¹⁸¹³

- Earthquakes: Armenia (1988), Turkey (1999), Algeria (2003), Iran (2003), Pakistan (2005), Indonesia (2006), Haiti (2010), Japan – deployment of Polish expert (EUCPT) (2011)

¹⁸¹³ Website of the State Fire Service.

- Floods: Hungary (2000), the Czech Republic (2002), Germany (2002), Ukraine (2008), Montenegro (2010), Pakistan – deployment of Polish expert (EUCPT)(2011)
- Forest fires: Russia (2010)
- Ammunition depot explosion: the Republic of Congo – deployment of Polish expert (UNDAC Team) (2012)

Involvement in the humanitarian assistance actions includes:

- Medical support: Albania (1999), Romania (2000), India (2001)
- Equipment: Former Yugoslav Republic of Macedonia (2007), Romania (2008), Bulgaria (2012)
- Other assistance: Ukraine (2001), Iran (2004), Sri Lanka and Indonesia (2004/2005), Romania (2005), Pakistan (2005)
- Transport: Bulgaria (2006), Georgia (2008), Albania (2010)

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

Procedures and Guidelines

Art. 5 of the Act on Crisis Management introduces crisis management plans on all levels of public administration (national, voivodeship, poviats and gmina) and stipulates that the plans shall comprise all phases of crisis management (prevention, preparedness, response and recovery).

The crisis management plans shall contain the following three elements: a core plan (including identification of threats and risk assessment, risk maps and maps of threats, tasks and responsibilities of actors involved in the form of a matrix, capabilities and resources), the set of tasks in the case of crisis situations, and the functional annexes to the main plan specifying procedures for implementation of the tasks of crisis management.

Part III of the NCMP¹⁸¹⁴ details 11 SOPs (including aim, responsible authority, applicable law, course of action) for the implementation of tasks in the field of crisis management, namely:

6. Convocation of government meetings
7. Activation of additional funds
8. Organisation of crisis communication
9. Suspension of the provisions of the Schengen agreement
10. Commissioning activities and procedures of the crisis management system
11. Introduction of a state of natural disaster
12. Introduction of a state of emergency
13. Introduction of a state of martial law
14. Tool system in case of abduction by terrorists of Polish citizens outside Poland
15. Action in the event mass influx of foreigners in the territory of Poland
16. Cooperation between public administration and owners / operators of critical infrastructure

Part III of the NCMP deals also with:

- the organisation of a system for monitoring risks, warning and alerting;
- the principles of informing the population;
- the organization of the evacuation of areas at risk (from abroad, and within Polish borders);
- the organization of rescue, medical care, social assistance and psychological aid;
- the organisation of medical emergency actions (incl. Air rescue);
- the rules and procedures for assessing and documenting damage caused by natural disasters.

In addition to the NCMP, art. 5b introduces a National Critical Infrastructure Protection Programme with the aim to distinguish the facilities, equipment, installations and services that are essential for the security of the state and its citizens and to ensure efficient functioning of public administration authorities, institutions and enterprises. At the same time, the programme is to enable support of the entities.

¹⁸¹⁴ Available only in Polish language.

4.2 Operations planning

Information could not be obtain for this specific section.

4.3 Logistics support in crises

Information could not be obtain for this specific section.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

Crisis communication to the public

In the preparedness phase, province, county and municipal websites provide relevant information. The State Fire Service also provides information about risks on its website and, occasionally, uses social media channels. In addition to that, in some cities SMS warning systems have been introduced. Alert systems are built at province level and are based on sirens. A ministerial decree on the detection of contamination and of the authorities in these matters of 2006 orders use of alarms in case of an air attack and contamination. The organisation of the alert systems is within the responsibility of provincial governors.

In an emergency situation various methods of informing the public are used, like posters, leaflets etc. Media have legal obligations to inform in case of emergency.

There have been several examples of information campaigns initiated by various government agencies: on the 112 emergency number; on removing snow from roofs; on safety during winter holidays; on safety during winter recreation and sports etc. There have been several campaigns related to floods, e.g. the National Water Management Authority launched the “To know more about Water” campaign, while the Institute of Meteorology and Water Management has formed a special task force dealing with information and education on flood preparedness.

5 Capabilities

5.1 Human resources

In April 2014 the Polish Government adopted a comprehensive Rescue and Civil Protection Program (PRiOL)¹⁸¹⁵ for the period 2014-2020, which provides an overview of the current status of the rescue and civil protection system in Poland, stipulates the strategic goals and the ways and means for their implementation and details financial parameters related to the programme's realisation.

The programme is a joint effort of the Ministers of Interior, Administration and Digitisation, Health and National Defence and interferes with issues concerning the National Firefighting and Rescue System (NFRS), the National Medical Rescue System and the Alert and Rescue System.

PRiOL specifically mentions volunteer and rescue organisations, supporting the NFRS in Poland, such as:

- the Volunteer Fire Brigade – listed as a unit subordinated to the State Fire Service (as per two regulations of the interior minister listed below in text);
- the mining rescue stations; and
- the Mountain Volunteer Search and Rescue (GOPR) and the Tatra Volunteer Search and Rescue (TOPR) – authorised to take part in mountain rescue operations as per relevant act of 18 August 2011 on the safety and rescue in mountain areas and designated ski zones.

PRiOL notes that organisations such as the GOPR, TOPR, the Water Volunteer Search and Rescue (WOPR), Mazurian Volunteer Search and Rescue (MOPR), Mazurian Rescue Service and the Polish Red Cross should have opportunities to integrate more closely and cooperate more effectively with state rescue services, including the PSP.

Specifically, the Polish Red Cross rescue capabilities include following groups: 20 Rescue Groups – trained and equipped for participation in a major disaster; 1 Medical Rescue Group – arranging a Field Medical Point where qualified medical assistance is provided to victims; 1 Special Rescue Group – providing support to Rescue Patrols in their search efforts with 470 members and 6 Humanitarian Assistance Groups consisting of 83 members.

5.2 Materiel (non-financial) resources

According to PRiOL, Poland has committed to the EU civil protection mechanism, to support rescue and humanitarian missions, 340 fire men, 6-12 dogs and 85 vehicles, namely:

- module for middle to heavy urban search and rescue operations (MUSAR and HUSAR);
- 2 modules for High Capacity Pumping (HCP);
- 3 modules for Ground Forest Fire Fighting using Vehicles (GFFV);
- module for CBRN detection.

5.3 Training

Professional training

The Main School of Fire Service is an academic facility subordinated to the Minister of Internal Affairs and an operational unit of the State Fire Service (PSP). It educates the firefighters of the PSP, officers of other services and guards of the MI system. The school also trains civilians. According to the Act on the State Fire Service, the School provides cadet officers with the opportunity to serve as trainees in the School Rescue and Firefighting Unit.¹⁸¹⁶

Trainings for citizens

The State Fire Service coordinates the educational programme Safe Life (together with the Swedish League for Civil Defence), targeting primary schools. As of November 2013, more than 3500 teachers and 111 700 kids received training covering several thematic areas – safe house, safe school, first aid, and took part in demonstration exercises.¹⁸¹⁷

5.4 Procurement

5.4.1 Procurement regulation

The public procurement system of Poland is based on the Act on Public Procurement (PPL)¹⁸¹⁸ of 29 January 2004, with further amendments.

In principle, contract award procedures are transparent, with few exceptions as per art. 4, pp. 1-14, including when “contracts are classified as “confidential” or “strictly confidential” under provisions of the act on protection of classified information, or if this is required in view of significant national security interest or protection of public security.”

The PPL is applied to the contracts above EUR 30 000 (art. 4, p.8 of the PPL).

The PPL distinguishes between the following procedures for awarding public contracts:

- Open tendering
- Restricted tendering
- Negotiated procedure with publication
- Negotiated procedure without publication
- Single-source procurement
- Request-for-quotations
- Electronic bidding

Procedures start with the publication of a contract notice that (depending on the value of the contract) is placed in the Public Procurement Bulletin and/or dispatched to the Publications Office of the European Union for the publication in the Official Journal of the European Union.

The dispatch of a notice to the latter is obligatory if the contract or design contest value exceeds the amounts indicated in the Regulation of the Prime Minister of 23 December 2013¹⁸¹⁹ on the threshold

¹⁸¹⁶ Website of the Main School of Fire Service.

¹⁸¹⁷ Website of the National Civil Defence, in Polish, <http://www.ock.gov.pl/>.

¹⁸¹⁸ Website of the Public Procurement Office, Act on Public Procurement, unofficial translation into English, 92 pp., ftp://ftp.uzp.gov.pl/publikacje/2008_public_procurement_law.pdf.

value of contracts and design contests which imposes an obligation of dispatching the notices to the EU Publications Office.¹⁸²⁰

As the regulation mentioned above, contract notices are submitted to the EU Publications Office, if the value of contracts awarded by public finance sector awarding entities is equal to or exceeds PLN equivalent of EUR 134 000 – for supplies or services and EUR 5 186 000 – for works.

Related thresholds are:

- for contracts awarded by other awarding entities: 207 000 Euro – for supplies or services; and 5 186 000 Euro – for works;
- in case of utilities contracts 414 000 Euro – for supplies or services; and 5 186 000 Euro – for works;
- in case of defence and security contracts 414 000 Euro – for supplies or services; and 5 186 000 Euro – for works;

As the PPL apply to contracts and contests above the EUR 30 000 the notices in the Public Procurement Bulletin include contracts equal or above 30 000 and below the European threshold.

As regards crisis management, public procurement notices are also published at the website of the State Fire Service and relevant authorities; the Centralised System for Access to Public Information (<http://ssdip.bip.gov.pl/search/publiccontracts/>).

Chapter 4a of the PPL stipulates separate provisions for contracts in the field of defence and security, which involve “1) deliveries of military equipment, including all the parts, components and subassemblies; 2) deliveries of sensitive equipment, including all parts, components and subassemblies; 3) works, supplies and services directly connected with the equipment mentioned in point 1 and 2, and all its components and subassemblies connected with life-cycle of this product; 4) works and services for special military purposes or sensitive works and services.”¹⁸²¹

5.4.2 Procurement procedures

A total of 302 contract notices has been published by the State Fire Service (HQ and Regional HQs) in the period 2009-2014, covering a wide range of items – from vocational trainings and software to vehicles and specialised equipment.

PORTUGAL

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: ATOS (Diego Alexander Chanto García, Darío Ruíz, Alejandro Afonso Spinola)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by ECORYS and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

In Portugal, civil protection is an activity developed by the Government, the autonomous regions, local authorities, the citizens and all the public entities which main goals are to avoid accidents or disasters and protect and rescue people.

Civil protection activity is permanent, multidisciplinary and multisector, fitting to all agencies and departments of the Public Administration to promote the necessary conditions for its implementation in a decentralized manner, without prejudice to mutual support between organizations and the same level entities or through higher levels.

The National System of Civil Protection (Sistema Nacional de Protecção Civil, SNPC) was created in 1975, and the structure and the duties were established under the Decreto-Lei 510/80 (Decree-Law 510/80) on October 25, 1975.

The civil protection structure is organised at the national, regional and municipal levels.

In 2005 the Government decided to create a new firefighters department specialized in fighting forest fires. Two years later, in 2007, the Special Force Canarinhos Fire was created under the Artigo 19º do Decreto-Lei n.º 247/2007 (Article 19 of Decree-Law No. 247) of 27 June 2007. The Special Force Canarinhos Fire (Força Especial de Bombeiros Canarinhos, FEBC) is a particular branch of civil protection, organized and integrated into the operation device of the National Civil Protection Authority.

National crisis management & disaster response concept:

The entire civil protection system integrates the National Authority for Civil Protection (ANPC), the Regional Services for Civil Protection in the Azores and Madeira (SRPC), the District Commands for Relief Operations (CDOS, one in each district) and the Municipal Civil Protection Services (SMPC, one in each municipality).

The heads of the administrative civil protection units (district commanders) are nominated by the National Authority for Civil Protection.

The responsibility for the civil protection policy lies with the Government, which shall introduce, in the respective programme, the main orientations to be adapted or proposed in this field of intervention. The Prime Minister and the Ministry of the Interior are therefore responsible for directing the civil protection policy at national level.

At regional/district level, there are District Civil Protection Commissions (responsible for the political coordination and policy advice to the civil governor) and District Coordination Centres (operational coordination).

In each district there is also a District Command for Relief Operations, a branch of the Portuguese Civil Protection Authority. In the autonomous regions of the Azores and Madeira there are Regional Civil Protection Services, depending on the regional government.

The civil governors of each of the 18 districts in the mainland and the presidents of the Azores and Madeira autonomous regions, in the exercise of their function as the responsible entity for the civil protection policy in each district, are responsible for activating, during the occurrence of a serious accident or catastrophe, the adequate civil protection actions aimed at prevention, aid, assistance and rehabilitation for each case.

At local level, there are Local Civil Protection Services depending on the mayor. Political and operational coordination is assured by the municipal civil protection organisations. The mayor, in the exercise of his functions as the responsible entity of the civil protection policy in the municipality, is responsible for activating, during the occurrence of a serious accident or catastrophe, the adequate civil protection actions aimed at prevention, aid, assistance and rehabilitation for each case.

Soon after a major disaster cannot be solved either by the means assigned to the municipality or to the district, where the disaster takes place, the ANPC activates the National Coordination Centre to coordinate and control the relief operations and logistics support at national level.

A National Command for Relief Operations operates 24 hours a day in the ANPC to control and manage the current situation.

Inter-ministerial coordination is integrated by the National Civil Protection Commission (CNPC), an advisory board that assures coordination between different ministries and organisations and provides policy advice to the Government.

Inter-agency coordination is ensured by the National Coordination Centre (CCON). CCON is the coordination body of the Integrated System for Relief and Protection Operations (SIOPS). SIOPS is a set of rules and procedures, which guarantee that civil protection agents act, at the operational level, in a coordinated way and under a unique command.

Operational organisations act under civil protection command according to the rules of the SIOPS. Decisions are made by the National Coordination Centre.

According to the nature of the disaster, specific organisations may be called to act under civil protection authority (e.g. the Water Institute, the Forest Services, etc.).

In terms of civil protection, Portugal has bilateral agreements with Cape Verde, France, Morocco, Russia and Spain.

Key stakeholders: ANPC, CCON, CDOS, FEB, SIOPS, SMPC, SNPC, SRPC.

On the one hand, as volunteers, the Portuguese Red Cross exercises, in cooperation with the additional agencies and in harmony with its proper statutes, civil protection functions in the domains of intervention, support, aid, sanitary and social assistance and Humanitarian associations of voluntary fire-fighters are the main organisations.

On the other hand the National Association of Portuguese Municipalities, the National Fire School and the Portuguese Fire League are the main private actors.

Niche crisis management capabilities of interest to the EU and other MSs:

SIRESP: Sistema Integrado das Redes de Emergência e Segurança de Portugal (<http://siresp.com/>) security and emergency network of Portugal.

1 Policy

1.1 Risk Assessment

Portugal is vulnerable to various types of natural risks. The erosion of the Portuguese coastline has worsened over the last century, placing people and properties at risk, as well as natural heritage. In the centre and north of the country, the main areas at risk of coastal erosion are located between the mouth of the River Douro and Nazaré, the Espinho-Ovar and Aveiro–Areão stretches standing out in particular, as well as that from Caminha to the mouth of the Douro. In the south of the country, of note is the stretch between Vilamoura and the mouth of the River Guadiana, where the cliffs have receded and sea breaches have been verified.

Around the 35% of continental Portugal is at risk of desertification. The most susceptible areas are located in the Alentejo, the Algarve coast, Vale do Douro, Trás-os-Montes and the Raia area in Beira Baixa.

Flooding also constitutes a natural risk deserving of attention.

Drought situations are frequent in continental Portugal, temporary natural phenomena that are distinguished from other catastrophes as they occur more imperceptibly, their advance is verified more slowly, they last for longer periods of time, can extend over far larger surface areas and recovery from them is much slower, at times causing significant socioeconomic impacts, particularly on agriculture and cattle farming and, also, on energy production.

Wildfires represent the greatest risk to Portugal's forests and they have led to a high number of personal accidents and significant economic losses. The area affected by wildfires in Portugal every year has been larger than the forest area and this has been an important contributing factor to desertification.

Portugal, in the context of plate tectonics, is located between the Eurasian and African plates. The great historical earthquakes had their epicentres located in the crash Azores-Gibraltar with an approximate magnitude of 8.75. Tsunamis are produced as a consequence of earthquakes. The greatest tsunami registered was produced by the Azores-Gibraltar earthquake and it had a height of 15 meters.

In other words, in Portugal, key risk areas of concern are; Floods, forest fires, tsunamis, earthquakes (the Azores are subject to severe earthquakes), heat waves and storms.

The resolution of the Council Cabinet 87/2013 of 11 December published the approval of the National Civil Protection Emergency Plan (PNEPC). This Plan is a support to the civil protection operations instrument in case of imminence or occurrence of a major accident or disaster in continental Portugal, with a view to enabling the drive direction of the actions to develop the technical and operational coordination of the means to commit and the adequacy of exceptional measures to be adopted.

The PNEPC was created in order to control a series of natural or technological risks that can take place in continental Portugal such as adverse weather conditions, hydrological and geological risks, transport accidents, industrial activity and urban areas and fires in rural or forest areas.

The PNEPC can guarantee all the conditions for improving the efficiency and effectiveness of the civil protection agents and services and contributes to increase the resilience in every phase of the emergency cycle.

The emergency plans are made depending on the guideline issued by the National Commission for Civil Protection (CNPC), in particular:

- Hazards classification.
- Precautionary measures that must to be taken.
- Identifying the ways and resources deployed in a disaster situation.
- The operative structure that must guarantee how to take a permanent control of the situation.
- The definition of the responsibilities that involve the public or private organisations and structures with experience in the civil protection area.

In function of the specific surface, the emergency plans could be national, regional, district or municipal and depending on its purpose they could be general or specific emergency plans.

The most important disasters in Portugal in the last 25 years are listed below:

Year	Disasters
2010	Floods, Madeira, 42 deaths, 100 injured, disruption of water supply systems
2006	Extreme temperature, 41 dead
2005	Wildfire, 15 dead
2004	Wildfire, 2 dead
2003	Wildfire, 14 dead
2003	Extreme temperatures, 2696 dead in August, 41 dead in July
2001	Floods, 6 dead
2000	Storm, 4 dead
1998	Earthquake in Azores, 8 dead, 110 injured, 1600 homeless, 500 destroyed houses, damage estimated at EUR 60 million
1997	Floods and mudslides in the Azores; 29 dead, 60 homeless, damage estimated at EUR 15 million
1997	Floods in Lisbon, Algarve and Alentejo; 11 dead, 44 injured, 300 homeless, 95 collapsed/destroyed buildings, destruction of agriculture assets and crops
1995-1996	Floods in the districts of Porto, Aveiro, Coimbra, Viseu, Satarém and Lisbon; 12 dead, 1,340 homeless; damage estimated at EUR 80 million
1995	Forest fires in the north/central region, 170,000 hectares destroyed
1992	Aircraft crash at Faro Airport; 58 dead, 238 injured

1991	Forest fires north of Tejo, 182,000 hectares destroyed
1991	Aircraft crash at Funchal; 86 injured
1991	Aircraft crash at Funchal airport; 6 dead
1990	Forest fires north of Tejo, 137,000 hectares destroyed
1990	Oil slick from the Cypriot tanker Ogennitor in the harbour of Sines, 500 km ² polluted by oil

Table 8: Major disasters in Portugal¹⁸²³

1.2 Policy and Governance

The National Strategic Reference Framework (NSRF) describes in a specific section how important the prevention, management and monitoring of natural risks are. Portugal's vulnerability to diverse types of natural risks, with particular mention for coastal erosion, whose worsening represents a very worrying situation, placing both people and property at risk and natural heritage, is one of the intervention priorities in this field. Desertification, which affects a considerable percentage of the continental territory, as well as flooding, also constitute natural risks that deserve attention within the framework of the programming of the structural interventions. Also a priority for this type of intervention is the prevention of wildfires and the risks to public health.

Furthermore, it should be stressed that the existence of a comprehensive and integrated system of prevention, warning and management of natural and technological risks and the repair of the damage associated with them constitutes one of the essential aspects of territorial enhancement and a priority for territorial planning and sustainable development policy.

The Civil Protection structure is organized in four levels:

- National
- Regional
- District
- Municipal

The conduct of civil protection policy is the responsibility of Government, which, in the respective program, must create the main guidelines to adapt or to propose that domain. The Prime Minister is the manager of civil protection policy.

The responsible for civil protection of the government, in co-operation with the District Operational Commander and the civil protection agents must resolve any problem in a serious accident or catastrophe case. They should know how to act in every different situation such as:

- Civil protection prevention
- Rescue, assistance of people and appropriate rehabilitation of buildings or historical monuments.

The mayor of the town hall is the responsible for activating the civil protection policies in the imminence or occurrence of a major accident or disaster, civil protection prevention, rescuing and assisting people and the appropriate recovery in each case.

¹⁸²³ Major disasters in Portugal. Accessed January 26, 2016
http://ec.europa.eu/echo/files/civil_protection/vademecum/pt/2-pt-6.html/

1.2.1 Strategy scope and focus

The civil protection task is to prevent collective risks and the occurrence of serious accidents or resulting disasters; to attenuate collective risks and to limit their effect; to rescue and to assist people and other living beings in danger; to protect cultural and environmental assets and other assets of high public interest; and to support the reestablishment of normality in the life of people living in the areas affected by serious accidents or disasters.

The CNPC is chaired by Minister for Internal Affairs and is composed of:

- Delegates of Justice, Environment, Economy, Agriculture and Forestry, Transport, Communication, Social Security, Health and Scientific Research Ministries;
- The President of the National Authority of Civil Protection;
- Fire Portuguese league and the National Association of Professional Firefighters.

Representatives of the Armed Forces, the National Republican Guard, Public Security Police, the National Council for Civil Emergency Planning, the Office of Security, the Maritime Authority, the Aeronautical Authority and the national Institute of Medical Emergency also participate in this committee.

Emergency plans are approved by the CNPC, according to the advice issued by the National Civil Protection Authority (ANPC).

Civil protection planning is performed according to the guidelines laid down in Regulation 25/2008. This Regulation defines that emergency plans at national, regional, district and municipality levels are mandatory. These plans follow an all-hazard approach.

By ensuring the necessary activities and means of prevention, warning and risk management and the repair of the damage associated with them, this system contributes to increasing the safety indices, thereby constituting a factor for economic and social development and cohesion with clearly positive effects in terms of competitiveness and quality of life.

The central functions of the system are to increase the country's ability to prevent and manage risks, centred generally on the following objectives:

- To guarantee the conditions, means and resources necessary and adequate for the centralized and permanent treatment of data and information relevant for the identification, evaluation, prevention, warning, management and correction of the diverse situations of vulnerability and risk;
- To ensure the conditions for the centralized and integrated programming and planning of the means and actions of prevention, warning, risk management and repair of associated damage;
- To make the rational and coordinated use of means, equipment and resources viable, ensuring the capacity to respond rapidly, efficiently and effectively, coherently and in integrated fashion and with recourse to innovative and technological means;
- To create conditions for the adequate protection of facilities of structural importance in situations of natural or technological risk;
- To promote the inter-communication and inter-operability of public and private means and entities involved in the prevention, warning, risk management and repair of associated damage, orienting their respective participation according to the speed and quality of reaction to risk situations;

- To valorise and include the adequate participation of civil society, bolstering its respective involvement from the perspective of a permanent approach to risk prevention and minimization of its respective effects.

1.2.2 Monitoring and analytical support to policy making; R&D

In Portugal, the Centre for Environmental and Marine Studies from the University of Aveiro is dedicated to R&D actions and also has a series of thematic lines such as:

- Marine Ecosystems and Resources;
- Environmental Biology and Health;
- Ecology and Functional Biodiversity;
- Integrated Environmental Systems.

Global warming may have severe consequences on the lives of people and it is very important to take care of the marine ecosystem to avoid and prevent severe risks. The Marine Ecosystems and Resources (MER) thematic line focuses on sustainable challenges in fisheries, aquaculture, and bio prospection and energy resources.

MER thematic line is based on multidisciplinary research, monitoring, advice, training, dissemination and outreach to underpin integrated assessment, management and governance of coast and ocean systems, deliver food security, preserve biodiversity, and maintain ecosystem services. It supports implementation of the European Water, Habitats and Marine Strategy Framework Directives and the revised Common Fisheries Policy in Portugal, promoting sustainable regional development. Its main objectives are:

- Technology for coastal and ocean observation: It develops environmental observation and information systems actions. It owns innovative coast and ocean observations systems for acquisition of chemical, geological, oceanographic, biological and ecological data.
- Training, dissemination and outreach: Improving societal awareness and skills; providing knowledge and tools for effective decision making and public engagement in the protection and sustainable use of marine resources; promoting synergies between academia and industry; developing advanced training.¹⁸²⁴

The Environmental Biology and Health (EBH) thematic line emerges from the need to give a special attention to the link between ecosystems and human well-being, which is seen as the main target of managing the socio-economic systems. The EBH centres its activity in environmental sustainability; the development of biological indicators that contribute the development of environmental instruments; human health risk assessment identifying some of the contaminants and pathogens that have emerged in recent years and anticipate situations that endanger human health; ecosystem services and human well-being, improving the knowledge of ecosystems and their services. Its main objectives are:

- *To provide ecological risk assessment, by evaluating the probabilities and magnitudes of harm that might come from environmental contaminants, including emergent contaminants of concern, and emergent pathogens;*

¹⁸²⁴MER thematic line of the Centre for Environmental and Marine Studies. Accessed February 12, 2016 <http://www.cesam.ua.pt/index.php?menu=76&language=eng&tabela=geral>

- *To access the flows and benefits driven from ecosystem services at present and in possible future scenarios, regarding social, economic and environmental issues as inseparable and interdependent components of human progress and human well-being;*
- *To support new risk assessment guidelines foreseeing environmental and public health protection;*
- *To promote technical and advance training courses;*
- *To promote outreach activities, including disseminating to students from schools, encouraging and motivating them to pursue careers in science; To engage citizens enhancing academics-stakeholders interactions; To strengthen international cooperation, namely with Portuguese speaking countries;*¹⁸²⁵

The Ecology and Functional Biodiversity (EFB) thematic line generates innovative solutions to the growing challenges associated with the environmental conservation, protection and sustainable use of terrestrial, freshwater and marine ecosystems.

The Integrated Environmental System (IES) thematic line aims to contribute to innovative products, services, models and processes that can benefit the environment by preventing and reducing present and future anthropogenic pressures on natural resources. Regarding risk and climate change adaptation, Portugal is the more vulnerable European country, according to all known studies and scenarios. The main risks include natural and anthropogenic phenomena, such as emission and transport of emerging pollutants, desertification, soil erosion, salinization of soils and decline organic matter, coastal erosion, floods, landslides, droughts, wildfires and hazards. Taking into account the existing strategic and operational instruments, as well as the identified needs, IES research will aim at increasing the knowledge about the risks affecting the country, through assessment of vulnerabilities, monitoring and modelling, and at contributing to national, regional and local policies on risk management, through planning from a perspective of resilience and adaptation.¹⁸²⁶

On the other hand, the Interdisciplinary Centre of Marine Environmental Research (CIIMAR) also is a research and advanced training institution hosted by the University of Porto. Its mission is to develop exceptional-quality research, promote technological development and support public policies in the area of Marine and Environmental Sciences. CIIMAR is focused in three research line that may be represented in figure 1:

¹⁸²⁵ IES thematic line, from the Centre for Environmental and Marine Studies. Accessed February 12, 2016 <http://www.cesam.ua.pt/index.php?menu=73&language=eng&tabela=geral>

¹⁸²⁶ EBH thematic line objectives, from the Centre for Environmental and Marine Studies. Accessed February 12, 2016 <http://www.cesam.ua.pt/index.php?menu=75&language=eng&tabela=geral>

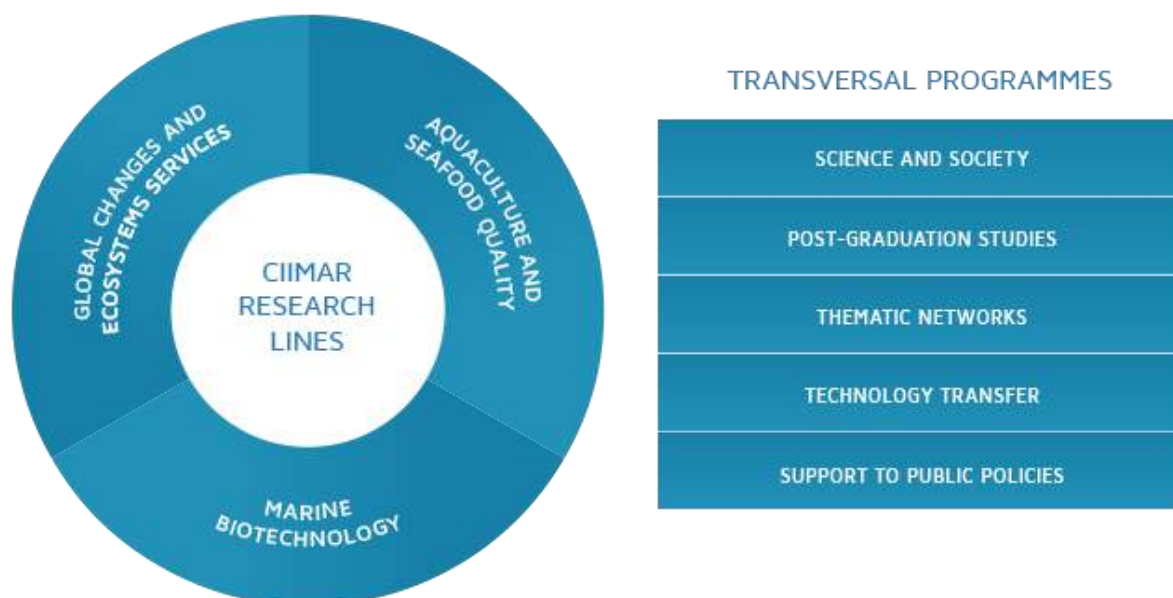

Figure 8: Research lines and transversal programmes of CIIMAR¹⁸²⁷

One of the main areas of research is the Global Changes and Ecosystems Services. More than one third of the world's population lives in coastal areas and depends on the resources and services provided by the aquatic ecosystems. The objective of this Thematic Line is to contribute to develop basic knowledge and tools to support the protection and management of marine, estuarine and freshwater ecosystems and inter-related compartments for the sustainable exploitation of their resources, fostering at the same time the emergence and production of valuable goods and services. It is organized into 15 Research Groups that develop work on the following areas: Establishment of an ocean observatory system that will improve the detection of physical changes in the ocean and improve the accuracy of future predictions and early warning systems, expanding risk assessment capabilities and the development of tools and strategies to address global climate change issues; Unravelling marine biodiversity, ecosystem function and management; biogeochemical cycles; Environmental risk assessment; Sustainable exploitation of fisheries; Human impact in coastal, open and deep sea ecosystems; Mechanisms of toxicity of natural elements and man-made chemicals; Combined effects of multiple stressors such as natural and anthropogenic priority and emergent chemicals, ocean acidification and hypoxia.¹⁸²⁸

The Instituto Dom Luiz (Don Luiz Institute, DLI) has a series of research groups such as:

- Climatology and Climate Change which main objectives are:
 - To develop statistical models and predictability studies at the monthly-seasonal range in the Atlantic-European region;
 - To evaluate different types of weather driven natural hazards: floods, droughts, landslides and heat waves;
 - To assess the impact of volcanoes, solar storms and variability on the Earth's magnetic field and climate.
- Coastal hazard and Warning Systems: Coastal Hazards are an important topic of research in the DLI, due to the impact of the large tsunamis in the southern

¹⁸²⁷ Research lines and transversal programmes of CIIMAR. Accessed February 12, 2016 http://www.ciimar.up.pt/images/research_grafico.png

¹⁸²⁸ Global Changes and Ecosystems Services of CIIMAR. Accessed February 12, 2016 <http://www.ciimar.up.pt/researchgroups.php?rl=global-changes-and-ecosystems-services>

Portuguese coasts and to the vulnerability of a major part of the territory to coastal hazards. This research group has a series of objectives:

- To establish the scientific basis for tsunami warning and mitigation;
- To develop innovative observational methods to quantify beach changes at different spatial and temporal scales;
- To develop strong cooperation with end users, namely civil protection, coastal management authorities, local authorities and other entities involved in coastal planning and management;
- Seismic and Volcanic Hazards: The researches of this group are focused in the Azores archipelago and other Macaronesian volcanic archipelagos such as Madeira, Cape Verde and Canary Islands located in oceanic intraplate domain. The main objectives are:
 - To constrain the seismic potential of active faults in the study regions and characterize their seismic cycle using modern techniques in Active Tectonics and Paleo seismology, for providing a complementary earthquake data set to complete the historical and instrumental earthquake catalogues using the geological information;
 - To search for evidences of past and of potential or nucleating collapses of volcanic edifices, as potential sources for major tsunamis, and search for evidences of correlative tsunamis and their characterization;
 - to predict ground motions due to strong earthquakes and the potential damage on built structures;

1.2.3 Policy for Prevention

In 2005 Portugal subscribed to the Hyogo Framework for Action and has taken concrete steps to integrate and streamline Disaster Risk Reduction (DRR) into national development strategies and legislation, recognizing the importance of DRR for the promotion of sustainable economic growth and progress.

The establishment of the Portuguese National Platform for Disaster Risk Reduction, in May 2010, was a key issue towards better coordination of prevention, preparedness, and response activities.

Paying attention to the Hyogo Framework for Action there are some rules named:

- *Each State has the primary responsibility to prevent and reduce disaster risk, including through international, regional, sub regional, transboundary and bilateral cooperation.*
- *Disaster risk reduction requires that responsibilities have to be shared by central Governments and relevant national authorities, sectors and stakeholders, as appropriate to their national circumstances and systems of governance;*
- *Disaster risk reduction requires an all-of-society engagement and partnership. It also requires empowerment and inclusive, accessible and non-discriminatory participation, paying special attention to people disproportionately affected by disasters, especially the poorest. A gender, age, disability and cultural perspective should be integrated in all policies and practices, and women and youth leadership should be promoted. In this context, special attention should be paid to the improvement of organized voluntary work of citizens;*

- *While the enabling, guiding and coordinating role of national and federal State Governments remain essential, it is necessary to empower local authorities and local communities to reduce disaster risk, including through resources, incentives and decision-making responsibilities, as appropriate;*
- *Disaster risk reduction requires a multi-hazard approach and inclusive risk-informed decision-making based on the open exchange and dissemination of disaggregated data, including by sex, age and disability, as well as on easily accessible, up-to-date, comprehensible, science-based, non-sensitive risk information, complemented by traditional knowledge;*
- *While the drivers of disaster risk may be local, national, regional or global in scope, disaster risks have local and specific characteristics that must be understood for the determination of measures to reduce disaster risk;¹⁸²⁹*

In Portugal another policy to reduce disaster risks is the improvement of the critical infrastructures. Critical infrastructures have been increasing exponentially because they play key roles for the economy and security of the countries, particularly the most developed. Their prolonged downtime may cause tremendous losses to the economy due to the shutdown of the strategic activities and may jeopardize the response capacity of States.

The protection of critical infrastructures won legal support in Portugal when, on May 9, 2011, the Decree-Law 62/2011 was published. The Decree-law establishes the procedures for the identification and protection of critical infrastructures for health, safety and well-being of society in energy and transport in case of natural disaster or catastrophe, according to Directive No. 2008/114 /CE of the Council of 8 December.

The protection of critical infrastructures began in 2004, simultaneously with the first initiatives in the European Union with a view to build a strategy and an action plan for protecting and increasing the resilience of critical infrastructures.

1.2.4 Policy for Preparedness

Paying attention to the section 1.2.3, in May 2010, Portugal established the Portuguese National Platform for Disaster Risk reduction, aimed to have a better coordination of prevention, preparedness and response activities.

Government also has to emphasize the importance of disaster preparedness and building back better after a disaster strikes. Good preparedness involves all groups of society male or female, old and young.

Portugal also follows a series of common tips to be prepared in a risk situation or catastrophe according to the Sendai Framework for Disaster Risk Reduction (SFDRR).

The steady growth of disaster risk, including the increase of people and assets exposure, combined with the lessons learned from past disasters, indicates the need to further strengthen disaster preparedness for response, take action in anticipation of events, integrate disaster risk reduction in response preparedness and ensure that capacities are in place for effective response and recovery at all levels.

¹⁸²⁹ The Hyogo Framework for Action. Page number 6. Accessed January 26, 2016 <http://www.unisdr.org/2005/wcdr/intergover/official-doc/L-docs/Hyogo-framework-for-action-english.pdf/>

1.2.5 Policy for Response

As a policy for response the Integrated System of Protection and Rescue Operations (SIOPS) is the set of structures, standards and procedures which ensure that all the civil protection agents and the entities with special duty of cooperation operate, at operational level, articulately under one command without prejudice to the respective hierarchical and functional dependence. The SIOPS is regulated in specific legislation.

SIOPS aims to respond to situations of imminent or serious accident or disaster.

According to the Article 26 in the Decree 134/2006 on July 25, 2006 SIOPS must provide an operational response device with permanent intervention teams intended for priority intervention in relief missions.

SIOPS Institutional coordination is assured at the national and district levels by the so called Operational Coordination Centres (Portuguese acronym CCO). The CCO is integrated by representatives from the entities which intervention is justified in accordance with each concrete occurrence.

CCO's are responsible for the management of the operational participation of each force or service in the rescue operations.

The CCO main objectives are:

- To ensure coordination of resources and logistical support for relief operations and to provide assistance in emergency cases;
- To collect relevant strategic information for protection and rescue missions;
- To inform continuously the political authority of all relevant facts that could lead to bottlenecks in operational responses in emergency cases;
- To guarantee the management and monitoring of every case of emergency and to guarantee an appropriate response under the Integrated System of Protection and Rescue Operations.

1.2.6 Policy for Relief and Recovery

In Portugal, in each district, there is also a District Command for Relief Operations, a branch of the Portuguese Civil Protection Authority. In the autonomous regions of the Azores and Madeira there are Regional Civil Protection Services, depending on the regional government.

Soon after a major disaster cannot be solved either by the means assigned to the municipality or to the district, where the disaster takes place, the ANPC activates the National Coordination Centre to coordinate and control the relief operations and logistics support at national level.

A National Command for Relief Operations operates 24 hours a day in the ANPC to control and manage the current situation.

Inter-agency coordination is ensured by the National Coordination Centre (CCON). CCON is the coordination body of the SIOPS - a set of rules and procedures, which guarantee that civil protection agents act, at the operational level, in a coordinated way and under a unique command.

The ANPC shall perform the following tasks within the area of protection and relief operations:

- To guarantee the organic and territorial continuity of the relief operation command system;
- To monitor all protection and relief operations at local and autonomous regional levels, and to foresee the need for the intervention of means at district or national level;

- To plan and guarantee the use, under the law, of private or public means available to deal with situations of serious accidents or disasters;
- To ensure the horizontal coordination of all civil protection actors and other structures and public services playing a protection-and-relief-related role.

In Portugal there is a National Command for Relief Operations, CNOS for short, which is headed by the national operational commander, assisted by the 2nd national operational commander and by three national operation deputies.

The CNOS comprises the planning, operations and information cells, the logistics cell, the air resources cell and the communications cell.

Powers granted to CNOS and to cells referred to in the preceding paragraph are provided for in the scope of the SIOPS, approved by Decree-Law No 134/2006, of 25 July.

At a district level each district shall be provided with a District Command for Relief Operations, CDOS for short, headed by a district operational commander, assisted by the 2nd district operational commander.

By order of the member of the Government in charge of the Internal Administration area, taking into account the needs arising from natural, technological and human activity risks, the CDOS may be joined by a district operation deputy.

Powers granted to CDOS are provided for in the scope of the SIOPS, approved by Decree-Law No 134/2006, of 25 July.

CDOS shall also ensure a permanent operational articulation with the municipal operational commander.

1.3 Financing

Portugal does report its funding decisions to the Office for the Coordination of Humanitarian Affairs (OCHA) Financial Tracking System (FTS). The annual (consolidated) Portuguese humanitarian budget is not transparently available in any form, during the budget year, even within the Portuguese Institute to Support the Development (IPAD), which further hinders accountability and transparency.

1.3.1 Investing in preparedness

Currently about 15% of Portugal's aid budget is channelled through IPAD, which prevents IPAD from acting as a single point of financial oversight. Financial transfers take place between Lisbon line ministries and partner countries' ministries, and thus embassies are not involved in deciding or arranging disbursements.

Portuguese crisis management and civil protection is changing rapidly and this influences the procedures for investing in preparedness. In Portugal, each of the 18 districts combining the efforts of the fire brigade, police, public health institutions and the National Authority of Civil Protection (ANPC), are mainly responsible for the operational mitigation of a crisis.

The last year the ANPC spent EUR 74.257.786 on combating forest fires which represents a 10.3 percent more than in 2011, according to data from the ANPC.

Portugal has subscribed to the Hyogo Framework for Action (HFA) in 2005 and has, since then, taken concrete steps to integrate and streamline disaster risk reduction in its national development strategies. Furthermore, recognizing the importance of disaster risk reduction for the promotion of

sustainable economic growth and progress, Portugal has sought to include Disaster Risk Reduction (DRR) concerns in its development and humanitarian aid policies, in particular in the bilateral cooperation maintained in this regard with African Portuguese speaking countries.

The competent ministries and agencies will execute their activities using their budget. The public administration dedicates part of its budget investing in Disaster Risk Reduction (DRR) for resilience that includes public and private investment to prevent and reduce losses, for example ensuring the safety of critical facilities such as hospitals, power plants, roads and schools.

Infrastructure investment boosts economic growth beyond its direct impact on the stock of capital. Better infrastructure, particularly in transport, can facilitate and enhance the division of labour, encourage the adoption of new organisational practices, and also improve the operating methods of civil protection bodies in case of emergency.

Government also has to emphasize the importance of disaster preparedness and building back better after a disaster strikes. Good preparedness involves all groups of society male or female, old and young.

The HFA provides 7 targets to reduce disaster risk. There are 4 targets to reduce disaster losses.

- To reduce global disaster mortality by 2030. Over 700 000 people around the world lost their life from disasters between 2005 and 2015;
- To reduce the number of people affected globally by 2030. In the last 10 years almost 1.4 million people were injured and over 24 million have been made homeless;
- To reduce direct disaster economic lost in relation to GDP. 1 EUR invested in resilience can save 7 EUR or more in response and recovery costs;
- To reduce damaged infrastructures.

The HFA also sets target for increasing the number of countries with reduction risk reduction strategies, increasing the international cooperation to developing countries and substantially increasing public access to early warning systems.

1.3.2 Investing in consequence management

Information on this subject could not be found.

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

The Post-Disaster Needs Assessments (PDNAs) conducted under the leadership of affected country governments are the most important tasks of the Standby Recovery Financing Facility (SRFF). The flagship products of SRFF are the reports that these assessments generate. These are reports of the respective governments prepared with the assistance of GFDRR and the international community at large. They are increasingly being used by governments and the international development community to base the recovery and reconstruction plans and programs upon. They are also as the base document for discussions to determine international development assistance in cases requiring

external assistance including leveraging of targeted or additional assistance from the World Bank and other traditional donors.

After a series of natural disaster in Portugal, a comprehensive national assessment on natural and man-made risks was established by the National Emergency Plan. An important project on seismic risk at Lisbon was carried out by an interdisciplinary team covering:

- *Historical seismicity;*
- *Seism tectonic environment;*
- *Building stock;*
- *Population's dynamic;*
- *Damage simulations;*
- *Emergency management;*
- *Prevention measures.*

Detection and early warning systems for adverse weather conditions and forest fires have been developed so far.

The Water Institute (INAG) has developed a very effective Detection and Warning System for Floods whose main objective is to provide real time hydrometric data 24 hours a day on the watershed of the Portuguese big rivers.

An extensive population awareness and information campaign has been in force since 1992 through the dissemination of around 50 million leaflets containing security procedures and self-protective measures upon earthquakes, floods, storms, domestic and forest fire, saving water resources, using domestic gas, etc.

*Frequent training and exercises for authorities, civil protection agents, response units and vulnerable groups of population have been met at national, district and municipal level.*¹⁸³⁰

1.4.2 Departmental Lessons Learned systems

According to the Organisation for Economic Co-operation and Development (OECD),

A lack of resources has meant that Portugal's humanitarian programmes are not systematically monitored or evaluated, and Portugal has not yet participated in joint evaluations of multilateral partners. Instead, Portugal relies on narrative reports and audited accounts from its NGO partners, and accepts global reports from multilateral organisations. However, lesson learning exercises are conducted when civil protection teams return from the field. Sharing these lessons with other partners/donors could help promote mutual learning, and would comply with the Good Humanitarian Donorship (GHD) principles to support learning and accountability initiatives. An overall programme evaluation of Civil Protection's emergency deployments would also be useful, especially if Portugal continues to use this mechanism as its primary humanitarian aid instrument.

1.4.3 Centralised (national) Lessons Learned system

Information on this subject could not be found.

¹⁸³⁰ Portugal: end of IDNDR assessment report,
http://www.preventionweb.net/files/32520_endidndrassessmentportugal.pdf

1.4.4 Regular policy reviews

Information on this subject could not be found.

1.5 Resilience

In Portugal, particularly Lisbon has joined the 100 Resilient Cities Challenge, an initiative of the United Nations Organization which seeks to find 100 cities that are ready to build resilience to the social, economic, and physical challenges that cities face in an increasingly urbanized world.

According to the 100 Resilient Cities Challenge disruptions or catastrophes cannot be exactly predicted. But countries can control how they respond to those challenges. Some of the resilience challenges that Lisbon is facing are:

- Aging infrastructure;
- Declining or aging population;
- Earthquake;
- Flooding (Coastal and Rainfall);
- Landslide;
- Rising sea level and costal erosion.

The main objectives of this challenge are:

- Strengthen and support the local level in the risk management process;
- Encourage the local level to implement measures to reduce the vulnerability of the territory;
- Include the risk reduction factor in the planning process;
- Raise the awareness of citizens and governments in terms of reducing urban risks.

Apart from Lisbon, Amadora, Cascais, Funchal, Lisboa, Odivelas, Setúbal e Torres Vedras are also involve in this challenge.

Some good practices on Disaster Risk Reduction and Resilience may be:

- The use of the Information and Awareness Program for Disaster Risk Reduction in the Municipality of Amadora;
- To use management tools of prevention and planning such as:
 - Municipal Emergency Plans;
 - Early Intervention Plan;
- Use a contingency plan for heat waves and cold weather to reduce in most of the cases forest fires;
- Use of social networks (Facebook and YouTube for example)to reduce risks at local level;

1.6 Information sharing and data protection

In Portugal, the IPAD has to collect data from all ministries throughout the year in order to consolidate figures on disbursement for its own use, for Portuguese embassies and indeed for its partners. Having a more effective and systematic way to collate forward and current financial information would help Portugal to increase predictability and transparency. In addition, Portugal's official representations in its partner countries are the embassies. As such, they need reliable financial information to enable them to exercise appropriate oversight and accountability. It is vital that Portugal addresses this problem both at the central and local level.

2 Legislation

2.1 Crisis (emergency, disaster) management concept

The technological, industrial and urban development provides a better life style but also produce a series of risks and disasters. In Portugal, according to Decree-Law 173/2004 Crisis Management, the National System of Crisis Management (SNGC) aims to organize the existing resources to support the Prime Minister in the decision making process within the government action of managing crisis situations.

The SNGC consists of:

- The Crisis Cabinet;
- A support group;
- Implementing agencies.

The SNGC has the mission of decision making in crisis management situations. The Crisis Cabinet is chaired by the Prime Minister and is structured as follows:

- Minister of National Defence;
- Minister of Foreign Affairs;
- Minister of the Interior;
- Minister of Justice;
- The chief of the Armed Forces;
- The National Director of the Judicial Police;
- Other entities or people designated by the Prime Minister when the situation requires them.

The support group includes:

- The entities that make up the National Council for committees of Civil Protection planning;
- Advisers and technical experts in crisis management.

Its main objectives are:

- Monitor the development of the situation;
- Use the information provided by the competent authorities;
- Prepares studies and proposals ordered by the Crisis Cabinet or on its own initiative, on matters related to crisis management;
- Advise on matters relating to the European Union systems, the NATO and other international systems of crisis response.

In crisis management the National Authority of Civil Protection is one of the principal organisms of action. The National Authority of Civil Protection plans are approved at the different levels: the state, known as national level, the districts (regional level) and the local authorities. The role of the national authority of civil protection is to verify the drawing up of the plans and the updating of them.

The operation management system is formed by different levels, such as strategic, tactic and manoeuvring levels.

The strategic level develops different tasks:

- The determination of a proper strategy of acting.
- The preparation and updating of the strategic plan acting.

- The forecasting and planning of results

The tactical level manages how to achieve the operative activities, depending on the situation and according to all the strategies defined.

In crisis management, the ANPC has to:

- Contribute to the definition of national emergency planning policies, draw up general guidelines, promote the preparation of studies and emergency plans and provide technical support and give advice on their preparation by sectoral organizations;
- Ensure coordination of public and private services which should perform missions related to emergency planning, particularly in the areas of transport, energy, agriculture, fisheries and food, industry and communications.

The manoeuvring level determinates how all this strategies that have been defined should be developed in any situation according to the objectives defined.

2.2 General crisis (emergency, disaster) management law

Having a look at the vademecum¹⁸³¹, the different crisis management laws are described as follows:

- *At national level, the most important laws and regulations for civil protection are:*
 - *The General Law for Civil Protection (Law 27/2006) which main objectives are:*
 - *Protect people in a natural or technological disaster situation;*
 - *Prevent and alleviate the collective risk situations;*
 - *Continuous analysis of vulnerabilities;*
 - *Inform the citizens in crisis situations;*
 - *Planning emergency solutions (the provision of relief, assistance and evacuation; accommodation and supply; etc.);*
 - *Elaborate an inventory of the available and the most easily deployable resources at a local, regional and national level.*¹⁸³²
 - *The Law Decree establishing the Integrated System for Relief and Protection Operations (SIOPS) (Law-Decree 134/2006) that is the group of structures, rules and procedures to ensure that all the agents act in the operational plan, under a single command, without prejudice to their hierarchical and functional dependence;*¹⁸³³
 - *The National Civil Protection Authority Law (Law-Decree 75/2007) establishes that the ANPC has as a mission planning; coordinate and execute a civil protection policy to prevent several accidents and catastrophes; and protect and rescue people.*
- *At Ministerial level*
 - *The General Law for Civil Protection (Law 27/2006)*
 - *The Law Decree establishing the Integrated System for Relief and Protection Operations (SIOPS) (Law Decree 134/2006).*
- *Inter-ministerial cross-cutting coordination*
 - *The General Law for Civil Protection (Law 27/2006).*
- *At regional level*

¹⁸³¹ The Vademecum on Civil Protection, Portuguese branch. Accessed January 26, 2016 http://ec.europa.eu/echo/files/civil_protection/vademecum/pt/2-pt.html/

- *The General Law for Civil Protection (Law 27/2006)*
- *The Law Decree establishing the Integrated System for Relief and Protection Operations (SIOPS) (Law Decree 134/2006).*
- *At local level*
 - *The Law defining the organisation of Civil Protection at local level (Law 65/2007).*
- *At international level*
 - *The General Law for Civil Protection (Law 27/2006).*¹⁸³⁴

2.3 Emergency rule

Crisis management is to solve a series of critical situations that arise suddenly or gradually. The critical situation that occurs slowly can be averted. According to the Environmental Hazard and Risk Assessment and Management (RISKAM) research group. There are some rules to follow:

- *To support and encourage efforts at national, regional and local level in order to prevent disaster, the readiness of those responsible for civil protection and rapid response in case of disaster;*
- *To contribute to public awareness in order to increase the level of self-protection of citizens;*
- *To establish a system for effective and rapid cooperation between national administrations for civil protection in case of mutual assistance is needed;*
- *To increase co-operation at the international level in the field of civil protection;*
- *To involve all organizational units and residents into crisis management tasks.*

Some of the rules related to monitoring, support and preparedness in emergency situations are:

- *Monitoring of situation in given system (i.e. a situation in an organizational unit in terms of comprehensive security);*
- *Support for detection of critical situations (evaluation methodology for data from monitoring);*
- *Preparedness to cope with critical situations, i.e. alternative scenarios based on national practices and development of implementation plans 248 (qualified plans are tackling feuds, confrontations and conflicts);*
- *Mastering the critical situation and start of recovery, i.e. the implementation of stabilization methods that are based on national habits (in each stage or nodal point, it is necessary to carry out risk assessments and evaluate their potential impacts, to ensure prevention of losses during response and recovery);*
- *Execution of reconstruction and triggering of other effective preventive measures to increase resiliency of organizational unit.*

Very important it is the co-ordination of all organizational units, which is the main task of public administration, the rules that have to be followed are:

- *Management and other employees of public administration and any other organizational unit should be aware that critical situations can affect the part that falls under their responsibility, and therefore, they need to be trained how to behave and what to do;*

¹⁸³⁴ The different crisis management laws. Accessed January 26, 2016
http://ec.europa.eu/echo/files/civil_protection/vademecum/pt/2-pt.html/

- *The emergency of critical situations cannot be excluded, and therefore, any management has to count with them;*
- *Managers of organizational units need to realize that in case of critical situations in the area, it is not about question whether any organizational unit will be pulled into critical situations, but how soon and how strongly;*
- *Organizational unit managers are forced to know that every critical situation escalates when confusion or loss of control in organizational units occurs even for only short period of time;*
- *In dealing with critical situations, the response focuses only on the priorities and it is forced to reckon with the fact that:*
 - *It does not have enough information that is most needed;*
 - *There are events beyond the responsibility of organizational units;*
 - *There is a loss of control, endangering of vital interests, intensive monitoring from the outside, panic, disruption of regular decision making processes, managers shift of interest to short-term planning, decision making and activities.*
- *During the critical situations it is necessary to perform tasks for maintaining peace, such as facts gathering, avoiding the conflicts, ensuring the evaluations from the right experts, considering the legal consequences, protection of professional image, protection of vital interests, etc.;*
- *General recommendations for communicating with the public need to be focused on obtaining the public support and avoiding the confusion, ensuring the necessary activities, providing the right instruction at the right time for disabled people on what to do;*
- *A critical situation can be effectively managed only if the organizational unit is prepared for the worst.*¹⁸³⁵

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

Crisis management is not only carried out within the state but also within each sophisticated organizational unit, municipality, organization and human being itself. Its main defined objective is the survival of people and creation of conditions that allow recovery and start of redevelopment.

Each organizational unit, in addition to goals that have been set up to reach its own objectives, must respect moral and ethical rules of society in place where it operates.

There are three levels of management:

- *Current management, strategic targeted safety management, which addresses security and sustainable development of an organizational unit understood as a system, i.e. for ensuring security and sustainable development of protected interests pursued by organizational unit. The main focus is on management of human activities and measures carried out by people, applied to that changes in given organizational unit caused by occurrence of adverse events;*
- *Emergency management, which is used in cases where serious problems occur and necessity exists to perform such activities and measures that would make loss, damage and harm to protected interests of the organizational units acceptable, when standard resources and forces of organizational unit are used;*

¹⁸³⁵ Emergency rules: Competent crisis plan for crisis management of municipalities and complex facilities. Accessed February 18, 2016 http://riskam.ul.pt/images/pdf/prochazkova_et_al_%202015.pdf

- *Crisis management, which is used in cases in which the organizational unit encountered a critical problem and it is necessary to perform activities and measures to limit loss, damage and harm to protected interests of the organizational units within and outside it to acceptable level;*¹⁸³⁶

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

In Portugal, in the National Authority of Civil Protection system, every administrative level (local, regional, central) needs to have in place a preparedness plan for its focus area. In respect to the local and regional plans, the central government sets minimum criteria for their drafting.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

According to Article 2 of Lei n.º 71/98 (Law 71/98) of 3 November, volunteering is the set of actions of social and community interest, carried out selflessly by people on projects, programs and other forms of assistance to the service of individuals, families and communities, developed under a non-profit concept by public or private entities.

In order for an activity to be considered as volunteering, 4 characteristics must be met:

- Solidarity and altruism – related to the beneficiaries of the benevolent activities
- Freedom – interpreted as the autonomy and good will in order to be part of such activities
- Free of charge – interpreted as the main difference between a working relationship and a volunteering relationship
- Organization – under which such activities are going to be performed within an overall program or project

Law does not cover any activity which main philosophy is different to a disinterested goal as a volunteering activity. In other words, volunteering is out of scope when involving activities with any kind of relationship with relatives, friends, or neighbours, since altruism may be missing from this type of relationship.

In Portugal, volunteerism can be defined as a set of public interest activities carried out without an economic interest by individuals, within the framework of projects or programmes developed with a non-profit purpose by public entities, private organisations, or NGOs for the benefit of needy individuals, families or communities¹⁸³⁷. Starting from this definition, a legal framework has been established.

In addition to Section 2.2, there are also a series of regulations related to volunteerism:

- “Lei n.º 71/98 de 3 de Novembro , establishing the basic legal framework of volunteerism in Portugal” 1998. This is by far the most relevant law or regulation regarding volunteerism nowadays;

¹⁸³⁶ Competent crisis plan for crisis management of municipalities and complex facilities. Accessed February 18, 2016 http://riskam.ul.pt/images/pdf/prochazkova_et_al_%202015.pdf

¹⁸³⁷ Study on Volunteering in the European Union. Country Report Portugal. 2011

- “Regulamento do Programa Jovens Voluntários para a solidariedade nº745- G/96 de 18 de Dezembro” 1996;
- “Regulamento do Programa Lusíadas nº745 - H/96 de 18 Dezembro” 1996;
- Decreto-Lei n.º 40/89, de 12 de Fevereiro - Institutes the voluntary social insurance, a facultative regimen in the scope of the Social Security;
- “Decreto-Lei n.º 389/99 de 30 de Setembro , of the Ministry of Labour and Solidarity, developing the contents of the latter framework Law —Lei n.º 71/98” 1999;
- Resolução de Conselho de Ministros n.º 50/2000 (publicada no D.R., II série, n.º94, de 20 de Abril). This resolution defines the composition and the functioning of the National Council for the Promotion of Volunteering;
- Portaria n.º 87/2006, de 24 de Janeiro - Approves the Identification Card of the Volunteer.

Volunteering laws in Portugal also covers the volunteers’ rights, such as: issuing volunteer identification cards, insurance, and a program through which the voluntary activity is explained as a form of contract with the related organisations¹⁸³⁸.

2.7 Legal regulations for international engagements of first responders and crisis managers

The bilateral cooperation is based primarily on an agreement between two countries, which seek to regulate various aspects related to the joint development of the Civil Protection activities in various areas, such as:

- Training exchange;
- Exchange of experts;
- Holding meetings and information exchange of technical and scientific concepts
- Procedures for requesting and provision of mutual assistance in emergency situations, such as financial matters, border crossing, communications and contact points.

Portugal has bilateral agreements with Cape Verde, France, Morocco, Russia and Spain.

Bilateral agreement between Portugal and Cape Verde

Aid is still an important component of Cape Verde’s economy. Portugal is one of the biggest donors of Cape Verde. Cape Verde participated in the Budget Support Group (BSG). Portugal was the chair of the group in 2010.

Portugal has a long-standing relationship with the Government of Cape Verde and with the Cape Verdean people, both through its colonial occupation. In 2007 Portugal made a commitment to lend Cape Verde over USD 200 million. This can be drawn down as individual loans for specific projects.

Portugal has established conceptual and practical links between aid and non-aid activities in Cape Verde. While this means Portugal has to pay close attention to what it reports as Official

¹⁸³⁸ The Portuguese nonprofit sector in comparative perspective. Campos F., Raquel, et al. Universidade Catolica Portuguesa and Johns Hopkins University. 2005

Development Assistance (ODA) and ensure that ODA-related activities are directly focused on development and poverty reduction for example.

Bilateral agreement between Portugal and Spain

Relations with Spain are based on the protocol between the Kingdom of Spain and the Portuguese Republic of Mutual Technical Cooperation and Assistance of 9 March of 1992. This treatment defines the modalities of mutual assistance and also the assistance in the area near the border.

Portugal and Spain shared a common and frequent natural disaster, forest fires, one of the main reasons of the agreement between Portugal and Spain.

Bilateral agreement between Portugal and Spain

There are political; economic; and cultural, scientific and technique agreements between Portugal and France.

Portugal and France also cooperate in terms of national defence. The bilateral relations are based on a bilateral agreement signed on 30 July 1999. A meeting is held every 18 months at the headquarters of armées. Notre cooperation includes visits to authorities, regular political-military exchanges, targeted cooperation actions in different areas and the distribution of organizational models. It contributes to the maintenance of a favourable climate for the Portuguese and French defence interests in consideration of their proposals, particularly in organizations and security.

Bilateral agreement between Portugal and Morocco

Portugal and Morocco have signed 18 agreements such as environment; water treatment; marine and air transport; communication; and financial, economic and cultural cooperation.

3 Organisation

3.1 Organisational chart

The civil protection structure is organised at the national, regional and municipal levels.

The entire civil protection system integrates the ANPC, the Regional Services for Civil Protection in the Azores and Madeira (SRPC), the District Commands for Relief Operations (CDOS, one in each district) and the SMPC (one in each municipality).

The heads of the administrative civil protection units (district commanders) are nominated by the National Authority for Civil Protection.

The responsibility for the civil protection policy lies with the Government, which shall introduce, in the respective programme, the main orientations to be adapted or proposed in this field of intervention. The Prime Minister and the Ministry of the Interior are therefore responsible for directing the civil protection policy at national level.

At regional/district level, there are District Civil Protection Commissions (responsible for the political coordination and policy advice to the civil governor) and District Coordination Centres (operational coordination).

In each district there is also a District Command for Relief Operations, a branch of the Portuguese Civil Protection Authority. In the autonomous regions of the Azores and Madeira there are Regional Civil Protection Services, depending on the regional government.

At local level, there are Local Civil Protection Services depending on the mayor. Political and operational coordination is assured by the municipal civil protection organisations. The mayor, in the exercise of his functions as the responsible entity of the civil protection policy in the municipality, is responsible for activating, during the occurrence of a serious accident or catastrophe, the adequate civil protection actions aimed at prevention, aid, assistance and rehabilitation for each case.

Soon after a major disaster cannot be solved either by the means assigned to the municipality or to the district, where the disaster takes place, the ANPC activates the National Coordination Centre to coordinate and control the relief operations and logistics support at national level.

A National Command for Relief Operations operates 24 hours a day in the ANPC to control and manage the current situation.

Operational organizations act under civil protection command according to the rules of the SIOPS. Decisions are made by the National Coordination Centre.

The institutional coordination of SIOPS is ensured at national level and at the level of each district, the Operational Coordination Centres (CCO), which include representatives of entities whose intervention is justified on the basis of each occurrence in concrete.

The CCO is responsible for managing the operational involvement of each force or service for relief operations to trigger.

The responsibilities of CCO are:

- Ensure coordination of resources and logistical support of relief operations, and emergency assistance undertaken by all members of SIOPS organizations;
- Inform permanently its political authority of all relevant facts that may lead to problems or bottlenecks within the operational response;

- Ensure the management and monitoring all instances, ensuring an appropriate response under the SIOPS.

According to a national response, the National Operational Coordination Centre (CCON) makes sure that all the entities and national institutions which main activity is based on protection and rescue operation, emergency and assistance of a serious accident or catastrophe hang together.

The main representatives of the CCON are:

- National Authority of Civil Protection
- Republican National Guard
- Public Security Police
- National Institute of Health Emergency
- Institute of Meteorology
- A branch of the armed forces that is dedicated to protection and rescue operations and emergency assistance of human beings and material resources.

The CCON is coordinated by the National Authority of Civil Protection and can be represented by the operative commander of the National Authority of Civil Protection.

Its responsibilities are:

- Integrating, evaluating, and monitoring the whole operative activity in a disaster situation or a serious accident.
- To guarantee a continuous flow of strategic information to the Districts specific civil protection department in a case of a disaster situation or a serious accident.
- Disseminating information and notices to the people, entities and institutions.
- To evaluate the situation and propose to the National Civil Protection Commission a set of requests for assistance to other countries.
- To guarantee that all the operation methods in a case of alert or catastrophe are achieved.

In terms of a district response, the District Operative Coordination Centres (CCOD) ensure that all the entities and district level institutions essential in protection and rescue operations hang together.

The main representatives of the CCOD are:

- National Authority of Civil Protection
- Republican National Guard
- Public Security Police

The CCOD are coordinated by the operative district commanders of the National Authority of Civil Protection.

Responsibilities of CCOD are:

- Integrating, evaluating, and monitoring the whole operative activity in a disaster situation or a serious accident.
- Disseminating information and notices to the people, entities and institutions.
- To evaluate the situation and propose to the Civil Governor the district methods of operation under the supervision of the National Government.

According to the nature of the disaster, specific organizations may be called to act under civil protection authority (e.g. the Water Institute, the Forest Services, etc.).

Figure 1 gives an outline of the organisational structure of the disaster relief in Portugal.

Figure 9: Organisational Chart of the National Authority for Civil Protection in Portugal¹⁸³⁹

Figure 3 gives an outline of the organisational structure of civil protection in Portugal.

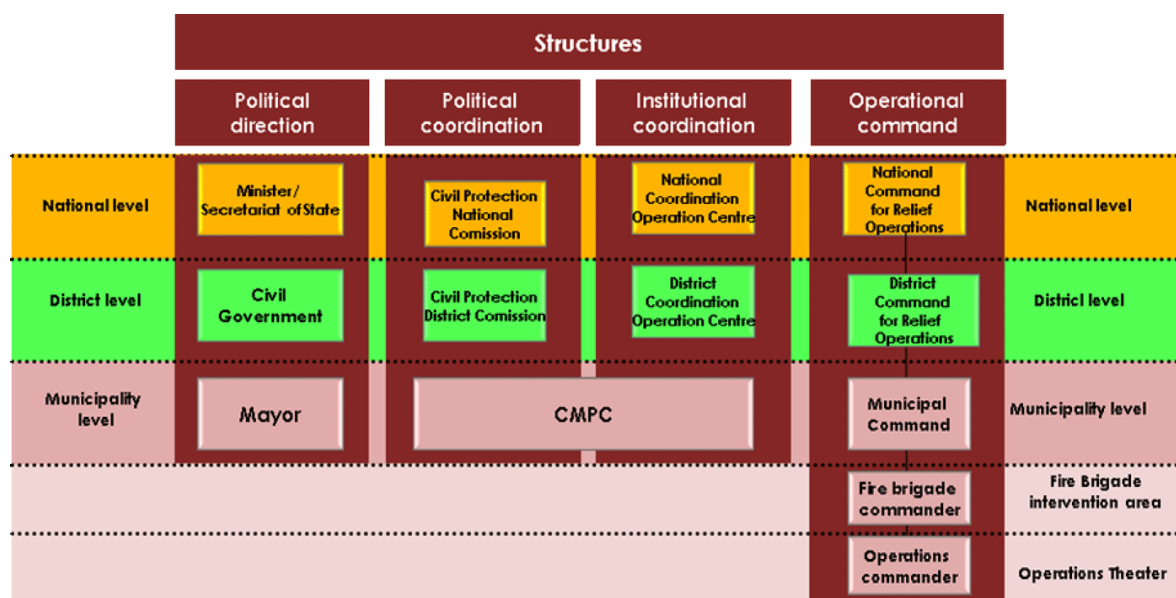

Figure 10: Structure of the National Authority for Civil Protection in Portugal¹⁸⁴⁰

Another actor in the Crisis Management is The Força Especial de Bombeiros Canarinhos (Special Force Fire Canarinhos, FEBC). The FEBC is a particular force of the civil protection; it has its own structure and its own command chain. The FEBC is a part of the National Authority of Civil Protection and it was created by Article 19 of Decree-Law 247/2007 of 27 June.

The FEBC has a series of tasks and values, a structures, and different branches. They are named in the following sections.

The FEBC has a series of tasks:

- *Reply with high degree of readiness, the requests of protection and relief, prevent and combat fires scenarios, serious accidents and disasters anywhere in the domestic or overseas territory and in other part of the missions Civil protection;*

¹⁸³⁹ Organisational Chart of the National Authority for Civil Protection in Portugal. Accessed January 26, 2016 http://ec.europa.eu/echo/files/civil_protection/vademecum/pt/2-pt-1.html#orga/

¹⁸⁴⁰ Structure of the National Authority for Civil Protection in Portugal. Accessed January 26, 2016 http://ec.europa.eu/echo/files/civil_protection/vademecum/pt/2-pt-1.html#orga/

- *Provide specialized training in values that can be accredited by the National School of Fire (Escola Nacional de Bombeiros, ENB).*

The values of FEBC are:

- *Permanent disposal to any Mission;*
- *Quality and efficiency in any operation;*
- *Professional ethic;*
- *Good interpersonal abilities.*¹⁸⁴¹

Nowadays FEBC is formed by:

- *Three companies, seven subunits and a total of two hundred and fifty professional in fighting fire operations.*
- *A management unit and logistic support.*
- *A General Staff that is a body of support and advice to the Commander of the FEB.*

The FEBC has a series of departments:

- *Recovery-Savers group (Grupo de Recuperadores – Salvadores, RS): The Recovery-Savers (RS) are part of a specific group in the direct dependence of the Commander of the FEB, distributed by Helicopter Base Permanent Service (BHSP), defined superiorly. The Recovery-Savers Group competes performing search and rescue missions in aquatic and terrestrial environment. The main missions of this group are:*
 - *Reply with high degree of readiness, to requests for search and rescue that require the intervention of an air means with the necessary qualifications;*
 - *Participate in prevention actions in the field of civil protection;*
 - *Participate in other actions for which are technically prepared and included in the specific purposes of the missions assigned to Special Force Fire (FEB).*
- *Group of Mountain Rescue, the Rescue group in Mountain carries out its mission in the area defined in PONSE (National Plan of Operations of the Serra da Estrela).*
- *The Brigade of Logistics Support of FEB was established to assist and support the logistical tasks within the cell CNOS Logistics.*
- *Group on International Response, the International Response Group performs in international missions of protection and relief or humanitarian aid, and may intervene integrated in joint or combined forces, together with other civil protection agents.*
- *Recognition and Situation Assessment Team (ERAS), the ERAS are characterized by their great skill and expertise, guaranteeing permanent interconnection, and their main objective to provide the CNOS or CDOS, according to the level of activation, with immediate and essential information to the decision-making process.*¹⁸⁴²

3.2 Organisational cooperation

In Figure 2 and 3 in Section **¡Error! No se encuentra el origen de la referencia.**, it is possible to understand all the different cooperation levels from political, institutional and operational activities. There is also an established structure depending on the scope in which these activities take place.

There is Cross-border Territorial Cooperation between Spain and Portugal. The European Commission approved on 25 October 2007 a European territorial cooperation programme for Cross-border cooperation between Spain and Portugal for the period 2007-2013. The overall objective of the programme is to develop further and broaden the common border areas of both countries within the priorities set by the new European territorial cooperation objective. This marks a substantial shift in the overall programme objectives, away from previous programmes, that is geared chiefly towards improving connectivity and basic infrastructures in the border areas and towards a new approach aimed at improving competitiveness, promoting employment and enhancing socio-economic and institutional integration in the border regions.

The trend established through successive programmes has led to a new type of cross-border cooperation in the current period that focuses on:

- Reinforcement of the immaterial component of the interventions;
- Widening of the scope of stakeholders in the cooperation process;
- More intense cooperation in all phases of the development of interventions (design, development and operation, joint management);
- Strengthening of joint cooperation structures.

The Southwest European (Sudoeste Europeo, SUDOE) Cooperation Programme is developed by taking as a basis the 2020 Europe Strategy for the Operational Programme's contribution to the Union strategy for smart, sustainable and inclusive growth and the three growth models (smart, sustainable and inclusive) that are the guiding principles of the 2014-2020 programme. In its turn the Programme has accumulated the experience of the four previous generations of programmes in its knowledge of the territory, its players, and the understanding of the development modes of its projects.

The strategy of the 2014-2020 SUDOE Programme is developed initially from a group of main elements, which will be developed later throughout this section and the remaining ones of the Programme:

- Territorial (socioeconomic) diagnosis of the eligible area to establish the challenges and prior priorities of the space.
- Revision of the complementarity of actions with the regional operating programmes in each of the NUTS¹⁸⁴³ 2 regions, of the national multiregional programmes, and of the transnational and cross-border cooperation programmes that partially operate in the eligible territory.
- The intervention proposals and the possibility of carrying out actions linked to the Partnership Agreements of the four participating member states.
- The capitalisation of the results of the previous programming periods, in particular of the 2007-2013 period.
- The participative process established with the agents of the territory, in particular of the surveys carried out in 2012 and 2013 (on the type of potential actions and the systems for

¹⁸⁴³ NUTS (Nomenclature des Unités Territoriales Statistiques) regions included in the cooperation programme

initiating them) by the managing authority and the national authorities in their respective territories.

- The establishing of the logical framework of intervention as a conclusion of the above points and the result of the agreements among the participating states, taking as a basis for development the analysis of the feasibility of the actions considered optimum for their initiation in the Programme.

In terms of accessibility and transport, the SUDOE space is generally satisfactory, although it is still necessary to encourage intermodal connections (the intermodality of transport systems) and to improve land communications between frontier zones of Spain and Portugal. The multimodal accessibility index of the territories of the SUDOE area is lower than the EU average apart from certain coastal areas of the Mediterranean and the Atlantic. These multimodal access limitations are more acute in particular in inland border areas of Spain and Portugal, especially in the Alto Tras-os-Montes/Zamora and Beira Interior Sul/Salamanca frontier areas and in the Pyrenees. In general the SUDOE regions have good density indexes for infrastructures and overland communication, such as main roads and major railway lines. They also enjoy good connections with the main commercial ports on both the Mediterranean and the Atlantic coasts, which are now affected by regional policies and programmes. Mobility still remains difficult in certain areas, above all in the northeast frontier zones between Portugal and Spain and between Spain and France, which is the result of the scarcity of crossing points or the complexity of the geography of the territory.

Since the ANPC merged with CNPCE, a “back to their origin country” plan was developed. With this plan people who live in other countries could be evacuated in the fastest way, in this specific case, to Portugal. This plan is an instrument that defines the structure and the steps that has to be followed to create the best returning conditions to Portuguese people who live in another country with unnatural situations.

This plan develops in three steps:

- Manage every operation method in the residence country and coordinate how people are transported back to Portugal. This action is coordinated by the Ministry of Foreign Affairs. Ministry of Solidarity and Social Security
- The second step covers actions on arrival in Portugal and the activities arising from host. This action is coordinated by the Ministry of Solidarity and Social Security;
- The third step comprises support actions and supervision of citizens to their integration into society, being coordinated in Portugal by the District Social Security Centres, and in the islands by the regional governments.

This plan is driven by the prime minister, by his own decision or proposal of the Executive Council, which is responsible for the overall supervision of the unit plan. This Committee is chaired by the Secretary of State for the Presidency of the Council of Ministers and the Vice President of the ANPC.

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

The Integrated System for Relief and Protection Operations (SIOPS) defines a set of rules and procedures, which guarantee that civil protection agents act, at the operational level, in a coordinated way and under a unique command.

Operational organisations act under civil protection command according to the rules of the SIOPS and decisions are taken by the National Coordination Centre.

Specific emergency plans may also exist as instruments of planning, organization, coordination and operational command of Integrated Device Protection and Relief Operations (DIOPS). For example:

- Fight against forest fires DECIF - Dispositivo Especial de Combate a Incêndios Florestais
- Integrated Protocol for Aircraft Disaster Response DIRACAERO - Dispositivo Integrado de Resposta Acidentes com Aeronaves
- Integrated Operational Protocol for Nuclear, Radiological, Biological and Chemical, NRBQ - Dispositivo Integrado de Operações-Nuclear, Radiológico, Biológico e Químico
- Integrated Protocol for Relief and Protection Operations DIOPS - Dispositivo Integrado das Operações de Protecção e Socorro

The Decree-Law No. 73/2012, of 26 March, transferred to the National Civil Protection Authority tasks of the National Council for Civil Emergency Planning, and Decree-Law No. 163/2014 of 31 October, attributed to the ANPC the task of ensuring the planning and coordination of national needs in emergency civil planning area in order to address situations of crisis or war. This was a substantial strengthening of the action framework of the ANPC, which now encompass situations of crisis and war in addition to serious accidents and catastrophes.

The ANPC set up the pillars of the concept of civil emergency planning, translated basically in collecting, analysing and sharing information intended to provide the effective use of the capacities and civilian resources in support of military structures.

This development would materialize in the definition of five specific areas of action in the field of civil emergency planning:

- Civil support for collective defence operations;
- Support for crisis management operations;
- Support to national authorities in emergency management;
- Support to national authorities in protecting against the weapons of mass destruction;
- Cooperation with partner countries in the preparation and response to emergencies.

4.2 Operations planning

In 1984 the National Council for Civil Emergency Planning (CNPCE) started operating in dependence of the Prime Minister.

Later, in 1991, it was legally enshrined the existence of the National System of Civil Emergency Planning, which encompassed both the CNPCE and a set of Emergency Planning Committees of

various sectors of activity. The civil emergency planning thus became understood in Portugal as the activity that is intended to coordinate non-military components and capabilities of national defence and civil support to the Armed Forces as well as to organize and prepare the various strategic sectors of the Nation in situations of crisis or war, in order to contribute to the guarantee of freedom of political and governmental action, as well as for the safety and well-being of the population.

With the extinction of the CNPCE and the absorption of its powers by the ANPC began a new cycle. Since April 2012, the ANPC took responsibility to ensure a national representation in the Civil Planning Committee of Emergency of NATO also taking the mission at national level and in partnership with organizations from the fields of industry, energy, transport, communications, agriculture, environment, health and cyberspace, to define, update and implement the emergency civil planning policies.

Since the ANPC merged with CNPCE a “back to their origin country” plan was developed, with this plan people who live in other countries could be evacuated in the fastest way, in this specific case, to Portugal. This plan is an instrument that defines the structure and the steps that has to be followed to create the best returning conditions to Portuguese people who live in another country with unnatural situations.

4.3 Logistics support in crises

In the context of an emergency or crisis, the protection civil agents provide the required logistic support according to the severity level and the nature of the incident. The most relevant civil protection agents in Portugal are listed below:

- Recovery-Savers group (Grupo de Recuperadores – Salvadores, RS);
- Group of Mountain Rescue;
- The Brigade of Logistics Support of FEB;
- Group on International Response;
- Team Recognition and Situation Assessment (ERAS);
- The Lifesaving brigade;
- The Operational Command teams of National Reserve;
- Analysis and Use of Fire Team (EAUF);
- The operators of emergency telecommunications (OTE);
- The fire departments,
- Security forces;
- The Armed Forces;
- The INEM (National Institute of Medical Emergency) and other health services;
- The forest firefighters.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

Risks and crises cannot be managed without communication because, as research shows, communication is the most powerful influence on people’s risk decision-making and behaviour.

Increasingly, communications is being recognized as essential to enabling people and organizations, including governments, to manage risks and crises effectively.

Portugal is a member of the International Association of Risk and Crisis Communication (IARCC). The International Association of Risk and Crisis Communication (IARCC) is a non-governmental, independent and international network of nationally organised associations with headquarters in Geneva, Switzerland. Today, five national associations are member associations of the IARCC. They are registered in Austria, France, Portugal, Switzerland and the United Kingdom.

The objectives of the IARCC are the furthering of responsible and professional communication and its recognition as an important tool to reduce risks, prevent crisis and catastrophe scenarios or reduce the harm they cause.

As a recent example, ARCC Portugal has developed a risk communication campaign proposal for URBSIS, a project for “Assessing Vulnerability and Managing Earthquake Risk at Urban Scale” which main goal is the adoption of measures to reduce seismic risk, promoting research in this scope and encouraging a national plan to reduce seismic vulnerability. Those communication proposals are:

- Risk communication audit: Provides the techniques to prepare people through communication for a natural hazard.
- Risk and crisis communication strategy and plans: ARCC Portugal proposes to accompany the actualisation of risk and crisis communication strategies and the drafting of communication plans in preparation of seismic risks and catastrophes.

The objectives of the risk communication project are:

- Ensure a good cooperation with population;
- Make sure that the contents of the audit report of the scientific team are well understood and that practical actions are taken in accordance with the report findings;
- Improve the risk and crisis communication strategy and plan of earthquake catastrophes. Enhance risk awareness, preparedness and crisis management capabilities.

The Portuguese alert-level status can be monitored in real time for many natural menaces. The ANPC, in cooperation with national organizations, provides information on:

- Forest fires;
- Daily risk of forestall fire happening;
- UV radiation index;
- Heat wave alerts;
- Weather alerts;
- Civil Protection Alerts.

In Portugal, the ANPC edited the collection of 21 booklets called Prevention and Protection directed to the general public and children and youth seeking knowledge and adoption of prevention and self-protection against a range of risks.

16 audio spots were produced as Prevention and Self-protection tools through partnership with the Imaging Technique School of Image and Communication (ETIC) in order to multiply the information tools provided by ANPC.

The ANPC produced two cards (one for adults and another for children), which let people know all the booklets of the ANPC and the prevention and self-protection measures related to collective risks of natural and technological origin.

The ANPC also created PROCIV which is a newsletter that monthly provides news about national and international actions, agents, technical dossiers, key legislation and a schedule of events within the civil protection.

5 Capabilities

5.1 Human resources

The different local and regional government have their own resources and means to tackle emergency situation.

The Operations Management System (SGO) is a form of operational organization that develops a modular configuration, according to the importance and type of occurrence, applying whenever a force of any Civil Protection Agent (CPA) or institution with special duty of cooperation is driven to an instance in which the head of the first team to reach the site immediately assumes the command of the operation - Relief Operations Commander (COS) - and we build an evolutionary command and control system appropriate to the current situation.

The National Relief Operations Command (CNOS) consists of the national operational commander and three deputies and comprises the cell planning, operations, and information and logistics cell.

The Psychosocial Support Teams (EAPS) are part of the operational response of the National Civil Protection Authority. The coordination of these teams is carried out by the Security Centre and Health (NSS), Unit Support of Volunteers (UAV) that integrates the National Fire Department (DNB).

The Special Force Fire Canarinhos (FEBC) has its own structure and its own command chain.

The Special Force of Fire is assumed as a professional fire department unit able to intervene at any stage in the field of protection and assistance, whether in the country or outside the country.

The establishment of this Force was only possible with the indispensable assistance of the fire department Humanitarian Associations who provided their firefighters and highlighted them according to the protocol established with the ANPC.

In the initial phase of operation, the Special Force of Fire was primarily used in the initial control on wildfires by air or by land. Increasingly, teams and groups began specialized training in the remaining civil protection valences.

According to the Special Force of Fire report activity, in July 1, 2014 (at the beginning of Charlie's Phase DECIF), the FEB had a total of 269 active members, distributed by function as follows in table 2.

Groups	Functions	Members
Command	Commander	1
	2 nd Commander	1
	Assistant	3
	Company Commander	2
Territorial	Chief of group	8
	Brigade chief	20
	Team chief	30

	Firefighters	190
Rescuers and savers	Technical checker	2
	Assistant technical checker	2
	Rescuer-saver	8
	Total	269

Table 9: Active members, distributed by function¹⁸⁴⁴

The FEB currently consists of 3 companies and 7 subunits or groups and currently has an overall effective of 259 firefighters.

The FEB currently has 57 members accredited by the National Fire School (ENB), to provide training in different areas of knowledge that make up the training offer of ENB to the universe of Fire, according to Table 3.

Training area	Accredited trainers
First Aid Techniques	3
Technical Rescue and extrication	14
Head of Rescue Team	8
Driving Off Road	2
Rescue techniques in Grand Angle	4
Defensive Driving	1
Fighting urban and industrial fires	5
Fighting Forest Fires	12
Lifeguard	1
Relief vessels driving	1
Hazardous materials	2
Central Operator	2
Techniques Shoring	2

Table 3: Training in different areas of knowledge¹⁸⁴⁵

<http://www.prociv.pt/FEBombeiros/Documents/Relat%C3%B3rio de Atividades FEB 2014.pdf/>

5.2 Materiel (non-financial) resources

The FEB has currently 57 operational vehicles. It includes a set of equipment for intervention in different scenarios outside the scope of fighting forest fires, according to Table 4.

Tools	Amount
Lighting balloons	9
Relief vessels	2 ¹⁸⁴⁶
Diving equipment	10
Rescue and extrication equipment	12
Rescue equipment in Grand Angle	1
Rescue equipment in Mountain	20
High Capacity Generator	2
Lifeguard	1
Average capacity generator	6
Inflatable tents	7

Table 10: Equipment for intervention in different scenarios¹⁸⁴⁷

The ANPC has special vehicles properly equipped with telecommunication means and systems to ensure the operation in an emergency situation. Since 2005, the Civil Protection has been making a great effort to extend and renew the fleet of vehicles, at district level:

- Light vehicle fire fighting
- Forest fire fighting vehicle
- Urban vehicle fire fighting
- Urban tactical tank vehicle
- Rural tactical tank vehicle
- Rescue vehicle and tactical assistance
- Rescue vehicle and special assistance
- Tactical Command Vehicle
- Rescue Ambulance.

Territorial Groups of the FEB are located in seven permanent bases, installed in each of the districts where it operates.

The Recovery Group - Rescuers of the FEB operates from 2 Helicopter bases that provide a Permanent Service (BHSP).

¹⁸⁴⁶ A vessel under an agreement of transfer of use between ANPC and the Administration of the Hydrographic Region of Alentejo

The Portuguese Red Cross shall perform, in cooperation with the other agents and in accordance with its own constitution, civil protection functions in the areas of intervention, support, relief and health and social care.

The following entities play special roles as civil protection agents:

- Humanitarian associations of volunteer firefighters;
- Security services;
- National Institute of Legal Medicine and Forensic Sciences;
- Social security institutions;
- Institutions with rescue purposes and solidarity;
- Bodies responsible for forests, nature conservation, industry and energy, transport, communications, water resources and environment;
- Security services and private help public and private companies, ports and airports.

The Portuguese Red Cross aims to help vulnerable people, whoever they are and wherever they are, in order to protect their lives.

This institution also aims to prepare the community to respond to emergency situations of natural or human origin. And when the emergency ends, providing the necessary support for the recovery and restoration of life of those affected.

Internationally, the Portuguese Red Cross is involved in several development programs, directly or as part of the International Federation of Red Cross and Red Crescent.

Humanitarian aid pays special attention to the most immediate needs of people in emergency situations: rescue, shelter, clean water and sanitation, food aid and nutritional support, health and psychological support.

Currently, humanitarian aid has become an increasingly necessary task. Situations where this type of aid is needed, emergency has increased in number and complexity.

The Portuguese Red Cross focuses on strengthening its ties with the National Societies of Portuguese Language, to create a network of cooperation between countries with a common history, culture and language.

In July 2003 the Forum of National Red Cross Societies of Portuguese Language (SNLP Forum) was created, after more than a decade of informal meetings. The main objective of this group is to strengthen cooperation among its members, particularly in the areas of:

- Health;
- Preparation for intervention in disasters;
- Training;
- Migration.

5.3 Training

The SNPC is a body for the development of plans, policies and coordination and control of emergency response. There are no organic disaster response units or schools for civil protection within its organisation. The training of civil protection agents lies with the commands/directions that have schools and training centres for such purpose.

Several civil protection exercises are conducted every year, but there is no national exercise planning directive. These exercises take place at different levels: local, regional and national, and can assume different natures: command post or live exercises. Some examples of exercise are the following:

- The first civil protection international exercise took place in the Lisbon Urban Area on May 2009 and aimed at testing the operational procedures foreseen in the Lisbon Emergency Plan for Earthquakes.
- The “Terra Treme”¹⁸⁴⁸ is a preparation exercise and self-protection for the seismic risk during one minute, in which every citizen could participate individually or in groups. This is a training exercise organized by ANPC.

The Civil Protection is a system with multiple agents, valences and performance tools. A citizen aware of the risks and the contribution it can make to avoid or mitigate their consequences is, in principle, a civilian protection active agent, playing a key role in the system. It is already common to say that the Civil Protection starts and ends in each person, if people prepare themselves to be both their agents and their beneficiaries. In education and citizenship, the ANPC strategy is based on the following assumptions:

- *Use of resources and knowledge at the closest level to the citizen;*
- *Preference for positive approaches (no risk is greater than our ability to manage) at the expense of negative (catastrophes are inevitable);*
- *Identification of children and youth as a privileged public but not exclusive;*
- *Importance of non-formal and informal education as a supplementary resource;*
- *Recognition of the state's limitations, supplementing them with collaborative partnerships;*
- *Use of Information and Communication Technologies to achieve its objectives in a better way;*
- *Setting targets, commensurate with the means available.* ¹⁸⁴⁹

The knowledge of the risks, safety procedures and appropriate behaviour is not only responsibility of the state and authorities, but also a duty of citizenship.

In addition to the residents in high risk zones, more familiar with local constraints and the precautions to be taken, all citizens must be aware of the main risks and respective collective self-protection measures in the event of a serious accident or catastrophe.

In Portugal, the National Authority of Civil Protection also provides a series of manuals to teach people how to act in different disaster or catastrophe situations, in this case, at home, at school (providing different manuals to teachers), at the workplace and in opened air places.

The family emergency plan is drawn up in order to prevent accidents that could endanger family members and / or their properties.

Citizens should know the hazards serious accidents or disasters that occur in their homes and in the workplace usually occur by surprise.

The Family Emergency Plan should take into account the conduct of an inspection of the entire house looking for potential risks by performing relatively simple actions such as:

- *Fix the shelves to the walls;*
- *Place heavier objects or bulk on the floor or on the lower shelves;*
- *Do not put pots or window boxes on the windowsills or balconies;*
- *Identify sites that offer greater protection in the event of collapse: under beams, tables, doorways;*

¹⁸⁴⁸ <http://aterratreme.pt>

¹⁸⁴⁹ The ANPC strategy in education and citizenship. Accessed January 26, 2016 <http://www.prociv.pt/educid/Paginas/Educa%C3%A7%C3%A3oCidadania.aspx/>

- *Make periodic or general cleaning to the typically underutilized locations or difficult to access (attics, storage rooms, archives, etc.) and not to allow the accumulation of dust or waste (potential fuels);*

As survival articles people should have:

- *Flashlight and a battery operated radio (with extra batteries), clothing (blanket, change of clothes), water and packaged food, in sufficient quantities to respond to family needs for a minimum of 3 days.*

These are some general procedures in case of serious accident or catastrophe being at home:

- *Check for injuries and give first aid;*
- *Ask for help if there are serious injuries;*
- *Turn the radio on and follow the instructions given;*
- *Check for severe damage at home and make sure they do not represent a risk of collapse;*
- *Use battery-powered flashlights and do not turn on the power if you suspect the possibility of gas leakage;*¹⁸⁵⁰

At the workplace the existence of an emergency plan is very important for several reasons. First, endows the company with an effective level of security, identifying the risks to which workers are exposed in the workplace, and the measures of prevention and protection.

With an emergency plan properly tested by all, there is an interaction from the base to the summit, for everyone to participate in preparing the plan. So with an approved emergency plan, the company can recover more easily from an emergency situation.

The company has an obligation to ensure the safety of its employees and providing an effective emergency plan is one of the elements for the implementation of a safety culture.

Nowadays, the outdoor spaces are increasingly visited by people looking for contact with nature, particularly through sport activities.

These spaces could be form by unstable ground or could be on high altitude, for example, and a series of meteorological phenomena can evolve rapidly and sometimes violently and the ignorance of the all these factors can have serious consequences for people health and security.

Many of the outdoor sports require a minimum of technical and training and should not hesitate to resort to training centres and specialized schools. A monitor or professional guide can be very useful for the most adventurous expeditions. With a good education will save effort and increase your safety.

Safety depends on behaviours based fundamentally on the information, preparation and prudence.

In most cases, the walks do not require great learning or special techniques and can be practiced by people of all ages. However, some cases require more preparation and experience.

5.4 Niche capabilities

In terms of communication there is an organisation called Telecoms Sans Frontiers (TSF) that intervened in a forest fire in Portugal in 2003, and provided the satellite lines for communication. The mission of TSF is to provide telecommunications in places where local infrastructure are destroyed, are insufficient or non-existent.

Driving Innovation in Crisis Management for **European Resilience**

ROMANIA

Policy, Legislation, Organisation,
Procedures & Capabilities (PLOPC) in
crisis management and disaster response

Responsible Partner: CSDM (Valeri Ratchev, Todor Tagarev, Zlatogor Minchev, Vesselin Petkov)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by ATOS and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

Romania is highly vulnerable to catastrophic natural disasters. It is situated in a seismically active region and has a history of devastating and deadly earthquakes, including the one with strongest impact, in Vrancea in 1977. Furthermore, the Bucharest area has experienced a number of tremors of varying intensities, and the probability that a severe and damaging earthquake will occur is high. Romania is also at risk by other natural and technological hazards. More specifically, the 2010 floods revealed weaknesses of the civil protection system and triggered a process of improvement. Of the former group, floods, drought and heat/cold waves have been experienced frequently, while the most affecting example of a man-made disaster has been the accident at the Baia Mare gold processing plant, where, in 2000, 100 000 cubic meters of toxic wastewater spilled out and flooded into the Danube River, affecting Romania, Hungary, Ukraine, Serbia, and Bulgaria.

The Romanian crisis management concept views civil protection as a public policy issue, and as a civil operation during which the military could provide support with both assets and people. Crisis management does not rely on a centralised structure but is a result of the interaction of parallel architectures. The latter involve bodies and agencies dealing with particular risks, while the crisis management system-of-systems implements an all-hazard approach. The most significant developments within the crisis management domain took place in 2004, as well as after the 2007 accession to the European Union.

Coat of the General Inspectorate for Emergency Situations of Romania

The National Emergency Management System (NEMS) is a nationally owned mechanism of multiple stakeholders, which provides coordination and response in case of emergencies, and serves as an advocate for prevention and disaster risk reduction at different levels. It is organised at four levels (national/governmental, ministerial, county and local), with a particular coordination and communication role for the national-level authorities. The system is led by the Prime Minister, supported by the National Committee for Emergency Situations, and the Minister of Administration and Interior designated as a chief executive. The main executive administrative body is the General Inspectorate for Emergency Situations (GIES), which coordinates plans and operational activities in cases of natural and man-made emergency situations. Specific plans are prepared at all administrative levels. Funding is provided through the state and local budgets though they are used mostly for post-disaster recovery and less for preventive measures.

The role of the private sector in the civil security system is limited, while NGOs cooperate closely with the state institutions, mostly in the fields of education and training. The number of organised volunteers is about 130 000. Regulations require that everyone be prepared to take care of himself in the immediate aftermath of major disasters. Every family and company should develop its own emergency plan, stock its own emergency survival kit, and ensure that each family member or a company employee is familiarised with emergency procedures and can take precautions to protect their personal safety. However, in general, the society is not well organised at a community level and expectations that disaster management is a state responsibility are shared widely.

After Romania's EU accession in 2007, the country improved its cooperation with international actors and increased its efforts to make the crisis management system coherent with international (particularly the EU) context. Romania has increased its engagement in the work of committees and working groups dealing with the EU's civil protection. Romania has activated the EU's Monitoring and Information Centre (MIC)¹⁸⁵¹ several times and contributed to several MIC-coordinated interventions providing support to Greece, Georgia, Hungary, Moldova and Turkey. Bilateral agreements or protocols are signed with some of the Romania's neighbours (Bulgaria, Hungary, and Moldova), as well with other European (Czech, Denmark, France, the Netherlands, and Turkey) and non-European countries (Azerbaijan and the USA –with FEMA and USTDA).

The Romanian capacity for emergency response includes several niche capabilities: pyrotechnical capabilities for drainage, controlled breaches, and detonation, for water purification and transportation and for marine de-pollution. Military cargo aircraft are also available in cases of emergencies at home and abroad (C-27J Spartan – 6, C-130 Hercules – 3, and An-26 Curl – 4).

¹⁸⁵¹

MIC has been renamed to Emergency Response Coordination Centre (ERCC).

1 Policy

According to the National Strategy on Civil Protection, Romania emphasises disaster risk reduction and emergency management policy as one of the pillars of national security. Recently, it is focused on a combination of legislative and organisational measures, capability building and training efforts and actions in cases of emergencies. In a long-term perspective, the strategy is directed towards building a culture of safety and resilience. In order to achieve such progress, national, regional and local development programs and projects are and will be subsumed to the principles of sustainable development, environmental impact prevention and reduction, responsibility and protection of citizens against disasters.¹⁸⁵²

The policy-making and implementation mechanism is established around the following main phases: risk assessment, analyses, monitoring, alerting, decision-making, and interventions.

According to the Romania National Progress Report on the implementation of the Hyogo Framework for Action (2013-2015), “In 2013 GIES (General Inspectorate for Emergency Situations) has initiated a EU fund project for national risk assessment. This project will develop a common set of tools for assessment: a unitary methodology, data-base and WebGIS portal. These instruments will contribute to a unitary assessment of all risks in order for the results to be compared and the investments to be prioritised. The national risk assessment will be coordinated by National Risk Assessment Working Group,¹⁸⁵³ which is a part of The National Platform.”¹⁸⁵⁴

1.1 Risk Assessment

According to an official statement, “Romania’s territory is exposed to a large number of natural risks as a result of its geographical position and landscape, such as: earthquakes, floods, landslides, dangerous meteorological phenomena and forest fires, as well as, industrial risks as result of economic activities which use technologies with hazardous materials.”¹⁸⁵⁵ However, despite growing public demands for proper disaster management, the current open source risk assessments are mostly focused on the character and likelihood of occurrence of hazards, and much less on various types of exposure – physical, social, economic and environmental as a minimum. Vulnerability, as a result from the interaction between hazards (harmful events) and the structural components, exposed to them, could provide more relevant and useful (in terms of crisis management policy) assessment of risks associated with natural and technological hazards. In result, the data and studies are dominantly of quantitative character and do not provide enough convincing picture of disaster risks in Romania. (Tanislav, 2009)

¹⁸⁵² *National Strategy on Civil Protection* (Published in Official Gazette no. 600 as of 12 July 2005).

¹⁸⁵³ National Risk Assessment Working Group, being a part of the National Platform, is not legally established yet in 2015.

¹⁸⁵⁴ Romania National Progress Report on Implementation of Hyogo Framework for Action (2013-15), p.11.

¹⁸⁵⁵ Statement of Romania, Delivered by Dr. Raed Arafat, Secretary of State, Ministry of Internal Affairs, Head of The Emergency Situations Department at the 3rd World Conference for Disaster Risk Reduction (Sendai, Japan, 14th-18th March 2015). Available at [http://www.preventionweb.net/files/globalplatform/romania\[1\].pdf](http://www.preventionweb.net/files/globalplatform/romania[1].pdf).

Natural hazards

In terms of systematic study of natural hazards, Table 1 provides categorisation by Romanian scholars based on historical evidences or likelihood of occurrence.

Table 11. Natural hazards, which affected or may affect Romania.

SUBGROUPS	CATEGORIES	SUBCATEGORIES	TYPES
1.Cosmic (astrophysics) hazards	Cosmic corps fall		Meteors fall
	Cosmic corps clink		Comets, asteroids, stars clink
	Cosmic corps blast		Gamma radiations
2.Geological hazards	Hazards produced by internal factors of the Earth		Earthquakes
			Volcanic eruptions
	Hazards produced by external factors of the Earth	Movement of released soils, roks and sediments masses	Landslides
			Falls, rolling land-slide or crumbling of rocks
		Movement of snow and ice masses	Avalanches
3.Hydro-meteorological hazards	Movement of air masses		Storms, Blizzards, Tornados
	Movement of water masses	Movement of fresh water	Water flow, Torrents, Floods
		Movement of sea water	Storm waves
		Movement of fresh and sea waters	Floods on the Danube
	Electrical discharges		Lightnings, Thunders
	Frost phenomena of water	Frost water in air	Fogs, Hails
		Frost water on rivers	Ice floes, Ice bridges
	Moisture deficiency		Droughts
	Excessive temperatures		Very high temperatures
			Very low temperatures
			Arsons of forest
4.Biological hazards	Epidemics	Epidemics caused by bacteria	Plague, Cholera, Anthrax, Leprosy, Brucellosis
		Epidemics caused by viruses	Smallpox, Encephalitis, Meningitis, Malaria, Influenza, West Nile, SARS, HIV
		Epidemics caused by rickettsii	Foot and mouth disease, Typhus
		Epidemics caused by toxins	Botulism
		Epidemics caused by unknown causes	Balkan endemic nephropathy (NEB)
	Epizootics	For people and animals	Cholera, Plague, Brucellosis, SARS, Foot and mouth disease, Glanders, Ornitoza-psittacosis
			Pig pesta
		For animals	Caterpillars invasion
	Invasions of insects		Grasshoppers invasion

Source: Marinescu et al., 2010.

In terms of monitoring and analysis of natural hazards in Romania, the scope is quite large and typical for a continental European country. However, the focus is placed mostly on earthquakes, floods and landslides and extreme temperatures (including droughts). Table 2 provides an overall picture of natural hazards for a period longer than a century.

Some of the crises have been of national importance, involving mobilisation of the various services, while the greater number caused local or regional disturbances. The floods in 2005, 2006, 2008, and 2010 are among the major disasters of the last decade. The types of disasters encountered in Romania are the following: floods, heavy snowfalls, strong storms, earthquakes, landslides, epidemics, nuclear, chemical or biological accidents, infrastructure accidents, hazardous material spills, large fires and water works accidents.¹⁸⁵⁶ Table 3 presents natural disasters in Romania with strongest negative impact.

Table 12. Summarised table of natural disasters in Romania between 1900 and 2014.

Earthquakes

Romania is one of the most seismically active countries in Europe. According to a World Bank-sponsored study (WB, 2007), "Even though, as per EM-DAT, earthquakes comprised just 5 per cent of all hazards recorded in the country during 1974-2006, there have been some damaging and catastrophic earthquakes in Romania in the past. Historic records show that the earthquake of 1940

¹⁸⁵⁷

Available at <http://www.preventionweb.net/english/countries/statistics/?cid=141>.

had 980 fatalities while the 1977 earthquake had 1,641 fatalities and led to economic damages of USD 2 billion.”¹⁸⁵⁸

Even though Romania has not recorded any major earthquake in the last three decades, the vulnerability of the country to earthquakes is of special concern for the state authorities. Many of the disaster management measures taken are driven by earthquake considerations. Vrancea seismic zone is the main source of concern (in the past 300 years, a single major seismic event occurred with an epicentre outside this area – in 1916). The map below illustrates the concentration of the earthquake threat.

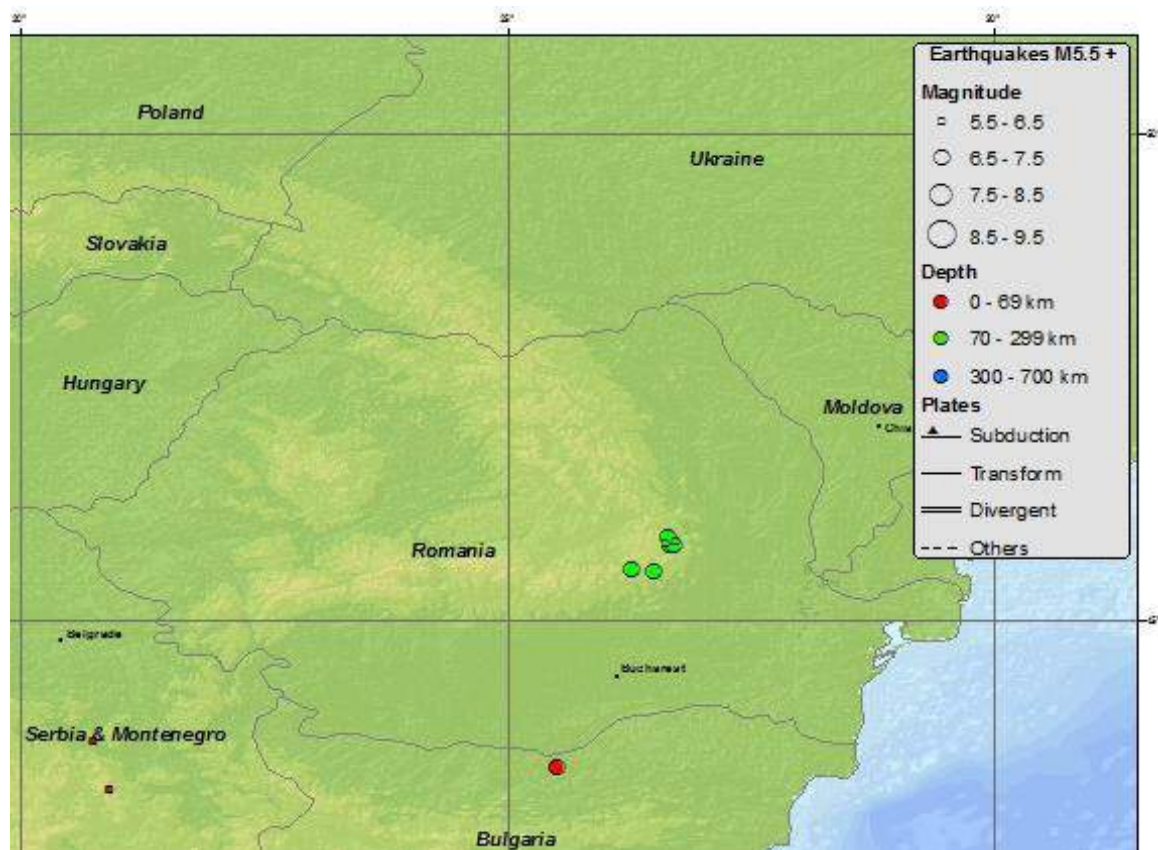

Figure 11: Seismicity map of Romania for the period 1900 – 2012.

Source: United States Geological Survey's (USGS) Earthquake Hazards Program¹⁸⁵⁹

As Figure 2 shows, in a case of serious seismic activities within the Vrancea zone more than 50% of the territory of the country could be affected. However, from vulnerability risk point of view, Romanian research data indicate that within the area of higher seismic activities (probabilities) there is not significant population concentration, national critical infrastructure or industrial businesses, using dangerous substances. (Ozunu, 2011)

Floods

Romanian studies point at floods of internal rivers and of the Danube as the most frequent hazards usually having great economic and social consequences. Marinescu et al. revealed that

Annual occurrence is around 10-15 floods, with greater frequency at medium altitudes (in the mountains and Sub-Carpathians) and lower frequency towards the plain. Catastrophic floods are produced every 50 -100 years because of torrential rains combined with sudden snow melting. They are most frequently occurring in the western part of the country. Spring held regularly floods by melting snow, above which the overlap of spring rains. At the beginning of summer, they are wide spread in the country, being due to heavy rain. Autumns are rarer, due to rainfall during October-November and having a higher frequency in Banat and Oltenia. It is estimated that the maximum exposed flooding in our country is about 3.5 million ha, representing 15% of the country. (Marinescu, 2010)

Damage to the Romanian economy from large-scale floods, as those in 2005 and 2010, has exceeded 1.7 billion USD. As a result, the National Strategy for Civil Protection determines floods as one of the most dangerous natural phenomena that may require evacuation and sheltering of a mass number of population. Figure 3 illustrates the most affected by floods areas of Romania recently.

¹⁸⁶⁰

Available at <http://earthquake.usgs.gov/earthquakes/world/romania/gshap.php>.

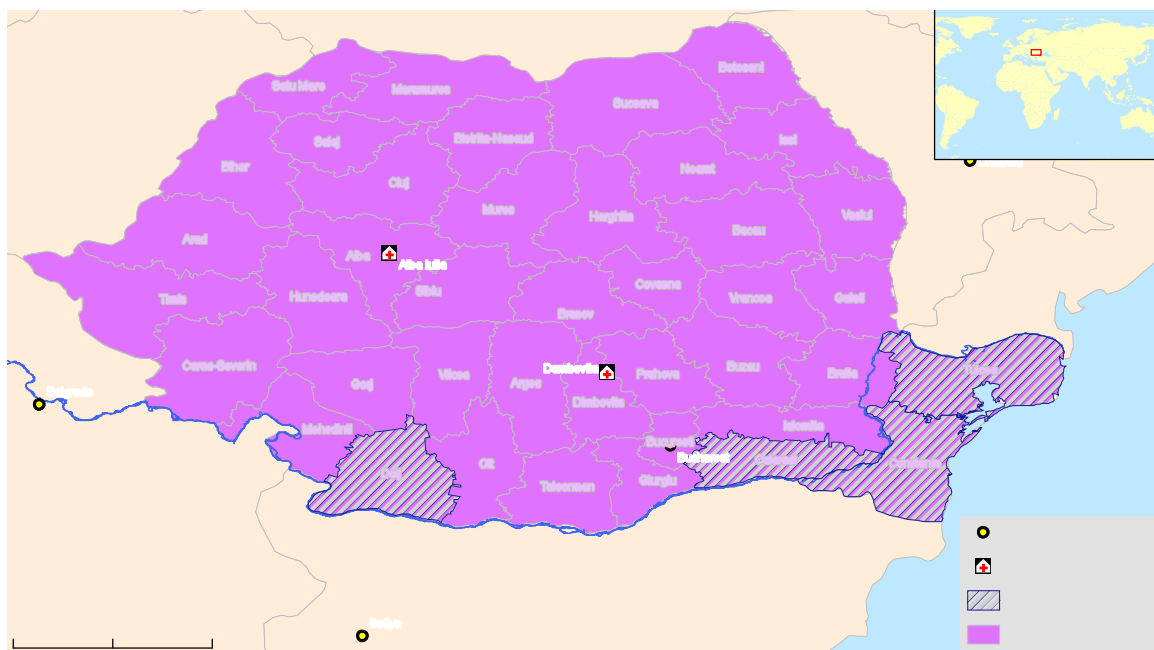

Figure 13: Usually the most affected counties by floods

Source: Federation of Red Cross and Red Crescent Societies.¹⁸⁶¹

According to the information, published by the GIES, regarded the Romanian experience in flood management, “Following the severe rainfalls that affected Romania starting 21.06.2010, 37 counties out of a total of 41 were seriously affected by floods, torrents, flash floods or land slides. The most affected counties were in the NE part of the country: Iasi, Suceava, Neamt, Bacau, Botosani, Covasna, Galati and Vaslui.¹⁸⁶² The GIES provides the following information for the damage, cause by this disaster:

- More than 6 746 700 persons have been affected, 19 997 have been temporary evacuated and 23 deceased;
- 8 882 houses have been affected at different levels, approximately 700 km of protective works/embankments have been destroyed, 35 dams damaged;
- 5 257 km of national, county and local roads have been affected together with 707 bridges and 2 729 small bridges;
- In the agriculture sector 110 585 hectares of crops, 33 110 hectares of pastures, vineyards and 8 220 hectares of saplings have been completely wasted;
- Many public utilities like schools, kindergartens, hospitals, churches, etc. were damaged at different levels.
- The estimated direct damages are approximately 875 million EUR.¹⁸⁶³

Figure 4 illustrates the most affected areas during the 2010 floods.

Droughts

The National Strategy for Civil Protection determines droughts as one of the main natural phenomena that may threaten the Romanian population.¹⁸⁶⁴ Droughts are seen as resulting from variations of temperature that might be frosts, droughts, and heat waves. Elena Mateescu et al. argue that “[i]n Romania, the drought affects 7.1 million ha, which represent 48% from the total agricultural land.”¹⁸⁶⁵ According to their study, “[t]he South, Southeast and East parts of the country are the most hit areas (<600 m³ water/hectare – extreme and severe pedological drought) during the extremely droughty years average yields of various crops representing only 35-60 per cent of the potential yields.”¹⁸⁶⁶ The research also emphasises that, “[s]ince 1901 until now (2013), Romania has seen in every decade one to four extremely droughty/rainy years, an increasing number of droughts being more and more apparent especially after 1981.”¹⁸⁶⁷ The statistics in Table 5 illustrate this conclusion.

Table 15. Droughty/rainy years in Romania, 1901-2010.¹⁸⁶⁸

"Country Report
Drought conditions
and management
strategies in
Romania"

" for the Initiative on "Capacity Development to support National Drought Management Policy" (WMO, UNCCD, FAO and UNW-DPC).

According to a vulnerability assessment by the European Environment Agency,¹⁸⁶⁹

drought related periods (regarding intensity, duration and spatial extension) have been more frequent and severe in the last decade and have had a very negative effect upon crop yields. Some of the years may be considered as catastrophic given their impact on the main yield of winter wheat and maize crops – the most important crops in Romania. Some research studies and data from the Ministry of Agriculture and Rural Development have shown that the decline in crop yields reached 40-60%, especially in the southern part of the Romanian Plain. In the excessive drought years, the main crop yields have been partially or entirely compromised in the areas without irrigation systems. The critical development stage of these crops (formation of the reproductive organs during flowering and grain filling) very often coincides with almost total depletion of the available water supply in the soil and with the maximum evapotranspiration demand.

Figure 5 below shows a general picture of how long a drought takes across Romania's territory.

Technological hazards

In terms of technological hazards, the major risks in Romania are associated with nuclear plants, mining and chemical (petrochemical and rubber) industry.

Nuclear

Risks from nuclear pollution are associated with the Romanian nuclear power plant (NPP) at Cernavoda and the Bulgarian one at Kozlodui.

¹⁸⁶⁹ European Environment Agency (EEA, 2009), *Water resources across Europe – confronting water scarcity and drought. Technical report No 2/2009*. Quoted at www.climateadaptation.eu/romania/droughts/.

Figure 15: Average number of months/year with drought (referenced period 1951-2010).¹⁸⁷⁰

Source: European Drought Observatory, quoted by Popescu, A. *The dry road to vulnerability – A close-up of Romania's vicious dry spells* (September 2013).

The Cernavoda nuclear power plant is part of the 1980s strategy of the communist regime to make the country fully energy independent. According to an updated observation study, "... the big dam projects on the Danube River – Iron Gate II, Turnu Magurele and Silistra, large hydro projects in the Carpathian Mountains, and ambitious wind energy plans in the Danube Delta had to be realised and implemented. In fact, only several hydro projects in the Carpathian Mountains and the Iron Gate II became a reality."¹⁸⁷¹

The same study reports that with the end of Communism, "the Cernavoda project was halted, but shortly afterwards, construction of unit 1 continued, coming on-line on 11 July 1996. After this, construction of Cernavoda 2 was also restarted, which came on line on 7 August 2007."¹⁸⁷² In terms of design, "reactors in Cernavoda are based on the Canadian CANDU6 design, which, according to the Western European Nuclear Regulators Association, has not changed since 1979."¹⁸⁷³

The Kozloduy NPP in Bulgaria has two operational reactors (Russian design VVER 1000), while four of older design were closed down. Intentions have been announced to build a new reactor, based on a different technology, but experts question to utility of the project.¹⁸⁷⁴

www.capital.bg/politika_i_ikonomika/bulgaria/2015/04/01/2504355_proektut_za_sedmi_blok_na_aec_kozlodui_propada/.

Other sources of concern are nuclear reactors used for research and engineering purposes. Figure 6 below illustrates the dislocation of nuclear facilities and estimates of the risks from the major nuclear facilities in Romania and bordering Bulgaria.

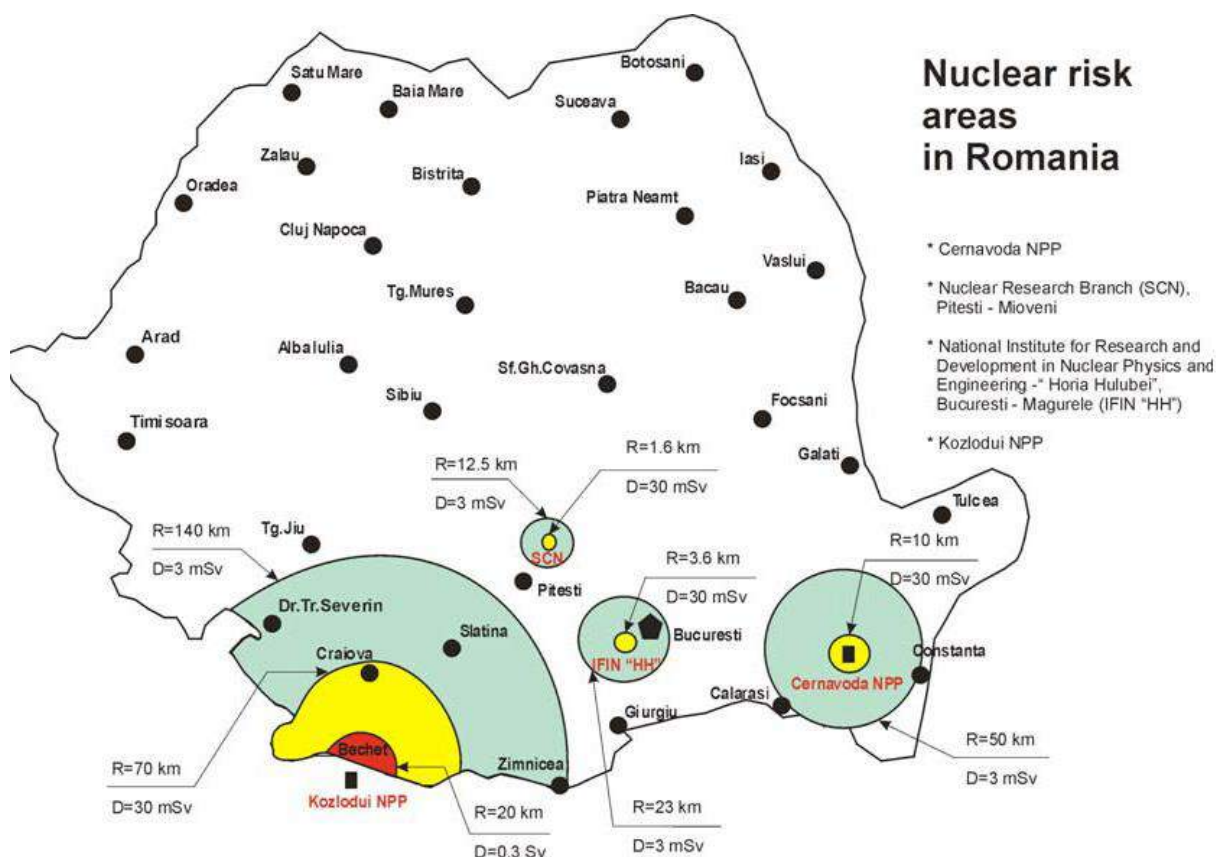

Figure 16: Nuclear risks areas in Romania

Source: UNISDIR, 2008. Courtesy of the Romanian General Inspectorate for Emergency Situations.

Mining-environment

Technological hazards relate also to industrial mining and storing related waste. In one notable case, “on 30 January 2000, the dam containing toxic waste material from the Baia Mare Aurul gold mine in North Western Romania burst and released 100 000 cubic meters of wastewater heavily contaminated with cyanide, into the Lapus and Somes tributaries of the Tisza river, one of the biggest in Hungary. The cyanide-contaminated water was carried to the river Danube that flows through Serbia, Bulgaria and Romania.”¹⁸⁷⁵ Reports from the area indicate that there was extensive damage to the river ecosystem and its fauna (between 80 and 100 per cent of the fish stock has been killed) while another wildlife has also been affected, including Mute Swans, Black Cormorants, foxes and other carnivores. The dam has been built as recently as 1998, and owned by Romanian interests and an Australian company. (UNEP/OCHA, 2000)

Chemical industry

The chemical industry in Romania is a traditional branch – one of the largest in Eastern Europe. According to the Romanian Ministry of Finance, at the end of 2011 there have been “...4 598

¹⁸⁷⁵ Kanthak, J., Greenpeace report: *The Baia Mare Gold Mine Cyanide Spill: Causes, Impacts and Liability*. Available at <http://reliefweb.int/report/hungary/baia-mare-gold-mine-cyanide-spill-causes-impacts-and-liability>.

companies operate in the sector, generating a total turnover of €10.53 billion and employing 89 696 people.”¹⁸⁷⁶ More than 75% of them are micro business while only 7% could be classified as middle (248), large (48) and very large (10 with more than 1 000 employees). Their main activities could be grouped in four clusters: Manufacture of coke and of refined petroleum products (19), manufacture of chemicals and chemical products (20), manufacture of basic pharmaceutical products and pharmaceutical preparations (21), and manufacture of rubber and plastic (22).¹⁸⁷⁷ However, according to the Romanian Chemicals Producers and Distributors Association the number of companies in the chemical sector has declined at the end of 2013 with 22 per cent compared with two years earlier.¹⁸⁷⁸

As Figure 7 illustrates that most of the production sites are distributed South from the Carpathian Mountains where are located the main oil sources and big refineries, and the highly populated areas as well.

Figure 17: Chemical industry risks areas in Romania.

1.2 Policy and Governance

Romania has been exposed to a range of natural disasters and several industrial catastrophes during the last several decades, causing human, economic, social and psychological distress and damages.

¹⁸⁷⁶ Quoted by Claudiu Tuncu, President Romanian Chemicals Producers and Distributors Association (APDCR) in a publication for *Landscape of the European Chemical Industry*. Available at <http://www.cefic.org/Documents/Landscape-European-chemical-industry/Landscape-of-the-European-Chemical-Industry-March-2014.pdf>.

¹⁸⁷⁷ Source: The Coface Economic Publication Panorama, 2013.

¹⁸⁷⁸ Ibid., Claudiu Tuncu.

Modern crisis management policy for civil security is still in a process of setting up. Similar to other former communist countries, the culture behind policy-making and implementation is dominantly reactive and, to a minimum degree, preventive and proactive. From a social psychological point of view, the general expectation is that any kind of emergency preparedness, actions and reactions are the exclusive responsibility of the state, while the role of the citizens is minimal, even concerned their own property and values.

Such a cultural mindset robustly reflects the building of country's new crisis management architecture, namely the set of institutions, norms, procedures and practices. Similar to other former Warsaw Pact countries, the civil security system in Romania has been built as a component of the national defence organisation with typical characteristics as a strong centralisation (more power to the "centre" than to any local authority), hierarchical decision-making and ministerial based resourcing. It has been organised to address mostly the consequences of war (both conventional and nuclear) and, as a secondary function, those from natural disasters and industrial accidents.

A strong signal about the need of serious improvements in the civilian protection organisation of the country have been the tragic consequences of the 1997 earthquake in Vrancea: 7.2 on the Richter scale caused 1 570 dead (according to other sources, 1 578), 11 300 injured, 32 900 houses collapsed or severely damaged, 35 000 families displaced, 763 business units affected. The damage amounted to 10 billion lei, the equivalent of more than USD 2 billion. The lesson has been to establish a new professional civil protection organisation at both national and local levels. Zulean and Prelipcean (2012) argue that the "Law no.2/1978 regarding civilian defence set up the norms, rules and institutions both on a national and a local level to take measures in the case of natural and man-made disasters within the system of national defence." Despite the fact that the new arrangements place the civilian defence again under the umbrella of the Minister of Defence, there is a special Commandment of Civilian Defence, consisting of non-uniformed professionals.

The first in Romania civilian organisation for emergency management has been established in 1996 under the supervision of the Minister of Interior. The Law of Civil Protection No 106 sets a unified design for the responsibilities of the personnel in charge of that matter and laid down guidance for operations in emergency situations.

Over the last two decades, the focus on over-centralisation has been shifted (very slowly) towards the establishment of a system that is more relevant to the contemporary European crisis management practices. However, several international research and assessment projects have identified serious weaknesses in key components of policy-making, organisation, legislation and professional performance. For example, a World Bank's country report from the Hazard Risk Mitigation & Emergency Preparedness Project indicated that "The current institutional setup and technical capacity are obsolete and do not match the requirements of a modern emergency management system, nor the requirements of the EU integration" (WB, 2004-11). This conclusion is confirmed by the risk assessment data presented above.

The major changes in policy-making and governance have took place in 2004 when the emergency management and civil protection service have been combined into a unified system called, "National System for Emergency Management" and the General Inspectorate for Emergency Situations has been established by merging and reorganising the General Inspectorate of the Military Fire-fighters Corps and the Civil Protection Commandment. (Nițică, 2013)

The current civil protection management in Romania is not organised strictly according to the modern emergency management construct that includes prevention, mitigation, preparedness, response and recovery or to the European Civil Protection Mechanism, adopted in 2007 (EC

779/2007, Euroatom). According to the Government Emergency Ordinance No 21/2004 (Art. 3), the principles of emergency management are:

- *Prediction and prevention;*
- *Priority protection and rescue of people's lives;*
- *Compliance with the fundamental rights and freedoms, accountability for emergency management of the public administration authorities;*
- *Cooperation at national, regional and international level with similar bodies and organisations;*
- *Transparency of activities carried out for the emergency management, continuity and gradualness of emergency management activities, efficiency, active cooperation and hierarchical subordination of the components in the National System.*

These principles have been transferred into a three-phase mechanism that actually reflects the preliminary risk reduction work, actions during emergencies and post-crisis activities:

- Pre-disaster measures and activities;
- Disaster response activities;
- Post-disaster measures and activities.

1.2.1 Strategy scope and focus

An international regional research project, led by UNISDR and the World Bank (UNISDR, 2008), identified that “civil protection is viewed in Romania both in terms of the traditional concept of protection and rescue and the broader notion, prevalent in the EU, that each citizen has the right to safety at home, at work and while travelling around the country. Moreover, each citizen has the right, as well as an obligation, to be trained in protection and rescue and to receive full and timely information about all threats of disaster, as well as all available protection measures and activities.”¹⁸⁷⁹

Crisis management and emergency preparedness in the context of natural and technological disasters seems to be a component of the National Security Strategy of Romania as it “refers primarily to the following fields and activities: the rule of law, citizens’ safety, public security and national defence, protection against natural disasters, degradation of living conditions and industrial accidents.”¹⁸⁸⁰

From normative point of view, the National Strategy on Civil Protection (2005) determines the civil protection in the following way:

Under the law, the civil protection is a component of the national security system and represents an integrated set of specific organisational, technical, operational, humanitarian and public information activities, measures and tasks, planned, organised and carried out for preventing and reducing disaster risks, protecting people, property and the environment against the adverse effects of emergencies, armed conflicts and their aftermath, and for operative removal and securing the conditions necessary for the survival of affected individuals. The protection of population is a

¹⁸⁷⁹ UNISDR, World Bank and others (UNISDR, WB, 2008), *The Structure, Role and Mandate of Civil Protection in Disaster Risk Reduction for South Eastern Europe*, available at www.unisdr.org/files/9346_Europe.pdf.

¹⁸⁸⁰ The National Security Strategy of Romania, 2007, available at <http://www.isn.ethz.ch/Digital-Library/Publications/Detail/?ots591=0c54e3b3-1e9c-be1e-2c24-a6a8c7060233&lng=en&id=156800>.

*national interest; it is a permanent function performed under the law by the central and local public administration authorities, other legal subjects and private Romanians.*¹⁸⁸¹

The scope of the civil protection strategy includes natural hazards and technological risks. Earthquakes, landslides and avalanches are emphasised along with floods, heavy snow and effects of temperature extreme variations such as frosts, droughts, and prolonged heat waves. Epidemics and epizootics are also foreseen as potential hazards. The technological risks are broadly defined as results from human activities that might threaten the life of people or destruct important infrastructures.

Generally, the crisis management strategy of Romania during the last two and more decades gradually moves in four main directions as thinking, approaching and developing:

- a) Towards progressively established balance between military/civil defence and civil security/civil protection. This process is not completed and is accompanied with inter-institutional frictions.
- b) From mostly consequence management towards prevention and risk reduction. A significant role for such developments plays the transposing of EU norms to the Romanian internal legal arrangements and the intensive international cooperation with the UN institutions, the World Bank, Germany, Norway, Japan, and others. An important result from the partnership with the World Bank is the development of Emergency Management Information System (EMIS).
- c) From a completely centralised system towards a vertical equilibrium in crisis management decision-making. This process is also not completed yet as its implementation requires the building of huge capacity for a large number of local and regional authorities. The decentralisation of funding is a component of this process as well.

Table 6 illustrates the gradual elaboration of the Romania strategic goals in the area of civil protection for the periods 2011-13 (NPR, 2011) and 2013-15 (NPR, 2013).

Table 16. Elaboration of the Romania's civil protection strategic goals for the periods 2011-13 and 2013-15.

¹⁸⁸¹ National Strategy on Civil Protection (2005), p.1.

Strategic Goal Area 1: The more effective integration of disaster risk considerations into sustainable development policies, planning and programming at all levels, with a special emphasis on disaster prevention, mitigation, preparedness and vulnerability reduction.

Strategic Goal Statements 2011-2013

1. Establish the legal framework for National Platform for Disaster Risk Reduction.

2. A national policy and a plan for implementing disaster risk reduction measures at all levels and also a system to monitor the progress in this field are in place.

Strategic Goal Statements 2013-2015

1. Establish the new legal framework for National Platform for Disaster Risk Reduction according to changes made to the National System for Emergency Situations.

2. Also make The National Platform a functional organism it is priority because it will be the main entity dealing with the disaster risk management.

Develop a flood risk management plan for important areas until the end of 2015.

Strategic Goal Area 2: The development and strengthening of institutions, mechanisms and capacities at all levels, in particular at the community level, that can systematically contribute to building resilience to hazards.

1. Disaster risk reduction strategies and plans are based upon national risk assessment.

2. Local emergency volunteers' services are strengthened with a focus on prevention and preparedness.

3. Local authorities have responsibilities in implementing disaster risk reduction plans at community level.

1. Strengthening the prevention component of the volunteer emergency services.

2. Running an institutional analysis to identify the need for dedicated departments in order to implement the disaster risk reduction strategies.

3. Standardizing the information exchange protocols between responsible authorities for management of disasters in order to implement DRR in a unitary way at all levels.

Strategic Goal Area 3: The systematic incorporation of risk reduction approaches into the design and implementation of emergency preparedness, response and recovery programmes in the reconstruction of affected communities.

1. Lessons learned are integrated in response plans.

2. Local authorities ensure permanent update of General Urban Plan, taking into consideration the hazard maps.

3. Local emergency volunteers' services have sufficient personnel and better equipment.

1. Develop a methodology for damage and needs assessment in order to facilitate the incorporation of disaster risk reduction into the reconstruction phase.

2. Conducting a risk management capability assessment in order to prioritize investments for raising capacity.

1.2.2 Monitoring and analytical support to policy making; R&D

The Romanian authorities see the monitoring and analysis of hazards as one of the key objectives of the National Civil Protection System: “In order to achieve this fundamental goal, the strategy of civil protection in Romania defines the following objectives:

- Identifying, monitoring and managing the types of risks generating existing natural and technological disasters in Romania or on the territory of neighbouring states that could affect the national territory.”¹⁸⁸²

With respect to the functions of the National Emergency Management System, the following tasks pertain to that objective:

- To monitor the parameters of all obvious sources of risks;
- To collect and process data, to be shared within the system when they overcome established concrete limits of attention.

Monitoring and analyses are also seen as “prevention information.” Prevention information is the result of the application of a set of actions and measures that ensure relevant awareness of citizens and institutions on the existing and possible risks in a certain time and place (including through training and orientation), and on the protective measures and behaviour they should follow in case of emergency. Ministries and state agencies, local authorities, volunteers, healthcare service, media, environmental specialists, industry, and NGOs are engaged to collect and deliver out preventive information.

However, the system for monitoring of natural hazards has not been completely reformed. Some of the sectors have been developed within the environmental policy framework (water, air quality, Black sea water, forests, etc.) while others have been established after major natural disasters (earthquake, floods, landslides, etc.). They are at different levels of modernisation and operate more independently than as a system. In reality, there are several major areas and issues to monitor, from which the information flows towards various ministerial crisis management centres and to the GIES. Decision-making is either ministerial or for the committee that is supported by the GIES.

Monitoring is organised in the following way.

The most comprehensive and sustainable monitoring systems are:

- *Seismic monitoring and early warning system.* According to Marmureanu et. al. (2010), “The early warning system consists of several different parts: a dedicated acquisition system, algorithms to rapidly detect seismic events, algorithms that eliminate false detections and alarms and methods to estimate the earthquake’s magnitude and to send the warning to the users. All of these parts have been designed to work automatically, in real time, without interruption for a long period. ...The average absolute error is low of 0.171 magnitude degrees. The software developed by National Institute for Earth Physics was tested during the Vrancea earthquake on April 25, 2009, when the magnitude (Mw=5.7) of the earthquake was computed in the first 4 seconds with an accurate value.”¹⁸⁸³
- *A meteorological system for the prevention of hazards associated to severe hydro-meteorological phenomena.* The National Meteorological Administration maintains an automated national meteorological system. The core of the system is the National Meteorological

¹⁸⁸² National Strategy on Civil Protection (2005), p.5.

¹⁸⁸³ Source: Romanian presentation at The Third International Disaster and Risk Conference IDRC Davos 2010 Davos, Switzerland, available at <http://www.slideshare.net/GRFDavos/davos-2010prezentareppt>.

Forecast Centre, which provides data collection from different sources as radars, and surface automatic observation stations for air/water and rainfalls measurements and forwards information to a variety of operational bodies. As stated in the Romania report (HYOGO, 2005), “[a]mong the benefits of this new system are: continuum information and data flow regarding the hydrological and meteorological status; the compatibility and informational integration with other international meteorological networks; anticipation of the water quantities (rain and snow) that will fall in a certain area on an certain period of time; the anticipation of the floods produced by the rainfalls, storms, tornados and torrents; the anticipation of the atmospheric pollution dispersion; the anticipation of the rain and ice storms (the areas where the aerial electric and phone wire network will be affected).”¹⁸⁸⁴ According to Gabriela Isac, the Romanian meteorological monitoring system includes “159 surface weather stations (110 automated and 49 classical), of which: 55 stations with an agro-meteorological programme, 9 stations performing actinometrical observations, 2 upper-air stations, 8 Doppler radar systems, a detection of atmospheric electric discharges system, a system for the reception of MSG satellite data and 70 rain gauges.”¹⁸⁸⁵

- *Hydrological risk monitoring.* According to Gabriela Isac, “The Hydrological Information System (HIS) and the organisations it supports are divided into multiple levels of operational responsibility, including sensor-level operations, sub-basin level operations, basin-level operations, and national-level operations. Each of those operational levels is further broken down into elements dealing with automated sensors, hydrological operations processing, dispatch operations processing, communications, and interfaces with existing Romanian infrastructures.”¹⁸⁸⁶
- *Integrated water monitoring system* in Romania has been established in accordance with Article 8 (1) of the Water Framework Directive (2000/60/EC). It has been operational since 2006 and includes six subsystems covering rivers, lakes, transitional waters, coastal waters, groundwater, and wastewaters (control monitoring of wastewater discharged into natural receivers). The monitoring of the water is done by the National Administration “Romanian Waters” through its territorial units (in some sections of the Danube delta and in coastal waters the monitoring is done by the National Institute of Development Research “Danube Delta” – Tulcea and the National Marine Research Institute that “Gheorghe Antipa” – Constanta).¹⁸⁸⁷

According to Government Ordinance No 2288/2004, Annex 2, the functions related to monitoring of hazards and risks and their negative effects are divided among various ministries and state agencies in the following way:¹⁸⁸⁸

- Centralisation of data and information on hazards and risk monitoring, as well as their negative effects: Ministry of Internal Affairs through the GIES;
- Quality of air monitoring: Ministry of Environment and Climate Change;

¹⁸⁸⁴ National Report Regarding the Disasters Prevention in Romania (HYOGO, 2005), p. 17. Available at <http://www.unisdr.org/2005/mdgs-drr/national-reports/Romania-report.pdf>.

¹⁸⁸⁸ The original text is available at www.crucearosi.ro/uploads/Legislatie/Hotarare%202288%20din%202004%20-%20functii%20de%20sprijin.pdf. The names of several ministries were changed accordingly in the current (end 2014) Government.

- Environmental monitoring: Ministry of Environment and Climate Change;
- Seismic hazard monitoring: National Institute for Earth Physics (INCDFP) and National Institute for Research & Development in Construction;
- Monitoring of hydrological phenomena on watercourses and quality their waters: Ministry of Environment and Climate Change through National Administration “Romanian Waters”;
- Monitoring the main hydraulic works: the Hydro administrator, Ministry of Environment and Climate Change and the Ministry of Economy;
- Monitoring dangerous weather phenomena: Ministry of Environment and Climate Change, National Meteorological Administration;
- Public health monitoring: Ministry of Health;
- Monitoring shipments of hazardous chemicals: Ministry of Transport;
- Monitoring of sources of nuclear and radiological risks: National Commission for Nuclear Activities through the Nuclear Agency & Radioactive Waste;
- Monitoring of nuclear activities and transport of nuclear fuel and radioactive material: National Commission for Nuclear Activities;
- Hazard monitoring of special nuclear research and development facilities: Ministry of National Education;
- Monitoring of safety construction: State Construction Inspectorate;
- Monitoring of economic sources of chemical risks: Ministry of Environment and Climate Change, Ministry of Internal Affairs, the Ministry of Economy and the National Dangerous Chemical Substances Authority;
- Monitoring of the economic sources of risks of fire and explosion: Ministry of Internal Affairs and Ministry of Economy;
- Monitoring shipments of military explosives: Ministry of Defence;
- Monitoring of sources of risks of military explosions: Ministry of Defence;
- Hazard and risk monitoring signalled externally: Ministry of Foreign Affairs through the Crisis Operation Centre;
- Hazard monitoring for communications networks and information: Ministry of Communications and Information Technology, Special Telecommunications Service and the National Regulatory Authority for Communications;
- Monitoring of critical infrastructure security: the ministerial committees for emergency situation;
- Monitoring of food safety: National Sanitary, Veterinary and Food Safety Agency.

Analysis

Analytical work on threats assessment and risks identification is organised in two areas – natural hazards and technological risks. It is based on List of methods/procedures for fire risk assessment approved by the General Inspectorate for Emergency Situations.¹⁸⁸⁹

A Methodology for Risk Analysis Involving Industrial Hazardous Substances (in Romanian language, “Metodologie pentru analiza riscurilor industriale ce implică substanțe periculoase”)¹⁸⁹⁰ has been

¹⁸⁸⁹ Available in Romanian language at http://www.igsu.ro/documente/metode_avizate_risc_incendiu_02.06.2011.pdf.

introduced for risk analysis in the technological domain. It has been developed in accordance to the Directive 96/82/EC, the so-called Seveso II, and Directive 2003/105/EC, amending the latter. In Romania, Seveso II applies to several thousands of industrial establishments where a number of dangerous substances exceed the thresholds, established by the Directive. The authorities, responsible for the implementation of Seveso II, are:

- At the national level: the Ministry of Environment and Climate Change, National Environmental Protection Agency, the General Inspectorate for Emergency Situations, and the National Environmental Guard;
- At the regional level: Regional Directorates of the National Environmental Protection Agency and Regional Commissariat of National Environmental Guard;
- At the local level: Environmental Protection Agencies, County Inspectorates for Emergency Situations, and County Commissariat of National Environmental Guard.

There are number of checklists and assessment guides developed for the implementation of the Methodology for Risk Analysis Involving Industrial Hazardous Substances, as follows:

- Site inspection checklist for fertilisers;
- Checklist for inspection of activities of the mining industry;
- Checklist for inspection in refineries;
- Checklist for inspection of liquefied petroleum gas deposits;
- Assessment guide for external emergency plan;
- Implementation guide for Seveso spatial planning and urbanism;
- User rating for security reports.

According to the Government Ordinance No 2288/2004, Annex 2, chapter C, the risk assessment functions are dedicated to different ministries and state agencies in the following way:

- Mass illness: Ministry of Health/Directorate General for Public Health and the State Sanitary Inspection, National Centre for Surveillance and Control of Communicable Diseases and the National Veterinary Services and Food Safety;
- Epizootic diseases/zoonosis: Ministry of Agriculture and Rural Development and the National Sanitary, Veterinary and Food Safety Authority, in collaboration with the Ministry of Health;
- Failure cosmic objects: Ministry of Education and Research/Romanian Space Agency, Ministry of Internal Affairs, Ministry of Defence;
- Collapse of land caused by mine explosions: the Ministry of Economy and administrators of geological exploitation;
- Collapse of land in urban areas: Ministry of Transport, Ministry of Internal Affairs/local government;
- Landslides: Ministry of Internal Affairs/National Agency of Cadastre and Land Registration and the Ministry of Transport;
- Biological threat: Ministry of Health and the National Sanitary Veterinary and Food Safety Authority;
- Ecological threats: Ministry of Defence and Ministry of Environment and Climate Change;

¹⁸⁹⁰ Available in Romanian language at www.igsu.ro/documente/seveso/Metodologie_analiza_risc_final.pdf.

- Threats to critical infrastructures: Ministry of Transport, Ministry of Communications and Information Technology, Ministry of Economy, Ministry of Environment and Climate Change, Ministry of Health, Special Telecommunications Service and the Protection and Guard Service.

The organisation for monitoring and analysis of hazards in Romania is comprehensive and covers all key sources of natural and industrial risks. A work for internal integration between different sub-systems based on modern telecommunications solutions is in progress. Implementation of the EU directives is advanced based on specialised EU funding. Cross-border and regional co-operation for early warning and analytical work has been established and is expanding.

1.2.3 Policy for Prevention

The policy of prevention at a national level is dedicated to a specialised structure of the General Inspectorate for Emergency Situations, entitled "Prevention Inspection" and led by a Deputy Inspector General. Its objectives include:

- *Ensuring compliance with normative acts and other regulations on fire safety and civil protection;*
- *Identification, evaluation and analysis of potential hazards by assessing the probability of their occurrence and the consequences they entail for human life, environment and property;*
- *Risk awareness by exchanging information between different institutions, policy-makers, and other stakeholders and actors interested and/or involved in civil protection;*
- *Public information on potential risks.*¹⁸⁹¹

The main forms of prevention include drafting and approval of specialised regulations, authorisation of measures and preventive activities, providing of a specialised technical assistance, sharing of preventative information with the national and local authorities, agencies, stakeholders and the public. A special attention is paid on the timely and relevant preparation of the population, business and authorities for emergencies. Performing a strict control for violation of emergency related legal provisions is also seen as an instrument of prevention.¹⁸⁹²

1.2.4 Policy for Preparedness

The policy for preparedness to cope with civil emergencies is comprehensive and includes three domains: pre-disaster research, monitoring and analysis of hazards and risks, planning for emergency response, and organising of professional, voluntary and business capabilities.

The primary objective within the pre-disaster research, monitoring and analysis of hazards and risks is their identification by character and area of possible exploration, monitoring of those sources and analysis of their escalation in time and scope. This work results in drafting and implementing of specially funded programmes and plans for risks mitigation and in building and maintaining of a nation-wide early warning and alert system.

Based on hazards and risks analyses operational plans are drafted that reflect hypothetical scenarios for different hazards, including combined of different types and of mixed natural-technological character. Their primary objective is to provide relevant and timely preparation of the population,

¹⁸⁹¹ Source: http://www.igsu.ro/index.php?pagina=prevenire_generalitati.

¹⁸⁹² Ibid.

institutions, infrastructure, and specialised units for disaster response with emphasis on the organising, equipping and training of professional and volunteer crisis response units. Planning is done for each county and the capital city of Bucharest, for each town, as well as for public and educational institutions and businesses.

Organising and training of professional, voluntary and business capabilities is aimed to maintaining a strong, reliable, and sufficient quantity of prepared people and resources in size and scope relevant to the risks assessments. Training is provided in a formal framework for the professional institutions; non-formal seminars, workshops, round tables for a large number of participants; and informal – through different media and public happenings.

An important aspect of the policy for preparedness is the systematic improvement of the crisis management related legislation, including further transposing of the relevant EU Directives.

1.2.5 Policy for Response

The National Strategy on Civil Protection determines the overall policy for response in cases of emergencies (also in cases of an armed conflict). The policy is aimed to maximum limit the surprise throughout the population and authorities, implementing measures to protect people and property and limiting the effects of disasters (also air attacks and military actions) on people, animals, and infrastructure.

According to the Strategy on Civil Protection, the policy of response is based on three mutually reinforcing components: alarming, updating of planning, and response operations:

- The timely and effective alarming of the population and authorities is seen as a key factor for relevant response operations.
- Reviewing and updating the deliberate plans and taking protective measures to limit the scope of the danger and damages is the national and local authorities primary aim.
- The timely deployment and intensive conduct of information-based operations by the specialised formations, specialists and volunteers to protect the lives of the people and important infrastructure are seen as core functions of the overall civil protection policy. Evacuation of people, animals and other valuable material goods out of danger zones, providing shelters, immediate medical treatment and other life-support are operational priorities.
- Following the developments on the field, a further raising the capacity for crisis response by forces and means through mobilisation, outreach and making requisitions is expected.
- Policy also includes sharing information, analysis and assessments with neighbouring countries and international organisations as well as requesting of international support in case of a need.¹⁸⁹³

1.2.6 Policy for Relief and Recovery

The policy for relief and recovery is formulated as “post-disaster measures and activities,”¹⁸⁹⁴ which are organised and performed in short-, medium- and long-term frameworks to include:

¹⁸⁹³ Source: the Government of Romania, *National Strategy on Civil Protection* (Published in Official Gazette no. 600 of 12 July 2005). Available in Romanian language at www.igsu.ro/documente/legislatie/HOTARARE_Nr_547.pdf.

¹⁸⁹⁴ Ibid, National Strategy on Civil Protection, p. 8.

- The short-term civil protection measures include continued search and rescue operations, improvement of the situational awareness about the losses and damages, caused by the disaster, drawing analysis and recommendations for further actions and measures, taking measures for immediate support of the people in need, improving the quality of measures, taken during the period of rapid response, and maintaining the cross-regional and cross-border co-ordination and support.¹⁸⁹⁵
- In a mid-term timeframe, the focus is on restoration of the vital social, economic and security functions within the damaged areas and throughout the country, creation of normal living conditions for the population, including through collection, storage and equitable distribution of essential national and foreign humanitarian aid, restoration of the main elements of affected infrastructure and utilities management.¹⁸⁹⁶
- In a long-term perspective, measures and actions will continue to provide support to the affected population, removing the effects of disasters and helping to resume the normal economic and social activities, eventual relocation of evacuated population, restoration of civil protection assets, materials and funds used in response actions.¹⁸⁹⁷

Addressing the overall challenge of disaster prevention, mitigation and response require a comprehensive approach to the continuum of disaster risk assessment, forecast, prevention, preparedness and mitigation (pre- and post-disaster), bringing together the different policies, instruments and services available to the state, regional and local authorities. In Romania, most of the important components exist, but their integration and optimisation into a real modern and effective “system” yet to happen. Some Romanian authors (e.g., Zulean, Prelipcean, 2012; Tanislav, 2009) believe that the existing links between civil protection and environmental policies should be reinforced in order to take full advantage of the preventive measures included in environmental legislation and ensure an integrated approach to disaster prevention and mitigation.

1.3 Financing

In accordance with the National Strategy on Civil Protection (2005), funds should be allocated primarily to programmes that ensure the efficient and cost-effective crisis management. A second priority has been determined to be the balanced structure of the budget – the target being the average in NATO countries allocation of resources – 40% for personnel, 35-40% for investments, and 25-20% for operations and maintenance, to be achieved around 2008. The strategy also declares that the period 2008-2012 shall be dedicated to a modernisation of the equipment and training for crisis management interventions.¹⁸⁹⁸

1.3.1 Investing in preparedness

To achieve the strategy’s aims, the ministries, and the local and central public authorities are forced by law to provide funds for prevention and mitigation of disaster effects. According to Emergency Ordinance No 21/15.04.2004, the National Committee has the main duty to examine and propose to the Government for approval a national plan for ensuring human, material and financial resources

¹⁸⁹⁵

Ibid.

¹⁸⁹⁶

Ibid.

¹⁸⁹⁷

Ibid, p. 9.

¹⁸⁹⁸

We were not able to find more recent information on the achievement of those goals.

for the purposes of emergency management, elaborated by the General Inspectorate for Emergency Situations. Further, the Committee proposes to the Government the inclusion of funds in the annual state budget, necessary for emergency management.

In accordance with Public Financial Law no.500/2002, the state budget includes the Government's Intervention Fund, which is allocated, on the basis of Government decisions, for financing emergency actions with the view of eliminating disaster effects and supporting the individuals suffering from calamity.

Local and county councils, within their own budgets, must secure the necessary funds for intervention and prevention of disasters for the purposes of limiting and mitigating the disasters' consequences. In special cases, e.g. state of emergency, according to the law, there is a possibility of making requisitions of technical means and materials necessary for intervention. Perishable items and goods that can be used only once can be made requisite, according to the law, by paying a certain amount of money as compensation.

In addition to that, the annual budget of the Ministry of the Environment and Climate Change may contain funds for works for flood protection, as well as for repair of protection facilities damaged during the previous year. Through the annual budget of Ministry of Transport, funds may be allocated for multi-floor inhabited buildings' strengthening, if they are classified as being most exposed to seismic risk and thus represent a public danger.

Within the National Progress Report on the Implementation of Hyogo Framework for action for the periods 2011-13 and 2013-15,¹⁸⁹⁹ Romania has been asked to provide information on "the ratio of the budget allocation to risk reduction versus disaster relief and reconstruction." The answer includes the following information:

Table 17: Dedicated resources to implement disaster risk reduction activities in 2011-13 and 2013-15.¹⁹⁰⁰

Source:	Ratio: Risk reduction/Prevention (%)		Risk reduction/Relief and reconstruction (%)	
	2011-13	2013-15	2011-13	2013-15
National Budget	0.002	0.0158	N/A	N/A
Decentralised/sub-national budgets	1	0.003	2.5	0.002
USD allocated to hazard proofing sectoral development investments (e.g. transport, agriculture, infrastructure)	N/A	N/A	N/A	N/A

The 2011 report makes the following description:

Important amounts of money were invested in prevention activities and in disaster risk reduction measures, especially in the flood risk field. These funds are from the local councils, decentralized public services, central authorities and European programs. The investments in

¹⁸⁹⁹ Ibid. National Progress Report on the Implementation of Hyogo Framework for action 2011-13 and 2013-15.

¹⁹⁰⁰ National Progress Report on the Implementation of Hyogo Framework for action for the periods 2011-13 and 2013-15.

disaster risk reduction made by central authorities are easily identified (hydrotechnical works, hazard and risk maps, the program for the reduction of seismic risk of the buildings).

*At the local level, there are also current investments in disaster risk reduction (capacity building of the local emergency situations services, public awareness campaigns, the maintenance of ditches and dikes), investments covered by the emergency situations dedicated funds. These funds are dedicated for all prevention, response and recovery actions. Local authorities spend 0-4% of the local budget for disaster risk reduction measures and 0-10% for response and recovery, depending on the existing situation.*¹⁹⁰¹

Two years later, the report concluded that “Institutional commitments [were] attained, but achievements are neither comprehensive nor substantial.”¹⁹⁰²

1.3.2 Investing in consequence management

According to the World Bank, an important criterion for disaster consequence management is the insurance penetration, defined as insurance premiums as a percentage of the Gross Domestic Income (GDI). Non-life insurance (which consists mostly of property and automobile insurance) penetration is one of the criteria used to illustrate the ability of a particular society (not a state) to recover from heavy damages as of natural or man-made sources. However, specific data of catastrophic risk insurance in Romania are not available. This makes it difficult to explore the role of catastrophic insurance in financing natural disaster recovery. With these limitations, The World Bank has classified Romania as a mid-level country in terms of both GDI and non-life insurance penetration.

As part of the reforms in disaster management sector, initiated after 2004, Romania has introduced catastrophe-related insurance by adopting Law no. 260/2008, in force since 2009, on compulsory house insurance against earthquakes, landslides and floods, amended by Law no. 248/2010 (actually, in Romania there are only two compulsory insurances: the compulsory motor liability insurance and the compulsory home insurance, reflected in Figure 1). This law regulates:

- The terms and conditions of compulsory insurance for dwelling owned by individual legal entities;
- Relations between parties, their rights and obligations;
- The setting up, aims, goals, responsibilities, status, organisation and operations of the National Disaster Insurance Pool (PAID – Pool de Asigurare Impotriva Dezastelor Naturale).

Established according to the law, the Romanian catastrophic insurance scheme works the following way:

- Perils covered: earthquake, flood, and landslide;
- Property covered: dwellings only (both public and private), in accordance with the category of construction;
- Not covered: outbuildings, appurtenances, contents, temporary accommodation;
- Basis of loss: replacement cost or repair;
- Sum insured or limit of cover: EUR 20 000 or 10 000.¹⁹⁰³

¹⁹⁰¹ Ibid., National Progress Report on the Implementation of Hyogo Framework for action 2011-13, p. 6.

¹⁹⁰² Ibid., National Progress Report on the Implementation of Hyogo Framework for action 2013-15, p. 5.

¹⁹⁰³ Source: prof. Dumitru G. Badea, Chairman and CEO of the Romanian Insurance Institute.

Potential beneficiaries of PAID are about 8.4 million homeowners. Under pressure by the insurance business, some amendments to the law were introduced in 2010: homeowners who have bought a volunteer insurance policy are excluded from the obligation to buy a compulsory one. The major problems related to recovery funding are:

- The current legislation, which mixes volunteer products with compulsory policy, as the latter cannot compete with volunteer products (sum insured is four times higher);
- Poor financial education;
- Low level of insurance culture.

International aid

The European Union Solidarity Fund (EUSF) was set up to respond to major natural disasters and express European solidarity to disaster-stricken regions within Europe. The Fund was created as a reaction to the severe floods in Central Europe in the summer of 2002. Table 8 below¹⁹⁰⁴ provides information on the EU support for the disaster recovery during the last decade.

Disaster Relief Emergency Fund (DREF) of the International Federation of Red Cross and Red Crescent (IFRC) is also providing funds for disaster recovery to the country. After heavy floods in 2013, DREF has provided CHF 185,736 to support the Romanian Red Cross Society in delivering

Table 18. EU Solidarity Fund for Romania.

immediate assistance to some 900 families (3,600 beneficiaries), mobilising its branches in the affected territories and with the help of other stakeholders.¹⁹⁰⁵

The reviewed independent and academic studies agreed that despite declared priority, disaster management in Romania has not received special funding recently. There are specifically allocated funds for disaster management within the state budget and the local budgets. When needed, these can be supplemented by reallocating funds within the state budget by governmental decree, using resources from the so-called Intervention Fund. However, dedicated funding and resources are sometimes used in higher-priority areas, due to financial constraints.

Recent Romanian achievements in the areas of prevention, preparation, mitigation and risk reduction everything has been financed via the budgets of various ministries. Such practice is met often in South-Eastern Europe. However, the quoted studies underline that it could be successful only if investments are based on a well co-ordinated and properly managed a government-level national plan. The established in Romania mechanism for crisis management, led by the Government through the National Committee for Emergency Situations and administrated by the GIES, may provide such consolidation of efforts.

¹⁹⁰⁵ IFRC.

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

Post-crisis impact assessment involves a systematic analysis of socio-economic and environment losses and impact, along with reports that contain the disaster effects mitigation measures that were taken and also the measures that will be implemented to prevent that kind of situations. Those reports are presented to the Government and mass media and can be consulted by every interested person or institution.

The physical preliminary evaluation and the value disaster effects evaluation are a permanent care of the Romanian emergency management body, aiming to realise some urgent operative measures and also medium- and long-term rehabilitation and reconstruction measures in order to normalise the social-economic activities and to promote the long-lasting objectives.

At a local level, there are consequences evaluation commissions that use a specific methodology for estimation of the losses, to ensure compensations and provide necessary funds for situation normalisation. In cases of disasters with major consequences, governmental commissions are responsible for the assessment of the impact, sometimes involving cooperation with international experts.

1.4.2 Departmental lessons learned systems

Each civil protection institution is doing lessons learned for itself and reports to the central authority. For example, in its report on the floods in 2010, the GIES has focused on the following recommendations:

- To launch a major project for improvement of the flood prevention and protection in the upstream of Prut and Siret rivers;
- To build a system with automatic water level monitoring stations;
- To improve the level of preparedness of the local authorities;
- To strengthen cooperation with neighbouring countries;
- To improve the national disaster damage assessment regulations;
- To speed up the process of drawing up the risks maps according to the Flood Directive 2007/60/EC;
- To develop guidelines on the management of emergency situations generated by floods, dangerous meteorological phenomena, and hydro-technical accidents, and accidental pollutions (on rivers and sea shore);
- Romania to apply for support from the European Union Solidarity Fund.¹⁹⁰⁶

1.4.3 Centralised (national) lessons learned system

A specialised lessons learned-unit has not been established yet.

¹⁹⁰⁶ Presentation of the report is available at www.igsu.ro/documente/SAEARI/ROMANIA_Floods_2010.pdf.

1.4.4 International exchange for lessons learned

The General Inspectorate for Emergency Situations is the national contact point in relations with the specialised international organisations such as:

- Monitoring and Information Centre – MIC / Community Civil Protection Mechanism;
- Euro-Atlantic Disaster Response Coordination / NATO / EADRCC;
- Office of Coordination of Humanitarian Affairs / UNOCHA;
- Consultative Group on International Search and Rescue - INSARAG focal point.¹⁹⁰⁷

At a regional basis, exchange of lessons is provided mostly within the Initiative for Disaster Prevention and Preparedness in South Eastern Europe (DPPI SEE) within the Regional Cooperation Council.¹⁹⁰⁸

1.4.5 Regular policy reviews

Disaster management policy is not yet a subject of overall periodical reviews. As the ANVIL Project Deliverable 2.1 pointed out, “Published evaluations of the efficiency and effectiveness of Romanian civil security system are limited, but there are however a few reports on the major floods available.”¹⁹⁰⁹ Reporting mechanism includes mostly two types of documents: ministerial reports and inter-institutional reports.

The ministries that have legal obligations to monitor and lead the disaster response produce ministerial reports. They are post-factum and provide information mostly on the causes for the disaster and on “who-did-what.” Causes usually explain the connection between the specific natural phenomena and the man-made preconditions for disastrous consequences (as deforestation, wasting of watercourses, illegal house construction in landslide areas, etc.). The criterion for doing the right is based on instructions and guidance. Having these, ministries make their own assessment of the damage and draw conclusions on the organisation and performance of emergency management mechanism.

The inter-ministerial commissions have produced most of the policy review reports. Commissions are established depending on the type and scope of the situation under the supervision of the National Committee for Emergency Situations. The focus of these commissions is on circumstances, causes, interventions and comprehensive impact of emergencies. Reports include recommendations for improving the overall National Emergency Management System, including legal, organisational and capabilities aspects.

In any case, the reports are directed to the General Inspectorate for Emergency Situations and respectively, to the Minister of Internal Affairs. The latter presents a summary of the assessments and the recommendations to the National Committee for Emergency Situations, providing also a draft committee decision. Depending on the case, the abovementioned two bodies decide in what degree and format the post-emergency reports, conclusions and recommendations will be made publicly available.¹⁹¹⁰

¹⁹⁰⁷ Source: GIES web-site, http://www.igsu.ro/index.php?pagina=cooperare_internationala.

¹⁹⁰⁸ See <http://www.dppei.info/>.

¹⁹⁰⁹ ANVIL – Analysis of Civil Security Systems in Europe, Deliverable 2.1. p. 872. Available at http://anvil-project.net/wp-content/uploads/2014/01/Deliverable_2.1.pdf.

¹⁹¹⁰ However, there is no evidence that this mechanism has been followed throughout each emergency.

Non-governmental organisations such as the Red Cross also make post-disaster reports, which are focused mostly on damages and needs than on policy, performance and organisation.¹⁹¹¹ Caritas Romania Confederation has focused its work on community level of risk reduction and disaster preparedness.¹⁹¹²

Within the framework of different international projects, a variety of international organisations (UN, EU, The World Bank) and countries (Japan, Norway) have compiled or sponsored studies and produced reports on major aspects of the Romanian emergency management policy, organisation and practice. These are usually self-assessment reports or field studies. As a rule, they propose specific policy recommendations in different time perspectives:

- The ANVIL Project has made an assessment of the Romanian crisis management capacity from the point of view of “civil security”, focusing on three criteria: legitimacy, effectiveness, and efficiency. However, the project has produced “key findings” but did not draw policy recommendations.
- National progress reports on the implementation of the Hyogo Framework for Action (HFA) are based on self-declared strategic goals for a two-year period and a self-assessment sheet for the previous two years (the last report available is for the period 2011-2013¹⁹¹³). An example of the way these reports may contribute to policy improvement is the following assessment and recommendation: “The legislation concerning the management of emergency situations (crisis management) is put in place, each central and local authority having specific responsibilities on this issue. On the other hand, risk management is focused more on disaster prevention and mitigation rather than on risk reduction as a whole.”¹⁹¹⁴
- In 2007 the United Nations International Strategy for Disaster Reduction (UNISDR), within the context of the Global Facility for Disaster Reduction and Recovery (GFDRR) awarded a consultancy project to prepare a report of the risk assessment of the South East European countries. The Report analyses the risks from both vertical (country), and horizontal perspectives (SEE sub-region level) emphasising the trans-boundary disaster risks and their effects. Risk assessment of all the member countries is prepared along with addressing the country level and regional issues and area of cooperation. The report concludes with recommendations that are general for all SEE countries; for example: “The system must ensure a very close working relationship between the policy formulating body, the committee within the ministry responsible for national disaster management, and the operational agency/s that implement the decisions.”¹⁹¹⁵
- Another UN – World Bank sponsored regional crisis management study has been undertaken within the scope of the South Eastern Europe Disaster Risk Mitigation and Adaptation Programme (SEEDRMAP), in cooperation with a number of international and regional partners, including the European Commission. The study focused on four issues: legislation, organisation, funding, and societal engagement. An example from the policy

recommendation is; “Furthermore, risk assessment procedures are reasonably well established, although further development could enhance the ability to cope with potential future hazard scenarios, especially those related to climate change.”¹⁹¹⁶

—

1.5 Resilience

The concept of resilience is not an explicit component of the Romanian civil security policy. However, considering that resilience is the capacity of a state, society and communities to cope with the challenges of different hazards by changing or resisting in order to reach and maintain acceptable levels of functioning and structure, in Romania many activities have been initiated and measures have been taken to reduce the vulnerability of the country to the risk of disasters. Since 2004, different governments have taken the resilience approach, particularly in the enforcement of certain regulations. Romania is one of the South-Eastern European countries with a recognised success in the systematic incorporation of standards regarding the building and infrastructure codes.

As resilience is also the capacity of a community to grow through disasters, it is partially determined by the degree to which the social system is capable of organising itself to increase its capacity for learning from past disasters for better future protection and to improve risk reduction measures. Across the efforts, undertaken while reforming the civil protection service in Romania, one may identify some core elements that actually build-up on the ground of resilience as:

- Reducing the most dangerous vulnerabilities through improving legislation, investing in preparedness and monitoring, developing a relevant alerting system and building intervention capabilities.
- Mitigating the impact of natural and man-made situations applying protective standards in the construction of housing and critical infrastructure, implementing new insurance policy and culture, maintaining a rapid reaction capacity and reserve materials.
- Improving the education and training at all levels and developing towards knowledge based disaster management.

During the decade after 2004, Romania has been very active reforming inherited ineffective civil protection service using the paradigm of resilience: to addresses the loss of life, property and economic productivity caused by weather extremes and other natural hazards in the context of the implementation of the Hyogo Framework for Action 2005-2015: Building the Resilience of Nations and Communities to Disasters. To that end, Romania has three focus areas:

- Hydrometeorological forecasting, data sharing and early warning;
- Coordination of disaster mitigation, preparedness and response; and
- Financing of disaster losses, reconstruction and recovery, and disaster risk transfer (disaster insurance).

The resilience concept, as part of the national civil protection policy, has been already realised through non-structural channels such as urban planning and building codes. According to the UN study, “[r]isk maps are being developed covering every locality considered to be in a risk area to chart the risks posed by hazards including floods, earthquakes and landslides. The maps identify hazards and populations at risk and include information about measures needed to prevent disasters

¹⁹¹⁶

Report is available at http://www.unisdr.org/files/9346_Europe.pdf. Quoted text at p. 156.

caused by natural or technological hazards. The maps will be accessible by all interested parties and will be included in urban development plans to manage building and land use” (UNISDIR, 2008, p. 156).

Regarding standardisation, starting on 31 October 1998, the Romanian Standards Association (ASRO, Asociația de Standardizare din România) has taken over the position of a specialised private body of public interest on standardisation issues. It is a not-for-profit association, authorised by the Government, replacing, in this respect, the former Romanian Standards Institute. In conformity with Law 355/2002, the Romanian Government granted ASRO governmental recognition as a National Standardisation Body for standardisation in all aspects of European and international standardisation. The association represents Romania in the international standardisation process by coordinating the national input, organising delivery of information on standards and providing a wide range of services both for the distribution of standards and for accredited certification activities. It also issues (in printed form and on electronic media) various publications and performs training courses. ASRO members represent the industry, the economy, the research and development area, consumers, national authorities, university media, certification bodies and various other stakeholders, all standards users and developers.

There is no available information for the implementation of ISO/TC 223 Societal Security in the country’s overall crisis management system. ASRO plan for 2014 does not envisage issues, related to crisis management, to be standardised.

1.6 Information sharing and data protection

Romanian disaster management concept and practice are based on, among other things, the understanding that efficient flow of information ensures a permanent connection with the National Emergency Management system’s objectives. The constitutionally guaranteed access to information is the grounds to improve the education and knowledge of hazards and crisis management, and this way, to further improve the culture of safety and resilience.

The National Strategy on Civil Protection determines that the success of civil protection depends primarily on the amount and quality of information. The Strategy also governs that one of the primary strategic missions is the collection and processing of data and information for any controlled parameters that go beyond the determined limits. However, the document does not specify how the sharing of information should happen.

Without being explicitly regulated, information about hazards and emergencies is viewed as preventive and operational. The legislation on civil protection (Law 481/2004) uses two terms regarding the delivery of information:

- Notification – an authorised transmission of information about impending or occurrence of disaster and/or armed conflict by central or local public administration authorities, as appropriate, in order to avoid surprise and the achievement of protection measures;
- Warning – providing the population with necessary information about impending or occurrence of disasters. (Art. 9, (1), c), and d))

In addition, Article 3, (1), b) from Law No 481/2004 determines that among the civil protection attributions are the collection, processing, storage, study and analysis of data and information on civil protection.

The information on hazards and emergencies is co-ordinated nationally by the Ministry of Internal Affairs and delivered through the General Inspectorate for Emergency Situations (GIES). According to the GIES, “[p]reventive information consists of all the actions and measures that ensure:

- Citizens’ awareness of the risks that could expose you to a certain time and a certain place, and on protective measures and behaviour should adopt in the event of an emergency;
- Educating citizens on how their alarm and permanent information in case of an emergency.”¹⁹¹⁷

The flow of information for decision-making and operational command and control is presented in Figure 8. During emergencies, operational information is aimed at clarification of the situation, analysis of the necessary measures, adaptation of contingency plans, warning (including internationally), and decision-making.

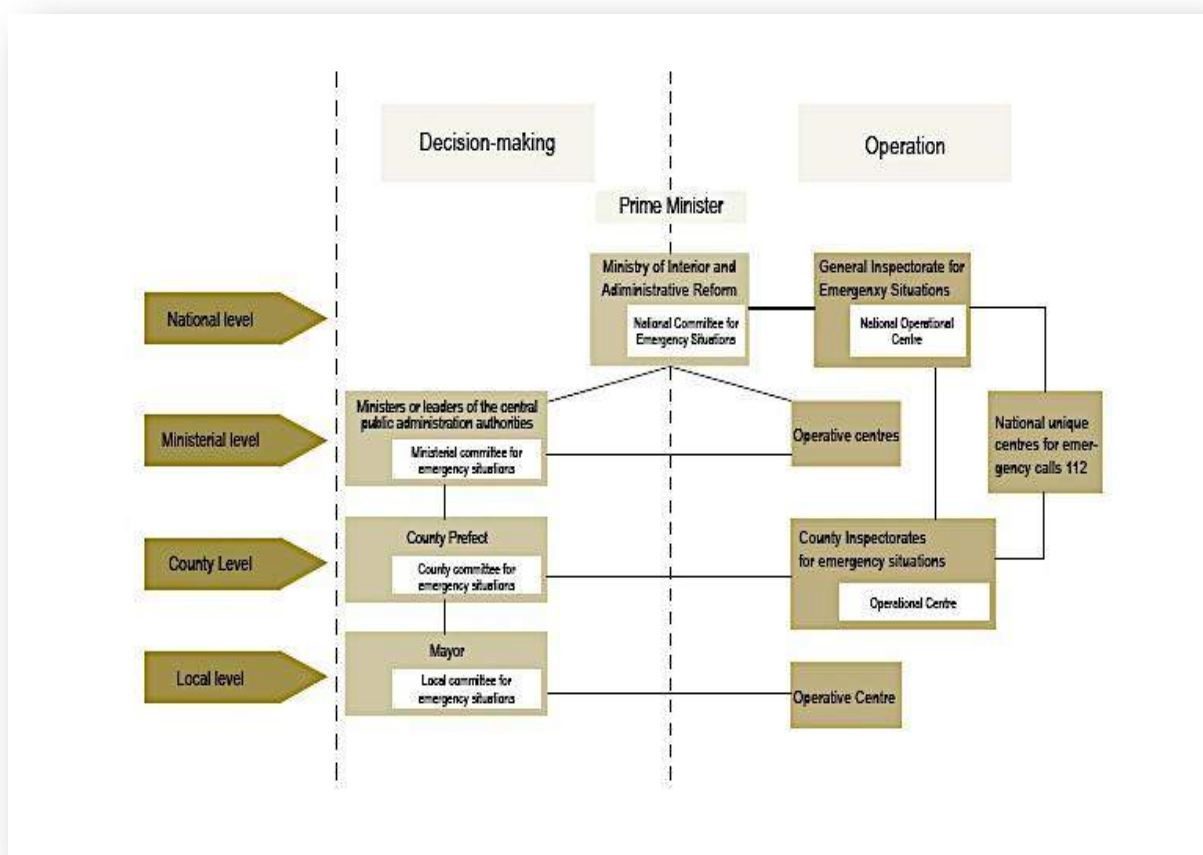

Figure 18: Flow of information in the Romanian National Emergency Management System.¹⁹¹⁸

¹⁹¹⁸ Source: UNISDIR, WB, 2008.

2 Legislation

Generally, the Romanian legal system belongs to the “civil law model,” under which only the Constitution and other statutory legislation constitute a legitimate source of legal rules. It does not recognise case law or judicial precedent as a source of legal rules. Previously decided cases, therefore, are not binding upon lower courts and do not create “a law.”

2.1 Crisis (emergency, disaster) management concept

The key conceptual document at the strategic level crisis management in Romania is the National Strategy on Civil Protection. It has been approved by the Government on 9 June 2005 and published in Official Gazette No 600 of 12 July 2005.

An important characteristic of the strategy is that it integrates civil (security) protection and traditional civil defence into one package. Among others, that determines a role of the military throughout the entire “peace-crisis-war” continuum. The civil protection tasking is done for:

- Peacetime (in terms of normality or of disasters that do not require the declaration of emergency);
- Crisis situations caused by disasters and declaration of state of emergency;
- Time of war.

The strategy determines four pillars of civil protection in Romania: credible response capability, restructuring and modernisation, enhanced operational partnership and gradual integration with EU and NATO (in terms of crisis management).

- Credible response capability. The concept is based on the understanding that the national civil protection in Romania must be permanently maintained in order to be able to respond effectively and appropriately to any escalating natural and technological risk or military threat. The response will be provided in two phases: pre-disaster actions and measures (in peacetime) and post-disaster measures and actions (over the short, medium and long term).
- Restructuring and Modernisation. The number of risks and scope of dangers they pose to Romania require that, in the future, forces and means emergency structures to grow in terms of efficiency and specialisation. Sizing and equipping them will depend on financial resources that the central and local government would be able to dedicate to civil protection. To strengthen the capacity of uniformed organisations, the central and local authorities support the establishment of volunteer formations.
- Enhanced operational partnership. Partnerships are seen as the best way to prepare civil protection structures in Romania to integrate into the collective security. It will amplify the dynamics of civil protection structures of other NATO and EU member states. In bilateral and multilateral cooperation, the civil protection structures of Romania participate in group exercises, joint forces and multinational operations for humanitarian assistance.
- Gradual integration.¹⁹¹⁹ Integration of Romania in NATO and EU is seen as a core factor for national security, including in civil protection context. Focus of international co-operations is placed also on OSCE and integration into the International Organisation of Civil Protection

¹⁹¹⁹ The National Civil Protection Strategy has been approved before Romania joined EU.

(ICPO).

The concept of civil protection has a comprehensive scope, but relatively short inwardness. Obviously, it suffers from the lack of relevant interpretation of modern civil protection practices and benchmarks. The inclusion of both peace and war time situations into one concept does not serve to the higher efficiency of its civil security component and keeps the over-centralised management, inherited from the past.

In September 2010, in the aftermath of the heavy floods in 2007, the National Strategy for the Management of the Flood Risk was adopted.¹⁹²⁰ This strategy address issues such as integrated management of the water sources, land management and urban development, environment protection including forestry and agriculture, protection of the transport infrastructure, tourist areas, and individual protection.¹⁹²¹

2.2 General crisis (emergency, disaster) management law

The legislative set concerning civil protection in Romania has been established and gradually improved over the last decades, beginning with the aftermath of the catastrophic earthquake in 1997, when one of the lessons learned was the need of having professional civil emergency personnel and organisation at the national and local level.

By way of background, Law No 2/1978 on civil defence assigned its organisation to the Ministry of Defence (a typical solution for the Warsaw Pact countries for that time) and led by Commandment of Civilian Defence. (Zulean, Prelipcean, 2012) In 1990, Romania ratified the additional First and Second Protocols of the Geneva Convention (1949), which provided a framework for further improvement of the civil protection service. The Constitution as of 1991 regulated the state of emergency in very broad terms without making a distinction between different causes and forms – military, social unrest, ethnic clashes, natural disasters, technological catastrophes, environmental accidents, etc. During the 90s, in parallel with the first military reforms, civil protection gradually moved away from its military frame and wartime core. With the introduction of the Law of National Defence No 45/1994, “civil defence” was transformed into “civil protection.” Two years later, the Romanian Parliament passed the Law on Civil Protection No 106/1996, setting the responsibilities of the personnel in charge to this purpose of that matter and providing guidance to civil protection operations in case of emergency.

The latter organisation was used until the socio-political clashes of 1999. The coal miners’ attempt to through down the government triggered the establishment of a new law enforcement mechanism. The Government’s Emergency Ordinance No 1/1999 laid down regulations on declaring a state of siege and emergency on the territory of the country. Furthermore, through series of legal acts adopted between 1999 and 2002 the crisis management system received a civil security focus, becoming more decentralised, and professional. In this way, the course of the evolution of national security and civil protection is from “war – civil defence” dominance towards priority on “civil security – crisis management”.

With any natural disaster and major industrial accident, lessons have been learned and legislation improved. A variety of factors, mostly the floods and the prospect of NATO membership in 2004, have generated political will for comprehensive and quick legal regulation and development of an

¹⁹²⁰ Available in Romanian language at http://www.rowater.ro/dacrisuri/Documente%20Repository/Legislatie/gospodarirea%20apelor/strategia_nationala_de_management_al_riscului_la_inundatii.pdf.

¹⁹²¹ GIES presentation, available at http://www.igsu.ro/documente/SAEARI/ROMANIA_Floods_2010.pdf.

improved civil protection system. The first major step forward was the Government Emergency Ordinance No 21/2004 that set up the National System for Emergency Situations Management. Its first principle was formulated as “prevention and anticipation,” while the newly established National Committee for Emergency was made responsible to the Government for drafting the National Plan for providing resources in case of emergency. (Zulean, Prelipcean, 2012) According to the ordinance, the emergency is an exceptional, non-military event, the intensity of which threatens the life and health of the population, the environment, and important material and cultural values. This formally moved civil protection away from the concept of civil defence and the dominance of the military over the civil security.

Several months later, a new *Law on Civil Protection* (No 481/2004) determined the civil protection situation as a situation caused by the imminence or occurrence of a disaster, military conflict and/or other unconventional situation. From an organisational perspective, the newly established General Inspectorate for Emergency Situations (GIES) was defined as a co-ordinating and executive body that serves under the National Committee for Emergency’s guidance. The *law on Civil Protection* (as amended in 2006 and 2008) represents the core civil security legislative act.¹⁹²² It stipulates that civil protection is a component of the national security that aims to prevent and reduce the risk of disasters, and to protect the public, property and environment from the negative effects of emergencies and armed conflicts. The *Law on a Health Reform* (2006) also pertaining to the organisation of the Romanian crisis management system. It sets up the mobile emergency rescue service, placed within the professional emergency services.

In 2006, the *Law on Health Reform* set up the mobile emergency service for resuscitation and extrication placed within the professional emergency services.

In 2008, a newly introduced Article 4 in the Law No 481/2004 regulated radiological, chemical and biological protection in cases of an emergency. Public institutions and operators that manufacture, transport, store or handle hazardous substances in such quantities that may endanger the life and health of the public must check for radioactive, chemical and biological contamination of raw materials and products, and when necessary, to decontaminate their personnel, lands, buildings and machinery. The decontamination should be performed according to technical regulations established by the respective ministries and approved by the General Inspectorate for Emergency Situations. Pollution control consists of specific measures for the identification and removal of polluting sources and includes evacuation, agricultural and consumption prohibitions. Operators and public authorities must warn the population immediately of any pollution or contamination

Currently, disaster management is addressed by various legislative documents and the work of various administrative authorities, public institutions, volunteers, and specialist bodies with responsibilities for disaster prevention, monitoring, and response (See “Resources”). Overall, according to some national experts and international assistance projects, the legislative base of civil protection in Romania seems to be comprehensive, but also too complicated, scattered and in some aspects is out-dated.

2.3 Emergency rule

The Constitution of Romania provides the basic legal framework for regulating extraordinary situations, determining that:

¹⁹²² Civil Protection Law No. 481 of 8 November 2004; a consolidated version of the law with all amendments since 2004 has been published in the Official Journal, Part I No. 554 of 22 July 2008.

Article 93 [Siege, Emergency]

(1) The President of Romania shall, according to the law, institute the state of siege or emergency in the whole or part of the country, and shall request Parliament approval of the measure thus adopted within five days from adoption.

*(2) If Parliament does not sit in a session, it shall be convened de jure within 48 hours from the institution of the state of siege or emergency, and shall function throughout this state.*¹⁹²³

Article 148 (3) further states, “The Constitution shall not be revised during a state of siege or emergency or at wartime.”¹⁹²⁴ Under the same paradigm, Article 89 (3) guarantees the role of Parliament during emergencies, stipulating that “Parliament cannot be dissolved during the last six months of the term of office of the President of Romania, nor can it be dissolved during a state of siege or emergency.”

The Constitution also determines that the legislation, concerning “the states of siege and emergency” are qualified as “organic.” (Art. 72, e) This means that the law on civil protection is among the fundamental legal acts in Romania.

The Article 114 stipulates that “(1) Parliament may pass a special law enabling the Government to issue orders in fields outside the scope of organic laws.” This text provides opportunity for additional legislation concerning the emergency and crisis management. Further, with respect to emergency, which may occur in an unexpected form and scale, the Constitution (Art. 114) permits that “(4) In exceptional cases, the Government may adopt emergency orders, which shall come into force only after their submission to Parliament for approval. If Parliament does not sit in a session, it shall obligatorily be convened.”

This legal framework provides for the institution of a state of siege or a state of emergency under Art. 93. Law no. 453 of 12 November 2004, modifying Government Emergency Ordinance no. 1/1999, detailing the elements of a state of emergency. It is to be instituted in cases where dangers to national defence and security or threats of calamities occur.

The President has the power to declare a state of emergency by decree, which will then be up for parliamentary approval. A state of emergency can end if Parliament does not approve it within five days of the issuance of the decree if Parliament decides that the danger has been removed ahead of term, or at the expiration date included in the presidential decree. It can also be prolonged by Parliament.

Law no. 453 clarifies the international law limits, which operate to restrict the state of emergency. These include the right to life (except when the death is the result of a lawful act of war), torture and inhuman and degrading treatment, punishment for offences not previously proscribed as such, and restrictions of the access to justice.¹⁹²⁵

Introduction of states of emergency can be applied in two forms, each designed for a different type of situation.

- Emergency situation (*Stare de alertă*): In case of a non-military combat situation, a prefect can enforce emergency. Roadblocks are enforced. Any utilitarian vehicle or equipment can

¹⁹²³ Constitution of Romania. Available at www.cdep.ro/pls/dic/site.page?den=act2_2&par1=3#t3c2s0sba93.

¹⁹²⁴ Ibid.

¹⁹²⁵ Source: Geneva Academy of International Humanitarian Law and Human Rights, available at http://www.geneva-academy.ch/RULAC/national_legislation.php?id_state=182.

be temporarily used by the state, without any restriction. Evacuation is not mandatory, unless extreme circumstances apply. Only emergency medical service, police and firefighting personnel are required to intervene. This situation can be enforced in case of natural disasters or civil unrest.

- State of emergency (*Stare de urgență*): Military can only be enforced by the President of Romania. The military becomes the upper form of control in the country (under the rule of the president). The civilian population is subject to strict regulations, imposed by the type of emergency. All private and public non-crucial activities are suspended. Essential services might be disrupted. This situation can be enforced in case of extreme circumstances, such as a war.

The declaration of an emergency represents an exceptional act, which allows the application of a series of political, economic and public order measures covering the entire territory (national level), or parts of the territory (country and local level). Emergency status can be declared when there exists a serious actual threat or imminent threat to national security or the functioning of democracy; or there exists an actual calamity or imminent threat of calamity, which requires prevention or mitigation activities.¹⁹²⁶

During an emergency, the National Committee for Emergency Situations manages intervention activities, which is directed by the Minister of Administration and Interior, while the Prime Minister explores oversight and co-ordination role.

The local police have also a legal opportunity to introduce “special security zone” (Zonă specială de siguranță publică) as an administrative measure in different situations with a public character that may (usually) turn into public unrest. This implies installation of road checkpoints and higher numbers in police and gendarmes/riot police presence, patrolling the area. There could be applied also a ban that restricts the right to travel for people in the area; any vehicle and individual transiting the zone are subject to screening.

The best known event in which the state of emergency has been enforced has been because of the 1977 Vrancea earthquake. The last instance in which the special zone of public safety has been enforced was on 8 December 2013 in Pungești and Vaslui, following popular unrest in Pungești triggered by Chevron’s plans to begin exploring shale gas in the village¹⁹²⁷ (Drilling has been cancelled in 2015¹⁹²⁸).

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

The highest-level governmental interagency body with responsibilities for crisis management is the National Committee for Emergency Situations. It was established on the same day as the GIES by Decision no. 1489 of 9 September 2004, on the organisation and functioning of the National Committee for Emergency Situation.

The main executive agency for civil protection at the national level is the Ministry of Internal Affairs. It was established in its current format on 28 June 2003, by means of the Romanian Government Emergency Ordinance no. 63, which merged the Ministry of Interior and the Ministry of Public Administration.¹⁹³⁰ In the civil protection domain, the Ministry of Internal Affairs has the following functions:

- Drafting and implementing the national strategy on civil protection;
- Developing and updating of the action plan establishing the state of emergency and coordination of the uniform application of measures in a state of emergency by the military and civilian public authorities involved;
- Monitoring of the development of the situation, and proposing the extension of the operation or the restriction of the period of application of the state of emergency;
- Monitoring of the operational situation and proposing measures for the prevention and

¹⁹²⁹ Source: <http://www.naturalgaseurope.com/riot-police-special-security-zone-chevron-romania>.

¹⁹³⁰ Source: http://www.mai.gov.ro/engleza/index01_1.htm.

mitigation of the consequences of the crisis in the field of public order; and

- Operational management in case of crisis.

The highest-level state agency, focussed only on civil protection from natural disasters and industrial incidents, is the General Inspectorate for Emergency Situations (GIES; in Romanian, *Inspectoratul General pentru Situații de Urgență – IGSU*). This is a structure subordinated to the Minister of Administration and Interior. It was created on 9 September 2004,¹⁹³¹ by merging the Civil Defence Command (*Comandamentul Protecției Civile*) with the General Inspectorate of the Military Firefighters Corps (*Inspectoratul General al Corpului Pompierilor Militari*).

In such a configuration, policy guidance and oversight for civil protection are provided by the National Committee for Emergency Situations; coordination, control, and expert technical assistance is secured by the Ministry of Internal Affairs, via the General Inspectorate for Emergency Situations, and locally, by the County Inspectorates and the Inspectorate of the Municipality of Bucharest for Emergency Situations.

According to the Romania's National progress report on the implementation of the Hyogo Framework for Action for the period 2013-15, "[i]n order to improve the National System for Emergency Situation Management, based upon lessons learnt in the recent disasters, the legal framework has been changed twice in the last year. The National Committee for Special Emergency Situation has been created, with revised responsibilities and structures. Changing the structure of The National System on the other hand has delayed the adoption of the set of laws establishing the structures responsible with disaster risk reduction and their precise responsibilities."¹⁹³²

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

Emergency Ordinance no.21/2004 has established the National Management System for Emergency Situations, which acts as reference body for Level 0 disasters. It is composed of emergency committees at the national and ministerial levels, the General Inspectorate for Emergency Situations, professional emergency services, operational centres for emergency situations, and an action commander.

At Level 1, there are the county committees for emergency situations (Romania is divided into 41 counties and 1 municipality – Bucharest), headed by the county prefects. The counties' council presidents (since 2008 the county council president is elected directly by the local people), managers of public institutions and private companies (that may generate emergency situations) are forming committees. The organisation, attributes and functions of the counties' committees are established by orders of the prefects.

The current Constitution and the Law on Local Public Administration determine the Prefect as a political figure, representing the Government. According to the law, the Prefect is "... responsible, in conformity with the law, for the preparation and implementation of non-military defence measures; the military authorities and the local bodies of the Ministry of Internal Affairs are required to inform the prefect on any problems relevant for the county; (the Prefect has also other duties)." (Art. 110)

¹⁹³¹ Available in Romanian at http://www.igsu.ro/documente/legislatie/HOTARARE_Nr1490.pdf.

¹⁹³² Romania National progress report on the implementation of the Hyogo Framework for Action (2013-15), p.5.

At Level 2 are local committees for emergency situations (each county is further subdivided into cities and communes, the former being urban, and the latter being rural localities; there are 319 cities and 2686 villages in Romania. Each city and village has its own mayor and local council). They are convened at city, commune or village level under the leadership of mayors. The members of local committees include a vice-mayor, local secretary, and representatives from public institutions and companies in that territory. The mayor, with the agreement of the prefect, organises and establishes the attributes and functions of the local committee.

A special status has been provided for the Bucharest municipal committee for emergency situations. In terms of governance, including on civil protection, the capital is equalised to a county level.

In later documents, the identification of 0, 1, and 2 levels has been replaced with “national,” “county” and “local” levels.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

The role of the volunteers for the crisis management policy and especially for the civil protection from natural and industrial hazards is expanding at both normative and organisational levels. Recently they are regulated by a set of laws, governmental and ministerial acts:

- Volunteer Law no. 195 of 20 April 2001;
- Order of Ministry of Internal Affairs no. 718 of 30 June 2005, approving the capabilities and organisational structure of emergency volunteer services;
- Government Ordinance no. 1579 of 08 December 2005 regarding the statute of volunteer personnel from emergency volunteer services;
- Government Ordinance no. 160 of 14 February 2007 regarding the conditions and details for using the uniform protection equipment and distinctive signs for emergency volunteer services personnel;
- Order of Ministry of Internal Affairs no. 160 of 23 February 2007 on the rules for planning, organising and performing the emergency prevention activities within the emergency volunteer services.

According to the Romanian Volunteer Law (*Legea Voluntariatului*), adopted in 2001 and amended in 2006, volunteering is an activity of public interest, undertaken out of free will by a person aiming at helping others, without being motivated by financial or material gains. The public interest activity is carried out in various domains such as social assistance and services; environmental protection; culture, education, arts etc. The organisation hosting the volunteers or carrying out the volunteer activities may be a non-profit private or a public organisation, run in the public benefit.

2.7 Legal regulations for international engagements of first responders and crisis managers

At the international level, activities related to crisis management and disaster risk reduction, early warning, response and recovery are governed by different bi- and multi-lateral agreements, conventions, and compacts as well as with operational agreements for concrete emergency situations and missions.

3 Organisation

Romania is divided into 41 counties and 1 municipality (Bucharest): Alba, Arad, Arges, Bacau, Bihor, Bistrita-Nasaud, Botosani, Braila, Brasov, Bucuresti, Buzau, Calarasi, Caras-Severin, Cluj, Constanta, Covasna, Dimbovita, Dolj, Galati, Gorj, Giurgiu, Harghita, Hunedoara, Ialomita, Iasi, Ilfov, Maramures, Mehedinti, Mures, Neamt, Olt, Prahova, Salaj, Satu Mare, Sibiu, Suceava, Teleorman, Timis, Tulcea, Vaslui, Vilcea and Vrancea. Each county is further subdivided into cities and communes, the former being urban, and the latter being rural localities. There are 319 cities and 2686 communes in Romania. A county council, responsible for local affairs, as well as a prefect, appointed by the central government, administer each county.

The civil protection structure is organised at national and ministerial levels, for the capital city of Bucharest specifically, and at county and municipal levels.¹⁹³³ Decision-making is attributed to national (when two counties and more affected), county and local committee, depending on the emergency.

At the national level, an inter-ministerial body, the National Committee for Emergency Situations (NCES) has coordination responsibilities in terms of emergency management. The NCES is composed of decision-making representatives, experts and specialists designated by the ministries. The National Committee is established and acts under the direct guidance of the Minister of Administration and the Interior under the coordination of the Prime Minister.

The National Committee for Emergency Situations is structured as follows:

- President: the Minister of Internal Affairs;
- Vice President: one of the Secretaries of State within the Ministry of Internal Affairs;
- Members: one Secretary of State from each of the ministries involved or deputies representing heads of central public institutions;
- Consultants: one or two experts/specialists from each ministry and the central public institutions.

To handle inter-ministerial and crosscutting coordination, the committees for emergency situations are structured also at ministry, county and local level. The committees are chaired by the respective ministries/head of institution, county prefect (the Bucharest Committee is chaired by the Prefect of Bucharest), and the mayor (endorsed by the respective county prefect).

At national level, the General Inspectorate for Emergency Situations (GIES) is the national civil protection authority responsible for managing the implementation of emergency management actions and measures on national territory. The GIES is part of the National Emergency Management System and a component of the National Defence System. The GIES is an integrated body within the Ministry of Internal Affairs managed by a General Inspector.

All competent institutions in the field of defence, public order and national safety are required to transmit to the GIES or, if necessary, to the Minister of Internal Affairs or the Prime Minister information on potential emergencies, their expected evolution and consequences. The GIES communicates the decisions made by the Government or by the National Committee (through its

¹⁹³³ In terms of architecture, the Romanian National Emergency Management System is quite similar to the one of The Netherlands. For a comparison see http://ec.europa.eu/echo/files/civil_protection/vademecum/nl/2-nl-1.html.

Technical Secretariat) to the authorities of central public administration in order to secure coordinated management of emergencies. At county level, County Inspectorates for Emergency Situations operate in the 41 counties and in Bucharest. They are subordinated to the General Inspectorate for Emergency Situations (GIES) and provide - in their areas of competence - guidance and control of prevention and management of emergencies.

In addition to that, Operational Centres for Emergency Situations are organised at ministerial, municipal level (except Bucharest Municipality), city and commune levels. These centres can have a permanent character (for those ministries/institutions with complex functions within the National Emergency Management System) or a temporary character (they become active only when requested, following the decision by the National Committee for Emergency Situations).

The recent establishment of a Governmental Command Operational Centre (COCG), as a decision-making support for the National Committee for Emergency Situations (NCES), is seen as a way to make coordinated and rapid intervention in emergency situations, which will account for more lives saved and less money spent. The COCG is operational since 8 April 2014 when the centre hosted the first meeting of NCES led by the Prime Minister together with the Deputy Prime Minister for National Security, and all other members of the committee.

Figure 20: The Government's Command Operational Centre (COCG) at the Victoria Palace.¹⁹³⁴

Other state organisations involved in crisis management and emergency management

Gendarmerie. The Romanian Gendarmerie, component of the Ministry of Internal Affairs, is a specialised state agency with military status, having the following attributions under the law:

¹⁹³⁴ Source and photo: (copyright) Liviu Sova, AGERPRES.

defending public order, fundamental citizens' rights and freedoms, public and private property, preventing and detecting crimes and other violations of laws, protecting state institutions and fighting against terrorism. Due to its responsibilities, organisation, training and territorial coverage, the Romanian Gendarmerie contributes to guaranteeing the state sovereignty, independence, authority, unity, security and constitutional democracy throughout the national territory both in peacetime and in crisis. Romanian Gendarmerie units' activities are focused on law enforcement, respecting fundamental citizens' rights and freedoms while ensuring social equilibrium status within society.¹⁹³⁵

Police. In terms of emergency, the police is engaged in homicide, armed assault attacks, public disorder, traffic accidents resulting in human casualties or persons trapped in cars, explosions; electrocution, falls, landslides, serious subway accidents, aviation and train accident.

Ambulance. Bucharest Ambulance Service (S.A.M.B.) is a unique medical unit at both Bucharest and country level. It is a strategic medical unit, operating 24/7/365. S.A.M.B. is subordinated to the Bucharest Public Health Division and provides pre-hospital emergency medical assistance at both the requested location and during patients' transport to hospital (ill people, injured ones, pregnant women).¹⁹³⁶

Mobile Emergency Service for Resuscitation and Extrication (SMURD). SMURD is responsible for the entire range of interventions covering all emergencies for saving one or more persons' lives. These interventions include road accidents, explosions, work or home accidents such as falls from height or electric shocks, unconsciousness that include cardiac arrest, suspected strokes, acute respiratory insufficiencies and also multiple victim accidents. In addition to usual ambulances interventions, SMURD staff also uses various types of helicopters and airplanes for transferring patients in critical condition to different medical centres within the country or abroad. In these particular cases, the medical crew consists of two persons, one of them being a doctor with experience in emergency and intensive care.¹⁹³⁷

Inter-agency operations

Inter-agency operations during emergencies are managed by a person (action commander) nominated by the national, ministerial or county (or Bucharest) committees for emergency situations, depending on the nature or the extent of the event or on the number of forces involved. He/she may receive support in executing the tasks from the operative groups and the advanced operative point according to the legislation in force.¹⁹³⁸

3.1 Organisational chart

Romania's National Emergency Management System (NEMS) is a nationally owned mechanism of multiple stakeholders, which provides coordination and response in case of emergencies, and serves as an advocate for prevention and disaster risk reduction at different levels.

The core legal documents concerning the NEMS are:

- Emergency Ordinance no. 21 of 15 April 2004 on the National System of Emergency Situations Management;

¹⁹³⁵ Source: www.jandarmeriaromana.ro.

¹⁹³⁶ Source: www.ambulanta.ro.

¹⁹³⁷ Source: www.smurd.com.

¹⁹³⁸ This chapter has been based on variety of sources (with corrections, amendments and compilation): European Commission, Humanitarian Aid & Civil protection: Vademecum - Civil Protection; Zelean, Prelipcean, 2012; UNISDIR, WB, 2008; GIES web site <http://www.igsu.ro>.

- Ordinance no. 2288 of 9 December 2004 regarding support, provided by different stakeholders for crisis management;
- Decision no. 1489 of 9 September 2004 on the organisation and functioning of the National Committee for Emergency Situations;
- Decision no. 1490 of 9 September 2004 on the GIES;
- Decision no. 1491 of 9 September 2004 approving the Framework Regulation on the organisation, competence, functioning and endowment committees and operational centres for emergency situations.

The key components of NEMS are presented at Figure 11.

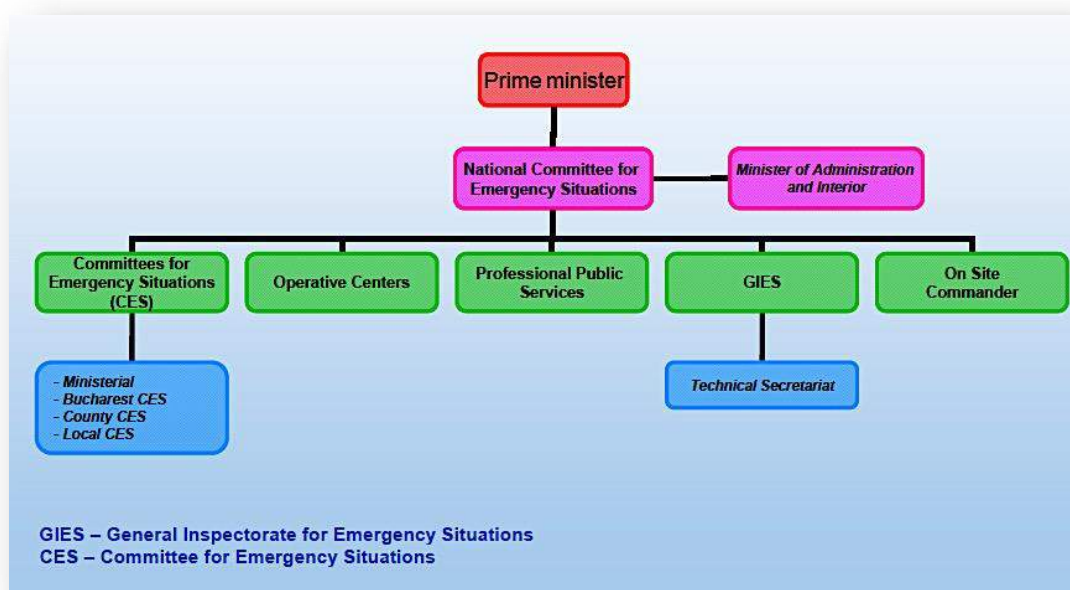

Figure 21: General structure of NEMS.¹⁹³⁹

NOTE: The National Committee for Emergency Situations has been recently transferred into National Committee for Special Emergency Situations (source: Romania National Progress Report on implementation of Hyogo Action Plan (2013-15)).

Within this architecture, NEMS has three levels of activation (Figure 12).

¹⁹³⁹

Source: GIES presentation, available at http://www.igsu.ro/documente/SAEARI/IGSU_EN.pdf.

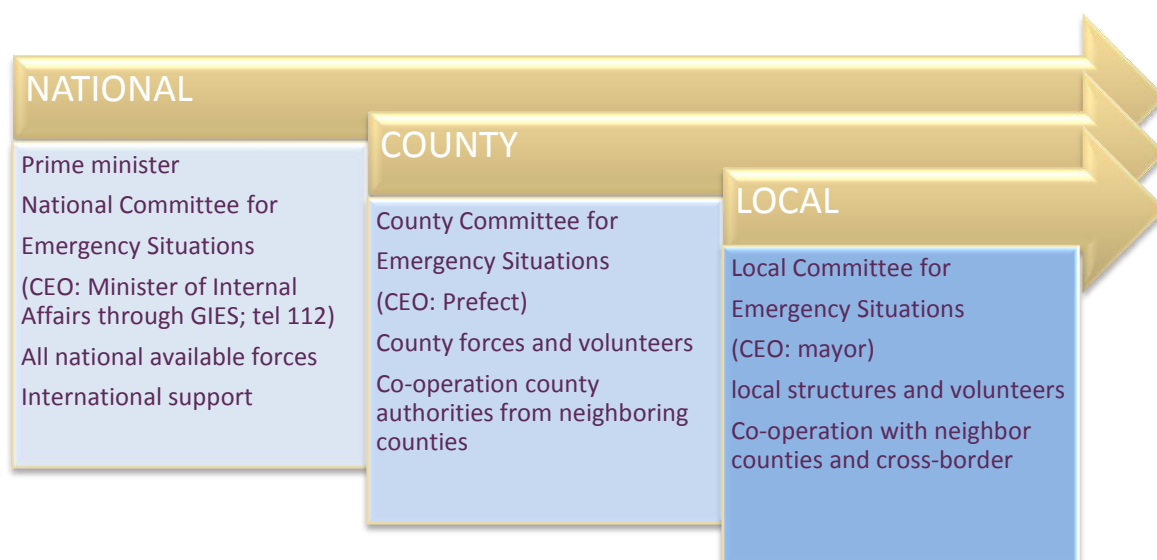

Figure 22: Institutional chain of command by levels of activation.

The Prime Minister is at the top of the NEMS. The Minister of Internal Affairs, who chairs the National Committee for Emergency Situations (NCES), reports directly to the Prime Minister. As described above, the NCES is an inter-ministerial organisation, composed of decision-makers and experts from authorities with responsibilities in emergency situations.

The Committee's attributes include: Initiating legislation regarding emergency management and approving ministerial and county committees' legal papers, examining and proposing for Government approval the national plan for human, material and financial resources for emergency management, subsequent to Prime-Ministerial approval, declare the setting-up/cessation of "warning status" at national level or at the level of several counties; decide the application of an evacuation plan under the proposal of ministerial or county committee.

NCES is responsible for the co-ordination in cases of emergency in more than two counties simultaneously (that determines the "national" level), the co-ordination of any disaster mitigation activities of international forces, and for disseminating information to the public regarding emergency management.

According to the Romania National Progress Report on Implementation of Hyogo Action Plan (2013-15), "In order to improve the National System for Emergency Situation Management, based upon lessons learnt in the recent disasters, the legal framework has been changed twice in the last year. The National Committee for Special Emergency Situation has been created, with revised responsibilities and structures."¹⁹⁴⁰ The decision follows the SMURD ¹⁹⁴¹ medical helicopter crash in the Siutghiol Lake when four people died.

According to the than the Interior Minister Gabriel Oprea, a "Unique Intervention Concept for Integrated Action in Emergencies Situations" will be developed. The exact measures and changes to the system have not yet been announced (December 23, 2014).¹⁹⁴²

Ministerial committees

¹⁹⁴⁰ Ibid., Romania's National Progress Report ... 2013-15, p. 5.

¹⁹⁴¹ Abbreviation in Romanian language of the Mobile Emergency Service for Resuscitation and Extrication.

¹⁹⁴² Source <http://www.romania-insider.com/an-emergency-rescue-helicopter-crashes-in-a-lake-near-the-romanian-seaside-resort-of-mamaia/137789/>.

Ministerial committees for emergency situations operate at national level and are composed of decision-makers and experts from ministries and other stakeholders within the civil protection domain.

The specific functions of different ministries and state agencies, regarding civil protection, are explained in Annex 1 to Government Ordinance No 2288/2004.¹⁹⁴³

County committees

County committees, responsible for managing emergency situations at county level, are headed by prefects. These committees are formed by the county council president, managers of public institutions and private companies and the managers of private companies that represent potential risks and can generate emergency situations. The organisation, attributes and functioning of county committees are established by orders of the prefect.

Local committees

Local committees for emergency situations are convened at city, commune and village level under the leadership of mayors. The members of local committees include: one vice mayor, local secretary, and representatives from public institutions and companies in that territory. The mayor, with the agreement of the prefect, determines the attributes and functions of the local committee.

Notably, according to Article 24 of the framework Law No 195/2006 on decentralisation, the local authorities are responsible for prevention and management of emergencies at local level, and for public order and security.

General Inspectorate for Emergency situations (GIES)

GIES is the focal point in the Romanian emergency system. It integrates the political decision-making with the executive bodies and relevant types of forces. Its responsibilities cover the whole spectrum of disaster management – from risk reduction to consequence management. GIES is responsible in peace and wartime for the rescue of people, public evacuation, firefighting, mitigation of the environmental consequences of accidents (including chemical, radiological and biological accidents) occurring during transport of dangerous substances.

In terms of prevention, the GIES major tasks include:

- Risk identification and assessment;
- Verifying the well-observance of fire safety regulations for designing, execution, utilization and maintenance;
- Verifying the application of specific measures in order to maintain acceptable risk levels;
- Population preparedness and emergency training;
- Coordination of professional public emergency services and volunteers.

In cases of disaster response, the GIES manages:

- Rescue actions (persons in hostile environment, trapped, isolated, suicide intentions);
- Evacuations and relocations of affected persons (disasters, armed conflict);
- Mitigation of accidents' consequences and alerts of responsible environment stakeholders (detection, radiation measurement, establish contamination degree, neutralisation);
- Extrications.

¹⁹⁴³ Available at <http://www.crucearosie.ro/uploads/Legislatie/Hotarare%202288%20din%202004%20-%20functii%20de%20sprijin.pdf>.

GIES includes National Operational Centre, Prevention Inspection, directorates for planning, logistics, and finance. Subordinated to the GIES are 41 County Inspectorates for Emergency Situations plus the Bucharest Inspectorate for Emergency Situations, training centres, schools, research, IT&C, warehouses, logistics. Its component layout operates according to the minimum response time 8 to 10 min in urban areas and 14 to 20 min in rural areas.¹⁹⁴⁴

Overall, within the NEMS architecture, responsibilities are shared as shown in Figure 13.

	Authorities	Normality	Emergency
NATIONAL	NCES (<i>Minister of Interior</i>) Ministerial Committees GIES On site commander	CNCCI Ministerial operative Centres 112	CNCCI (<i>reinforced</i>) Ministerial operative Centres 112

Figure 23: Sharing of responsibilities within the NEMS.¹⁹⁴⁵

Volunteers and specialised NGO

Relevant volunteer and specialised NGOs are listed below.

Association of Voluntary Rescuers in Emergency Situations (ASVSU, <http://www.asvsu.ro/>) organises experienced specialists and volunteers for interventions in emergency, providing:

- Research-Search-release-rescue;
- First aid in emergency;
- Radio communications in cases of emergency;
- Accidental transportation from mountains;
- Psychological first aid;
- Search and Rescue Canine
- Search of missing children.

Romanian Red Cross (<https://www.ifrc.org/en/what-we-do/where-we-work/europe/romanian-red-cross>)

¹⁹⁴⁴ Source: Annex 2 to GO No 1490/ September 9, 2004.

¹⁹⁴⁵ Source: GIES presentation, available at http://www.igsu.ro/documente/SAEARI/IGSU_EN.pdf.

National Centre APELL for the Disaster Management – CN APELL RO. “Awareness and Preparedness for Emergencies at Local Level” (APELL) is a United Nations Environment Programme (UNEP) initiative in response to a number of industrial accidents that resulted in deaths and injuries, environmental damage, and extensive economic consequences for the surrounding communities. The APELL process is a methodological tool focusing on the local level for identifying possible industrial hazards, raising awareness of these hazards, and building local capacity for immediate, multi-party response in the event of an emergency. Romanian APELL co-ordinating group is allocated within the Babes-Bolyai University in Cluj-Napoca (<http://www.ubbcluj.ro>).

“Rescue Society of Bucharest” is a foundation, aiming to provide support for improving the quality of emergency medical services in Bucharest, especially the capacity of the “Bucharest Ambulance Service.” The foundation also organises scientific events in the field of emergency medical care locally, nationally and internationally and training courses for those interested in first aid. It has established a medical centre for healthcare of sexually exploited women.

Academia and research institutes: National Institute of Research and Development for Earth Physics, Institute of Geography, Institute of Geology, Institute of Geodynamics “Sabba S. Stefanescu,” German-Romanian Collaborative Research Centre (CRC), National Centre for Seismic Risk Reduction, and Research Centre for Disaster Management “Babeş-Bolyai.”

3.2 Organisational co-operation

Operations

The concept of emergency management operations is of a task force type. For each particular situation, a package of capabilities should be allocated and a commanding officer must be determined. When it is a first response operation, GIES has the leading role for immediate reaction. Otherwise, the commanding officer and the package of forces (capabilities) is assigned to the ministry, which is responsible for monitoring the particular source of hazard or threat.

The key coordination body—the NCES—has to be called immediately when a situation escalates to the “national” level (that means the emergency covers more than one county) or when the impact is high. In any case, NCES investigates the situation, coordinates efforts, capabilities and operations between both different agencies and centre-county-local levels assigned.

It is common for NCES to consider international support and, if needed, to deliver requests. GIES has a mandate to communicate with foreign partners, especially when the situation may have a cross-border impact. The Romanian contribution to the international humanitarian assistance and disaster relief operations is provided through the EU’s Monitoring and Information Centre (MIC), operated by the European Commission in the framework of Community mechanism to facilitate reinforced cooperation in civil protection assistance interventions and the Euro-Atlantic Disaster Response Coordination Centre (EADRCC/NATO).

The GIES coordinates and is directly responsible for all international assistance offered/received on a bilateral or regional basis or through the MIC, EADRCC and UN-OCHA.

International assistance is offered/requested on a case-by-case basis, based on a decision by the National Committee for Emergency Situations at the request of the GIES.¹⁹⁴⁶

Capability planning

¹⁹⁴⁶

Source: HA&CP.

Even though there is not a formal system for co-ordinated inter-departmental capabilities planning and acquisition, NCES and GIES have mandate to co-ordinate any national level plans and programmes. The procurement is done usually through the ministries, county and local authorities as they have both specific responsibilities and budgets.

Regional initiatives

Romania is expanding its engagement in both bilateral and regional civil protection initiatives. The country has signed bilateral agreements for mutual assistance in cases of emergency with Bulgaria, France, Hungary, Moldova and Turkey. Emergency management agreements have been signed with Azerbaijan, Czech Republic, Denmark, France, UK and USA.

Within some multilateral formats Romania is also involved in cross-border co-operation programmes with non-EU states, including Moldova, Ukraine and Serbia.

On a regional level, Romania (mostly through GIES) participates actively in initiatives, projects and actions developed under the regional bodies, which Romania is a part of, such as:

- Civil Military Emergency Planning Council for South-Eastern Europe (CMEPC SEE);
- Black Sea Initiative on Civil Military Emergency Preparedness (BSI CMEP);
- Commission on the Protection of Black Sea Against Pollution – Advisory Group on Environmental Safety Aspects of Shipping (AG-ESAS);
- European Maritime Security Agency (EMSA);
- Stability Pact for South-Eastern Europe / Disaster Prevention and Preparedness Initiative (DPPI);
- DKMT Euro-Region (Danube – Kris – Mures – Tisza);
- South-Eastern European Defence Ministerial (SEDM);
- Organization of the Black Sea Economic Cooperation (BSEC).

GIES participate in the NATO's missions in civil emergency planning with special attention to: critical infrastructure protection, preparedness for consequence management in the event of natural disasters and in incidents involving chemical, biological, and radiological materials. GIES also provides representation in the following bodies:

- Civil Emergency Planning Committee (CEPC);
- Civil Protection Group (CPG);
- Group of Experts on the Evaluation of humanitarian and disaster relief.

In the last ten years, Romania has provided assistance to other countries in case of emergency. Some of the support has been provided even when Romania has been also in emergency:

- 2006 – to Bulgaria: anti-pollution materials;
- 2006 – to Hungary: flood protection materials;
- 2007 – to Greece: means for aerial forest firefighting;
- 2010 – to Hungary: flood protection materials;
- 2010 – to Moldova: materials and flood protection intervention teams;
- 2011 – to Libya: emergency airlift;
- 2011 – to Turkey: support materials;
- 2012 – to Bulgaria: flood protection materials.

Further expansion of the Romania cross-border emergency management co-operation has been conceptualised through Government approved *National Strategic Concept of territorial development ROMANIA 2030*.¹⁹⁴⁷

¹⁹⁴⁷ Available in English at http://www.mdrl.ro/_documente/publicatii/2008/Brosura_Conc_strat_EN.pdf.

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

In the timeframe of the study we were not able to identify publicly available information that Romania produced standing operational procedures (SOP) for civil protection.

The National Operations Centre, which is a structure of the GIES, seems to be capable of producing such standards. The Centre operates the following services and departments:

- Service analysis, evaluation and coordination of intervention;
- Exhaust Service, pyrotechnics and emergency rehabilitation CBRN;
- Services are operational and dispatch;
- Disaster Medicine Department;
- Psychological compartment;
- Compartment specific standards and regulations;
- Permanent Technical Secretariat of the National Committee for Emergency Situations;
- Secretarial Department.

GIES has participated in the NATO led “Project on Minimum Standards and Non-Binding Guidelines for First Responders Regarding Planning, Training, Procedure and Equipment for Chemical, Biological, Radiological and Nuclear (CBRN) Incidents.” In result, a collectively produced Guideline for First Response to a CBRN Incident is in use.¹⁹⁴⁸ The guide covers:

- Information gathering;
- Scene management;
- Saving and protecting lives;
- Additional/specialist support.

4.2 Operations planning

Civil protection is a component of the national security system and represents an integrated range of specific activities, and organisational, technical, operational measures and tasks having a humanitarian and public character. Civil protection is planned, organised and performed according to the law on civil protection with a view to preventing and reducing disaster risks, protecting the population and the environment against the effects of emergencies and armed conflicts and securing life-saving conditions during emergencies.

The responsibility for the elaboration of (national) plans in emergency-related areas lies with the National Committee for Emergency Situations, the Ministerial Committees for Emergency Situations, as well as with the county and local committees for emergency. Planning activity for civil protection is set up through following documents:

- At national level: National Development Plan, National Strategy on Civil Protection, Climate

¹⁹⁴⁸ Available in English at http://www.igsu.ro/documente/SAEARI/Brochure_First_Response_Guidelines_-_EN.pdf.

change policy and strategy, Civil defence policy, strategy and contingency planning;

- At ministerial level: Operational plans for specific disasters, elaborated by the Ministerial Committees for Emergency Situations;
- At county and local level: Plans for protection and intervention in case of specific disasters; the relevant authorities draft and implement a General Urban Plan, taking into consideration the hazard maps.

The economic agents have emergency plans that are elaborated in cooperation with the counties civil protection inspectorates. These plans cover natural and technological disasters that may affect the economic agent and surrounding population. The basic principle in these plans is to use all possible human and material resources for interventions.

Academic, research, learning and nongovernmental organisations, volunteers and population are involved in the planning process at certain levels.

For protection against floods, meteorological phenomena and accidents threatening dams, once every four years plans are elaborated at county, city, locality and hydrographic basin level, which are revised whenever necessary. The plans represent technical documentation, containing preventive and intervention measures, detailing the information flow for warning the population in case of a danger. The responsibility for the activation of these plans belongs to the chairmen of county and local committees for emergency situations and the territorial water management units.

For earthquakes and landslides, the county and local emergency situation committees have plans for each phase of the disaster management process. These plans are revised annually and/or in account of the experience in a particular disaster. The Chairpersons of respective committees are responsible for the elaboration and revision of the plans.

The GIES draws and submits the National Plan for Emergency Situation Management for adoption by the Government. The national plan outlines the necessary human, material and financial resources. The GIES also agrees on intervention or technical assistance aspects of international plans for emergency management and submits them for adoption by the National Committee for Emergency Situations.

4.3 Logistics support in crises

In the timeframe of this study, we were not able to find information on the use of private logistic providers. The use of military logistic support is provided on the basis of a decision of the National Committee for Emergency Situations.

4.4 Crisis communication; Alert system; Public Information and Warnings

The basic legal document for communications in emergencies is Government Ordinance No. 548/2008, for the approval of the National Strategy for Communication and Public Information in Emergency Situations.

Romanian Emergency Management Information System (EMIS) is a fully integrated information system connecting all Emergency Operational Centres (EOC) and other stakeholders for streamlining information sharing and decision support for daily routine and in case of emergency as well. It is designed to support all phases of emergency management: mitigation, preparedness, response and recovery and is deployed in the EOCs of the National Emergency Management System (NEMS) as shown on Figure 14.

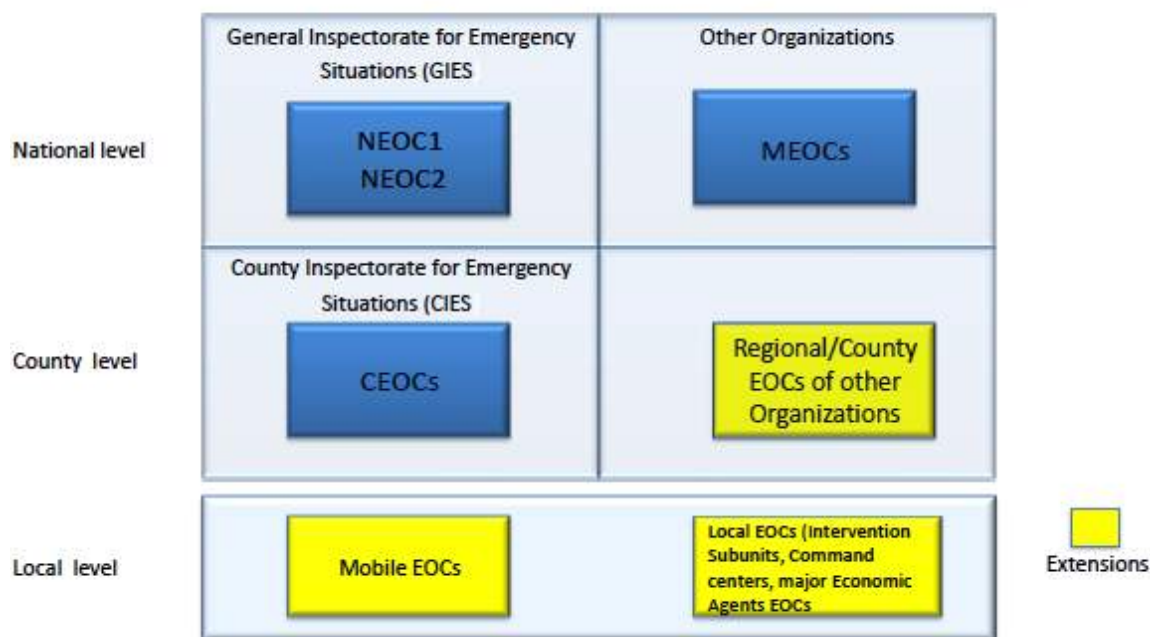

Figure 24: Romanian Emergency Management Information System within the NEMS.¹⁹⁴⁹

In this system, the EOCs are information hubs that move the flow of information through WAN from different primary sources towards the two levels of centralisation: country level (County Emergency Operation Centres, CEOCs) and ministerial level (Ministerial Emergency Operation Centres, MEOCs). It is replicated at the national level (NEOC 1, 2) where it is summarised, analysed, verified and presented in forms of draft decisions.

The CEOCs are not fully staffed on a permanent basis. In case of emergency, experts from different organisations operate them. NEOC1 has the coordinator's role in any serious emergency, while NEOC2 is activated only in cases of countrywide crisis as a reserve command centre.

In terms of the operational process, the system is organised in such a way as to support the basic emergency management functions (Figures 15 and 16):

- Planning (including tasking, task force creation, and budgeting);
- Response and recovery (including task force creation, evacuation, and damages in people, infrastructure and material);
- Alerting and notification;
- Reporting on situations and interventions;
- EMIS database management (including organisation, human resources, logistics, risks, hazardous materials management, evacuation, etc.).

¹⁹⁴⁹ Monitor II available at http://www.monitor2.org/downloads/MONITORII_WP4_Partner%20specific%20module_EMIS_PP6.pdf.

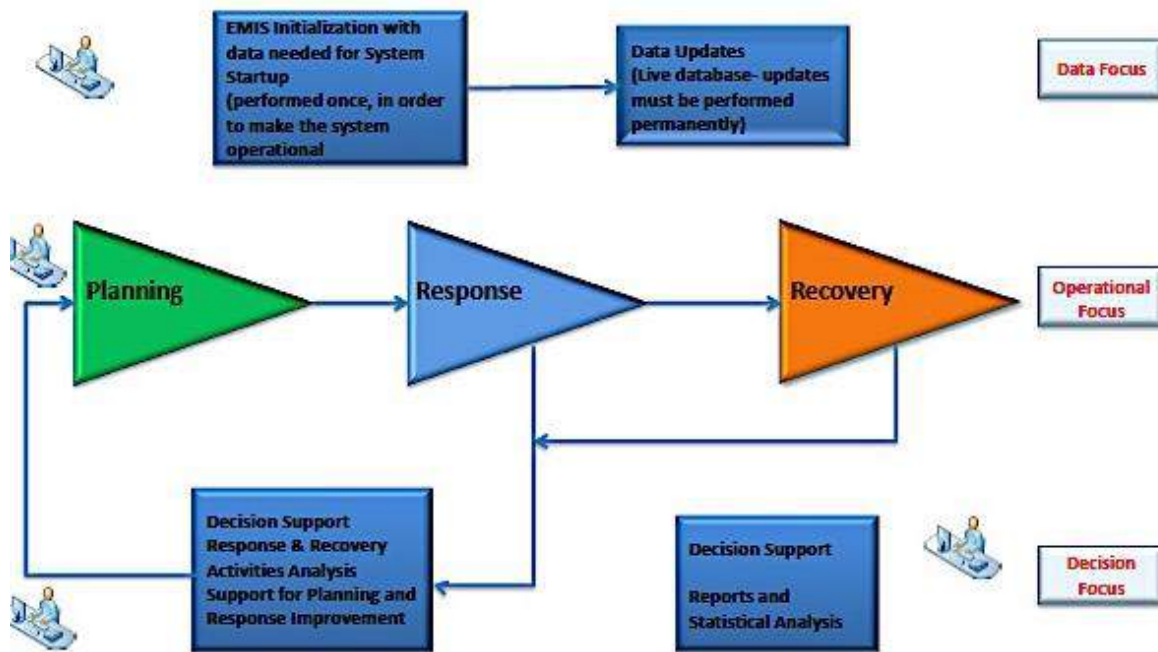

Figure 25: EMIS operational process.

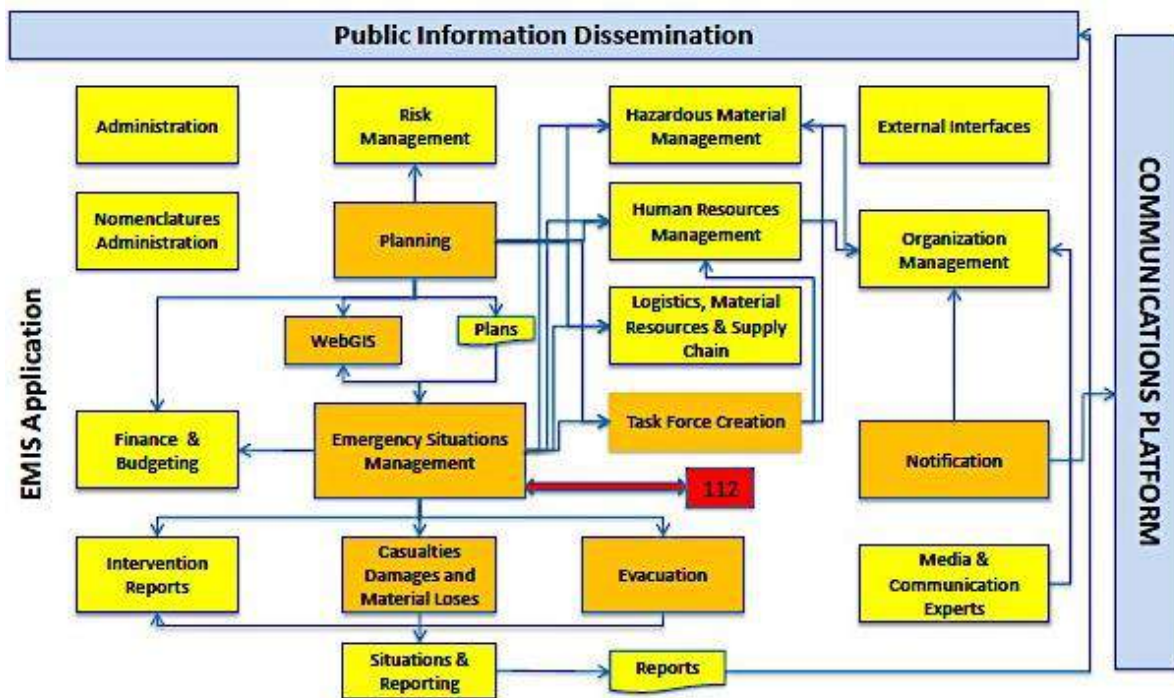

Figure 26: EMIS modular architecture

The workflow within the EMIS is presented in Figure 17.

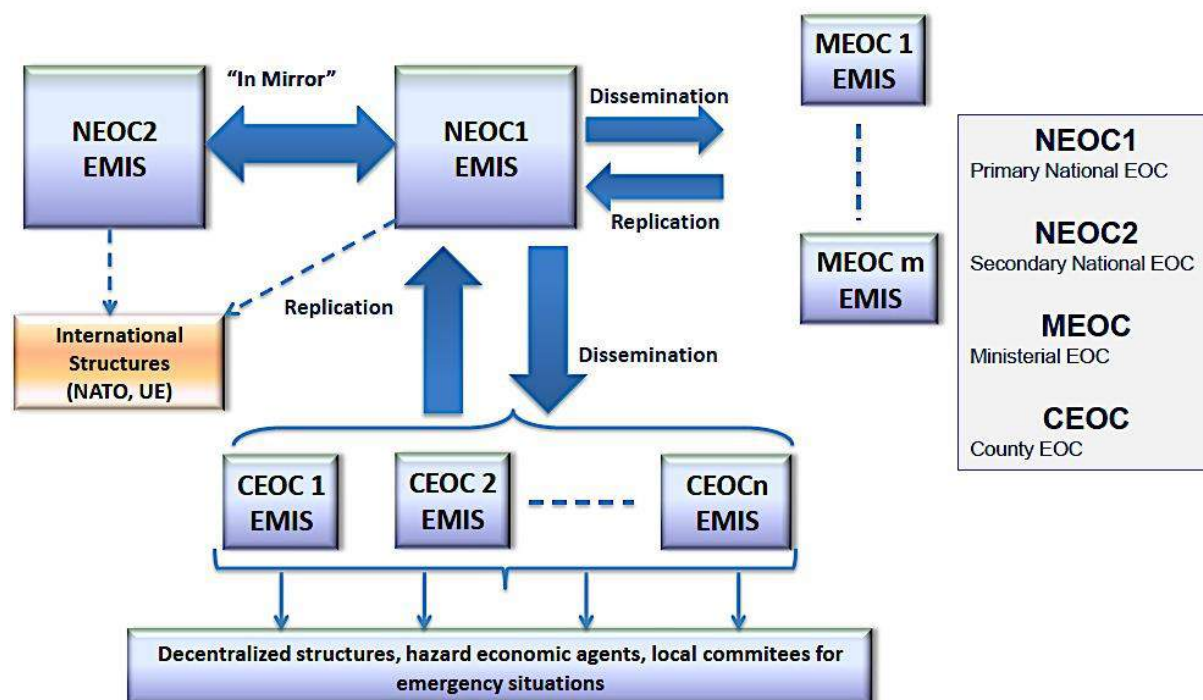

Figure 27: EMIS information workflows

Thus, the Romanian Emergency Information Management System seems to be completely relevant to the architecture of the NEMS. It covers the main processes as prescribed by the National Strategy on Civil Protection and related legislation – preparation, response and recovery.

Technically, the EMIS may serve as a network for daily routine exchange of information and reports, as well as during any kind of emergencies, allowing sharing of information between all participating actors in both vertical and horizontal projection. The system also can operate in two modes – real and simulation. The latter is a powerful infrastructure for crisis management training.

The system provides opportunity to trace any crisis management activities at each command level, including information on victims and damages, statistics and reports. In terms of lessons learned, this is a valuable source of analyses and measures to improve the overall system.

The EMIS is a component and key backbone of the national emergency alert system.

Alert information sources

Additionally to the national EMIS there are variety of independent alert networks, channels, and other opportunities that make the Romanian alert system more complicated but flexible and sustainable in unexpected emergencies.

The Single National Emergency Call System (SNECS). SNECS is a vital constituent of the universal service obligations, as laid down the EU acquis. The SNECS consists of 40 (one in every county capital, with back-up capacities) emergency call answering centres known as Public Safety Answering Points (PSAP) and their associated equipment - an operative telecommunications system, designed to notify, receive, process and transfer the emergency calls to the requested services, in a centralised and unitary way. The system also applies to the communications between the Police, the Fire

Brigade, and the Ambulance special response systems, which have the obligation to respond in case of emergency calls.¹⁹⁵⁰

The SNECS receives and automatically records the emergency calls received on/through telephone, radio, automatic announcement devices, signalling, and alarming by other methods, confirming and locating, as much as possible. It analyses, organizes and promptly transfers the emergency calls as received to specialised response agencies, competent authorities (depending on the nature of the events and their consequences); transfers immediately the calls, the data and the information received in case of disaster to the NCES, receives and records the data and information on the events and response development and collects, stores and makes available for the competent authorities the data regarding the handled emergency calls. This is a multi-lingual service made available to all countrywide citizens (both Romanian and foreign) who are in an emergency situation.¹⁹⁵¹

Rapid Early Warning System in Romania (REWS) for earthquakes has been developed, including the following stages:

- 1980-1982 – Installation of telemetry seismic network with 18 seismic stations
- 2004 – REWS extended to dangerous facilities;
- 2007 – REWS for nuclear facilities;
- 2011-13 – Danube Cross-border System for Earthquakes Alert.

Accident Emergency Warning System (AEWS) in the Danube Basin. AEWS is activated whenever there is a risk of trans-boundary water pollution, or threshold danger levels of hazardous substances are exceeded. The AEWS operates on a network of Principal International Alert Centres in each of the participating countries. These centres are made up of three basic units:

- Communication Unit (operating 24 hours a day), which sends and receives warning messages;
- Expert Unit, which evaluates the possible trans-boundary impact of any accident using the database of dangerous substances and the Danube Basin Alarm Model;
- Decision Unit, which decides when international warnings are to be sent.¹⁹⁵²

Electronic sirens, TV and radio and the Internet is used by responsible national agencies, e.g. Meteoalarm and National Institute of Hydrology and Water Management.

Operative information exchanged between operational forces involved in interventions is handled via a SIMPLEX handset. Coordination information is handled via a TETRA handset and the Mobile Command Post. Public information systems use TV, the radio, spokespersons and live transmissions from disaster scenes transmitted through the Mobile Command Post.

5 Capabilities

To achieve legally determined aims and goals, the Romanian strategy and policy on civil protection, the components of the National Emergency Management System, as well as the civil protection volunteers and professionals need to be prepared, trained and equipped.

5.1 Human resources

No open systematic information on human capacity for emergency management. The UNIDIR and The World Bank sponsored study as of 2008, as well as a 2007 GIES presentation provide the following figures:

- People, involved in civil protection in normal condition – 1 200;
- Resource of the General Inspectorate for Emergency Situation and its subordinates – 31 000;
- Organised into detachments volunteers around the country – 131 000;
- Personnel from private enterprises – 21 175.¹⁹⁵³

There is no definitive data available on the total number of volunteers in Romania. The lack of data on this matter is determined by two key factors:

- Not all volunteers sign a volunteering contract with the host organisation;
- There is no national register of volunteering contracts.

By way of background, according to a comprehensive study of the European volunteerism (GHK, 2010), the actual proportion of the overall active volunteers in Romania ("who do voluntary work on a regular monthly basis"), but not specifically on emergencies, is estimated to be fewer than 2% of the adult population. By this criterion, Romania has been classified by the study in the group of countries with low or relatively low levels of participation in volunteering with a modest trend towards an increase.

5.2 Materiel (non-financial) resources

In accordance to the National progress report on the implementation of the Hyogo Framework for Action (2011-2013) there are no funds dedicated for disaster risk reduction measures. The investment in response and recovery leads to limited/no budget left for disaster risk reduction measures. Most of the time, local authorities have to face many and various challenges with a limited amount of money and some of the emergency situations funds are used to cover more urgent needs. Important amounts of money were invested in prevention activities and in disaster risk reduction measures, especially in the flood risk field. These funds are from the local councils, decentralised public services, central authorities and European programs.

The National Administration for State Reserves is responsible for managing all materials and goods for supporting the affected population, on the basis of a governmental decision.

At the county level, emergency situation inspectorates manage warehouses with protection, intervention and first necessity materials for displaced population, financed by the counties' budgets.

¹⁹⁵³ Sources: GIES presentation and (UNISDIR, WB, 2008).

The warehouses belonging to the Romanian Red Cross can provide shelter materials, clothes, footwear and foods.

5.3 Training

The National Centre for Training Improvement in Emergency Situations Management¹⁹⁵⁴ operates regional training centres, which train personnel involved in civil protection and high-level public workers, and public workers with management responsibilities in the National System for Emergency Situations (officers, non-commissioned officers, public administration personnel, etc.).

There is a national emergency management exercises programme, which is part of the GIES main activities plan (not available to the public). Exercise planning is based on risk analyses and preparedness/prevention needs.

5.4 Procurement

5.4.1 Procurement regulation

The general legal framework of the public procurement legislation is Government Emergency Ordinance no. 34/2006 on the awarding of public procurement contracts, works concession contracts and services concession contracts ("GEO no. 34/2006"). In addition, the enforcement norms and secondary legislation are equally important.

In some context of the emergency management, the Government Emergency Ordinance no. 114/2011 on the awarding of certain public procurement contracts in the defence and security fields could be applied.

5.4.2 Procurement procedures

The International Comparative Legal Guides explains the following way the public procurement procedures in Romania:

- *Open procedure, within which any interested economic operator has the right to submit a tender; this procedure is carried out in one stage;*
- *Restricted procedure, within which any economic operator is entitled to submit an application, but only selected applicants are allowed to submit a tender; this procedure is carried out in two stages: selection of applicants and evaluation of tenders;*
- *Competitive dialogue, within which any economic operator is entitled to submit an application and the contracting authority conducts a dialogue with the admitted applicants in order to identify one or more solutions that can meet its requirements; once a solution is identified, the selected applicants prepare the final tender on the basis of that solution; this procedure is carried out in three stages: pre-selection of applicants, dialogue and evaluation of final tenders;*
- *Negotiated procedure, within which the contracting authority carries out consultations with the selected applicants and negotiates the contract terms, including the price, with one or several tenderers; the negotiated procedure can be carried out with or without prior publication of a contract notice; the negotiated procedure with prior publication of a contract notice is carried out in two stages: pre-selection of applicants; and negotiation;*
- *Call for tenders, namely the simplified procedure applicable for the award of contracts*

¹⁹⁵⁴ Source: <http://www.cnppmsu.ro/>.

below EU thresholds and above direct purchases thresholds, whereby the contracting authority requests tenders from several economic operators; this procedure is carried out in one stage; and

- *Design contest, namely a special procedure through which the contracting authority purchases, mainly in the fields of city and country planning, architecture or data processing a plan or a project by selecting it through a jury, based on competitive criteria, with or without awards.*¹⁹⁵⁵

The experts conclude that, “As a general rule, contracting authorities shall apply the open or restricted procedure. Only in specific circumstances, expressly provided by the law, the contracting authorities may award public contracts by means of other award procedures.”¹⁹⁵⁶

When the procurement of materials for civil protection is in the scope of particular ministry, then it has the responsibility to provide the necessary items or services. As a first step in the process, an annual plan for centralised procurement is prepared and during the budget year, public tenders are announced. In some cases, the tenders could be classified. In general, tenders are also made public at the web site of GIES.¹⁹⁵⁷

5.5 Niche capabilities

The Romanian capacity for emergency response includes several niche capabilities of potential utility for neighbouring countries and EU crisis response. These include: pyrotechnical capabilities for drainage, controlled breaches, and detonation; for water purification; transportation; and for marine de-pollution. Military cargo aircraft are also available in cases of emergencies at home and abroad (C-27J Spartan – 6, C-130 Hercules – 3, and An-26 Curl – 4).

6 Conclusion

Emergency management in Romania is a government function with rapidly growing importance during the last decade. Almost every year, serious natural disasters motivate and force the country leadership to work systematically on enhancing the relevant system for crisis management. Public expectations for a more decisive role of the state are also on the rise. The reform efforts' focus is currently diffused between a prioritisation of the natural disasters and terrorism and a coherent strategic approach.

Over the last two decades, the concept, legal framework and institutions of the civil protection system have been completely changed. The emergency system has performed better after the reform, but still lacks "...the knowledge and the necessary legislative, technical and financial capacities to respond effectively..." (Zulean, Prelipcean, 2012). The system has been oriented to cope mostly with "known unknowns" as earthquakes, floods and extreme temperatures, but there is a low level of preparedness and capabilities to respond to new types of threats.

Conceptually, the emergency management in Romania has not yet benefitted from a comprehensive civil security approach. Since the end of the authoritarian regime, the sector's focus gradually moved from wartime "civil defence" towards building an organisation that is more relevant to contemporary threats and risks. The transformation has resulted in the introduction of two basic architectures: the National Emergency Management System and the National System on Preventing and Combating Terrorism. Other elements of the comprehensive civil security, such as the economic, ecological, and social, have not been integrated so far.

De-centralisation in emergency management is a fact in legal and organisational terms. However, the lack of balance between the capabilities of ministries, and those of county and local authorities is obvious. As budgets dedicated to emergency management are not assigned to particular programmes, they tend to be spent for other than risk reduction purposes, mostly for post crisis recovery. Hence, funding is insufficient to fill the gaps in risk reduction, development of capabilities and nation-wide training.

Romanians expect the state to play a more active role in crisis management. Individual insurance seems to be at very basic level. General emergency training is limited. State agencies and several NGOs are campaigning for volunteer contribution and self-insurance, but they are considered mostly low profile, as the interest of the young generation in any volunteer work is in decline. The business has a defined, but limited role in the Romanian civil emergency system; it is more effective in the protection of privately owned critical infrastructures.

Romania is relatively active in the international co-operation for natural and technological risk reduction and emergency management. Bilateral agreements have been signed with all neighbours and co-operation is recently considered as effective. The country is engaged in the work of committees and working groups dealing with the EU's civil protection. Its specialised structures participate and organise exercises and trainings. Romania has activated the EU's MIC and received support several times, and has provided assistance to other EU Member States and non-EU countries. International co-operation is seen as an important factor for rapid response and filling the capability gaps.

Resources

Legislative acts

Basic legal acts:

- Ordinance no. 88 of 30 August 2001 regarding the establishment, organisation and functioning of public services for emergency situations;
- Emergency Ordinance no. 21 of 15 April 2004 on the National System of Emergency Situations Management;
- Emergency Ordinance no. 25 of 21 April 2004 amending and supplementing Government Ordinance no. 88/2001 regarding the establishment, organisation and functioning of public services for emergency situations;
- Ordinance no. 360 of 14 September 2004 approving the performance criteria for the organisational structure and professional equipment for emergency services;
- Decision no. 1492 of 9 September 2004 concerning the organisation, functioning and responsibilities of the professional emergency services (replacing Government Ordinance no. 88/2001);
- Law no. 481 of 8 November 2004 on civil protection;
- Decision no. 547 of 09 June 2005 approving the National Strategy for Civil Protection;
- Ordinance no. 1134 of 13 January 2006 approving the Regulation on planning, preparation, organisation, conduct and management of intervention stocks of emergency services professional, www.igsu.ro/documente/legislatie/OMAI_1134_din_2006_pentru_aprobarea_Regulamentului.pdf;
- Ordinance no. 1184 of 6 February 2006 for the approval of the organisation and ensure the activity of emergency evacuation;
- Decision no. 548/2008, for approval of the National Strategy for Communication and Public Information for Emergency Situations.

Other normative acts

Acts related to protection from natural hazards:

- Law no. 307 of 12 July 2006 on protection against fire;
- Regulation of 12 May 2005 concerning the management of emergencies arising from floods, hazardous weather, hydro construction accidents and pollution incidents.

Acts related to protection from industrial accidents:

- Law no. 92/2003 on the ratification and transposition of the Convention into the national legislation;
- Decision no. 95/2003 on the control of major accident hazards involving dangerous substances;

Implementation agency or department regulations:

- Decision no. 1489 of 9 September 2004 on the organisation and functioning of the National Committee for Emergency Situations;

- Decision no. 1490 of 9 September 2004 on the GIES;
- Decision no. 1491 of 9 September 2004 approving the Framework Regulation on the organisation, competence, functioning and endowment committees and operational centres for emergency situations;
- Order no. 370 of 28 September 2004 approving Regulation on organisation and operation of county and Bucharest emergency inspectorates;
- Decision no. 259 of 31 March 2005 on the setting up and establishing the powers of the National Centre for Fire Safety and Civil Protection;
- Decision no. 1514 of 29 November 2005 amending Government Decision no. 1 490/2004 for the approval of the organisation and functioning and organisational structure of the General Inspectorate for Emergency Situations.¹⁹⁵⁸

Decision no. 1489 of 9 September 2004 on the organisation and functioning of the National Committee for Emergency Situations.

Decision no. 1490 of 9 September 2004 on the GIES.

Driving Innovation in Crisis Management for **E**uropean **R**esilience

SLOVAKIA

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: AIT (Stefan Schirnhofner, Bettina Jager)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by CSDM and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

With a risk of 3.57% Slovakia ranks on the 135th place of the World Risk Report 2014. In the last twelve years, floods, storms, heat waves as well as cold waves affected Slovakia the most.

The initial regulation of civil protection in Slovakia can be dated to 1994, when the Act of the National Council of the Slovak Republic No. 42/1994 Coll. of Laws on Civil Protection of the Population was adopted. Therein, the narrow outlook of the protection concept focused solely on times of war, was expanded to the protection of the population also in peaceful times. Important milestones in the field of civil protection were reached in 2002 with the Acts concerning the reform of the Integrated Rescue System (IRS), the Management of the State in Crisis Situations apart from Wartime and States of War and the Constitutional Act 10 on National Security of the State in War, the State of War, State of Exception and State of Emergency (Act Nr. 227/2002 Coll.), which is the overall civil protection Act. For crisis and disaster situations, the Slovakian civil protection concept envisages rescue measures, mitigation and elimination actions as well as an inter-organisational and cross-border cooperation in for the assistance in emergencies.

At the regional level, the IRS plays a vital part in the Slovakian civil protection. Operated by regional state officers, the Ministry of Health and the Fire Rescue Brigade the IRS provides response to disasters at first instance. If an emergency exceeds the capacity of the regional level, a central crisis staff under the chair of the Minister of the Interior will be established to coordinate measures of the state and the self-governmental regions of the counties. While the ministerial level acts as a central planning and decision-making body, the assigned duties will be carried out by authorities at the regional and the local level.

As most relevant bodies of the Slovakian civil protection, the Government of the Republic, the Ministry of the Interior as well as other ministries, district officers, self-governmental regions as well as the municipalities can be identified. Apart from administrative/governmental bodies, voluntary organisations (e.g. T.O.R. rescue) and NGOs (e.g. Slovak Red Cross) as well as individuals take an important part in civil protection.

As one especial feature of the civil protection system in Slovakia, in crisis and emergencies legal persons are allowed to provide services of own civil protection units to the district offices and municipalities.

Annually, the Republic of Slovakia spends approximately 0.007 percent of the GDP for Civil Protection. The largest share is taken by the Ministry of the Interior, which expends the second largest amount of its budget to rescue services.

At the operational level, the long-established Voluntary Fire Brigades are an integral part of the Slovak civil security system and perform important tasks in the response to disasters.

1 Policy

Slovakia is a unitary state (republic) with a parliamentary system. The Parliament is unicameral, consists of 150 deputies and is called The National Council of the Slovak Republic (Národná rada Slovenskej republiky). The political system of the country is based on proportional representation. Since its independence in 1993, Slovakia has had experience with coalitions where one party dominated, as well as with the fragility of large coalitions. Institutional elements were taken from the German/ Austrian neo-corporatist model. Therefore, the system can rather be described as consociational. However, it is often pointed out that the Slovak reality is largely distant from the ideal model of consociational democracy. (Brazova et al. 2013)

In 1996 a new system of the regional and district division was introduced. In 1999, the government initiated a new round of reforms of public administration. In 2000, a Conception on Decentralization and Modernization of Public Administration was approved. The aim was to decentralize competencies to the self-governmental bodies, to de-concentrate competencies from central administrative bodies to local state specialized administration and to decentralize finances. In 2002, a new regional self-government system was created (consisting of eight self-governing regions). Currently, the country is divided into eight regions (Banskobystrický, Bratislavský, Košický, Nitrianský, Prešovský, Trenčianský, Trnavský, Žilinský – all of them have between 500,000 and 800,000 inhabitants) and 79 districts. There are 2,890 municipalities out of which 138 have the statute of a town. (Slovak Statistical Office online)

In another round of reforms starting in 2004, regional offices of the state administration were abolished and new district offices of state administration were introduced and specialized state administration at the regional level strengthened. Starting from January 2013, the specialized state administration bodies at the regional level (such as Office for the Environment or for Road Traffic and Communications) were abolished and their agenda integrated in district offices (a part of the state administration). (Brazova et al. 2013)

In Slovakia, currently the so-called parallel model of public administration exists, i.e. the state administration is completely separated from self-government. District offices and district offices in the seat of regions are now bodies of state administration, budgetary bound to the MoI. They are active also in the field of civil protection. The responsibility for civil security and crisis management rests mostly with the state administration. The legislative and main administrative competences rest on the national level with respective ministries, especially the MoI.

Despite the de-concentration and decentralization in public administration, the civil security system is rather centralized, although municipalities (bodies of self-governance) have an important place in the system of crisis management: they are the final link of public administration and the first one in contact with citizens. They can also declare an “extraordinary situation”, which has been the case with many local floods and heavy snowfalls. Principles of subsidiarity and the related up-scaling take place according to the territorial spread of a crisis event.

In case of a crisis, the government establishes a central crisis staff (the head is thereof the minister of interior) which coordinates activities of state administration bodies and self-governing bodies (The Act of the National Council of the Slovak Republic No 387/2002 Coll. on Crisis Management of the State in War and Warfare). The ministries are responsible for civil security planning and decide about measures to deal with crisis situations. These measures are executed by the district offices in the seat of region which in turn coordinate activities of district offices and municipalities. The district offices

then execute measures to deal with the crisis situation and coordinate activities of municipalities. At the lowest level, municipalities execute measures to deal with the crisis situation and they demand assistance from the district office (DO).

Table 19: Slovakian Crisis Management Structure

Source: Brazova et al. 2013 accessed: July 19th, 2014.

<i>Administrative level</i>	<i>Crisis management authority</i>	<i>Consultative and advisory body, participates at crisis management</i>	<i>Crisis Management Centre</i>
Centre	Government, the Prime minister	National Security Council (esp. Committee for Civil Emergency Planning)	Central crisis staff (head is the minister of interior)
Ministries and other central administration bodies; Slovak National Bank	Minister, head of the central administration body	-	Departmental crisis staffs
Region	Chief of the DO in the seat of region (<i>Prednosta Obvodného úradu v sídle kraja</i>) State administration	Security Council (Headed by the chief of DO; members include a police, fire-fighter and army representative)	Crisis staff of the DO in the seat of region
District	Head of the DO (<i>Prednosta</i>) State administration	Security Council	Crisis staff of the DO
Municipality	Mayor (<i>starosta</i>) Self-governing body	-	Crisis staff of the Municipality

1.1 Risk Assessment

Among other things the Ministry and the state administration authorities focus on risk analysis and risk assessment methodologies. The key risks are possible leakage of radioactive substances caused by accidents in nuclear power plants, possible leakage of dangerous chemical substances caused by accidents in chemical plants and in the course of their transport, threats of terrorist attacks and floods.

As stated by Brazova (Brazova et al. 2013), the most frequent crises that occur in Slovakia, in the independent history of the country from 1993, are caused by extreme weather conditions. Although industrial and transportation disasters do occur (such as a coal mine explosion in 2009 or explosion at military repair facilities in 2007), they are comparatively less important than natural disasters in terms of the number of people affected (EM-DAT online).

The typical crisis which regularly tests the civil security system preparedness is the flood. The most important one which also demonstrated the weaknesses of the system was the flood of 2010. As explained by ICPDR (ICPDR 2012), the extreme floods were recorded mostly in May and June. Altogether there were 206 days of flood alerts until the end of August (85 percent of the time) and the floods affected the whole territory of the Slovak Republic. Extreme flood events, which resulted from long-lasting rainfalls in the beginning of June, occurred in several river basins of the Central Slovakia.¹⁹⁵⁹

It revealed that the Integrated Recue system (IRS) was not sufficiently ready to deal with consequences of a large-scale event at the central level for a long period of time. After this experience, the government approved a new conception of the IRS and its operation in January 2011.

Table 20: List of Crises in Slovakia (2000 – 2012)

Source: Brazova et al. 2013; accessed: July 19th, 2014.

Year	Crisis description	Crisis category		Damage	
			# of persons killed	# of persons injured	# of persons affected
2000	Wildfire (in Spišská Nová Ves district)	Natural Disaster	7		
2001	Flood (Bodrog, Poprad, Hornád, Ondava, Topľa, Laborec and Torysa rivers)	Natural Disaster	1		
2003	Bus crash near Úhorná	Transportation accident	11	24	
2004	Flood (esp. Ondava river)	Natural Disaster	1	230	2004
2004	Storm (esp. in Tatra mountains)	Natural Disaster	2	24	10,300
2005	Flood (esp. Ondava, Laborec, Hornád rivers)	Natural Disaster	1		
2006	Army plane crash	Transportation accident	42	1	
2006	Flood (esp. south-east of the country)	Natural Disaster	1		100
2007	Extreme temperature	Natural Disaster	1	89	
2007	Explosion at military repair facilities	Miscellaneous Accident	11		
2009	Coal mine explosion in Handlová	Industrial Accident	20		
2009	Gas crisis (outage of gas supplies)	Infrastructure failure/ Other			NA
2009/2010	Flu H1N1	Infectious disease	56		1210
2010	Extreme temperature (heat wave)	Natural Disaster	122		
2010	Flood (whole territory)	Natural Disaster			850
2011	Medical doctors' shortage	Other			NA
2012	Extreme temperature (extreme frost)	Natural Disaster	5		

1.2 Policy and Governance

The Central crisis headquarters and crisis headquarters of the county and district offices fulfil their tasks in accordance on “Management of state in crisis situations except war and warfare”. The central crisis headquarters coordinates the activities of the bodies of the state management, of the bodies of the territorial self-administration and other compounds dedicated to the solution of crisis situation within the period of crisis situation. The minister of the interior is the head of the central crisis headquarters. The structure of the central crisis headquarters is stipulated by its statute, which is approved by the Government of the Slovak Republic (National Report in preparation for World Conference of Disaster Reduction 2004).

1.2.1 Strategy scope and focus

The aims of civil protection, as specified in the Act on Civil Protection of the Population (1994), are to protect the lives, health and property of the population and create conditions for survival under extraordinary circumstances and during the declared emergency situation.

An additional objective is to cooperate with the corresponding institutions of other countries in order to be able to provide coordinated emergency assistance. The Slovak civil protection is responsible for the following tasks¹⁹⁶⁰:

- *The organisation, management and execution of rescue, containment and elimination activities, especially those involving search and rescue operations, provision of paramedical and medical care, release of trapped persons and transportation of injured*
- *The organisation and provision of warning and information services*
- *The provision of emergency supplies and shelter*
- *The provision of refuge and evacuation*
- *The implementation of radiation and chemical protection measures*
- *The organisation and training of the civil protection forces, and the training of citizens in self-protection and self-assistance*
- *The evaluation and location of buildings according to land-use building procedures and the observation of the technical parameters of civil protection facilities.*

According to the Expert Interview (2014), crisis management is provided strategically in all phases – prevention, preparedness, response and recovery. In the area of natural disasters, there the focus is laid on preparedness and prevention. The main legal scope which expresses crisis management in terms of the Slovak republic is a constitutional act no. 227/2002 about security of state in case of war, warfare, state of emergency and emergency.

1.2.2 Monitoring and analytical support to policy making; R&D

Partial Monitoring System – Geological Factors

Systems of monitoring along with information system are important tools to ensure the quality of the environment. At the same time they provide the basis for decision-making on the current and future activities in the field of the environment. The environmental monitoring is a systematic, time/space defined observation of the characteristics of the environment compounds (usually in points, forming a monitoring network), with a certain degree of power to represent the area under study, and in summary, a larger territorial unit. The monitoring provides objective knowledge of the characteristics of the environment and their changes in the area under study. Partial Monitoring System - Geological Factors is a component of the Monitoring System of the Environment of the Slovak Republic. The focus is mainly in the so-

¹⁹⁶⁰ http://ec.europa.eu/echo/files/civil_protection/vademecum/sk/2-sk-2.html

called geological hazards, i.e. harmful natural or anthropogenic geological processes that threaten the natural environment and, ultimately, humans. The more and more adverse effects of natural forces formed the central issue in recent years, i.e. the number of incidents, disasters that have a negative impact on the lives and health of people or their property; in particular, recurring floods and landslides. The results of monitoring provide information to adopt appropriate and timely measures to prevent the incidents.¹⁹⁶¹

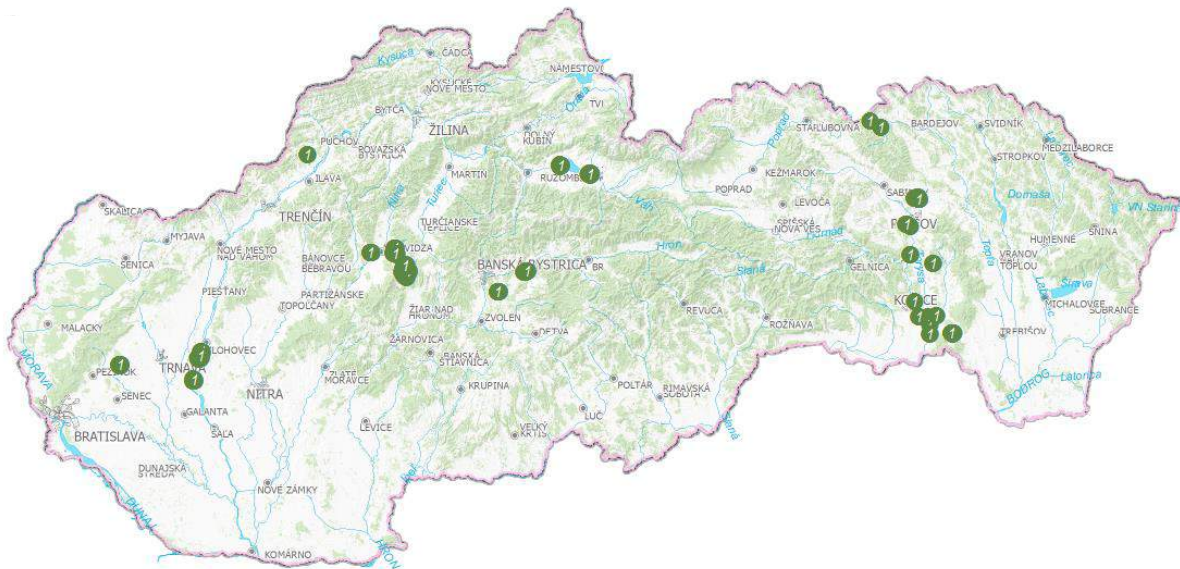

Figure 28: Partial Monitoring System

Source: <http://mapserver.geology.sk/monitoring/>; accessed: September 21st, 2014.

The monitoring of the geological environmental factors of the Slovak Republic is seen as multi-component, integrated and open system. Separate objects of monitoring are divided into the following subsystems¹⁹⁶²:

1. Landslides and other slope failures
2. Tectonic and seismic activity of the territory
3. Anthropogenic sediments of the environmental loads nature
4. Impact of mining upon the environment
5. Monitoring of the radon bulk activity within the geological environment
6. Stability of rock masses below historic objects
7. Monitoring of fluvial sediments
8. Volume unstable soils¹⁹⁶³

In addition, civil protection includes the complementary activities necessary for performing the above tasks, such as planning, organisation and provision of material and technical resources as well as inspections. These civil protection tasks shall continue to apply if a state of increased preparedness has been declared. The scope of the tasks is stated in the Decree on the

¹⁹⁶¹ http://www.geology.sk/new/en/sub/ms/cms_en

¹⁹⁶² Information available at: http://www.geology.sk/new/en/sub/ms/cms_en; accessed: November 2nd, 2014.

¹⁹⁶³ http://www.geology.sk/new/en/sub/ms/cms_en

Classification of the Territory of the Slovak Republic issued by the Government of the Slovak Republic.¹⁹⁶⁴

Radiation monitoring

Radiation monitoring of environmental components in case of emergency, release of radioactive substances leak in the Slovak Republic is organized by the Slovak Centre of Radiation Monitoring Network (Institute of Preventive and Clinical Medicine Bratislava). An important role in monitoring has the civil protection authority, which operates three monitoring systems:

1. Monitoring system based on radiometers RSPG¹⁹⁶⁵ with continuous measurement, evaluation and storage of results according to a reset mode. This system enables an automatic notification and builds the base for an emergency declaration, if the limit value is exceeded. The system consists of 23 stations allocated in the Slovak Republic.
2. The monitoring system based on dosimeters DC - 4C and DC - 4D, which is designed for monitoring and evaluation of radiation situation after the use of nuclear weapons. This system is activated, if necessary, with the possibility of using after the nuclear facilities accidents.
3. The monitoring system based on gamma spectrometric measurements of soil samples from predetermined points throughout the territory of the Slovak Republic. Samples are evaluated by the chemical control laboratory of the civil protection authority.

1.2.3 Policy for Prevention

Disaster prevention is part of the civil protection system. Coordination and cooperation are included within the general mission and tasks of civil protection.¹⁹⁶⁶

1.2.4 Policy for Preparedness

A variety of organisations and departments at national level are involved in DM. Most of these institutions were geared towards flood disasters, some of them being exclusively dedicated to deal with mitigation and preparedness for landslides and avalanches.

The legal bases of disaster preparedness for natural hazards in Slovak are:

1. The Constitution of the Slovak Republic
3. The Slovak Water Act (Nr. 364/2004)
4. The Slovak Flood Protection Act (Nr. 666/2004)
5. The water Framework Directive 2000/60/ EC
6. Directive of the European Parliament and of the Council on the assessment and management of flood risks (2007/60/EC)
7. Bilateral agreements
8. International water management plan 2006-15.

¹⁹⁶⁴ http://ec.europa.eu/echo/files/civil_protection/vademecum/sk/2-sk-2.html

¹⁹⁶⁵ More information at: <http://rspg-spectrum.eu/>; accessed: November 21th, 2014.

¹⁹⁶⁶ http://ec.europa.eu/echo/files/civil_protection/vademecum/sk/2-sk-3.html

1.2.5 Policy for Response

The 50 district offices are primarily responsible during civil emergencies. The Departments of Civil Protection and Crisis Management at the district offices plan, manage and provide the activities relative to the protection of the civil population in the case of emergencies. They can make use of employees at plants, factories and public legal institutions within their territory. When carrying out civil protection tasks, the MoI cooperates with state bodies, municipalities, legal entities and individuals as well as public-legal institutions with a humanitarian mission that are deployed in rescue operations in case of emergency (for example the Association of Rescue Services, the Mountain Rescue Service, the Slovak Red Cross etc.).¹⁹⁶⁷

1.2.6 Policy for Relief and Recovery

According to the European Commission (2014), the Government also manages the recovery of the effects of major natural and other disasters, and supervises the work of various ministries in the sphere of civil protection.

1.3 Financing

1.3.1 Investing in preparedness

The civil protection expenditures are approximately 0.007 % of the GDP.¹⁹⁶⁸

Table 21: Security and Defence Budgets

Source: Kratky 2010. "Slovakia Security Sector Overview" British Security Industry Association.

Institution	Budget 2011 (EUR million)	Budget 2010 (EUR million)
Slovak Intelligence Service	38.95	43.31

Ministry of Interior Budget	€ million	%
-----------------------------	-----------	---

¹⁹⁶⁷ http://ec.europa.eu/echo/files/civil_protection/vademecum/sk/2-sk-1.html#over

¹⁹⁶⁸ http://ec.europa.eu/echo/files/civil_protection/vademecum/sk/2-sk-1.html#over

Spending - 2010		
Emergency services	90.34	10.78%
Public Security (Police)	674.02	80.42%
Public Administration	73.8	8.81%
Total Budget	838.16	100.00%

1.3.2 Investing in consequence management

According to a personal communication with experts from the Slovak Ministry of Interior, Section of Crisis Management, regular systematic budget allocations for Disaster Reduction are estimated to reach 2,5 % of the total local budget allocation. Disaster prevention and risk reduction are the priorities of the parliament, through which they can reduce the loss of human life, as well as the amount of funds needed to deal with disasters.

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

As stated by the Expert Interview (2014), each emergency is evaluated and depending on its range, measures are taken by the body of crisis management in the area of civil protection or humanitarian aid. The main document that provides the basis for the post-disaster assessment is an analysis of a territory of the Slovak republic, which informs amongst others, people about possible risks.

According to Brazova et al. (2013) the analyses of operation were usually conducted at the regional level during the floods of 2010,. The Košice region can serve as an example- one of the most severely affected by the crisis. Already during the flooding event, the causes of the critical developments were analysed and evaluated. The activities of the crisis management bodies were subject to analysis at three levels: crisis staff, self-government of Košice and the EVA commission. The analyses showed that there were not enough persons to fulfil the tasks of civil protection and crisis management at the District Office (DO) level. Insufficiencies also appeared in the technical material and in the evacuation of ill and immobile persons. Generally, most of the results of the analyses stressed either a lack of financial resources or imprecision in the relevant legislation, rather than to point to a personal responsibility. These analyses led to changes on the local level, e.g. the crisis management unit at the DO level was strengthened. At the central level, after the 2010 floods and after a temporary fall-out of emergency lines in January 2011, the decision to reform the IRS was made. Although there was consensus about the need of this reform (to be finished in 2015), some disagreement exists between the current minister of interior and his predecessor on which bodies should be the leading ones.

As stated by the ANVIL Study (2013), no analyses have been conducted in the case municipalities in particular and self-governing bodies in general. So far, no objective and comprehensive evaluation of the conduct of self-governing bodies during rescue works has been conducted following any floods in the country's history. The mayors of municipalities are often seen as the weakest link by some practitioners in dealing with crisis.

1.4.2 Departmental Lessons Learned systems

Brazova et al. (2013) stated that the analysis of the floods in 2010 was conducted at the regional level, where the region of Košice was examined exemplarily. An evaluation of the performance of crisis management bodies was done by the crisis staff, the self-government of Košice and the EVA Commission. As a result, a lack of human resources for Civil Protection and Crisis Management, an insufficiency of equipment and deficits of evacuation performance became evident. Insufficient financial resources were considered as a main source of problem (Brazova et al. 2013).

1.4.3 Centralised (national) Lessons Learned system

The development of measures in the aftermath of emergencies and the implementation of experiences is in the competence of state administration bodies, which are cooperating together. The supreme body of Slovak republic is the government of the Slovak republic. Individual participants are allocating information that is needed on vertical or horizontal level. The connectivity of the system of crisis management and European Union is secured by the national contact points (Ministry of Interior of the Slovak republic, Ministry of the Defence of the Slovak republic and Ministry of Foreign Affairs of the Slovak republic (Expert Interview 2014)). Investigations of the floods in 2010 and the temporary fall-out of emergency lines in 2011 caused a reform the IRS, because of its inconsistency in command and control.

1.4.4 International exchange for Lessons Learned

As indicated by the Expert Interview (2014), the Slovak republic is participating in international practices, providing humanitarian aid, exchanging of experts and educating through courses in the community mechanism and through participation at specific missions. Slovak republic is cooperating with other partner states and providing important information that is needed.

1.4.5 Regular policy reviews

It was explained within the Expert Interview (2014), Crisis management and its origin of improvement is a day by day process, which involves evaluation of specific measures in the actual crisis situations. Structures of state and local government are one of the participants on those crisis situations.

1.5 Resilience

Slovak republic understands the concept of resilience as the analysis of territory of the Slovak republic. In case European Union requests the analysis of territory, Slovak republic is able to provide the analysis. In this regard is a possibility of understanding the legislation of Slovak republic in this way: plans of protection of citizens, plans of providing assistance and other standards are as concept of resilience (Expert Interview 2014). Therefore, Standards of ISO have been applied ad-hoc, and if it's needed en-bloc.

The concept of resilience in civil protection, in terms of county's capacity is to withstand shocks due to natural and other disasters, to rebuild itself with efficiency and to improve on the pre-existing state wherever possible, has not been explicitly established in the Slovakian Republic by law or other normative act.

According to the WDRC-Report (2004) the Slovakian Government has adopted in response to past flood Disasters the resolution No. 31 of January 19, 2000 by which the Master Plan was approved. It identifies several of flood-protective measures and its part is the project “Flood Warning and Forecasting System of the Slovak Republic” (POVAPSYS) which is aimed at the considerable innovation of the flood warning and forecasting practices. The Slovak Hydrometeorological Institute (SHMU) was made responsible for it. SHMU prepared a POVAPSYS was approved in February 2002 by the Ministry of Environment of Slovak Republic. The main aim of POVAPSYS is to develop a tool which would make possible to reduce the damage to life and property to those who might be affected by floods in future. Experience shows that it may be in a catchment, small of large, within the reach of flood waters. It is evident that achievement of this aim will increase substantially the quality of life of the local population by granting them more safety against flooding. It will also comply with the Directive on water 2000/60/EC of the European Parliament and of the Council of 23 October, 2000 which defines the framework of the Community for national water policy.

The following main components of the Project are listed below:

- Integrated management system
- Ground meteorological data monitoring system
- Hydrological data monitoring system
- Telecommunication network
- Satellite data receiver
- Radar network and lightning detection system
- Meteorological and hydrological forecasting methods and models
- Staff training.

1.6 Information sharing and data protection

The National Security Authority¹⁹⁶⁹ is responsible for the protection of classified information. It provides support in domain of information security and information systems certification, crypto-security and crypto-certification, personal security, R&D, and administrative security for the Slovak Republic.

The Expert Interview indicated, that the Slovak republic has transposed legal acts as sensitive, reserved, secret, and top secret in the area of information sharing. In case of vulnerability of critical infrastructure legal acts are transposed and used under very strict rules.

The WDRC Report (2004) states that on the base of bilateral agreement between the Austrian Ministry of Agriculture, Forestry, Environment and Water-Management and the Slovak Ministry of Environment Austrian side gave into the ownership of the Slovak side an automatic aerosol monitor AMS-02 including container and weather station. The Slovak Ministry of Environment provides the Austrian Ministry of Agriculture, Forestry, Environment and Water-Management with the reading of this monitor, free of charge, for at least 2 years and vice versa, the Austrian side gives the readings of the Austrian aerosol monitors to the Slovak Ministry of Environment free of charge. At present national monitoring centre in Bratislava-Koliba is connected via ISDN with Jaslovské Bohunice and Austrian centre providing the data exchange. In the frame of Unit database of radiation data in the Slovak Republic, SHMI cooperates with other partners like: Slovak Army, Civil Defence, Ministry of

¹⁹⁶⁹ Available at <http://www.nbusr.sk/en/>; accessed: November 2nd, 2014.

Health, Slovak Power Plants. At present bilateral data exchange with Slovak Army is running and with other partner is prepared.

International Data Exchange

SHMI cooperates with European Commission Joint Research Centre in Ispra in the frame EURDEP (European Union Data Exchange Platform). At present the Slovakian Republic uses the data exchange with EC JRC new version of format EURDEP 2.0. Data is sent from the monitoring network on ftp server of SHMI every 24 hour and then the data are downloaded to database in Ispra.

Austria

Data between SHMI and Radiation Warning Centre Vienna are exchanging by means of directories on the radiation monitoring server of SHMI. Every 10 minutes data from 336 Austrian stations are stored into the directory on our server and then inserted onto the radiation database. Every 10 minutes data from monitoring network are stored to the directory on server on the Slovakian side and then downloaded to the Austrian side.¹⁹⁷⁰

Hungary

On the base of agreement between the Hungarian Ministry of Environment, Hungarian Ministry of Interior and the Slovak Ministry of Environment, SHMI started the data exchange with Hungary Meteoservices in summer 2002. Data files with the radiation data in the EURDEP 2.0 format are exported from the Slovakian database every 10 minutes and then files are downloaded to the server in Meteoservice Hungary.¹⁹⁷¹

Slovakia is able to use volunteers (plan of providing integrated rescue system and coordination with volunteer organisations, which has the status – other rescue units in Slovak republic. Simple volunteers are used depending on their powers and resources and ability of intervention. Due to the fact, that Social media is not a transparent and reliable tool in case of crisis situations; there is no intent to use it.

2 Legislation

2.1 Crisis (emergency, disaster) management concept

In line with Brazova et al. (2013) the most current legal framework governing the civil security system was established in 2002. Since then, however, the respective acts have been subject to many changes. Competencies and responsibilities in the field of civil security are all legally institutionalized. The statutory basis of civil security in Slovakia does not rest upon a single law or provision. The Slovak Republic has also a security strategy which tackles crisis management issues. The system consists of a multi-faceted complex comprising foreign policy, economic, defence, internal security, social, rescue, and environmental instruments and their mutual links.¹⁹⁷²

2.2 General crisis (emergency, disaster) management law

The main act regulating security is the Constitutional Act on National Security of the State in War, the State of War, State of Exception and State of Emergency (Act Nr. 227/2002 Coll.). The country adopted this legislation for the first time in 2002. Since then, this act has been changed three times. The last change took place in 2006 (agreed upon in November 2005) and introduced a new threat to the list of threats, namely a pandemic – especially a flu pandemic but also any other pandemic caused e.g. by a terrorist attack with biological weapons. The previous two changes were reacting to the reform of public administration and to the reform of Slovak military forces, respectively. (Brazova et al. 2013)

Another crucial regulation is the Act on Management of State in Crisis Situations Other Than War and State of War (Act Nr. 387/2002 Coll.), specifying the authority of different bodies of public administration when dealing with crisis situations. Prior to the adoption of this act in 2002, no complex regulation existed. Competencies of public administration bodies, municipalities, as well as of private and legal persons in case of crises had been always stipulated only by a particular provision concerning a particular type of crisis (e.g. Act on Protection against Fires or Act on Civil Protection). (Brazova et al. 2013)

According to Brazova et al. (2013) the Act on Civil Protection of Population (Nr. 42/1994 Coll.) is somewhat older from 1994. Among other things, this regulation states tasks and authority lines of public administration bodies, as well as rights and obligations of natural and legal persons while ensuring civil protection. Also, the principles of warning and their specification are provided by this act. Since 1994, this regulation has been subject to a change fourteen times, the last taking place in 2012. From the point of view of civil security, the last interesting change to this act occurred in 2011, when the authority of the MoI was broadened so as to include professional education on civil protection. Also, the competencies of self-governing regions were broadened regarding the establishment of a crisis fund from which reparation costs after an extraordinary event can be covered. In the same year, by another change, the “threat to public health of a second degree” was introduced to the list of extraordinary events. (Act Nr. 172/2011)

The next important regulation is the Act on IRS (Nr. 129/2002 Coll.). This reacted to the need to coordinate various rescue services as the number of incidents was growing, where not only one but

¹⁹⁷² The security strategy of the Slovak Republic could be found under: <http://www.mosr.sk/data/files/795.pdf>

more different rescue agencies were needed simultaneously. The inspiration for such a system and for its coordination centres was taken from Austria, Germany and the Czech Republic. Also this act has been subject to change eight times so far, mostly due to changes in other related legislation. In 2011, the government approved a new Conception of the Operation of IRS. The Conception envisages a new delimitation of competencies and organizational changes at all levels of management¹⁹⁷³ and thus also further changes in the respective legislation might be expected.

2.3 Emergency rule

As stated by Brazova et al. (2013), there are legally defined special states which can be declared during a crisis. The least intensive – and the most often declared one – is the extraordinary or “emergency situation” (mimoriadna situácia) in which the IRS is used. Within the Constitution of the Slovak Republic, no specific circumstances have been provided for emergency rule. In contrast, the ordinary legislation refers to different types of emergency rule, such as the state of military alert, natural disasters and catastrophes. In a majority of cases, however, there are different types of emergency rule to deal with different kinds of emergencies in proportion to the gravity of the situation (Khakee 2009).

As stated by Khakee (2009), the President of the Republic declares a state of emergency or a state of war on proposal of the government, which should take its decision collectively. In the Slovak Republic, this is contingent up on the passage of a special constitutional law by the National Council (Parliament) which requires a three-fifths majority of all deputies (EUROPEAN COMMISSION FOR DEMOCRACY THROUGH LAW 1995). It is incumbent on the president to decide, when a state of emergency or a state of war shall come to an end.

The “state of emergency” can be declared by the government (only for the affected area), when lives and health of people are immediately threatened; or when property values are significantly threatened under natural disaster, catastrophe or industrial or other accident (Act Nr. Nr. 227/2002 Coll.; art. 5, sec.1). So far, this has been the case in 2011 when there was an acute shortage of medical doctors.

The “state of exception” has not been used in Slovakia so far. It can be declared by the president (on governmental proposal) in the following cases: terrorist attack, large-scale street unrests involving attacks on public authorities, looting or other mass attacks on property, and other mass violent unlawful action (ibid.; art. 4). Since 1993 (Slovak independence), civil protection (civilná ochrana) has been directed by the MoI. A clear distinction between internal and external security exists. Both of these spheres are ruled by their own legislation and have different leading agencies (MoI responsible for civil security; Ministry of Defence for any deployment of armed forces). The military serves as a secondary body in the IRS, i.e. it does not belong to its basic bodies (Act Nr. 129/2002 Coll.). Usually, the help of the military and its equipment is required when dealing with crisis situations. For example, heavy snowfall in Prešov in February 2013 meant that an “extraordinary situation” was declared. The city asked then the army to provide equipment necessary to clear away the snow (Frank 2013).

As emphasised by the EUROPEAN COMMISSION FOR DEMOCRACY THROUGH LAW (1995), despite the absence of constitutional provisions guaranteeing certain fundamental human rights and freedoms under emergency rule, Art. 15 of the European Convention on Human Rights would fully

¹⁹⁷³ Available in Slovakian language at:

<http://www.rokovania.sk/Rokovanie.aspx/BodRokovaniaDetail?idMaterial=19089>; accessed: 21st November 2014.

apply in such a situation, since Article 11 of the Slovak Constitution states that "international instruments on human rights and freedoms ratified by the Slovak Republic and promulgated under statutory requirements shall take precedence over national laws provided that international treaties and agreements guarantee greater constitutional rights and freedoms".

As stated by Brazova et al. (2013) there were 109 emergency situations registered at the Mol in 2011. Most of these were floods, leakages of dangerous substances or large traffic accidents. In most cases, these were local emergencies with emergency situations declared at municipal or local (district) level.

The crisis legislature and particularly the Act on Civil Protection stipulate the rights and obligations of the population in the state of a crisis. An individual has the right of warning, evacuation, sheltering, for obtaining relevant information on civil protection, and to immediate help when his/her life is threatened, as well as his/ her health and property. Individuals also have the right of education in civil protection with the aim of self-help learning and the ability to help others in need (Act Nr.42/1994 Coll.). (Brazova et al. 2013)

According to Brazova et al. (2013) a for legal obligations individuals are required to participate in the tasks of civil protection. When there is an emergency situation, people are legally required to follow the instructions of local offices, municipalities, and other legal entities as defined by law. Citizens are also legally obliged to carry out measures to protect food, water, animals, and feed which are in their possession or were entrusted to them. Natural persons are obliged to fulfil duties in civil protection units and to be prepared for these duties in advance. People also can be asked to participate in (time-limited) works which aim at the protection of life, health and property.

An obligation also exists for natural persons to provide material means which are in their possession (after the crisis, these are returned or refunded) and to provide room for emergency accommodation for the people affected by an emergency situation or to people conducting the rescue works. Legal persons are legally obliged to cooperate with district offices and municipalities in civil protection. They also can – based on their own judgment – establish civil protection units. Legal persons are further obliged to provide warning for their employees and to provide material means which are in their possession to the state administrative bodies or to municipalities for the preparedness for civil protection and during emergency situations.

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

As summarised at the VADEMECUM Web-Site (2014):

At ministerial level¹⁹⁷⁴

- Order No 75/1995 Coll. on the Provision of Evacuation, as worded in later instructions
- Order No 523/2006 Coll. on the Provision of Rescue Operations and Organisation of Civil Protection Units, as worded in later instructions.

Inter-ministerial cross-cutting coordination

Government regulations:

¹⁹⁷⁴ http://ec.europa.eu/echo/files/civil_protection/vademecum/sk/2-sk-1.html

- Regulation of the Government of the Slovak Republic No 130/1994 Coll. on Single Extraordinary Compensation for Injury or Death in Respect of the Protection of the Population, as worded in later instructions
- Regulation of the Government of the Slovak Republic No 166/1994 Coll. on Categorisation of the Slovak Republic's Territory, as worded in later instructions.

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

At regional level

- Directions of the Mol and methodological instructions of the Section on Crisis Management and Civil Protection of the Moil to the district offices stipulating the conditions of specific tasks in the civil protection field.

At local level

- The Act of the National Council of the Slovak Republic No 42/1994 Coll. on Civil Protection of the Population, as worded in later amendments including the tasks at local level.¹⁹⁷⁵

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

Although the state plays a dominant role, also some private bodies regularly participate in the provision of civil security. Private (for-profit) companies especially dominate in the field of health provision. The Health System Reform (agreed by the government in 2004) included complete privatization of health rescue services. The aim was to introduce market principles into the public health provision and to decentralize management and ownership of the health services. The role of the Ministry of Health was weakened. The main driver of this reform was economization of activities. (Brazova et al. 2013)

Currently, the providers of medical and health emergency services are linked together in the Association of Rescue Health Service Providers and the Association of Rescue Health Services, with 17 and 11 members (respectively). Also the formerly state-owned Medical Emergency Services has been transformed into for-profit companies. The Air Health Rescue Service operates on the same basis – the company Air Transport Europe operates seven centres.

Enterprises can establish their own fire-fighting and civil protection units. The company Flack Fire Services provides (since 2007) fire-fighting company brigades to large industrial enterprises (such as chemical plants or car factories). It also organizes and mediates educational and training programs in the field of fire protection for Slovak and Czech enterprises (Flack Fire Services online).

2.7 Legal regulations for international engagements of first responders and crisis managers

International intervention is governed by political agreements (EU, UN, NATO, CEI¹⁹⁷⁶, Visegrad Group¹⁹⁷⁷).

¹⁹⁷⁵ http://ec.europa.eu/echo/files/civil_protection/vademecum/sk/2-sk-1.html

3 Organisation

3.1 Organisational chart

According to the European Commission (2014), for the formulation in the area of civil security, the Mol¹⁹⁷⁸ is mainly responsible. The bodies responsible for crisis management, according to the current legislation, are the government of the Slovak Republic, ministries, National Bank, district offices at the seat of region (State administration bodies at regional level), district offices (State administration bodies at lower (district) level) and municipalities. The government commands and controls the ministries in terms of crisis management and decides about both asking for and providing foreign assistance (Act Nr. 387/2002 Coll.). In practice, the level which is meant primarily to respond to crises is the regional level. Here, the prominent position is held by the district offices in the seat of region which are managed/ led by the Mol. The role of the state administration in this field remains crucial.

In line with Brazova et al. (2013) the most important body to civil protection is the Mol. It approves the composition and size of expenses of the district offices for civil protection (which is financed through the Mol budget). At lower level, the role of the district offices in the seat of region is important as these bodies declare the “emergency situation” at the level of region and they lead rescue works in such case. At an even lower level, the district offices are tasked with leading the rescue works if these are not in competency of any other body (e.g. when an emergency situation is declared at a higher level) (Act Nr. 42/1994). In the field of civil protection – unlike in the case of crisis management – some more space is given to the self-governing regions. These can e.g. establish a crisis fund to finance a potential damage. Yet, the obligation to do so does not exist. The regions cooperate with state administration bodies in civil protection. They do not have any special or individual tasks to perform on their own. Municipalities are more involved in both crisis management and civil protection. Municipalities can and do declare emergency situations. They also create civil protection units from the citizens of the municipality.

Criticism exists that the legislation does not respect the experience of lower administrative bodies (both state and self-governing ones), most importantly their responsibility to the citizens. Also, the responsibilities of the fire rescue brigades are not entirely clear while leading rescue works before the lead is taken over by a state administration body. Responsibility is stated by the legislation only implicitly. The public administration reform did not affect the crisis management capabilities directly. Especially the replacement of regional crisis management bodies by strengthening of district offices in the seat of region is criticized as not conceptual. Moreover, the legal principles of functioning of the crisis staffs at the municipal, district and regional level remain unclear. The competencies and crisis management tasks of state administration and self-governing bodies are overlapping in large cities. (Brazova et al. 2013)

¹⁹⁷⁶ More information at: www.cei.int/; accessed: November 19th, 2014.

¹⁹⁷⁷ More information at: www.visegradgroup.eu/; accessed: November 17th, 2014.

¹⁹⁷⁸ The Mol's Section on Crisis Management and Civil Protection is responsible for the administration of civil protection in cooperation with public authorities and municipalities.

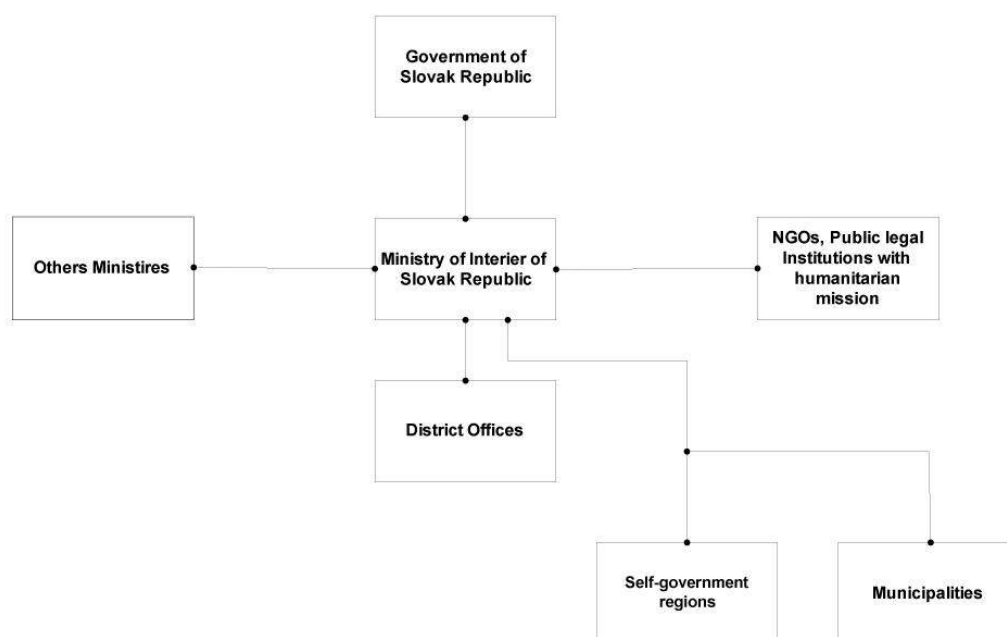

Figure 29: Organisational Chart of civil protection agents

Source: http://ec.europa.eu/echo/files/civil_protection/vademecum/sk/2-sk-1.html#orga; accessed: November 1st, 2014.

As indicated by the ANVIL report (2013) the civil security system has been practically provided by the so-called IRS since 2002. This is an operating platform to respond to crises within which operate: the Mol, Health Ministry, district offices in the seat of region and rescue bodies. The main leading and coordinating role is endowed to the Mol. Expenditures on the IRS are financed from the state budget through the budget of the Mol (Act Nr. 129/2002). The rescue bodies of the IRS are divided into three parts: basic rescue services, other rescue services and the police corps. The basic rescue services are: fire rescue brigades, health emergency services, inspecting chemical laboratories, Mountain Rescue Service, and Mining Rescue Service. Among the Other rescue services belong e.g. army, municipal fire brigades, municipal police, civil protection units, Slovak Red Cross (SRC) and others.

The main level of operation of the IRS is the regional level: The district offices in the seat of region establish a so-called Coordinating Centre (in place since 2003). Its operators are representatives of regional state administration, of Ministry of Health and of the Fire Rescue Brigade. The Centre ensures warning of the population. It also coordinates the actions of the rescue services within the IRS and gives orders to the respective (basic or other) service of the IRS to intervene. When the forces of the rescue services at the regional level are not sufficient to handle a crisis, the Coordinating Centre asks assistance from other regions through the Mol.

So far, floods have been dealt with at the regional level as the highest level. During the 2010 flood, many regions called an “emergency situation” (e.g. the chief of the DO in the seat of Košice Region in eastern Slovakia declared an “emergency situation” for the whole region during the 1st of June to the 25th of June because the forces and means of the state administration did not suffice any more for providing rescue and protection at the municipal and district level).

The floods of 2010 have shown that the IRS is not sufficiently ready to deal with a crisis in the whole country for a longer period of time (Brazova et al. 2013). In reaction hitherto, the government approved of a new conception of the IRS in 2011. The Mol also pointed to the malfunctioning of

some technical components of the IRS and to the absence of emergency plans. Also the cooperation among and operation of some bodies was problematic. For example the Fire Rescue Brigade was performing its professional duties but it was leaving broader civil security tasks to the civil protection bodies. Generally, the professional fire rescue brigades (due to their capacities) did not represent a decisive force in the rescue actions.

During the 2010 floods, municipalities remained “alone” for some time. The district offices’ (DO) staff and the IRS were not able to be everywhere and priorities had to be set. The forces and facilities of professional rescue bodies were not sufficient; the armed forces were not able to be in every village. The staffing of civil protection and crisis management units of the DO proved to be insufficient. Also there were problems in the coordination of humanitarian help. The cooperation on the side of the municipalities was problematic: these did not observe the obligation to update the higher levels of administration about the current situation. Also this case was said to show-case the inadequacy of legislation in the field of crisis management and civil protection: the position and competencies of leading agencies and bodies were not clear. Currently, the lack of financial resources illustrates a big challenge.

3.2 Organisational cooperation

As stated by Brazova et al. (2013), Slovakia has established bilateral cooperation with all its neighboring countries (the Czech Republic, Poland, Hungary, Austria and Ukraine). Other countries with which Slovakia has bilateral agreements for so-called extraordinary situations are: Croatia, Russia, Slovenia and Montenegro (Mol online). Multilateral agreements on cooperation in the cases of crises include the Central European Initiative (CEI) – an agreement on cooperation in anticipating, preventing and mitigating natural and technological disasters between the governments of Austria, Croatia, Hungary, Italy, the Republic of Slovenia (signed 1997; effective since 2000), and the UN/DHA project on the use of military and civil defense capacities in rescue operations.

Slovakia has also signed regional and multilateral provisions. It is a member of the Council of Europe, EU, NATO, OSCE and the UN. In terms of civil security, under the Visegrad Group take place regular meetings of the directors general for civil protection and disaster management. Also within the Salzburg Forum (a Central European governmental initiative on internal security) the establishment of a National Logistic Centre for humanitarian aid in Bratislava was discussed in February 2012. This could be used for providing help abroad as well as when national need arises. There is regional cooperation with Poland (Operation Program Poland – Slovakia), developing a common system of civil protection against natural disasters (Mol online). (Brazova et al. 2013)

After the storm damaging large forest areas in the High Tatra, the deputy prime minister of Slovakia requested financial help from the EU’s Solidarity Fund to finance part of the damage removal activities. During heavy floods in April 2006, Slovakia urgently requested 150,000 sand-bags from NATO’s Euro-Atlantic Disaster Response Coordination Centre. Within this mechanism, Austria, Croatia, Germany and Poland delivered the requested sand-bags. In the case of Poland, this help was provided through the EU-MIC mechanism¹⁹⁷⁹.

In 2010, when floods hit all of central Europe, the ministers of Slovakia, Poland and the Czech Republic agreed to cooperate. The Czech rescue workers (members of the firefighting brigade of the

¹⁹⁷⁹ More information available at: <http://reliefweb.int/report/slovakia/eadrcc-final-report-floods-slovak-republic>; accessed: November 12th, 2014.

Moravskoslezský Region and of the rescue corps of the firefighting brigade) were sent to Slovakia upon request of the Slovak government. The aim was to conduct a rescue operation in the district of Trebišov in eastern Slovakia.¹⁹⁸⁰

Due to the fact, that the most frequent emergencies in Slovakia are natural disasters, these events will be addressed as a priority.

¹⁹⁸⁰ More information available at: <http://www.usar.cz/webmagazine/subcategories.asp?idk=293>; accessed: November 6th, 2014.

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

According to the Journal of South Asian Disaster Studies (2010), the territory of Slovakia from the geographic location and geomorphologic characteristics' point of view was often exposed to natural hazards in the past. Since 1990, the periodicity of occurrence of natural hazards such as floods, landslides, and avalanches seem to increase. Most of dangerous natural phenomena in Slovakia occur in mild and moderate scale.

Slovakia has the *International Water Management Plan from 2006-15* for rivers and lakes separately but not for ground and coastal water. There are separate action plans for different categories of disasters in Slovakia. The National Action plan for disaster preparedness acted in different years (1992 through 2006). Now, all disaster preparedness projects to move ahead by ECO, the Water Resources Strategy 2000, are sectorial plan and polices that take care of Natural disasters relating to floods and landslides at national level. The building code of 2001 was brought in to mitigate the effects of earthquakes in urban areas and as a measure towards earthquake preparedness. The Government of Slovak Republic in 2001 has approved The National Program of Flood Protection till 2010 as part of the project 'Flood Warning and Forecasting System of Slovakia (POVAPSYS)'. The European Federation of Geologists (EFG) established panels of experts to provide high quality response to the European Commission and Parliament. Recently, the EFG expert panel on natural hazards was approached to provide additional input to the 7th Framework Programme, to be able to identify a strategic research agenda for the natural hazards sector. Organization of hazard prevention and public education developed as well and helped to minimize the risk. However, climatic changes increase extremes in precipitation influencing local storms, landslides, erosions, and sedimentations.

There is a document called "Analysis of a territory of the Slovak republic", which builds the basis for the SOPs. SOPs are based on generally accepted standards which are regularly exercised (Expert Interview 2014). Operations planning is a common procedure of all stakeholders on national and local level.

4.2 Operations Planning

Since 2002, the civil security system in Slovakia has been practically provided by the so-called IRS. This is an operating platform to respond to crises within which operate: the MoI, Health Ministry, district offices in the seat of region and rescue bodies. The main leading and coordinating role is endowed to the MoI. Expenditures on the IRS are financed from the state budget through the budget of the MoI (Act Nr. 129/2002).

Other rescue services belong e.g. army, municipal fire brigades, municipal police, civil protection units, Slovak Red Cross (SRC) and others. The main level of operation of the IRS is the regional level: The district offices in the seat of region establish a so-called Coordinating Centre. Its operators are representatives of regional state administration, of Ministry of Health and of the Fire Rescue Brigade. The Centre ensures warning of the population. It also coordinates the actions of the rescue services within the IRS and gives orders to the respective (basic or other) service of the IRS to intervene. When the forces of the rescue services at the regional level are not sufficient to handle a crisis, the Coordinating Centre asks assistance from other regions through the MoI (Brazova et al. 2013).

4.3 Logistics support in crises

The Slovak Republic has a specific mechanism to deal with disasters arising from relevant legal acts (the Act of the National Council of the Slovak Republic on Civil Protection of Population, the Concept of Organization and Development of Civil Protection by 2015, Act on Management of the State in Crisis Situations except for the Wartime and Hostilities, Act on Integrated Rescue System, Act on Fire Protection, Act on Mountain Rescue Unit, Act on Flood Protection and the other operational documents including Territory Emergency Analysis, Population Protection Plan, Evacuation Plan, Plan of material and technical equipment of civil protection units, documentation for radiological, chemical and biological measures). In accordance with the Act on Armed Forces of the Slovak Republic the armed forces can be utilized in order to provide necessary logistical support at the request of state bodies, municipalities and higher territorial units which charge the armed forces with task regarding protection, assistance and cooperation with the aim to eliminate consequences of natural disasters, catastrophes and accidents threatening human lives or property.¹⁹⁸¹

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

The government of Slovak republic is responsible for crisis communication and crisis management. Crisis communication runs between all interested subjects and Ministry of Interior takes care of voice and data system. Ministry of Interior is responsible for notification and warning of the citizens. As stated by the Expert Interview (2014), information for citizens is secured by warning system – sirens via voice communication means, local radio and etc. Warning signals of civil protection are used in the situation when notification and warning of the citizens is needed.

Brazova et al. (2013) found out, that the primary method of informing the public about an immediate crisis is through the use of sirens. Two different tones are distinguished: the “general threat” (všeobecné ohrozenie) and the “water threat” (ohrozenie vodou). The end of the threat or the end of the emergency is announced by a special signal “the end of threat” (koniec ohrozenia). Warning signals as well as the ending signal are further enhanced by information through the mass media. There is a special tone for the test of the sirens and the public is informed about the test through the media. The tests are coordinated by the Mol and are conducted four times a year, always in an exactly stipulated date and time (Act Nr. 42/1994 Coll.). In Slovakia, a notification network of civil protection exists. This is amended by an independent system of warning and notification which is provided by legal persons (e.g. chemical plants) who might endanger life, health or property of people through their activities. Starting from February 2013, a new governmental decree on warning entered into force. In reaction to advances in telecommunication, the state is now responsible to ensure warning of the entire permanently inhabited territory (earlier, 80 percent was the compulsory coverage area) by electronic sirens or other means. On the entire territory of Slovakia, thus, public telecommunication networks, mass-media, local wireless radio and electronic services of mobile providers can also be used for warning. An “emergency situation” is called on and called off through the mass media. The natural and legal persons who operate radio and TV broadcasting are legally obliged to publish information on a crisis and on the measures related to the provision of help. They are obliged to do so free of charge, upon request of the Coordination Centre (Act Nr. 129/2002). So far, the use of Internet for the informing of the public has not been large. Similarly, the use of social

¹⁹⁸¹ <http://www.ohchr.org/EN/HRBodies/HRC/AdvisoryCommittee/Pages/HRCACIndex.aspx>

media has not been extensive. The government's office as well as the MoI Facebook pages have been established only recently (e.g. the Facebook page of the MoI was set up on November 7, 2011) and have not served as a means of updating the public on crisis so far (the Facebook page of the MoI contains only one entry about an emergency situation: in Košice from 24.5.2012. In April 2013, this page was "liked" by 895 Facebook users).

5 Capabilities

5.1 Human resources

An official agreement between the MoI of the Slovak Republic and the Slovak Red Cross (SRC) on cooperation and assistance was signed on 22 November 2010. The SRC is a non-state organization which is exclusively accepted as a helping organization of the Military Medical Service. It is active in the field of civil protection and provides help during catastrophes, natural disasters, etc. It also organizes and mediates aid during catastrophes both within and outside of the Slovak territory. SRC is a part of the IRS and a member of the Central Crisis staffs at both central and local levels.

The number of SRC members (74,906) is relatively high. Basic organizational units of the SRC are local societies (1160), which join in larger territorial units (38 in total). The number of local societies is very high (e.g. 53 in the city of Košice; 44 in Nitra). At the top of the organization is the Central Secretariat of the SRC. A specific organization is the Water Rescue Service of the SRC. The overall number of SRC volunteers was 18,699 in 2011, out of which 2,255 were ready in crisis situations. In 2010 (the year of large floods), there were 26,606 registered SRC volunteers (2,306 ready in crisis situations) (Brazova et al. 2013).

Other NGOs have different positions compared to the SRC. These organizations are e.g. the Samaritan Association of the Slovak Republic (founded in 2005; currently having approx. 100 voluntary members), the Tatra Mountain Service (specialized at rescue and preventive-educational activities in the High Tatra mountains territory), the Mountain Service in Slovakia (search and rescue works) and the Mountain Service of Pieniny National Park (rescue and preventive-educational activities on the territory of Pieniny National Park). Due to their specialization and territorial location, these mountain services were not much involved during the 2010 flood. The Samaritan Association helped e.g. in the Kežmarok District providing logistics of supplies and medicine to people on territories made inaccessible by torn-down bridges (Hužiková, undated).

Over the last years, also the organization Modrý anjel (Blue Angel) has gained in importance. It specializes in crisis intervention (i.e. in dealing with crises in their acute state). It started its operation under a European Social Fund project aimed at providing psycho-traumatic first aid with the medical rescue services. Currently, the organization has 53 members. It has assisted in most of the large-scale crisis events (e.g. after the explosion in a military repair facility in 2007; during the 2010 floods). It was directly activated by the MoI after the coal mine explosion in 2009 (Modrý anjel online).

A very important voluntary organization is the VFB (established in 1922), whose main tasks include (besides regular fire-fighting) civil protection and education of voluntary fire-fighters. Currently, there are 2,478 VFB in Slovakia, consisting of some 90,000 members. These organizations form district and territorial boards of voluntary fire protection based on the territorial principle. There are also eight regional boards based on a principle of delegation (Dobrovoľná požiarna ochrana SR online).

As explained by Brazova et al. (2013), in the face of an emergency, the VFB provides rapid response at the site. Although, a better equipment might be desirable, their contribution to civil protection gained consideration during the floods in 2010.

As indicated by the ANVIL report (2013):

Other voluntary organization specializing in civil security are the T.O.R. RESCUE¹⁹⁸² from the town of Prešov (its main tasks being search and rescue actions during natural disasters) and the Dog Rescue Slovakia (established in 2000, specialized in search works). Beside this, a number of organizations and charities are partially involved in the civil security system too – by establishing money collection in the aftermath of crises. For example ADRA Slovakia organized such a collection after the 2010 flood and provided alimentation for 300 evacuated people.

Table 23 provides an overview on operational forces for civil protection activities.

Table 23: Overview on operational forces for protection and rescue activities in Slovakia

Source: Kratky (2010).

Stakeholder Type	Name	Number of Personnel
Voluntary Organisation	Fire Rescue Service (Employed + Volunteers)	90,000
	Mountain Rescue	120
	Slovak Red Cross (Employed + Volunteers)	130,000
Agency/Department	Czech Armed Forces	13,539
	Police	22,288
Total		255,947

5.2 Materiel (non-financial) resources

Among non-financial sources include organ compositions crisis management components of the IRS. Those reserves are located in the humanitarian aid store fuel reserves throughout the territory of the Slovak Republic (Expert Interview 2014). Specific resources from the military are deployed as needed. If necessary, it can be ordered in kind or personal assistance. Specific resources are also used by private operators.

Although floods have so far been the major disasters in Slovakia, they have never led to a declaration of an “emergency situation” or “state of emergency” at the central level. However, help from abroad was requested (and received) through NATO’s Euro-Atlantic Disaster Response Coordination Centre after floods in 2006 (sand-bags) and through bi- or tri- lateral cooperation within central Europe in 2010 (Czech Firefighters helping to deal with floods).

So far, a state of emergency has been declared once, when medical doctors were massively leaving to the Czech Republic in 2011: From the 29th of November to the 8th of December, 2011, a state of emergency was declared (see also chapter 5.1). The reason was that approximately 1,200 Slovak medical doctors left their jobs in a joint protest organized by the medical unions on the 1st of December, 2011. In summary, a state of emergency was declared for 13 districts and 15 hospitals were affected. Under the state of emergency, it was possible to order the doctors to be on so-called ‘labor duty’. However, even these measures were not entirely sufficient to provide full medical care in Slovakia. The government of the Czech Republic was asked by the Slovak government to send in help in the form of 30 military doctors. Help was also offered from the Austrian Ministry of Health which offered to accept patients from Slovakia in emergency cases in Austrian hospitals (Czech Press

¹⁹⁸² T.O.R. rescue is a voluntary organization, which includes rescuers, divers, cragsmen.

Agency 2011). In the end, the Slovak medical unions and the Slovak government reached an agreement and signed a common memorandum which put an end to the crisis.

A large crisis dealt with at the central level also occurred in January 2009. A “state of emergency in gas industry” was declared when there was a 70 percent reduction (later on growing to 100 percent) in deliveries of Russian gas due to a Russian-Ukrainian dispute. A crisis staff at the level of the Ministry of Economy was established relatively early to deal with the situation. The reserves previously thought to be fully sufficient but proved to be inadequate. The Slovak population was not directly affected, yet the government decided to reduce gas supplies to some one thousand selected enterprises. The Slovak prime minister asked his Czech counterpart for help. Some 6.3 million cubic meters of gas were then provided to Slovakia daily until the crisis was over. (Brazova et al. 2013)

5.3 Training

Training exercises are performed at all levels, educational activities, achieving proficiency in the field of CO, special courses and regular courses in European courses within the framework of the Community mechanism (Expert Interview 2014).

Ministries are responsible for the provision of education in the field of civil protection and training at all types of schools in the country. Civil preparedness is then realized at lower levels and also funded and organized by the self-governing regions. These cooperate with regional media which publish or air especially useful articles, footage of model exercises, etc. A legal obligation is given to the district offices to exercise (and if needed, to change) the plan of civil protection. This has to be done at least once every three years (Act Nr. 42/ 1994 Coll.).

The education in the Slovak public administration is organized hierarchically: Mol coordinates education and preparedness of the crisis staffs of Slovak ministries and of crisis staffs of the district offices in the seat of region. The latter ones, in turn, organize professional preparedness (education) of the crisis staffs of district offices. These organize the education of crisis staffs of municipalities.

People who are trained are employees who fulfil the tasks of civil protection and crisis management in the state administration, self-government and legal entities as well as individuals, entrepreneurs, directors and teachers of elementary schools and high schools. The centres of education and training are located in Slovenska Lupca, Nitra, Limbach and Spišská Nova Ves, which are an organisational part of the Section on Crisis Management and Civil Protection. National exercises programmes are included into the annual action plans of the Section on Crisis Management and Civil Protection. Yearly staff exercises are held at regional and district levels, examples include Košice 2005, Stropkov 2006, Airport 2008 and Fercekovce 2008.¹⁹⁸³

5.4 Procurement

5.4.1 Procurement regulation

In Slovakia, the Act on Public Procurement regulates the procurement including open procedure, restricted procedure, and negotiated procedure with or without prior notification and competitive dialogue (Bianchi & Guidi 2010), only design contest was not covered. For the procurement of services, it is sufficient to publish it in national e-Journals of Public

¹⁹⁸³ http://ec.europa.eu/echo/files/civil_protection/vademecum/sk/2-sk-3.html

Procurement and contract award notices will be published in the national e-Journal and the EU Official Journal.

The Office for Public Procurement and the Supreme Control Office at the Ministry of the Finance are the supervision bodies for the control of public procurement.

5.4.2 Procurement procedures

According to OECD (2007), the Slovak Republic has a centralised structure for Public Procurement, established at the Office for Public Procurement. The Council of Ministers is the competent authority for drafting of the primary and secondary legislation, advisory and support of operations, international co-ordination, monitoring and control publications and information promote the professionalization and strengthening the capacities as well as complaints review and remedies.

5.5 Niche capabilities

As stated by Brazova et al. (2013) the expectations of the public towards the government are relatively high. The fire rescue brigades are highly trusted. People are willing to volunteer both spontaneously as well as in an organized way. The most important civil organization here is the Voluntary Fire Brigades (VFB). It was considered as an integral part of the Slovak civil security system. Brazova et al. (2013) emphasised, that this long-established organisation play an important role at the operational level by performing necessary tasks in order to response to disasters. Besides regular fire-fighting, civil protection and education of voluntary fire-fighters are well established. The VFB are often the first to arrive and to respond to a crisis

It was stated, that the Mayors of municipalities are supposed to take an important role in response, nevertheless they are unprepared. Although, the rescue teams of the Slovak Republic exhibits a good performance in the field of chemical, biological and radiation threats.

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by AIT and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

According to official documents¹⁹⁸⁴ and reports,¹⁹⁸⁵ Slovenia is threatened by a variety of natural hazards, mostly earthquakes, floods, landslides, hail, storms, sleet, frost, and fire. The country has one nuclear power plant and a large industrial sector that operates dangerous substances – a potential source of ecological damages and catastrophic accidents.

The recent civil protection system has been constructed after 1992 by means of the adoption of a number of legislative acts and organisational reforms. The core characteristic of the civil protection system of Slovenia is that protection against natural and man-made disasters has been separated from the national defence system. This way, an integral and functionally unified system has been established based on common goals and principles. However, the main administrative and co-ordination structure for civil protection – Administration of the Republic of Slovenia for Civil Protection and Disaster Relief (ACPDR) is a constituent body of the Ministry of Defence.

Figure 30: Symbol of the Administration of the Republic of Slovenia for Civil Protection and Disaster Relief (ACPDR).¹⁹⁸⁶

Conceptually, the civil protection and rescue system is one of the three pillars of national security along with the defence system and the internal security system. However, “civil protection” in Slovenia is a relatively narrow concept; it includes very specific range of activities, commanding and co-ordinating bodies and specialised units for interventions and rescue in emergencies.

The system is built at three levels – national, regional and municipality. Functionally the focus is on regional capabilities and local authorities, supported by the state. Commercial entities, civil organisations and citizens have legally prescribed important functions for prevention, monitoring, alarming and responding to any extreme developments. Volunteering has a long lasting tradition in Slovenia.

Key civil protection stakeholders are the National Assembly, the Government, particular ministers, and the civil protection service that includes commanders, headquarters and heads of intervention and rescue units, and the local authorities. The administrative and specific expert tasks related to protection against natural and other disasters are carried out by the ACPDR, which is a multi-sectorial and coordinating body.

¹⁹⁸⁴ For example see *Doctrine on Protection, Rescue and Relief. Government of the Republic of Slovenia*, 2002, <http://www.sos112.si/db/priloga/p4359.pdf>.

¹⁹⁸⁵ For example see *Republic of Slovenia National Report and Information on Disaster Reduction for the World Conference on Disaster Reduction*, Kobe-Hyogo, Japan, 18-22 January 2005, available at <http://www.unisdr.org/2005/mdgs-drr/national-reports/Slovenia-report.pdf>.

¹⁹⁸⁶ Web site of the Administration of the Republic of Slovenia for Civil Protection and Disaster Relief www.sos112.si/eng/.

The units of the Slovenian Armed Forces and the Police are to carry out protection and rescue tasks related to their training and equipment. Their participation in protection and rescue operations is decided upon by the government and in emergency cases by the respective ministers at the request of the Commander of Civil Protection of the Republic of Slovenia.

Republic of Slovenia allocates annually approximately 0,5 % of the national budget for protection against natural and other disasters, while local authorities dedicate 3 % of municipal budgets for that purpose. In addition, fire protection is financed partially from the “fire fund,” generated from a fire insurance taxation.¹⁹⁸⁷

1 Policy

According to a study of the public opinion on threat perceptions, "... the great majority of adult citizens in Slovenia feel safe and secure."¹⁹⁸⁸ However, serious natural disasters during the last decade made them increasingly aware of ecological, natural and man-made emergency. The governments reflect the growing public demands for improving the preparedness and rapid reaction capabilities, making civil protection one of the pillars of national security policy.

The National Security Strategy¹⁹⁸⁹ explains civil protection policy as a component of the national security policy along with foreign, defence, and internal security policies.

The social context of civil protection in Slovenia is the nation's long lasting tradition in volunteering in cases of emergencies like fires, avalanches in the mountains, and floods. Despite the separation of the civil protection system from the defence system, Slovenians strongly perceive (above 80 %) an important military role in cases of emergency.¹⁹⁹⁰

¹⁹⁸⁸ Gerhard Kummel, Giuseppe Caforio and Christopher Dandeker (eds.), *Armed Forces, Soldiers and Civil-Military Relations* (Wiesbaden: VS Verlag für Sozialwissenschaften, 2009), p. 137.

Figure 31: Construct of the Slovenian National Security System.¹⁹⁹¹

1.1 Risk Assessment

According to the National progress report on the implementation of the Hyogo Framework for Action (2013-2015), Slovenia has adopted (2014) a Regulation implementing the Decision on the Mechanism of the Union in the field of civil protection. It "...determines the form, content and method for making individual risk assessments at the state level, risk assessment for individual hazards on local level, national risk assessment, the method of adoption and deadlines."¹⁹⁹² According to the same report, "[r]isk assessment for individual types of disasters is based on the Instruction for Conducting Risk Assessment, which serves as a basis for all risk assessments. The Administration of the Republic of Slovenia for Civil Protection and Disaster Relief is responsible for risk assessment for individual natural or other disasters, which affect the entire or parts of the national territory while risk assessment at the local level is performed by the competent municipal bodies."¹⁹⁹³

Natural and man-made disasters are between the focal points of the Slovenian National Security Strategy. The document points out that, "[n]atural disasters, which pose greatest risks to the Republic of Slovenia are earthquakes, floods, storms, droughts, major wildfires, and massive outbreaks of infectious diseases in human, animals, and plants."¹⁹⁹⁴

The Doctrine for Protection, Rescue and Relief (2002) determines that, "the main sources of dangers and threats of natural and other disasters are inadequate encroachment on the environment, pollution, military threats, terrorism, and other non-military sources of threat."¹⁹⁹⁵ Regarding the technological hazards, the Doctrine underlines that the industrial and transportation accidents, as well as those that are results of malicious attacks are of particular importance.

As a country, which is independent only since 1991, Slovenia continues to develop its system for hazards, risks and vulnerabilities mapping. In the EM-DAT database, hazards data of Slovenia is available only from 1995 onwards.¹⁹⁹⁶ However, as the preventive aspect of civil protection has been determined as a security policy priority, systematic efforts in this direction have been undertaken.

The Ministry of Defence's Annual Report for 2014 accounts for over 14500 disasters and incidents in Slovenia in 2014, grouped in eight main categories (see Table 1).¹⁹⁹⁷

A) Natural hazards

According to the Brussels-based Centre for Research of the Epidemiology of Disasters (CRED), earthquakes, extreme temperatures and storms cause the deadliest natural disasters.

Obviously, in terms of fatalities, the most dangerous proved to be extreme temperatures and earthquakes. For the period of the last 35 years, the average number of disasters per year is respectively, 0.03 and 0.06. The floods and storms cause the most serious material and financial damage, with an average appearance of 0.06 storms and 0.03 floods per year.¹⁹⁹⁸

Earthquakes

From a geotectonic point of view, each year Slovenia is shaken by about ten weak to moderate seismic shocks, which focus is at a depth between five and ten kilometres. This is because the country lies on the seismically active southern boundary of the Eurasian tectonic plate on the North-Western boundary of the Mediterranean-Himalayan seismic belt, which is one of the most seismically active zones on Earth.

According to a 2014 EU sponsored study, "The territory of Slovenia is characterised by high geological and tectonic complexity. A principal geologic feature of the Slovenia is very diverse lithology, which is mainly composed of sediments or sedimentary rocks. Consequently, approximately one-third of Slo-

¹⁹⁹⁹ Data are relevant from 1991 (the independence of Slovenia) to January 2014.

venia (and approximately 20 % of inhabitants) is at least highly exposed to slope mass movements due to morphology, geological and tectonic conditions. In general terms, slope mass movements occur in almost all parts of the country.”²⁰⁰⁰

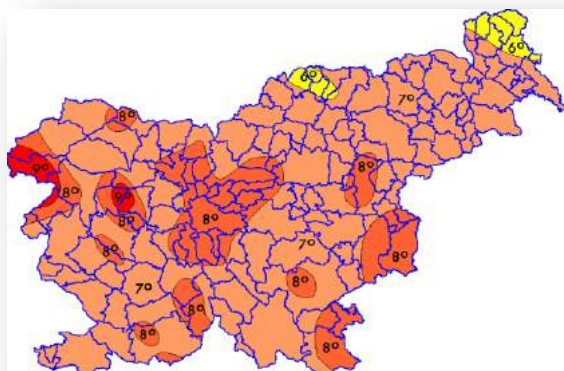

Figure 32. Population delivery vis-a-vis probabilistic assessments of seismic activities of 7, 8, and 9 level on MCS scale.²⁰⁰¹

The Slovenian territory is the juncture of three geotectonic units: the Alps in the north and west, the Dinarides in the Southern, South-Western and central part, and the Pannonian Basin in the north-east.²⁰⁰² There have been many destructive earthquakes in this region: in 1895, a strong earthquake with a magnitude between 8 and 9 on the MCS scale severely damaged Ljubljana, affecting the largest density of population and numerous important government functions.²⁰⁰³ Historically, the most destructive of them are the following:

Table 26. Most powerful earthquakes on the territory of Slovenia.²⁰⁰⁴

Date	Time	Location	MCS	Magnitude	Effect
26 March 1511	2 pm	Idrija-Cerkno	X	6,90	Destructive

9 January 1917	8.23 am	Brežice-Krška vas	VIII	5,59	Destructive

According to the World Health Organisation, the seismic map of Slovenia includes two specific areas of seismic activities. While the most active as a number of cases area is between the towns Ptuj and Novo Mesto the most dangerous epicentre of seismic activities is 50-70 km west from the capital city of Ljubljana, the so-called Gorenjska-Ljubljana area (with a seismic hazard higher than 4).

Figure 33: Seismic Hazard Distribution Map.²⁰⁰⁵

The Seismological Institute of the Republic of Slovenia provides the following scheme of the country's seismic zones (in Slovenian language spelling):

- Čičarija area (A);
- Goriško-Javornik area (B);
- Gorenjska- Ljubljana area (C1);
- Dolenjska-Notranjska-Bela Krajina area (C2);
- Karawanke-Kozjansko area (D);
- Koroška-Haloze area (E);
- Štajerska-Goričko area (F).

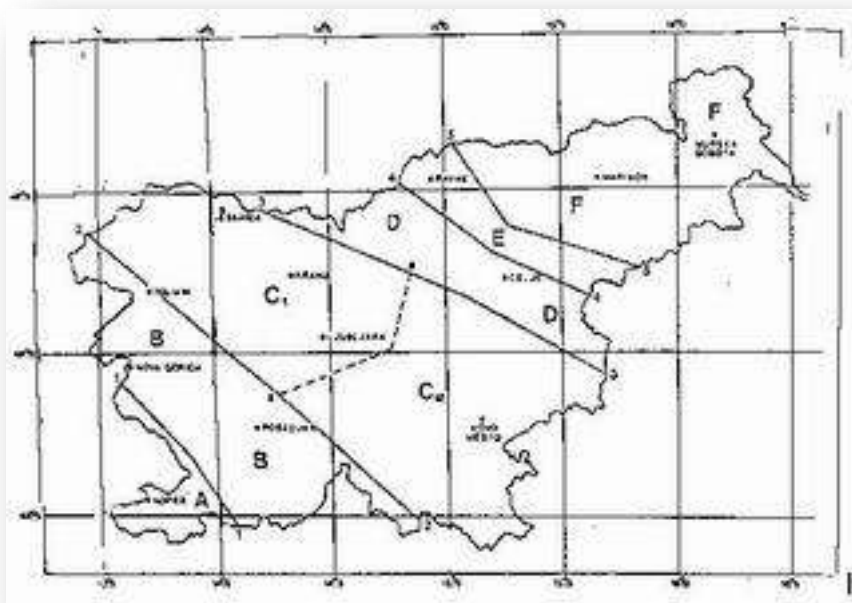

Figure 34: Seismic zones in Slovenia (Seismological Institute of the Republic of Slovenia, 1991).²⁰⁰⁶

The most active zones are C1 and C2 with assessed maximum magnitude as of 6.2 and intensity of 8-9 levels on the MSC scale. The towns at the highest risk include Idrija, Ljubljana, Krško, Tolmin, Ilirska Bistrica and Litija with a population about 700 000 citizens (more than 33% of the country's population).²⁰⁰⁷ The recent application of probabilistic seismic hazards methodology for distributed seismicity confirms the historical statistics.

Floods

In recent Slovenia, floods are considered as the natural phenomena with increasing damaging capacity and impact on people and economy. Floods pose a threat to over 300 000 hectares of land (about 15% of the territory of the country), which lies mostly in narrow valleys carved by torrents. The floods are a source of risk for about 600 000 people or over 30% of the population while under high risk of flooding are 24% of them.

The Slovenian authorities pay special attention to the floods: the research and monitoring of the flood risk is one of the civil protection focuses, along with the alert system, preventive measures and training of the population. Risk assessments are conducted according to the character of floods and source of the high water: heavy rains and the melting of snow. The civil protection organisation²⁰⁰⁸ uses the following set of qualifications for analyses of the character of floods:

- Type of stream (mountain, valley-bottom, flatland);
- Terrain (sloping, depressed);
- Volume;
- Intensity and extent of precipitation;
- Season (autumn, spring);

²⁰⁰⁶ Source: <http://www.sos112.si/eng/page.php?src=og11.htm>.

²⁰⁰⁷ 2005 Hyogo report.

²⁰⁰⁸ ACPDR web site,
<http://www.sos112.si/eng/page.php?src=og11.htm>.

- Type of high-water wave;
- Duration;
- Frequency in particular timeframe (5 for frequent to 50 years for catastrophic floods);
- Type of land and of inundated facilities.

In terms of defining the floods hazard, the local authorities have qualified the country's rivers in four categories, depending the main source of high waters – snow or rain:

- A – Snow driven regime (Mura and Drava rivers);
- B – Snow-rain driven regime (Sava and Savinja rivers);
- C – Rain-snow driven regime (Soca river);
- D – Rain driven regime (Dragonja, Rižana, Reka and Pivka rivers).

The risk from floods comes mostly from the River Sava (Upper, Middle and Lower Sava), as well from Drava and Savinja rivers (Figure 6).

The distribution and timing of rainfall are largely influenced by the geographical location of Slovenia and the diversity of its terrain. According to ACPDR, “[m]ost rainfall occurs during advances of wet and relatively warm air from the Mediterranean.”²⁰⁰⁹ The map of flood hazard level, produced by the World Health Organisation, illustrates that the level of flood risk is the highest (Figure 7, coloured in orange) for the North-eastern part of the country, followed by the area of Celje in central Slovenia, and the Valley of Sava River, including the capital city of Ljubljana.

Figure 35. The biggest rivers in Slovenia that cause most dangerous floods.

²⁰⁰⁹

ACPDR web site, <http://www.sos112.si/eng/page.php?src=og12.htm>.

Figure 36. Flood hazard in Slovenia.²⁰¹⁰

Landslides

Slovenian area is relatively highly exposed to slope mass movement processes due to its geological and morphological settings. Heavy rains and floods are the most often source of landslides – in Slovenia there are about 1 400 landslides at encompassing a territory of approximately 7 000 km² (everywhere, except in the Primorska and Dolenjska Karst region).²⁰¹¹

According to the latest study of landslides, "... the 15-years average landslide damage represents 7.6 % of total damages due to disasters in Slovenia (and 0.03 % of the GDP)."²⁰¹² In the last 15 years, more than 10 people have been killed in landslide events."²⁰¹³ Landslide susceptibility map of Slovenia at scale 1:250,000 have been completed, based on the extensive landslide database and analyses of

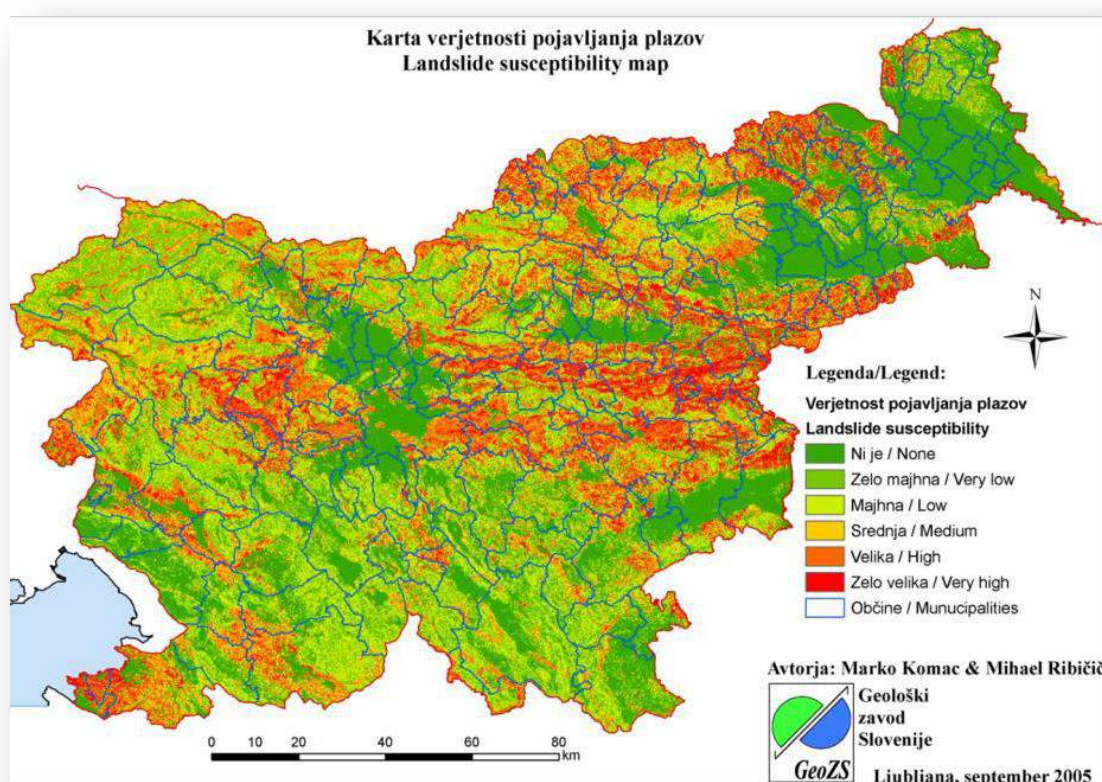

Figure 37. Landslide susceptibility map of Slovenia.²⁰¹⁴

landslide spatial occurrence.²⁰¹⁵ The map below illustrates that the landslides have been

concentrated along the main river valleys, related most of all to river regimes and the rain-snow factor.

Avalanches

Given the dominant mountain character of the country, avalanches are of permanent concern for the local people, tourists and business. With the overall expansion of ski tourism the government's concerns of avalanches are increasing – recently, more than 1260 possible avalanches have been registered.²⁰¹⁶

Forest fires

Forests are of special importance for the Slovenian people. The state provides comprehensive care for the health of the forests from a biological and reforestation point of view. According to the Government web site,²⁰¹⁷ “forest fires are a serious problem, especially common in the [region of] Karst.”

A specific character of the risk assessment of forest fires is the fact that during the last years, de-nationalisation of the land, the forests also became mostly private. According to the Slovenia Forest Service, 71 % of the total forested area in Slovenia is now privately owned (about 300 000 private owners), 26 % is in state ownership and 3% are owned by legal entities (local communities or other organisations). However, from a risk point of view, the area covered by private forests is highly frag

Figure 38: Avalanche threat in the Republic of Slovenia.²⁰¹⁸

mented – the size of the average forest holding is less than 3 ha. The larger forest holdings are in the hilly areas Koroška, Zgornja Savinjska, and Pohorje.²⁰¹⁹

Dangerous weather (cold, sleet)

The first major case of countrywide sleet has occurred on 31 January 2014: because of the heavy burden, trees and electrical infrastructure have started to collapse and fall down. On 2 and 3 February, there was widespread damage on electrical infrastructure and forests. From all 13, eleven provinces were affected: a lot of households were left without electricity; over 2000 km of electrical grid

were affected; 40 % of forests in Slovenia were heavily damaged and it will take decades to mitigate this damage. Combined estimated damage is over 430 million €, with one casualty and 23 injured at the end of the intervention among rescuers, electrical company workers and army personnel.²⁰²⁰

The Ministry of Defence Annual Report for 2014 provides a detailed picture of the number of natural disasters and incidents and the relevant number of operations that took place in 2014 (Table 4).

B) Technological hazards

The main technological hazards affecting Slovenia are those associated with nuclear and other radiological threats and chemical and industrial accidents.

Nuclear and other radiological threats

Slovenian authorities consider the following sources of nuclear and radiological threats:²⁰²¹

- Nuclear facilities (nuclear power plant, nuclear research reactor, uranium enrichment facilities, facilities for the production of fissile substances, facilities for the treatment and depositing of irradiated nuclear fuel, and facilities used for the storage, processing and depositing of nuclear waste material);

Table 27. Natural disasters and response operations in 2014.²⁰²²

Date	Number of Emergency Response Operations	Number of Participants	Number of Injured People
High Sea Tide	14	17	0
Floods	2321	17216	3
Avalanches	241	1673	0
Deep Snow	1284	6865	1
Hail	6	76	0
Strong Wind	451	2883	0
Lightning Strike	26	217	1
Sleet	2613	24433	13
Disruptions of Traffic due to Natural Disasters	16	95	0
Total	6972	53475	18

- Facilities where sources of radioactivity are used (stationary or mobile facilities where radioisotopes are used, e.g. in industry, research institutions and hospitals)
- Transport of radioactive substances (by road, rail, air or sea).

Figure 39: Slovenian nuclear facilities.²⁰²³

From civil protection point of view, there are four main nuclear and radiological facilities in Slovenia that may pose serious risks:

- There is one nuclear power plant in Slovenia (Krško NPP). It is situated on the left bank of the Sava River, around 3 km from the town of Krško. The power plant is 70 km South-East of Ljubljana and 35 km North-West of Zagreb. In 2013, the Krško NPP has produced about 5,3 MWh gross electrical energy from the output of the generator.
According to the 2013 Annual Report on Radiation and Nuclear Safety in the Republic of Slovenia,²⁰²⁴ there have been three operations shutdowns at Krško NPP. For its part, the latest Annual Report on Radiation and Nuclear Safety notes that 2014 has been “...one of the quietest years in recent years. At the Krško Nuclear Power Plant, there were no obstructions worth mentioning. It operated the whole year without interruption.” The Report underlines that “[F]or the first time the Krško NPP exceeded the magical limit of 6 TWh of electrical energy produced due to a year of no outages and enough water from the Sava river.” The Report states also that, “In the autumn the owners of the Krško NPP approved an investment in the safety upgrades programme in accordance with requirements on the basis of the lessons learned from the Fukushima accident.”²⁰²⁵
- The second nuclear reactor TRIGA²⁰²⁶ (RR TRIGA at Fig. 7) is for research purposes and is located near the town Brinje. The operator of the TRIGA Mark II Research Reactor is the Jožef Stefan Institute (JSI) and operation is carried out by the personnel of the Reactor Infrastructure Center (RIC). According to the above quoted Annual Report, in 2013, there were ten automatic reactor shutdowns, three of which were caused by operator error, six by disturbances of the linear channel switch, and one by primary water activity detector disturbances.

²⁰²³ Agency for Radwaste Management (ARAO), <http://www.arao.si/resolutions>.

²⁰²⁴ Annual Report 2013 on Radiation and Nuclear Safety in the Republic of Slovenia, Slovenian Nuclear Safety Administration, http://www.ursjv.gov.si/fileadmin/ujv.gov.si/pageuploads/si/Porocila/LetnaPorocila/2013/Ang_LP_2013.pdf.

²⁰²⁵ Annual Report 2014 on Radiation and Nuclear Safety in the Republic of Slovenia, p. 3.

²⁰²⁶ TRIGA reactor is the most widely used non-power nuclear reactor in the world. General Atomics (a division of General Dynamics) has sold 66 TRIGA reactors, which are in use or under construction at universities, government and industrial laboratories, and medical centres in 24 countries.

- The Central Interim Storage Facility (CISF BRINJE at Fig. 7) in Brinje is managed by the Agency for Radwaste Management (ARAO). It is for storing Low- and Intermediate- Level Waste (LILM) from small producers (about 130 industrial organisations and 7 hospitals). There are also still some temporary storage facilities operating under a special licence. The storage facility on the site of the Krško NPP accepts all LILW from the NPP. Its capacity will be probably filled out by 2020.
- In the area around Žirovski Vrh, the extraction of uranium ore had taken place between 1982 and 1990. Mill tailings have been disposed of on the Jazbec mine waste pile and hydrometallurgical tailings – at the Boršt site. In 1990, after the extraction of uranium ore has been temporarily halted and a subsequent decision on permanent cessation has been taken, the process of remediating the mining and its consequences has begun.

In general, the overall effective dose of radiation of an adult in Slovenia is estimated by the Annual Report 2014 as “extremely low.”

Table 28. Radiation exposure of the adult population in Slovenia due to global contamination of the environment with artificial radionuclides in 2014

Transfer pathway	Effective dose (mSv per year)
Inhalation	0.001
Ingestion: drinking water	0.037
Ingestion: food	1.1
External radiation	6.4
Total (rounded)	7.5

Chemical and industrial accidents with ecological consequences

The chemical sector of Slovenia represents manufacturing of chemicals, chemical products and man-made fibres (about 2/3 of the Slovenian chemical industry’s total income), as well as of rubber and plastic products (about 34 % of the total branch income). Manufacturing of pharmaceutical preparations and raw materials is indisputably the most important subgroup of the Slovenian chemical industry. As the range of the chemical industry’s products is rather extensive, only the basic subgroups of products are listed below:

- Chemicals, chemical products and man-made fibres includes technical gases, dyes and pigments, inorganic chemicals, organic chemicals, basic polymer materials, pesticides and other agrochemical products, coatings, lacquers, printing inks, putties, sealants, pharmaceutical raw materials, pharmaceutical preparations, soaps, detergents, cleansers, polishes, cosmetic products, explosives, adhesives, essential oils, other chemical products, man-made fibres;
- Rubber and plastic products, includes tires and air-tubes for vehicles, reconditioned tires, other rubber products, plastic plates, tapes, foils, tubes, pipes, hoses, profiles, plastics packaging, plastic products for construction, other plastic products.

Figure 11 illustrates the scope of sources of technology hazards throughout the territory of Slovenia. Obviously, areas under the most serious threats are the valleys of rivers Sava and Drina:

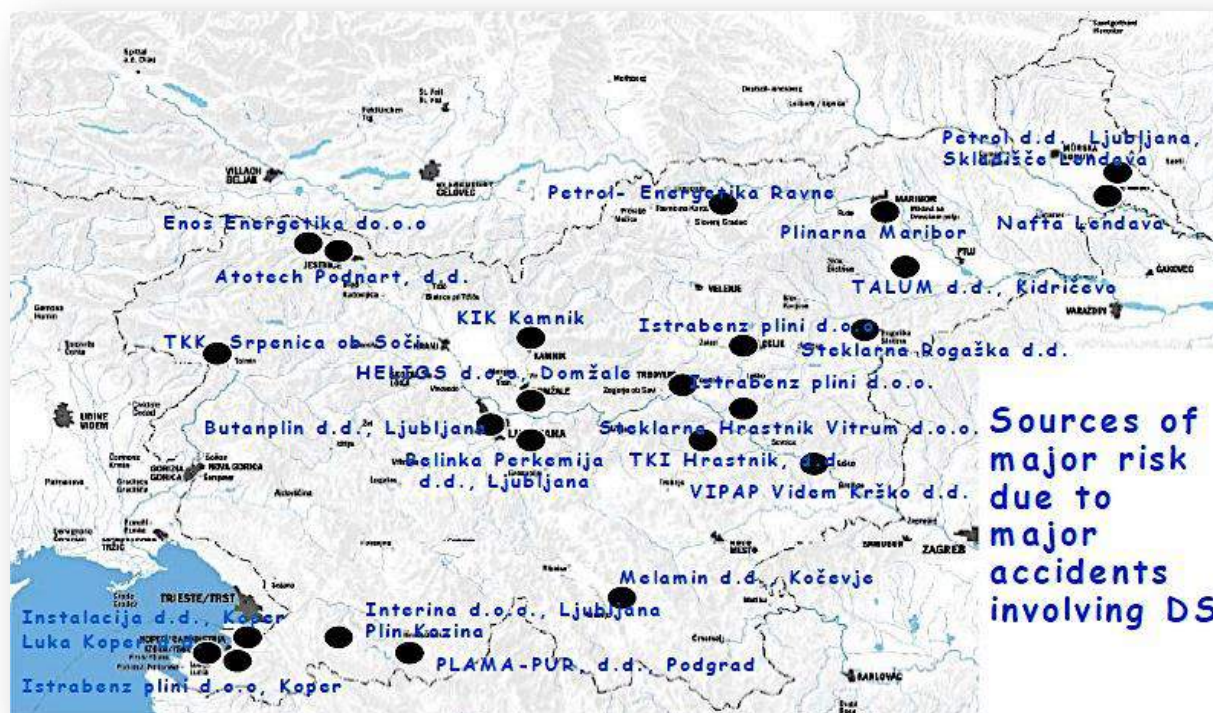

Figure 40: Main sources of risks due to major accidents involving dangerous substances (DS).²⁰²⁷

1.2 Policy and Governance

1.2.1 Strategy scope and focus

To continue the overall national security related legislative and organisational reforms, undertaken in Slovenia, the Government approved a package of principle documents: Act on Protection Against Natural and Other Disasters (1994), Resolution on the National Security Strategy of the Republic of Slovenia in 2001, Doctrine on Protection, Rescue and Relief in May 2002. This set framed the country's new approach towards comprehensive security in the 21st Century, civil protection included. The framework is innovative and with an ambition of being efficient and relevant.

In the Resolution on the National Security Strategy of the Republic of Slovenia of 2001, the political statement was that the national security policy consists of the three "basic" policies plus the economic policy and policy of protecting and preserving the national environment and space."²⁰²⁸ Obviously, this overwhelming definition puts civil protection from a natural and man-made disaster into a comprehensive context of the "national environment and space."

In 2010, the new National Security Strategy of the Republic of Slovenia introduced important changes. Accordingly, the overall approach to civil protection is seen as a part of the national security policy "... consists of the foreign policy, the defence policy, the policy of ensuring internal security and the policy of protection against natural and other disasters." (Art. 5.1) Even more, the chapter "Policy of Protection against Natural and Other Disasters" utters that "[t]he policy of protection against natural and other disasters will remain to be focused on the comprehensive management of

²⁰²⁷ Danica Babic, "Emergency response in Slovenia."

²⁰²⁸ Mesko et al., 2010.

natural and other disasters.” The policy is about wider and important social relationships that are governed through a variety of political, legal, organisational and other instruments while management is the implementation of policy by the state administration.

It is not clear, why the Slovenian authorities have decided to leave the comprehensive context and political approach and to focus on operational disaster management. The new approach builds an impression that the disaster management sector is too isolated and has more practical character than a political one. This issue is important, because definitions pave the way from political/institutional declarations towards instrumental legal regulations and the building of implementation architecture (in terms of organisation, procedures, and resources).

From one side, the country applies a comprehensive approach (NSS, 2010, art. 5.1) to security at all levels (international, national, societal and individual) and aspects (economic, social, environmental, medical, demographic, educational, scientific and technological...). If one adds to this list also the ‘standard’ aspects of foreign policy, defence and internal security, will see that the scope of security of Slovenia is extremely wide for a country in a relatively stable and secure international and internal environment. However, the National Security Strategy puts “...the protection of life and a high level of all forms of security for its people...” in a very broad context that definitely includes civil protection from natural and other disasters. Even more, the document entails an important political message that “[i]n the future, the fundamental purpose of the national security policy of the Republic of Slovenia will be to ensure the highest possible level of human security ...,” as stipulated by art. 5.1 – so the paradigm shift from national towards human security is an impressive ambition and the civil protection policy is in its context.

From another side, it is obvious the strong emphasis on “management” instead of on “policy.” The chapter “Policy of Protection against Natural and Other Disasters” begins with the statement that in the Art. 5.1 that “[t]he policy of protection against natural and other disasters will remain to be focused on the comprehensive management of natural and other disasters.” It is not clear, whether such a replacement of policy with management is a result of a poor expression or there is a strong desire to make things more practical than political.

However, in summary, the key points of the recent Slovenian strategy towards civil protection include:

- Disasters – natural and man-made, are between the risk factors for the national security;
- All kinds of disasters are managed under integrated and co-ordinated policy;
- Disaster management policy is a civil one;
- The core political approach is to guarantee the balance and co-ordination between national and local authorities;
- The core strategic organisational approach is towards strengthening the capacity of local administration and communities and equalisation of the capabilities between different communities;
- The scope of disaster management includes preparedness, response and relief;
- The focus of the disaster interventions is rescue and relief;
- The human resources for disaster management is a rational combination between professional units and large number of volunteers;
- Raising citizen awareness and ability for providing personal, family and community protection;
- Budgets for disaster management are provided at national, ministerial and local level;

- Socialisation of risks and consequences is reduced through strengthening of the insurance policy and culture;
- Enhanced regional and bi-lateral co-operation in disaster management, contribution to the EU overall civil security mechanism and active engagement in the relevant international organisations and programmes.

1.2.2 Monitoring and analytical support to policy making; R&D

According to the Doctrine on Protection, Rescue and Relief (2002),²⁰²⁹ “[d]isaster preparedness consists of monitoring and researching dangers and methods for protecting against them.” Among the key instruments for providing protection, rescue and relief are the “monitoring, notification and warning system.” Art. 4 defines it as a “unified subsystem” that “consists of informational and telecommunication systems, notification centres and warning equipment.” In later documents, monitoring and warning are determined as components of the Slovenian “comprehensive management of natural and other disasters.”²⁰³⁰ Currently, the unified monitoring, notification and warning system in Slovenia comprises:

- Monitoring networks;
- Notification centres;
- Computer support and telecommunications service;
- Warning system.

Slovenia’s report of 2005 for the Hyogo Framework for Action explains the basic objectives of the system in the following way:

- monitoring of meteorological, hydrological, seismological, radiological, ecological, health and other conditions;
- a collection of data on hazards, disasters and other phenomena and developments important to the protection system against disasters;
- organisation and maintenance of a database of protection, rescue and relief units and their intervention and resources;
- provision of information to competent national, local community and other bodies and services responsible for the management and implementation of protection, rescue and relief operations;
- warning of the population of any imminent danger, and public alarm announcements;
- activation and co-ordination of rescue service operations;
- logistical and other forms of support in the provision of rescue services.²⁰³¹

The monitoring, notification and warning sub-system has the following architecture:

²⁰²⁹ On the Doctrine on Protection, Rescue and Relief, see Chapter 2.1.

²⁰³⁰ National Security Strategy (2010), Art. 5.1.

²⁰³¹ Hyogo, 2005, Art. 2.5, p. 15.

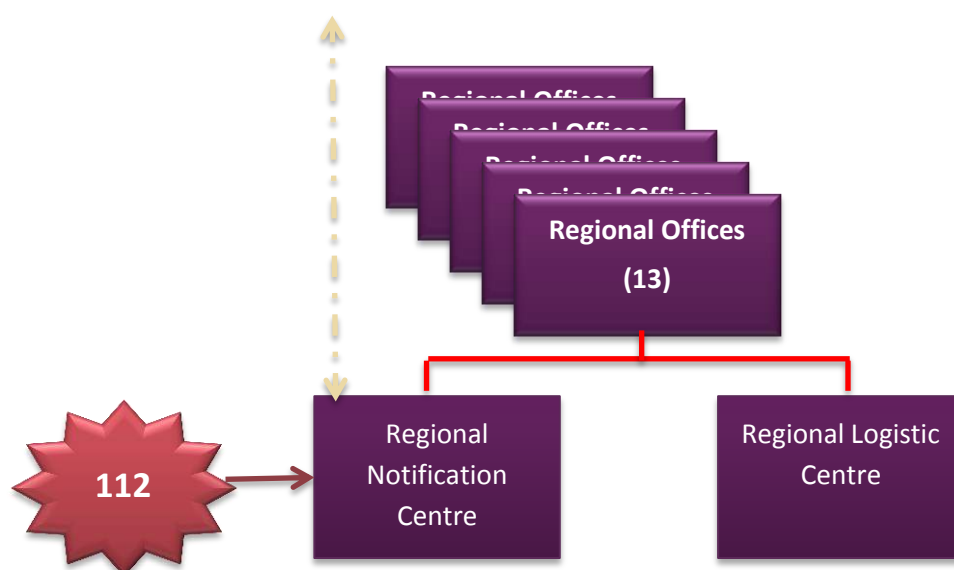

Figure 41: Monitoring, notification and warning sub-system.²⁰³²

Monitoring of natural and other hazards is organised through institutionally based observation posts or networks, contributions from incidental informers and through the horizontal exchange of information. Data are collected, processed, stored, and forwarded by the national and regional notification centres. In particular, data on meteorological, hydrological, seismological, nuclear, and environmental situations, threats to health, traffic events, obstruction of infrastructure systems, other dangers and threats, the conducting of protection, rescue and relief efforts, and damage are collected in permanent databases.²⁰³³

According to the National progress report on the implementation of the Hyogo Framework for Action (2013-2015), “The unified monitoring, notification and warning system in Slovenia comprises:

- the monitoring network,
- notification centres (13 x 112 Centres),
- the computer support and telecommunications service, and
- alarming and warning system.”²⁰³⁴

The report enlightens the multi-agency approach to monitoring the hazards and the established a shared information system that connects the monitors with notification centres. A further development of the video control system for wildfire and oil spills at the sea shall provide capacity to monitor of about 40,000 additional hectares.

The network of notification centres (see Figure 13) is seen as the core of the system: the National Notification Centre and 13 regional offices establish the hub that connects the sources of information with the decision-making bodies. Each regional office of the ACPDR includes a regional notification

centre and a regional logistic centre (warehouse). The National Notification Centre integrates different monitoring sources, manages the overall communication and information system, does the analytical and statistical work on collected data and has less operational duties. The regional centres, in addition to collecting data and responding to emergency 112 calls, are in charge of dispatches for fire-fighting, emergency medical aid, the mountain rescue service, the cave rescue service, the underwater rescue service, civil protection and other rescue services.”²⁰³⁵ The regional centres are based in Ljubljana, Kranj, Trbovlje, Celje, Slovenj Gradec, Maribor, Murska Sobota, Ptuj, Krško, Novo mesto, Postojna, Koper and in Nova Gorica.

According to the Slovenia’s 2005 Hyogo report, the number 112 has been used in Slovenia since the beginning of 1997. Ordinary citizens can call this number in an emergency or if they need a fire brigade, emergency first aid, or aid from any other rescue services. “By dialling 112, people also can obtain critical information on weather, water, snow and other conditions, on disturbances and interruptions in the supply of potable water, electricity and gas and in other areas of life importance.”²⁰³⁶

All 13 regional notification centres are integrated into a computer network. Information support is provided through tailor-made computer applications in the regional notification centres, such as the Geographic Information System (GIS-Ujme), the sound alarm management and triggering system (DUNJA), the system for the acceptance of telephone calls (ROK), the radio traffic control system (KC08), the radio network control system (Nadzor ZARE) and the pager system (ZAPP).²⁰³⁷

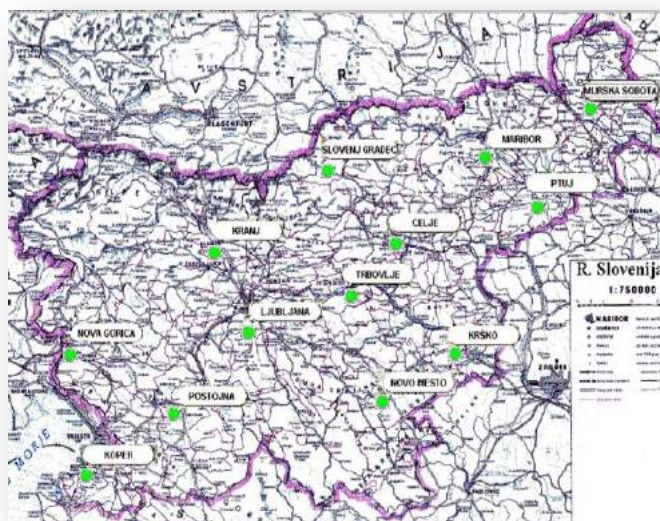

Figure 42. Regional notification centres²⁰³⁸

In recent years, much attention has been devoted to the communication and information system upgrade of notification centres. The new services regarding the 112 emergency calls (application

²⁰³⁵ 2005 Hyogo report, Art. 2.5, p. 16.

²⁰³⁶ 2005 Hyogo report, p. 16.

²⁰³⁸ Babic, “Emergency response in Slovenia.”

SMS112 for receiving text emergency calls and application video112 for receiving video emergency calls) have been introduced, and the public alert system has been reorganised.²⁰³⁹

In Slovenia, the civil protection is viewed as an interdisciplinary field in terms of research and scientific work, analysis, experimentation, and development. Academia, specialised institutes, private companies and individual researchers provide scientific support to disaster management. “The majority of work is accomplished in the following areas: civil engineering, chemistry and chemical technology, water resources management, forestry, geology, health, public relations, fire engineering, computer science, information systems, psychology and insurance companies.”²⁰⁴⁰

Slovenian National progress report on the implementation of the Hyogo Framework for Action (2013-2015) informs that “...the following research and development projects have been successfully concluded in 2013:

1. Seismic hazard in Slovenia for the needs of civil protection – POTROG;
2. Early warning system in case of danger of triggering landslides – MASPREM;
3. Fire Control in nature - video surveillance system - VIDEOKRAS 4.”²⁰⁴¹

1.2.3 Policy for Prevention

According to the Act on the Protection Against Natural and Other Disasters (1994, amended in 2006)²⁰⁴², the principle of prevention is determined in the following way:

Article 12 (Principle of prevention)

In providing protection against natural and other disasters, the state and the local community shall, within their competence, give priority to the organization of preventive measures.

The act stipulates that each ministry is in charge for prevention in its area of work while the Administration of the Republic of Slovenia for Civil Protection and Disaster Relief uses their monitoring for risk reduction. In terms of prevention, the administration is charged with the tasks related to spatial planning.

1.2.4 Policy for Preparedness

According to the concept of civil protection, recently applied in Slovenia through the Act on the Protection against Natural and other Disasters, preparedness is the key function, performed at national, local and individual level that provides effective protection of people and infrastructure from natural and other disasters. The Doctrine on Protection, Rescue and Relief emphasises, “Priority is given to preventive measures in all forms of planning protection against natural and other disasters.”²⁰⁴³ The policy of preparedness is built on a precise risk assessment and forecasting (including using modelling and simulations) of a variety of natural and man-made hazards. An expanding monitoring, notification and warning system helps to integrate data and risk assessments through horizontal and vertical chains of communication and reporting. National and local contingency plans for emergency protec-

²⁰³⁹ Detailed information on Slovenian communication and information system for civil protection is provided in Chapter 4.4.

²⁰⁴⁰ 2005 Hyogo report, Art. 3.2.

²⁰⁴¹ Slovenian National progress report on the implementation of the Hyogo Framework for Action (2013-2015), available at http://www.preventionweb.net/files/41665_SVN_NationalHFAprogress_2013-15.pdf, p 22-23.

²⁰⁴² The Act is available at <http://www.sos112.si/db/priloga/p4360.pdf>.

²⁰⁴³ Doctrine on Protection, Rescue and Relief, Art. 3.

tion, rescue, and relief are drafted based on this comprehensive picture. The power of these plans is the combination of specialised protection and rescue units and a wide number of volunteers – both well trained and equipped. In parallel to the organisational and technical solutions, a system for education, training, and public awareness on hazards has been established. Relevant as size and components state and local reserves for protection, rescue and relief purposes have been provided and maintained.²⁰⁴⁴

1.2.5 Policy for Response

According to the Act on the Protection against Natural and other Disasters and the Doctrine of Protection, Rescue and Relief, the policy for response in cases of emergency is based on three core principles. The focal point of any intervention, rescue and relief and other protection activities during natural and other disasters is to protect the life of the people: every person has the right to protection and his/her protection shall be a priority over any other protection in case of emergency. Secondly, response to an emergency shall be started by the affected local authorities and expand gradually, engaging neighbours, regions, and the state; the Armed Forces and their resources are the last resort. Thirdly, the central authorities provide co-ordinated response to the major disasters, assisting to local communities in emergency response, providing support to the Civil Protection Commander and guaranteeing that the basic conditions for life are provided.

For the success of the response policy, citizens also have a crucial role. The Act on the Protection Against Natural and Other Disasters obliges them to:

- participate in the Civil Protection;
- provide material means (hereinafter referred to as material obligation);
- be trained and prepared for personal and mutual protection and implementation of required protective measures.²⁰⁴⁵

The overall responsibility for the co-ordination of disaster response preparedness and intervention is Administration of the Republic of Slovenia for Civil Protection and Disaster Relief.

1.2.6 Policy for Relief and Recovery

Conceptually, the Slovenian approach to post-emergency phases puts rescue and relief into a pair, while recovery is the last component of disaster management. This construct reflects the mechanism of decision-making and implementation, as well as the funding of recovery measures, programmes and policies. The Slovenian authorities believe that the focus on recovery is completely relevant and will provide more coherent and consecutive measures not only to return to function through rehabilitation of damages but for reconstruction and improvement. By law, the policy for recovery is one of the core responsibilities of the state. It shall provide “assistance in reconstruction and recovery from natural and other disasters in order to protect the life and health of people, property, cultural heritage and the environment, prevent further damage and provide basic living conditions.”²⁰⁴⁶

The Ministry of the Environment and Spatial Planning is the core state institution for recovery planning and management. Its operational body is the Natural Disaster Recovery Division, whose basic aim is to organise, co-ordinate and perform implementation of emergency works to stabilise and

²⁰⁴⁴ Doctrine, 2002; 2005 Hyogo report; Hyogo Progress report, 2013, 2015.

²⁰⁴⁵ Act on the Protection against Natural and other Disasters, Art. 15.

²⁰⁴⁶ Act on Protection, Rescue and Relief, Art. 36.

prevent the spread of the consequences of natural disasters. The Natural Disaster Recovery Division's functions include also:

- Drafting programme proposals for elimination of disaster effects;
- Observation of potentially endangered areas;
- Experts identification and assessment of risks within the disaster impact area;
- Drafting proposals for relocation, expansion and other adjustments for the existing infrastructure facilities, affected by the disaster events;
- Preparation of national spatial plan for cases of major interventions;
- In case of emergency, implementation of works to stabilise and prevent the spread of damages and other consequences;
- Conducting of administrative procedure which deals with removing the aftermath of natural disasters;
- Monitoring of measures for removing the aftermath of disasters;
- Implementation of decisions for allocation of funds for rebuilding to any beneficiary²⁰⁴⁷;
- Management of reconstruction works, based on the Removal of Consequences of Natural Disasters Act;
- Learning lessons and drafting legal and organisational proposals for further risk reduction;
- Database management as a basis for carrying out preventive measures and removing the aftermath of natural disasters as well as on the use of state aid funds;
- Others.

The municipalities are also responsible for organising and conducting recovery activities in their respective areas.

The policy for recovery is regulated by the Act on the Recovery from the Consequences of Natural Disasters (Official Gazette of the Republic of Slovenia, 75/2003),²⁰⁴⁸ the Procedure for Damage Assessment in Case of Natural and Other Disasters (ACPDR nb.017-00-23/2005-2 of 09/27/2005), and the Decree on the Damage Evaluation Methodology.²⁰⁴⁹

Recovery and reconstruction are also objects for academic and engineering research, experimentation, and development.

1.3 Financing

1.3.1 Investing in preparedness

Despite that, Slovenia (followed by Bulgaria) has the largest emergency reserve fund in the Balkans – about USD 40 million,²⁰⁵⁰ the amounts allocated are grossly inadequate for funding a major disaster event. The administrative process involved in mobilising additional resources in cases of major disasters (e.g. when the size of damages by far exceeds the financial resources available) appears to be administratively cumbersome, lengthy and complex, and as a result rather time-consuming.

²⁰⁴⁷ For details see 1.3.2.

²⁰⁴⁸ Available in Slovenian language at <http://www.uradni-list.si/1/objava.jsp?urlid=200375&stevilka=3620>.

²⁰⁴⁹ Available in Slovenian language at www.uradni-list.si/1/objava.jsp?urlid=200367&stevilka=3224.

²⁰⁵⁰ According to UN-WB study (Gurenko, Zakout, 2008). To compare: Bulgaria provides about US\$32 m.

Planning for emergencies is an integral part of the government budgetary process. According to the Public Finance Act,²⁰⁵¹ a budget reserve of up to 1.5 per cent from the total revenue “... shall be used to finance expenditures covering the elimination of the consequences of emergency situations such as an earthquake, floods, landslide, snowslide, snowdrifts, hurricane, hail, sleet, frost, drought, mass outbreak of contagious human, animal or vegetal diseases other natural or ecological disasters.” (Art. 46) The annual budgetary allocations for emergencies are typically mandated by existing legislation on disasters caused by the impact of natural hazards and on another emergency. In addition, the Government may provide additional budgetary resources through several state agencies, which can be released in the case of a disaster. In cases of emergencies, the Slovenian authorities (Government and Parliament) can also increase the originally planned budgetary appropriations for disasters by passing special emergency legislation. Country disaster funds seem to be non-accruing budgetary funds, meaning that they maintain the same statutory size and that in years when there are no losses they do not receive additional financial allocations.

Disaster management activities are financed through the national and municipal budgets, and through insurance payments and other funds contributed by commercial companies, institutions and other organisations. According to UN study,²⁰⁵² “[e]very year the Government of Slovenia allocates approximately 0.4 per cent of the national budget to the disaster management system. Municipalities are required to earmark 3 per cent of their annual budgets to civil protection, although the average actual figure stands at just 2.1 per cent.”

Fire risk reduction activities are partly financed from a separate fire fund, which is generated from a tax on fire insurance.²⁰⁵³ Currently, 5 per cent of all fire premiums is used for fire risk reduction activities.

The main financing body in terms of environmental protection and disaster prevention is the Investment Monitoring and Finance Division within the Ministry of the Environment and Spatial Planning. This directorate, among other functions, performs tasks related to the environmental protection public services and remediation of natural disasters. It provides cohesion policy for all kind of state investments in programmes and other measures aimed at reducing of natural hazards.

According to the Ecological Agency, there are six large-scale landslides in Slovenia, for which state aid for removal of consequences of landslides, prevention of their expansion and their stabilisation is legally defined. For this purpose, the following actions are defined:

- Prevention of spreading and stabilisation of landslide through construction of water management infrastructure;
- Restoration and replacement of damaged objects of local and state infrastructure, cultural sites, and protected natural sights;
- Renovation or replacement of residential and commercial buildings.²⁰⁵⁴

²⁰⁵¹ Public Finance Act, <http://unpan1.un.org/intradoc/groups/public/documents/UNTC/UNPAN015731.pdf>.

²⁰⁵² UNISDIR, WB, 2008.

²⁰⁵³ Hyogo, 2005.

²⁰⁵⁴ Source: <http://www.arso.gov.si/varstvo%20okolja/poro%C4%8Dila/poro%C4%8Dila%20o%20stanju%20okolja%20v%20Sloveniji/nesrece.pdf>, as it is quoted in *Who does what in Slovenia? Stakeholders involved in natural risk mitigation and risk management*. Published by the Alpine Network of Natural Hazards and Risks Prevention at www.RisKnat.org.

For state aid are entitled persons of public and private law (help for building replacement of facilities that need to be removed from the influence area due to landslide risk), local communities and competent ministries (for the reconstruction of infrastructure facilities). Funding amounts are determined by a programme for removal of landslide consequences for each financial year and for each landslide separately.²⁰⁵⁵

Different institutions fund hazard mapping on a different scale, as an important component of disaster management preparedness:

- Slovenian Research Agency (ARRS) within the Ministry of the Environment and Spatial Planning;
- “Geological Survey of Slovenia” (GeoZS);
- Faculty of Civil Engineering and Geodesy (FGG);
- “Anton Melik” Geographical Institute (GIAM);
- “Geolnženiring” (engineering geological mapping and rock classification, field and laboratory research for underground structures, landslides and mineral resources for construction).²⁰⁵⁶

1.3.2 Investing in consequence management

The Republic of Slovenia has had detailed assessment procedures in place on the national, regional²⁰⁵⁷ and municipal level since 2004. The Decree on the Damage Evaluation Methodology specifies the number of formulas for calculation of material and other wastes. Moreover, it rates prices list are published annually on the ACPDR website.

According to the Act on the Removal of Consequences of Natural Disasters, beneficiaries of recovery funds and measures could be: national authorities; municipalities; persons of public law; persons of private law for the renovation of facilities in which activities are carried out; apartment owners; owners of the buildings, which have been declared cultural monuments or an object that is intended to safeguard the natural heritage.

Funds for removal of the consequences of the natural disaster are allocated to the municipality as a special transfer from the government for reconstruction of the following objects:

- Public infrastructure and facilities of local importance;
- Objects that are owned by municipality and are used for carrying out its activities and for local public service;
- Residential buildings, which are owned by municipality;
- Objects that are owned and used by persons of public law, of which the founder or co-founder is the municipality and for which investment, investment-maintenance or maintenance work are provided within municipality budget;
- Forest roads, in the case of co-financing of reconstruction, for which funds are provided in accordance with the regulations, governing the management of forests.²⁰⁵⁸

From their side, the municipality allocates funds for removal the consequences of natural disasters.

²⁰⁵⁵ Ibid.

²⁰⁵⁶ Ibid.

²⁰⁵⁷ According to art. 8 of the Act on Protection Against Natural and Other Disasters “Region means a geographic, urban or otherwise integrated area comprising two or more local communities which, for the purposes of protection against natural and other disasters, represents a whole.”

²⁰⁵⁸ Large parts of the forests in Slovenia are private.

The Agency of the Republic of Slovenia for Agricultural Markets and Rural Development, subordinated to the Ministry of Agriculture, Forestry and Food, ensures proper and timely payment of the approved funds to final agriculture and food sector beneficiaries, suffered from natural and other disasters.

At an individual level, insurance companies are providing an evaluation of direct material damages due to the personal insurance policies.

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

Post-disaster assessment is regulated by the Decree on the Damage Evaluation Methodology.²⁰⁵⁹ This Regulation sets out the methodology for determining, assessing and documenting damage and other consequences, caused by natural and other disasters such as earthquakes, floods, landslides, avalanche, high snow, strong winds, sleet, frost, drought, storm, as well as from industrial accidents.

Damages are quantified in five categories:

1. Land: Forests; Agricultural land; Land for construction.
2. Facilities: Buildings (residential and non-residential); Civil engineering - Transport infrastructure (roads, railways, bridges, etc.), Distribution piping for water and wastewater; Waterworks and others; Electricity and telecommunications networks.
3. Fixed and current assets: Fixed and current assets - movable property; The current agricultural production; Orchard.
4. Cultural properties: Cultural and religious buildings, memorials, museums and other; Movable heritage (and other artwork).
5. Other.

Damage is divided into two categories: primary and secondary. Primary damage comprises the main emergency and the attendant costs to restore and set up damaged items in the condition in which they have been initially and the cost of repair and replacement of damaged parts or assemblies. The primary damage also includes the cost of clearing the site of damage, demolition of damaged and unserviceable parts, their removal and the necessary start-up costs. The secondary damage comprises operating costs of protection, rescue and relief and emergency protective or preventive measures for the protection of human, animal and other damaged items. It covers essential safety work, such as buffer embankments, ditches, splints, pumping, removal, spraying, fertilizer and other similar measures.

For post-disaster or accident assessment, the government sets up regional and national damage assessment committees.²⁰⁶⁰ In the committees, judicial officers, insurance evaluator and others authorised representatives of public institutions, professional teams or specialised services, and experts or members of professional associations and other institutions may be appointed. At local level, competent regional committees make the damage assessments.

²⁰⁵⁹ Available in Slovenian language at <http://www.uradni-list.si/1/objava.jsp?urlid=200367&stevilka=3224>.

²⁰⁶⁰ Law on Protection Against Natural and Other Disasters, Art. 97, p. 1.

According to the established procedures,²⁰⁶¹ when an accident occurs, the local community immediately informs the regional notification centre and provides (no later than 24 hours) a written report to the ACPDR's regional branch. ACPDR experts together with local authorities, visit the damaged area and identify the scope and intensity of disasters; based on this assessment, ACPDR issues a resolution for damage assessment, in which the start and end date of the damage assessment are determined. Within this timeframe, local authorities invite affected people to report the damage, filling prescribed sheets, and form a commission to review presented sheets, to assess their objectivity and, if necessary, amend or supplement them. After the expiration of the period, the local commission sends the collected application sheets to the regional committee for review and evaluation. The Regional Damage Assessment Committee sends the applications to the National Damage Assessment Committee, which elaborate a report for the Government. The Government decides on the report and the reimbursement of costs.

1.4.2 Departmental lessons learned systems

The documentation on civil protection in Slovenia does not contain requirements for a specific mechanism for learning lessons from emergencies to be established. However, one of the tasks of the Administration for Civil Protection and Disasters Relief is to produce proposals for improvement of legislation, organisation and procedures, which represents a kind of informal lessons learned practice.

The Law on Protection against Natural and Other Disasters stipulates the rights and responsibilities of the national authorities and local community authorities to use "...data on resources, natural and other disasters hazards, the inhabitants in endangered areas, residential and other buildings, public services, associations and other non-governmental organisations, commercial companies, institutions and other organisations the activities of which are important for protection, rescue and relief, collected and recorded with statistical research programmes or contained in other statistical databases, managed and provided by the national statistical agency and other authorised agencies, responsible for the implementation of mid-term and annual statistical research programmes..."²⁰⁶² The data should be used for the purposes of threat assessment, planning and implementation of protection, rescue and relief. Despite that, such a regulation does not formally establish a uniformed lessons learned system, in practice the huge amount of information, organised as a database, could be successfully used for improving legislation and the organisation of the civil protection. The same law (Art. 51, (6)) defines the Administration of the Republic of Slovenia for Civil Protection and Disaster Relief as the main national source of information on emergencies. ACPDR shall collect and manage data in a form of integrated central databases for the purposes of the preventive programmes planning, emergency management and post-disaster assessments. By law, these data should be shareable and made public, following prescribed procedures.

Information from emergencies is important also for the post-emergency assessments. The above-quoted Procedure for Damage Assessment in Case of Natural and Other Disasters requires general and technical databases to be established. The former include facts, such as location, type of damaged items, address or registered office, ownership, type and time of the accident, damage to a property group, purpose and activities. The technical data from crisis events consists of a description

²⁰⁶¹ Procedure for Damage Assessment in Case of Natural and Other Disasters (ACPDR nb.017-00-23/2005-2 of 09/27/2005).

²⁰⁶² Law on Protection against Natural and Other Disasters, Art. 51, (1).

of the situation and its characteristics, explanation of damaged items depending on their purpose, type, age and technical parameters.

1.4.3 Centralised (national) lessons learned system

The Doctrine on Protection, Rescue and Relief determines the lessons learned from previous accidents as one of the basics for planning and conducting protection, rescue and assistance efforts.²⁰⁶³ Together with the systematic “...interdisciplinary research of causes, forms of phenomena and consequences of disasters...,”²⁰⁶⁴ lessons from each emergency are expected to provide ground for improving the overall civil protection system of the country and any particular hazard as well.

Recently, in Slovenia no institution is explicitly focused on learning lessons from the emergency. However, the country’s civil protection legislation, organisation, practice and traditions stimulate cross-sector learning from past events and provide access to facts, statistics and expertise within the area of learning from emergencies and disasters in order to improve safety work at national and local levels.

As explained in the 2005 Hyogo report, ACPDR has prerogatives to provide a collective overview and assessment of incident and accident trends and safety work in society, thus giving decision-makers and the public a broad and unbiased overview of both emergency and post-disasters situations in different sectors and areas. Such task requires the ACPDR to develop and maintain a reporting system, databases and web applications to collect data, determined by law. As the law regulates the post-disaster assessment as well, the civil protection system also includes an estimation of the economic burden of injuries and damages.²⁰⁶⁵

Slovenia has reported that research methods and tools for multi-risk assessments and cost-benefit analysis are developed and strengthened.²⁰⁶⁶

1.4.4 International exchange for lessons learned

According to Jeraj, Slovenia has signed bilateral agreements on cooperation with neighbouring countries (Austria, Croatia, Hungary, cross-border protocol with Italy), and with Bosnia and Herzegovina, the Czech Republic, Germany, Macedonia, Montenegro, Poland, Slovakia and the Russian Federation. All the aforementioned agreements include provisions on mutual exchange of information and early warning in case of major disasters.²⁰⁶⁷

²⁰⁶³ Doctrine, 2005, Art. 2.3

²⁰⁶⁴ Ibid.

²⁰⁶⁵ 2005 Hyogo report, p. 6-7.

²⁰⁶⁶ According to the National Progress Report on the Implementation of the Hyogo Framework for Action (2011-2013), “Development research work in the area of disaster management has been performed on the basis of target research programme “Knowledge for Security and Peace for the period 2002–2010”, technology programme “Technology for Security and Peace 2006–2012”, individual researches and case studies in relation to the central activities and projects financed in the field of fire protection by the Fire Protection Fund.”

²⁰⁶⁷ Milena Jeraj, *Bilateral and regional cooperation in disaster management – good practices/experiences of Slovenia*, 22nd OSCE Economic and Environmental Forum “Responding to environmental challenges with a view to promoting cooperation and security in the OSCE area,” Vienna, 27 - 28 January 2014. Available at www.osce.org/eea/110805.

Slovenia, as a member of European Union, participates in the EU Civil Protection Mechanism and is also a signatory of the United Nations Convention on the Transboundary Effects of Industrial Accidents.²⁰⁶⁸

According to the European Commission's Vademecum on Civil Protection, in the regional co-operation format, Slovenia participates in the Disaster Preparedness and Prevention Initiative for South Eastern Europe (DPPI SEE) and the Adriatic-Ionian Initiative. The country implements the Alpine Convention as regards disaster risk reduction.²⁰⁶⁹

1.4.5 Regular policy reviews

The policy for civil protection as regards disaster management and relief is embodied by the "national programme of protection against natural and other disasters". The national programme "...shall be to set out the aims, policy and strategy of protection against natural and other disasters in the country for a minimum period of five years."²⁰⁷⁰

According to the mechanism of programming (followed by annual planning), the policy review and amendment should be done within the frame of programme review and assessment (the same for the annual plans).

However, there is no available information about policy review in the form of an overall assessment. In some cases, reports on performance during particular emergencies are published – e.g. Annual Reports on Radiation and Nuclear Safety in the Republic of Slovenia, Annual Reports of the Ministry of Defence, and others.

1.5 Resilience

The concept of resilience in civil protection, in terms of country's capacity to withstand shocks due to natural and other disasters, to rebuild itself with efficiency, and to improve on the pre-existing state wherever possible, has not been explicitly established in Slovenia by law or other normative acts.

However, the Slovenian approach towards civil protection from natural and another disaster is focused on four basic aims that form country's resilience policy "by doing":

- Effective decision-making – in Slovenia, it is based on a common understanding that the sectors at the highest risk should be the framework for prioritising the investment policy (in terms of financial, material, human, and political resources and the research agenda) in resilience.
- Efficiency – at this point of time, efficient disaster management steps on a national platform that centralises key data so all state and local institutions, society, the business, and the researchers as well, have access to information that is critical to protecting homes, property, community, regional, and national infrastructure.
- Transparency and openness – Slovenian disaster management framework is aimed to provide greater transparency and to build a culture of openness by removing restrictive barriers on accessing government and local administration plans, performance reports, and specialised database.

²⁰⁶⁸ Slovenia's 2005 Hyogo report.

²⁰⁶⁹ As of 06 December 2015, the source is under reconstruction.

²⁰⁷⁰ Law on Protection Against Natural and Other Disasters, Art. 41, (1).

- Availability – the Slovenian approach towards civil protection is based on the universal right of all citizens and their property, as well as the national and local material values to be protected from natural and other disasters.²⁰⁷¹

1.6 Information sharing and data protection

Collection and protection of personal data related to disaster management, including for preparation, disaster intervention, volunteers, and damage assessment are regulated by the Law on Protection Against Natural and Other Disasters. The law stipulates that the following personal data shall be collected, processed, used and kept by the administrative bodies, responsible for civil protection:

- *“Name and surname, date and place of birth, permanent and temporary residence address, date of birth of children, data on knowledge and skills relevant to protection, rescue and relief, education, employment, telephone number and mobile phone number of the members of the Civil Protection, civil servants in the field of protection and relief and citizens who voluntarily participate in the performance of protection, rescue and relief duties*
- *For the members of the Civil Protection additional data on the date of medical check-up of health and psycho-physical condition, responsibility within the Civil Protection for the purpose of ensuring up-to-date preparations, mobilisation and activation and provision of rights and obligations of the Civil Protection members and other protection, rescue and relief forces;*
- *Type, capacity and condition of means of transport and other means subject to material obligation as well as name, surname, home or business address of owners and users of such means, premises and buildings, for the purpose of completing headquarters, units and services.*²⁰⁷²

The Law prescribes also that the relevant administrative bodies shall keep personal databases on members of the Civil Protection, civil servants in the area of protection and rescue, citizens who voluntarily participate in protection, rescue and relief and persons subject to material obligation. The institutions are responsible for the protection of personal data.²⁰⁷³

The civil protection administration is authorised by law to collect, keep, and communicate above-mentioned personal data to the responsible national or local authority at their request. The relevant commercial companies, institutions and other organisations may request personal data on members of the Civil Protection assigned to them. All authorities, commercial companies, institutions and other organisations may use such personal data only for the purpose of organising protection against natural and other disasters and are responsible for the protection of personal data.²⁰⁷⁴

²⁰⁷¹ Comments based on Dean Myburgh, Chris Webb and Dr Erica Seville, “Enhancing Organizations’ Adaptive Capacity and Resilience Through Effective Decision-Making in the Recovery Phase,” *Continuity Central.com* (2012). Available at <https://www.continuitycentral.com/enhancingresilience.pdf>.

²⁰⁷² Law on Protection Against Natural and Other Disasters, Article 32 Collection and protection of personal data and materials.

²⁰⁷³ Ibid.

²⁰⁷⁴ Ibid., Article 33 Communication of personal data and materials.

2 Legislation

Slovenia's legislation, related to disaster management, comprises conceptual, basic, specific, and emergency laws and acts. The legal framework in the field has been developed after the independence of the country and has been improved based on the accumulated experience in emergency response. Significant improvement of the package of laws has followed Slovenia's membership in the European Union. However, as mentioned earlier, the Slovenian model has some specific aspects and differs from both the European and South-East European countries' civil protection systems. In any case, the legal framework in Slovenia provides systematic planning for risk reduction and relevant preparedness, a comprehensive mechanism for monitoring and alerting, a mixture between professional and volunteer human power, adequate resources and reserves for intervention and recovery.

2.1 Crisis (emergency, disaster) management concept

The core conceptual document on crisis management in cases of natural and other disasters is the Doctrine on Protection, Rescue and Relief. It is a document of the Government of the Republic of Slovenia, issued pursuant to Article 93 of the Law on Protection Against Natural and Other Disasters and adopted at the government's 76th regular session on 30 May 2002. This document is conceptually linked to the country's founding act in the field of security – The Resolution on the National Security Strategy of the Republic of Slovenia, published in OJRS, 56/2001.²⁰⁷⁵

The Doctrine provides a set of common principles on how should protection, rescue and relief be organised within the civil protection system. It also stipulates operational guidance to all professional and volunteer, national and local, state and private forces that based on law or other forms of organised engagement contribute to all or some aspects of the protection against natural and other disasters.

The platform of the Doctrine is that protection against natural and other disasters is a part of the internal security of Slovenia and "...that protection and rescue is, organisationally and functionally, an independent and unified subsystem of Slovenia's national security."²⁰⁷⁶ Out of this starting point, the Doctrine builds a system of integrated or co-ordinated preventive measures, protection operations, emergency services, and other efforts, which cope with the demands of the citizen for security against natural and man-made disasters and extreme conditions.

The document defines the "basic goal of protection, rescue, and disaster relief is to protect people, animals, material and other goods, as well as the environment, against disasters or destruction, damage and other consequences of disasters and to alleviate the consequences." Despite that the Doctrine does not strictly prescribes the most popular in Europe crisis management cycle – prevention and mitigation, preparation, response, and recovery, it includes core activities with similar content: preventive activities, preparedness for action, monitoring, notification and warning system, protection, rescue and disaster relief, and alleviation of the aftermath of disasters.

²⁰⁷⁵ OJ is abbreviation of the name of the Official Gazette of the Republic of Slovenia in Slovenian language.

²⁰⁷⁶ All quotations hereinafter in Chapter 2.1 are from the Doctrine on Protection, Rescue and Relief as it is published at <http://www.sos112.si/db/priloga/p4359.pdf>.

The Doctrine determines that the starting points for planning, organising and conducting protection, rescue and relief efforts and operations should be “...the dangers and threats posed to people, animals, property, cultural heritage, and the environment.”

In terms of disaster management preparedness, the concept includes “...monitoring and researching dangers and methods for protecting against them”, notification and warning, organising, equipping and training of specialised forces and volunteers as well as training of the population for personal and collective protection. Preparation also includes the provision of any kind of material and equipment that could be necessary in cases of emergency. Planning at all levels – national, institutional, local, and business, is also an important component of the country’s preparedness.

The principles of organising and providing civil protection are a combination of bottom-up and top-down approaches. First, in a case of emergency everyone is obliged to provide information to and about the others and to offer assistance to others (based on the Slovenian culture of volunteering). Still, the state and local authorities are obliged to provide the necessary preventive measures and preparation efforts, and, in a case of emergency, to conduct protection, rescue and relief operations.

From an organisational point of view, the Doctrine introduces a mixed system of professional permanent civil protection units and comprehensive network of volunteers – organised and individual. There is a single chain of command system for any rescue and relief operation. “Armed forces and defence assets can be used for protection, rescue and relief efforts if the forces and assets available are not sufficient for emergency rescue and relief and if the armed forces are not needed to conduct defence missions.”

The Police are also engaged in the mechanism of civil protection to “...prevent, detect and investigate criminal offences and violations, detect and apprehend perpetrators and other wanted persons and deliver them to competent bodies, maintain law and order, control and organise traffic and the movement of persons, participate in securing dangerous areas or accidents, conduct certain missions concerning foreigners and, if required, participate in rescue missions.”²⁰⁷⁷

2.2 General crisis (emergency, disaster) management law

The new legislation that framed Slovenia’s policy and organisation for disaster management was adopted after 1992 and has been conceptually and operationally amended after 2000. The number of legal acts has “...separated the system of protection against natural and other disasters from the defence system in order to organise it as an integral interdisciplinary activity based on common goals and principles, and to merge all rescue services and other protection, rescue and relief forces into an organisationally and functionally unified system.”²⁰⁷⁸ This approach has been applied to make the previous highly centralised and militarised system more flexible for inter-agency co-operation, more decentralised between the state and local authorities, and more open for extensive engagement of volunteers, NGOs and the business. Formally and legally prevention has become the fundamental guideline and major task of this system with implementation being carried out mainly by the local communities.

Recently, the protection from natural and other disasters in Slovenia is governed through a package of legal acts – laws (acts), different Government decisions (decrees), and a variety of sector-specific regulations. The most important between them is the Act on the Protection Against Natural and

²⁰⁷⁷ Doctrine, 2005, Article 6.5.

²⁰⁷⁸ Hyogo, 2005.

other Disasters (Published in the Official Gazette of the Republic of Slovenia No 64/94, dated 14 October 1994). It has been approved by the Parliament on 3 May 2006 and since then serves as a hub between the conceptual Doctrine on Protection, Rescue and Relief and variety of sector-specific regulations as the Fire Protection Act,²⁰⁷⁹ the Fire Service Act, the Recovery from the Consequences of Natural Disasters Act, the Environment Protection Act, the Protection Against Drowning Act, and others, as well as several general laws as Public Administration Act, Material Obligation Act, and others.

The Act on the Protection Against Natural and other Disasters sets the principles, architecture and key procedures for disaster management in a systematic manner:

- The scope of protection, provided through the Law, includes “...people, animals, property, cultural heritage, and natural environment.” (Art. 1)
- In protection, priority is given to the “risk reduction” (despite that the Law does not use the term), achievable through measures to reduce both the number of disasters and the number of casualties and other consequences.
- The established system for civil protection comprises programming, planning, organisation, implementation, supervision, and financing of measures and activities in implementation of Government’s policy and strategy on protection against natural and other disasters.
- The Law defines variety of basic tasks of the protection system that make it comprehensive and complicated, including detection, monitoring and research of natural and other disaster hazards, prevention measures, notification and warning of people, education and training, organisation of Civil Protection, mechanism for mobilisation in cases of emergency, rescue and relief, recovery, post-disaster damage assessment, as well as participation in international disaster management efforts.
- Civil Protection is both a service and an institution. The service might be mandatory, volunteer, and by contract. Mandatory service starts at 18 and ends at 55 for women, and at 63 for men while the volunteer starts at the age of 15. The contract service is in the Civil Protection units or is performed by individual contract for people that have been designated for highly specialised subject-matter duties. The organisation comprises of management bodies, protection, rescue and relief units and services, protection and rescue equipment and facilities for protection, rescue and relief. Thus, Civil Protection is “a special-purpose element of the system of protection against natural and other disasters.” (Art. 3)
- The core principles of providing protection include the right of every person of receiving protection, requirement for mutual assistance in emergency, the right of people to be timely and consistently informed about hazards and emergencies, dominant prevention and risk reduction measures, the principle of personal, corporate and official responsibility for implementation of protection measures and activities, gradual deployment of units and resources in emergency, and relevance of all protective legislation and practice to the international humanitarian law and international law on the protection of people, animals, cultural heritage and environment against harmful effects of natural and other disasters and pursuant to the accepted international obligations.
- The Law determines the responsibilities of the state, local authorities, commercial subjects, institutions, and private persons (as owners and users of buildings and other infrastructure).

²⁰⁷⁹

Available at <http://www.sos112.si/db/priloga/p4361.pdf>.

- Long-term planning for disaster management is arranged through a national programme for a minimum period of five years and an annual plan. The local communities adopt their own programmes and plans of protection against natural and other disasters, which must not be in contradiction with the national programme.
- Emergency plans are elaborated at the national level by the Administration for Civil Protection and Disaster relief, and at the local level by the relevant authorities. Commercial units also prepare such plans.
- The notification and warning system is comprehensive and includes state, ministries and agencies, regional, and local elements, supported by all-citizen contribution. At the head of the system is the Emergency Notification Centre of the Republic of Slovenia, supported by regional notification centres.
- Implementation of protection policy is performed by “...units, services and other operational structures of associations and other non-governmental organisations; commercial companies, institutions and other organizations; Civil Protection units and services;²⁰⁸⁰ the Police; the Slovenian Armed Forces in accordance with the law.” (Art. 72)
- The Law prescribes wider role to civil society volunteer organisations and associations and commercial entities in each aspect of the civil protection.
- The administrative and technical duties relating to protection, rescue and relief and other duties within the protection against natural and other disasters are dedicated to the Administration of the Republic of Slovenia for Civil Protection and Disaster Relief and its regional branches.
- National commander, to whom local commanders are subordinated, commands Civil Protection through a single chain of command.
- Post-disaster damage assessment is organised at national and local levels.
- The Law stipulates variety of requirements for providing safety at work and home.
- Education and training on protection are comprehensive and includes schools and all people, institutions and formal units. Training Centre for Civil Protection and Disaster Relief of the Republic of Slovenia is established.
- Funding of civil protection is provided through the state and local budgets, insurance premium, financial resources of commercial companies, institutions and other organisations, as well as by voluntary contributions and international aid.
- Penalty provisions are determined for violation of civil protection rules.
- The Law also introduces several EU directives.²⁰⁸¹
- Control over the implementation of laws governing the protection system is executed by the constituent body of the Ministry of Defence: the Inspectorate of the Republic of Slovenia for Protection against Natural and Other Disasters, and its branch offices.

2.3 Emergency rule

The Law on Protection Against Natural and Other Disasters does not treat the emergency rule issue, as it is regulated by the Constitution. According to art. 92:

²⁰⁸⁰ Art. 76 delivers a description of civil protection units and services.

²⁰⁸¹ The relevant EU Council Directives are 89/391/EEC, 89/618/EURATOM, 96/29/EURATOM, and 96/82/EC.

A state of emergency shall be declared whenever a great and general danger threatens the existence of the state. The declaration of war or state of emergency, urgent measures, and their repeal shall be decided upon by the National Assembly on the proposal of the Government.

The National Assembly decides on the use of the defence forces.

In the event that the National Assembly is unable to convene, the President of the Republic shall decide on matters from the first and second paragraphs of this article. Such decisions must be submitted for confirmation to the National Assembly immediately upon its next convening.

The Constitution (Art. 16) regulates the scope of limitations on individual rights and liberties during a “state of emergency” in the following way:

Human rights and fundamental freedoms provided by this Constitution may exceptionally be temporarily suspended or restricted during a war and state of emergency. Human rights and fundamental freedoms may be suspended or restricted only for the duration of the war or state of emergency, but only to the extent required by such circumstances and inasmuch as the measures adopted do not create inequality based solely on race, national origin, sex, language, religion, political, or other conviction, material standing, birth, education, social status, or any other personal circumstance.

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

To ensure the implementation of the above-mentioned sector-specific laws, the Government issues decisions, including the following: Decree on Fire Insurance Tax, Decree on Protection from Fire in a Natural Environment, Decree on Shelter Construction and Maintenance, Decree on the Organisation and Functioning of the Monitoring, Notification and Alarm System, Decree on Providing Protection, Rescue and Relief from Aircraft, Decree on the Organisation, Equipment and Training of Protection, Rescue and Relief Forces, and others.

The operational document that integrates the implementation of all legal acts into a civil protection effect for the people and the state is The Resolution on the National Programme of Protection Against Natural and Other Disasters for 2009-2015.

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

All issues, related to the regional and local authorities obligations and rights are regulated by the Act on the Protection Against Natural and Other Disasters. According to art. 37, local communities shall be responsible for the implementation of protection against natural and other disasters on their territories. They may co-operate with each other including sharing resources and capabilities and for protection, rescue and relief operations.

The local communities are responsible for:

- Management of all systems for civil protection on their territory;
- Systematic monitoring of all hazards;
- Notification and warning of the population;
- Drafting, resourcing and implementing of all required by Law plans and co-ordinating them with the neighbouring communities;
- Establishment of relevant to the hazards organisation for civil protection;

- Providing those organisations with resources, equipment and training;
- Providing basic conditions of living for affected by natural and other disasters people;
- Participating in international co-operation in protection, rescue and relief.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

The commercial companies, private institutions and other organisations have legal obligations according to art. 38 of the Law on Protection Against Natural and Other Disasters. Especially those that operate with hazardous substances shall elaborate a threat assessment, draft emergency response plans and implement them on their own expenses. This includes responsibilities to organise necessary rescue and relief forces, ensure notification and warning of employees and the surrounding population of danger and co-finance preparatory activities of the local community proportional to the extend and degree of threat constituted by their activity. The local authorities determine the type and the proportional scope of preparations in emergency response plans of commercial entities. They are also obliged to engage the personnel in relevant to the case specific hazards training.

The same requirements are spread also over any educational institution.

The Law on Protection Against Natural and other Disasters regulates all issues, related to the organisation and engagement of volunteers in any rescue and relief operations. Volunteerism is a national tradition in Slovenia and volunteers and other non-professional contributors have important role within the overall civil protection system. Reasonably, their status in case of emergency is equalised with those of the members of the Civil Protection service. Those that formally, through the planning process, are engaged in civil protection organisations as fire brigades, Red Cross organisations, Mountain Rescue Service, speleologists clubs, diving clubs, canine clubs, scout organizations, radio-amateurs clubs and other organisations) shall not be assigned to defence duties or Civil Protection operations.²⁰⁸²

Concerned the role of the NGOs in civil protection there two basic acts: the Act on Slovenian Red Cross (published in OJ RS, 7/93) and the Societies Act (published in OJ RS, 61/06).

2.7 Legal regulations for international engagements of first responders and crisis managers

Both the Law on the Protection Against Natural and other Disasters and Doctrine on Protection, Rescue and Relief regulate the international contributions and engagements of Slovenia in form of international aid.

Assistance to other countries is carried out by designated units. However, the Law provides an opportunity a separate operational structure to be organised for the performance of protection, rescue and relief in other countries. In both cases the Administration for Civil Protection and Disaster Relief is mandated to make proposals to the Government.

The decision to assist other countries is mandated to the Government on the proposal of the Civil Protection Commander of the Republic of Slovenia or the Minister of Defence, if it is related to international obligations of the state. However, they must perform duties that only correspond to the international and legal status of the Civil Protection.

²⁰⁸²

In times of war these units, together with Civil Protection units, perform civil defence functions.

Members of such units must be informed (through the contract) of the possibility that they might be deployed to other countries to perform their duties. Insurance for cases of death, permanent loss of general ability to work and temporary inability to work have to be provided for all of them.

3 Organisation

3.1 Organisational chart

The fundamental tasks of the protection system of Slovenia are 1) prevention, 2) warning, and 3) protection against natural and other hazards through 4) rescue and relief operations during disasters, 5) provision of basic living conditions after disasters and 6) reconstruction measures.

The system has been built and includes the whole range of activities carried out on the national and local (municipal) levels.²⁰⁸³ Between, there is a regional level of administrative structures (so-called urban municipalities, which are 13), aimed to provide better co-ordination when more than two local areas are affected by any kind of disaster. Moreover, with the Act on Protection against Natural and other Disasters have been established obligations to commercial companies, institutions and other organisations that, within the scope of their activities, are responsible for implementing of emergency measures, and as well as to the citizens for their private protection. At the state level, obligations and rights to introduce measures and take interventions have been assigned to the Government as a whole and to particular ministries. The leading role between them is for the Ministry of Defence – within its structure, the Administration of the Republic of Slovenia for Civil Protection and Disaster Relief (ACPDR) has been established by law in 1991 as the main national administrative body for disaster management.

According to Slovenia's report to the World Conference on Disaster Reduction,²⁰⁸⁴ the management and administration of the system has been layered the following way:

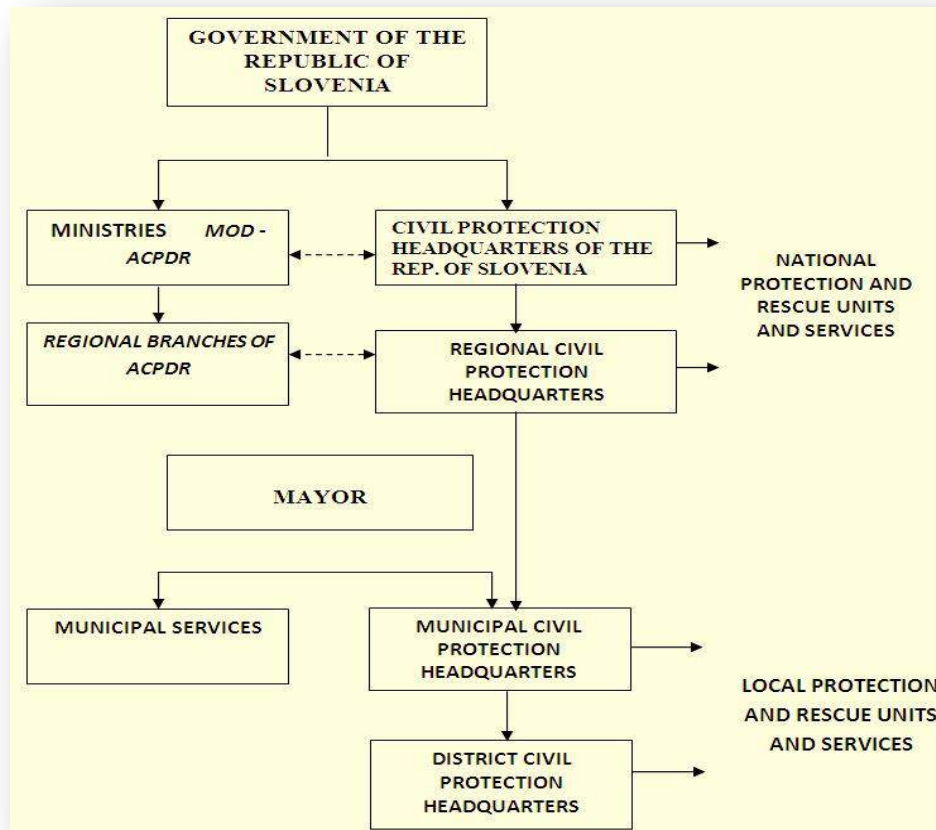

The National Assembly lays down the basic guidelines for organising and implementing protection against natural and other disasters at the national level, adopts the national programme of protection against natural and other disasters and supervises its implementation, and secures funds for the reparation of the effects of major natural disasters.

The government guides and co-ordinates the organisation, preparation and implementation of protection against natural and other disasters at the national level, adopts the annual plan of protection against natural and other disasters and national protection and rescue plans, manages the protection, rescue and relief and reparation of the effects of major natural and other disasters, and regulates international disaster relief. The government also guides and co-ordinates the operations of the Ministries responsible for the implementation of measures and the prevention of natural and other disasters and their consequences, along with states of readiness and the adoption of measures in the areas under their jurisdiction.

Operational management of civil and other protection, rescue and relief forces is organised and carried out as a uniform national system. Civil Protection commanders, headquarters and heads of intervention and rescue units carry it out. The municipalities operate and manage the system of protection against natural and other disasters independently in their areas. Professional protection, rescue and relief tasks are carried out by the municipal administration.

²⁰⁸³ There are 211 municipalities in Slovenia.

²⁰⁸⁴ 2005 Hyogo report.

Council for Protection
Against Natural and
Other Disasters
(2014)

Figure 43: Organisational chart of the Slovenia's disaster management system.²⁰⁸⁵

Within this architecture, the lines of command, control and reporting have been organised the following way:

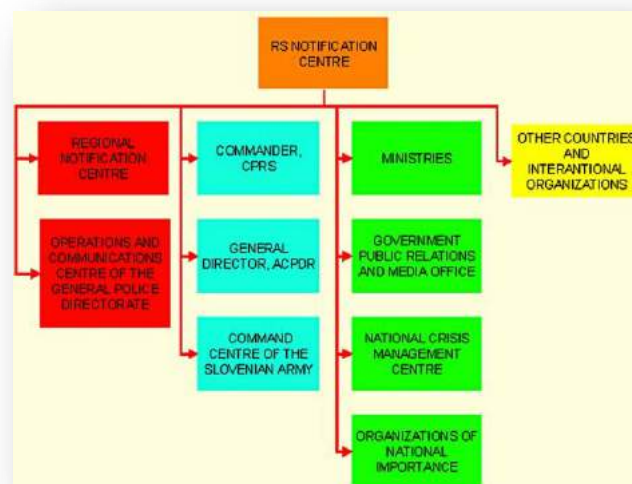

Figure 44: Lines of communication.²⁰⁸⁶

²⁰⁸⁵ EC Vademecum on Civil Protection, http://ec.europa.eu/echo/files/civil_protection/vademecum/si/2-si-1.html#orga; and Slovenian National progress report on the implementation of the Hyogo Framework for Action (2013-2015).

According to the Slovenian National progress report on the implementation of the Hyogo Framework for Action (2013-2015), the Government has established a Council of the Government of the Republic of Slovenia for Protection Against Natural and Other Disasters. The new body (since 24th July 2014) has been founded as an advisory body to the Government on protection against natural and other disasters. The Council shall function as a National Platform for Disaster Risk Reduction.²⁰⁸⁷

As a permanent co-ordinating body at national level, the Administration of the Republic of Slovenia for Civil Protection and Disaster Relief (ACPDR) is charged with the following administrative and technical duties:

- *“Elaboration of proposals of research and development projects relating to the protection against natural and other disasters;*
- *Elaboration of the proposal of the national programme and plan of protection against natural and other disasters;*
- *Providing for the organization and operation of the monitoring, notification and warning system;*
- *Elaboration of threat assessments and other technical documents for the planning of protection, rescue and relief and directing and coordinating of measures for the prevention and mitigation of consequences of natural and other disasters;*
- *Monitoring and announcing of danger of natural and other disasters and giving instructions for handling;*
- *Elaboration of national emergency response plans in co-operation with ministries and governmental services;*
- *Organisation, equipment and training of national Civil Protection units and services and other protection, rescue and relief forces and provision of conditions for the work of the commander, the Headquarters of the Civil Protection of the Republic of Slovenia and the national and regional damage assessment committee;*
- *Monitoring and co-ordination of the organisation of the Civil Protection and other protection, rescue and relief forces;*
- *Elaboration of programmes as well as organization and delivery of education and training for protection, rescue and relief;*
- *Creation and maintenance of national material reserves for the case of natural and other disasters.”*²⁰⁸⁸

ACPDR is divided into six units and is based in Ljubljana.²⁰⁸⁹

- Office for Prevention and Operations:
 - Sector for monitoring and alarming, including National Notification Centre;
 - Sector for Planning, Operations and Damage Assessments;
 - Sector for Fire Prevention, Protection and Fire-fighting;
- Office for Education and Training:

²⁰⁸⁶ EC Vademecum.

²⁰⁸⁸ Law on Protection Against Natural and Other Disasters, Art. 102.

²⁰⁸⁹

See

www.mo.gov.si/en/about_the_ministry/organization/administration_of_the_republic_of_slovenia_for_civil_protection_and_disaster_relief/ and <http://www.sos112.si/eng/>.

- Sector for Education and training;
- National Training Centre for Civil Protection and Disaster Relief and Fire-fighting school;
- Sector for Information and Communication;
- Department for General Affairs;
- Department for International co-operation and EU affairs.

According to the ACPDR web site, the unit has subordinated “...13 other ACPDR-branches operating throughout Slovenia. Within each branch, there is a regional notification centre that performs a 24-hour duty service. Altogether, 300 people are employed at the ACPDR branches and notification centres.”²⁰⁹⁰

Protection, rescue and relief forces at various levels (municipal, regional and national) are professional and volunteer and include also Civil Protection and certain companies, institutions and other organisations, which are, given the nature of their activities involved in this system:²⁰⁹¹

- The volunteer forces are the volunteer fire brigade, Red Cross, Slovenian Caritas, divers, dog-handler units, girl and boy scouts, scouts, amateur, broadcasters, Mountain Rescue Service, Cave Rescue Service and others.
- Professional emergency services include professional fire-fighters, public health services, public social welfare services, public veterinary services, environmental laboratory, mine rescue units, emergency rescue for disasters connected to corrosive substances, mobile meteorological unit, public utilities, regional and government public services and contract organisation.
- Civil protection is organised as a specific and deliberate part of protection and relief system and includes first aid teams, units for veterinary first aid, technical rescue units, units for radiological, chemical and biological defence, services for maintenance and usage of shelters, unit for protection against unexploded ordnance, unit for triggering avalanches, rescue unit for rapid intervention and support services.

Duty bound units and services for the protection, rescue and relief operations are organised on the basis of civic duty (units and departments of Civil Protection service). According to the Regulation on Organising, Equipping, and Training Forces for Protection, Rescue and Aid the following structure has been established:²⁰⁹²

- Units for first aid;
- Units for the first veterinary assistance;
- Technical rescue units;
- Units for radiological, chemical and biological (RCB) protection;
- Units for protection against unexploded ordnance;
- Units for use shelters;
- Service triggering avalanches;
- Support Services;
- Civil Protection commanders and their deputies and staffs of the Civil Protection;
- Commissioners for Civil Protection and their deputies;

²⁰⁹⁰ ACPDR, “Regional Offices,” <http://www.sos112.si/eng/>.

²⁰⁹¹ EC Vademecum.

²⁰⁹² EC Vademecum.

- Information centres;
- Logistics centres;
- Other units and departments.

Civil Protection itself is organised at the national level, regions, municipalities, institutions and commercial companies. At the state level, the Headquarters of the Civil Protection of the Republic of Slovenia and the National Unit for Rapid Intervention (in Slovenian – EHI) have been established. The latter is designed to perform specific difficult tasks in the field of protection and rescue in Slovenia and for providing international assistance to other countries in need. At the level of municipalities, staffs, units and departments of Civil Protection are organised differently. The structure depends on dominant regional threats, protection and rescue plans and the number of members of professional and volunteer units.

The Police and Slovenian Armed Forces are seen as “the last resorts” for natural and other non-violent disasters. According to the Law,²⁰⁹³ the Police participate in the tasks of protection, rescue and relief in accordance with the law, particularly in providing security, public order, public peace and cooperation in rescue operations by helicopters and other forces.

Slovenian Armed Forces participate in the tasks of protection, rescue and relief in accordance with the law, their structure, equipment and ability. In carrying out the tasks aviation units, units for nuclear, chemical and biological defence, engineering units, medical service and other units (if they are not engaged in carrying out defence duties) are involved. The table below illustrates the use of military helicopters for search and rescue operations and other civil protection in 2013-14:

Table 29. Use of Slovenian Armed Forces helicopters for search and assistance in 2013-14.²⁰⁹⁴

Number of Rescue Operations/ Injured Persons and Total Flying Hours	2013	2014	Change index
Mountain Rescue	85	88	104
Helicopter Emergency Medical Assistance	56	76	136
Wildfires and Disasters	14	25	179
Total Number of Rescue Operations	155	189	122
Total Number of Helicopter Flying Hours	257	270	105
Total Number of Injured Persons	145	176	121

3.2 Organisational co-operation

At the international level, in Slovenia, the importance of cross-border cooperation is considered in the five-year National Programme as the highest policy and planning document for disaster man-

²⁰⁹³ Law on Protection Against Natural and Other Disasters, articles 14 and 79.

²⁰⁹⁴ Annual Report of the Ministry of Defence for 2014. The “change index” illustrates the level of increase of the parameter (index 104 means increase with 4%).

agement, and defined in the main legislative act – the Law on Protection against Natural and other Disasters.

According to an official report, “Joint bilateral committees and sub-committees for cooperation between Slovenia and neighbouring countries have been established, such as joint committees led by director-generals of the competent national organisations and experts” sub-committees (i.e. for the prevention and preparedness of forest fires; early warning and notification, including the emergency call number 112; emergency response plans for joint risks at bordering regions; education and training).” Joint project teams have been established as well.²⁰⁹⁵

The principal areas of international organisational co-operation include:

- Early warning and notification on emergencies;
- Information exchange on hazards and emerging threats;
- Sharing of knowledge and experience;
- Joint education, training and exercises;
- Mutual assistance in case of disasters;
- Co-operation in international disaster response interventions;
- Co-operation within EU and NATO, and others.

According to the Slovenian National progress report on the implementation of the Hyogo Framework for Action (2013-2015),²⁰⁹⁶ bilateral agreements have been signed with the neighbouring Austria, Croatia, Hungary, and Italy, as well as with Bosnia and Herzegovina, Czech Republic, Germany, Montenegro, Poland, Slovak Republic, Russian Federation. In addition, intensive bilateral co-operation, particularly in the field of education and training, is ongoing with France, Sweden and the United States of America.

Standard operating procedures with Croatia to assist the aircraft on fire in an open space that defines the mutual exchange of information on hazards and fires in the border area has been signed in 2013.

An agreement is negotiated with Serbia. Co-operation has been arranged also with Albania and Kosovo.

Slovenia is also very active in the regional DPPI SEE and, together with Croatia, led the Disaster Management Training Programme, in which more than thousand participants from South-Eastern Europe have been educated and trained in disaster management.

The Administration of the Republic of Slovenia for Civil Protection and Disaster Relief is responsible for developing projects and research activities in support of the civil protection system improvement. It delivers a special emphasis on building capacity for mutual reinforcement at both horizontal (inter-agency) and vertical (state-regions-municipalities) operational levels.

The Administration is also co-ordinating and implementing the international co-operation activities of Slovenia in disaster management with neighbouring and other countries, as well as with regional initiatives, international organisations and the EU. It provides and co-ordinates rescue assistance in the event of major disasters abroad.

According to the 2014 Annual report of the Ministry of Defence, the international engagement of the Slovenia civil protection capabilities is the following:²⁰⁹⁷

²⁰⁹⁵ Jeraj (2014) provides information on seven international projects.

²⁰⁹⁶ Slovenian National progress report on the implementation of the Hyogo Framework for Action (2013-2015).

²⁰⁹⁷ Ministry of Defence Annual report for 2014.

At the end of May and beginning of June 2014, in accordance with the decision of the Slovenian Government, the SAF took part in rescue and assistance operations abroad (Bosnia and Herzegovina and Serbia) organizing and carrying out the transport of humanitarian aid and helicopter emergency response operations in flooded areas. Six convoys for the transport of humanitarian and other assistance to the affected areas were organised, with 110 vehicles transporting 705 tons of cargo. A SAF company with 120 members, who participated in the EUFOR joint military exercise in Bosnia and Herzegovina during the operations for the mitigation of flood consequences, were actively involved in those operations in June. Company members removed debris, disinfected public areas and facilities (nurseries, primary and secondary schools, health centres, municipalities) and analysed water and soil.

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

The principal source of standing operating procedures (SOPs) is the Ministry of Defence of Slovenia as disaster management is under its supervision.

SOP for fire-fighting has been developed in 2011 when a document, “Operativni Taktični Postopki”²⁰⁹⁸ (Tactical Operational Procedures) was adopted. It is about 13 professional fire departments, 1299 active volunteer fire fighting societies and 68 volunteer industrial fire-fighting societies. They are linked in 120 local and regional fire-fighting associations, which are all covered by the umbrella organisation, the Fire Fighting Association of Slovenia. Every fire department has operational units, which are classified into a range of categories according to the risks of fire in concrete areas.

SOP for nuclear, radiological, chemical, and biological protection (Standardni operativni postopek (SOP) za jedrsko, radiološko, kemično, biološko (JRKB) zaščito) was adopted in 2007.

Under the umbrella agreement between the governments of Slovenia and Croatia on cooperation in protection against natural or civil disaster, signed in 1997, standard operating procedure for the Administration of the Republic of Slovenia for Civil Protection and Disaster Relief and National Protection and Rescue Directorate of the Republic of Croatia was introduced in 2014. SOP is about providing assistance with aircraft in cases of fires in open space. The document guides information sharing and co-operation procedures for providing cross-border assistance with specialised aircraft. It is aimed to allow faster and more co-ordinated response to potential fires, especially in the border area.

Other forms of SOPs are the plans for emergency response that are developed at the state level and for each region. (See Chapter 4.2)

SOPs are provided also through officially issued by the Administration for Civil Protection and Disaster Relief instructions for citizens:²⁰⁹⁹

- Emergency food supply;
- Measures to take in the event of an earthquake;
- Measures to take in the event of a flood;
- Measures to take in the event of heavy snowfall;
- Protection against avalanches;
- Protection against lightning;
- Measures to take in the event of a fire in the natural environment;
- Measures to take in the event of a fire in a building;
- Measures to take in the event of the use of chemical weapons;
- Measures in the event of an accident involving chlorine;
- Protection against radiation;
- Measures to take in the event of the outbreak of a communicable disease;

²⁰⁹⁸ The document is available in Slovenian language at www.gasilec.net/modules/simplemod/datoteke/0-Operativno%20takticni%20postopki/RRN%20OTP.pdf.

²⁰⁹⁹ Hyperlinks to the instructions are provided.

- Measures to take in the event of an airstrike;
- How to prepare and use a shelter/refuge;
- Measures to take if you encounter unexploded ordnance;
- First psychological aid;
- Giving first aid;
- How to ensure healthy drinking water.

SOPs have been tested by both national and international exercises and through international exchange in forms of seminars and conferences.

4.2 Operations planning

According to the Hyogo, 2005, “Protection and rescue plans are drawn up by state bodies, local communities, commercial companies and other organisations. The plans are drawn up in accordance with the Decree on Content and Drawing up of the Plans for Protection and Rescue.”²¹⁰⁰ The relevant responsible bodies must adopt the plans – the Government adopts national protection and rescue plans, and local community plans – by mayors. The adopted protection and rescue plans have to be made public, particularly to threatened people and to other publics with a vested interest.²¹⁰¹

Protection and rescue measures must be drawn up for each individual type of disaster. The plans should define:

- Individual type of disaster for which plan is elaborated;
- Extent of planning;
- Concept of protection, rescue and disaster relief for the disaster for which plan was elaborated;
- Management and leading;
- Measures and tasks of protection, rescue and relief;
- Personal and mutual protection;
- Explanation of terms and abbreviations;
- Necessary forces and means and resources available;
- Organisation and implementation of monitoring, warning and alarming;
- Mobilisation of forces and resources.

Supplements and attachments to the plan are:

- Plans of activities of executors of the protection and rescue;
- Database needed for implementation of the plan;
- Programme of qualification, training and exercises;
- Instruction for maintenance and distribution of protection and rescue plan.

The national protection and rescue plans are drawn up by the Administration of the Republic of Slovenia for Civil Protection and Disaster Relief in co-operation with the ministries and other national bodies. On the national level, protection and rescue plans for the potential large-scale disasters are drawn up that could affect several communities or regions. The following plans have been prepared:²¹⁰²

²¹⁰⁰ 2005 Hyogo report, Component 5.1.

²¹⁰¹ 2005 Hyogo report.

²¹⁰² Hyperlinks to the available plans are provided.

- Emergency Response Plan in the event of Aircraft Accident;
- Emergency Response Plan in the event of an Earthquake in the Republic of Slovenia;
- Emergency Response Plan in the event of Floods;
- Nuclear Emergency Response;
- Emergency Response Plan in the event of Railway Accident;
- Emergency Response Plan in the event of Accidents at Sea;
- Emergency Response Plan in the event of Terrorist use of Weapons or Means of mass Destruction and/or in the event of Terrorist Attack with Conventional Means;
- Protection and Rescue Plan in a case of multiplicative appearance of contagious disease at animals;
- Military Aggression Protection and Rescue Plan.

Plans are drawn up based on the following information:

- Risk assessments;
- Analysis of vulnerability;
- Studies.

The planning scheme by different entities reflects the levels of the civil protection system (Table 7).

Table 30. Levels of disaster management planning.²¹⁰³

Threat, disaster	Company	Municipality (local)	Urban municipality (region)	State (national)
Earthquakes	-	X	X	X
Floods	-	X	X	X

4.3 Logistics support in crises

The Slovenian authorities see logistics as one of the emergency management systems along with monitoring, information, and communication systems. It is determined by the Law on Protection Against Natural and Other Disasters and has been established through the mechanism of the National Programme of Protection Against Natural and Other Disasters (Art. 41).

The Law prescribes eventual military logistic support from the Slovenian Armed Forces under the following conditions: “Where the available forces and resources are insufficient in order to carry out the necessary rescue and relief operations, armed forces and defence resources may be deployed, provided that such armed forces are not indispensable for defence operations.” (Art. 14)

Administration of the Republic of Slovenia for Civil Protection and Disaster Relief is responsible for the organisation and equipping of national civil protection units and services, provision of guidelines for the development and readiness of all public rescue services within national jurisdiction and co-funding of fire-fighting units that are of great importance for society and other organizations and societies. Under its command, the National Logistic Centre is dedicated to creating and maintain relevant as quantity and specifications national reserves of material assets for protection, rescue and relief purposes.

The Slovenian Armed Forces include a Logistics Brigade (deployed in the town of Kranj), which is able to provide logistics support in case of any type of natural or man-made disaster. It includes two logistics regiments and a Military Medical Unit. Despite that the brigade itself is not deployable abroad, the Slovenian military is engaged in an active international co-operation with the US and other NATO forces on emergency logistics not only for wartime but also for delivery of humanitarian support abroad.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

The monitoring, notification and warning system is comprised of monitoring network, notification centres, computer support and telecommunications service and warning. The Administration for Civil Protection and Disaster Relief is the headquarters of the communications and information support.

The Slovenian national report and information on disaster reduction for the world conference on disaster reduction provides the following information about the country’s crisis communications:

A uniform (autonomous) system of operational radio communication (ZARE) and personal calls (pagers) is used in the administration of protection, rescue and relief operations. The ZARE is used by all rescue services. The communication centres of this system are located in regional information centres and are used to connect users to public and other telecommunication systems.

The ZARE radio communication system operates in the VHF range. There are 32 semi-duplex channels available for over 40 upper transmission layer repeaters and 36 simplex channels for direct connections. The pagers system consists of 40 upper layer transmitters and 50 lower layer transmitters. The ZARE system provides adequate protection against disturbance (sub-tone) and abuse (ID code). Plans for a gradual transition to a new beam radio communication system have been established.

*Computer network and information support integrate all 13 regional notification centers and the Education, the Training Center, and the Administration for Civil Protection and Disaster Relief into one computer network. It serves the needs of the centers so they can ensure protection against natural and other disasters. For major connections, we use leased virtual transmission ways via the Internet, which allow for a smooth increase in transmission speed on an as needed basis. Information support is provided through tailor made computer applications in the regional notification centers, such as the Geographic Information System (GIS-Ujme), the sound alarm management and triggering system (DUNJA), the system for the acceptance of telephone calls (ROK), the radio traffic control system (KC08), the radio network control system (Nadzor ZARE) and the pager system (ZAPP). All the systems are linked into a uniform application used for the management of interventions (SPU112). There are also web applications available in the computer network, such as GIS and hazardous materials.*²¹⁰⁴

The emergency call number “112” has been used in Slovenia since the beginning of 1997. All citizens can use this number in an emergency or if they need a fire brigade, emergency first aid or aid from any other rescue services. In addition, by dialling this number, people can obtain other important information on weather, water, snow and other conditions, disturbances and interruptions in the supply of potable water and electrical and other energy sources and other areas of life importance. According to the Slovenian Ministry of Defence’s annual report for 2011, a StatKlic application was introduced in 2011 and the E-CALL upgrade should have been completed in 2012.

²¹⁰⁴ Hyogo, 2005, p. 16-17.

5 Capabilities

5.1 Human resources

Human resources for civil protection in Slovenia are managed under the Government's Decree on the Organisation, Equipment and Training of Protection, Rescue and Relief Forces of 2007 (amended in 2009 and 2011) and the Decree on Service in Civil Protection (2008).

According to the Ministry of Defence, at the end of 2014, the Civil Protection had listed more than 40 000 members of the Protection, Rescue and Relief forces (PRR). Of them, there have been about 22 000 members of duty units and about 18 000 volunteers. National PRR forces have consisted of 840 professionals, 1 200 volunteers and more than 1 505 members of duty units.²¹⁰⁵

Table 8 presents the numbers of personnel of the Headquarter of the Civil Protection of the Republic of Slovenia and the National Unit for Rapid Intervention at the state level (see also Chapter 3.1). Table 9 shows how the members of the Civil Protection are distributed through the regions.

However, the report states that due to budgetary constraints, the Administration for Civil Protection and Disaster Relief is far from providing the necessary highly qualified professional staff even for the most critical duties.

Protection, rescue and relief tasks are performed by volunteer and other nongovernmental organisations and their operational units in response to decisions made by the competent body at the local or national level if they meet the required personnel and material/technical conditions. These organisations include:

Table 31. State level Civil Protection personnel.²¹⁰⁶

- Slovenian Fire-fighting Association:²¹⁰⁷ In all 212 municipalities of Slovenia there are public fire services. Fire service is obligatory local service with no headquarters on the national level. Local Fire-fighting Chief is responsible to the mayor for preparedness, management, command and control of the Fire service. The number of volunteers is approximately 113,000 members, 44,000 of them active. There are nearly 500 professional fire-fighters and another 300 professional fire-fighters that work in industrial enterprises. All fire brigades include a fire-fighting unit trained and equipped to extinguish fires and provide rescue services in the event of a fire or other disaster. The Fire brigades are linked together by municipal and regional fire-fighting associations, which together form the Slovenian Fire-fighting Association. The Slovenian Fire-fighting Association became a member of CTIF (International Technical Committee for the Prevention and Extinction of Fire) since 1992.
- Slovenian Red Cross (SRC): As a non-governmental, non-political non-profit humanitarian organisation, the Slovenian Red Cross is primarily responsible for the areas of health and social welfare. Its volunteers see to the implementation of social welfare, health education and first aid programmes, blood donation, investigation services, and assistance to high-risk groups within the population. The Law on the Slovenian Red Cross (Art. 9) authorises the Red Cross to perform the following tasks:
 - Tasks related to informing, recording and inquiring about the victims of armed conflict and persons afflicted in natural and other disasters;
 - Organising the training of staff for the performance of tasks arising from the Geneva Conventions;
 - Organising first-aid courses and examinations;

- *Organising and trains first-aid units;*
- *Carries out campaigns for recruiting blood donors and organising blood drives;*
- *Issuing cards to donors of parts of the human body;*
- *Carries out measures for protecting the health of persons during natural and other disasters and in the event of armed conflict;*
- *Carries out measures for the reception of evacuated and other endangered persons, measures which may contribute to the care afflicted persons.*²¹⁰⁸

“SRC is composed out of 56 Local Branches, covering one to three local municipalities with the network spread over 887 local organisation, that are run by committed volunteers. Under the Slovenian Red Cross Association there is also a Slovenian Red Cross Youth and Health Resort Debeli rtič, based on the Slovenian Coast.”²¹⁰⁹ The Slovenian Red Cross is comprised of 800,000 volunteers and supporting members. It has been a member of the international Red Cross Movement since 1993 and is a member of the International Committee of the Red Cross and the International Federation of Red Cross and Red Crescent Societies.

- “Caritas Slovenia”: “Caritas Slovenia” is a charity institution of the Roman Catholic Church in Slovenia. Its activities are distributed among diocese and parish Caritas organisations. Its purpose is to perform charity and social welfare activities within the Slovenian Church and society, particularly related to response to the results of natural and other disasters both in Slovenia and throughout the world. Caritas of Slovenia is a member of both the international and European Caritas organisations. The organisation has about 9,000 volunteers.²¹¹⁰
- Slovenian Mountain Rescue Service: The Law on security against natural and other accidents has established the Slovenian Mountain Rescue Service as a public rescue service of national importance. It is organised in 17 stations that cover the entire Slovenian Alpine and Sub-Alpine regions. More than 660 volunteer mountain rescuers operate the stations. The Slovenian Mountain Rescue Service was formally recognised by the International Mountain Rescue Commission (IKAR) in 1992, although the Slovenian Mountain Rescue Service has co-operated actively with this Commission and was the representative of all Yugoslav mountain rescuers from 1955 on.²¹¹¹
- Slovenian Cave Rescue Service: The Act on the Protection against Natural and other Disasters has established the Slovenian Cave Rescue Service as a public rescue service at the national level. It is organised into seven rescue centers - Ljubljana, Postojna, Sežana, Tolmin, Kranj, Velenje and Novo mesto where 55 cave rescuers serve on contract basis. The organisation is a member of the International Speleological Association – Cave Protection Commission (UIS) since 1993.²¹¹²
- The Slovenian Canine Association and the Slovenian Federation of Associations of Rescue Dog Handlers: In Slovenia, there are 62 sport and 18 hunting canine associations, with a total

of 7,500 members. These associations are linked to the Slovenian Canine Association and the Slovenian Federation of Associations of Rescue Dog Handlers. More than 150 rescue dog handlers, members of canine associations, are involved in rescues from rubble and landslides. The Slovenian Canine Association was accepted into the International Canine Federation (FCI) in 1992. The Slovenian Federation of Associations of Rescue Dog Handlers became a member of the International Rescue Dogs Organisation (IRO) in 1995.

- Slovenian Federation of Divers: There are 21 associations with 1,200 volunteer divers, of whom 62 are instructors and 27 specialist physicians. The associations and their federation have jointly organised an underwater rescue service, intended to provide rescue services from and on a water. More than 90 volunteer divers are involved in underwater rescue activities. The Slovenian Federation of Divers became a member of the World Underwater Association (CMAS) in 1993.
- Slovenian Scout Association and the Slovenian Catholic Girl Guides and Boy Scouts Association: Scouts are organised in branches and other organisational forms of camping and Scouting associations, and are linked to the Slovenian Scout Association and the Slovenian Association of Catholic Scouts. All together, they include 12,000 Scouts. Through their activities, scouts systematically develop their level of preparedness to help people in the event of natural and other disasters. Their primary task is to set up tents and other temporary shelters for people who are left without safe accommodation in the event of a disaster. Slovenian Scout Association was accepted into the World Organisation of Scouting Movements (WOSM) in 1994.²¹¹³
- Association of Slovenia Radio-Amateurs: In Slovenia, there are 90 amateur radio-operator clubs with a membership of more than 7,000 volunteer amateur radio operators. Amateur radio operators can provide supplementary radio communications systems in municipalities for protection and rescue needs in the event of a mass disaster. They can also participate in providing information to the international public of the consequences of the disaster and the aid needed. The Association of Slovenian Radio-Amateurs became a member of the International Amateur Radio Union (IARU) in 1992.²¹¹⁴

5.2 Materiel (non-financial) resources

Material resources for civil protection and disaster relief are provided under the Decree on Minimum Personal and Collective Protection Resources and Equipment in the Event of Natural and Other Disasters and War of 1992. Head manager of the material reserves is the Administration of the Republic of Slovenia for Civil Protection and Disaster Relief. In the last decade, the Administration systematically enhanced the national commodity reserves, which according to the Law on Protection Against Natural and Other Disasters, are provided through the Institute for Commodity Reserves. Those resources are stored in the National Logistics Centre in Roje in Ljubljana and in the warehouse of commodity reserves in Zalog. In the National Logistics Center in Roje the following equipment has been accumulated as state commodity reserve: readers, dosimeters, special suits, safety masks, safety, respira-

²¹¹⁴ 2005 Hyogo report.

tors, gloves, special protective boots, water containers, decontamination means and equipment, etc.²¹¹⁵

According to the Law on Protection Against Natural and Other Disasters available defence resources might be used to carry out the necessary rescue and relief operations if the civilian resources are insufficient and the military are not indispensable for defence operations (Art. 14). Article 85 of the Law regulates the special powers, mandated to the Civil Protection commanders in cases of emergencies. It states (between others) that in the course of protection, rescue and relief the Civil Protection commander or incident commander shall have the right to order that:

- “... private means of transport be made available and used for the transportation of injured persons or required means of protection, rescue and relief;”
- “private premises be used for the purposes of protection, rescue and relief;”
- “premises be used as a temporary storage site for debris, soil and other material produced during the performance of protection, rescue and relief duties aimed at provision of basic living conditions;”
- “buildings be demolished or trees be cut.”

Such measures “...may only be ordered, where no other measures can ensure the protection of people and property and the performance of protection, rescue and relief, and shall apply no longer than absolutely necessary.”

The responsibility of the Civil Protection commander for using private and corporate assets is regulated by paragraph 5 of the same Article in the following way:

Normally, records shall be kept of decisions made by a Civil Protection commander or incident commander. For decisions with bigger financial implications, written orders shall be issued. Circumstances permitting, the written order shall be issued as soon as possible. In urgent cases Civil Protection commander or incident commander shall have the right to order owners or users of residential and other accommodation facilities that they provide temporary shelter and care for threatened persons until a decision has been made by the Mayor.

5.3 Training

Education and training on behaviour in cases of different emergencies is a national priority as a core component of disaster preparedness and nation’s resilience. It well regulated by the Law on Protection Against Natural and Other Disasters where a special Chapter (XIII) with six articles is dedicated to education and training. The elements of organising education and training are presented in Table 10.

According to the web site of the Administration for Civil Protection and Disaster Relief, the main training institution is the Centre for Civil Protection and Disaster Relief of the Republic of Slovenia. “The Training Centre is responsible for the development and evaluation of training programmes and prepares training materials”²¹¹⁶ for Civil Protection members, members of units, services and other operational systems of associations and other non-governmental organizations, commercial companies, institutions and other organisations. It also organises training forms within international organisations, mostly NATO, EU, UN and in a regional format. “It provides professional publishing support

5.4 Procurement

5.4.1 Procurement regulation

Slovenia's public procurement policy has been progressively harmonised with both EU directives and World Trade Organisation Government Agreement (GPA) since 2000. Recently, public procurement in Slovenia is regulated by the following legislation:

- The Public Procurement Act which lays down the procedures for the procurement of goods, services and works, which must be obeyed by public procurement authorities and providers, who submit a bid.
- The Public Procurement in the Water, Energy, Transport and Postal Services Sector Act covering procedures for public purchasing in the water, energy, transport and postal services sector, and
- The Review of the Public Procurement Procedures Act which lays down the laws and other regulations relating to procedures concerning the award of public contracts and the means of implementing EU legislation.

Applied to all state institutions and local administration, public undertaking and utilities, including those related to protection against natural and other disasters, "... the Public Procurement Act has increased protection for bidders, unified all procedural requirements and eliminated the 10% preference for domestic bidders. The Act established an independent body, the National Review Commission (NRC) whose members are appointed by Parliament to ensure their independence."²¹²⁰

²¹¹⁹ Administration of the Republic of Slovenia for Civil Protection and Disaster Relief, www.sos112.si/eng/page.php?src=iz1.htm.

²¹²⁰ OECD, 2009.

According to the Law on Protection Against Natural and Other Disasters (Art. 102) for the aims of providing protection, rescue and relief the Administration for Civil Protection and Disaster Relief has the right to provide the affected population with relief resources, specific protection and rescue equipment and tools free of charge. It also permitted by that Law, selected protection and rescue equipment and tools to be reassigned free of charge to units, services and operational structures. However, for any free of charge delivery the Government or the Minister of Defence and other ministers should take a decision.

5.4.2 Procurement procedures

The legislation on public procurement in Slovenia provides several options for the contracting authorities to open up a public procurement using one of the following procedures:

- Open procedure;
- Procedure with prior verification of eligibility (qualitative selection);
- Competitive dialogue;
- Negotiated procedure without publication of a contract notice;
- Negotiated procedure with prior publication of a contract notice;
- Procedure for collecting bids after prior call for competition;
- Procedure for collecting bids.

According to the legislation, any contracting authority must send notification of an intended procurement to the Office of the Official Publications of the European Communities, which will publish it, and to the Public Procurement Portal, if a procurement without VAT amounts to the following values:

- EUR 133,000 for procurement in goods and services, if the contracting authorities are State authorities or local councils,
- EUR 206,000 if goods and services are purchased by another contracting authority,
- EUR 5,150,000 for public procurement in construction works.
- For public procurement in the water, energy, transport and postal services sector the threshold amount for goods and services is EUR 412,000 and for construction works EUR 5,150,000.

However, the thresholds are different for each procedure, and for each type of public procurement, in particularly in the field of defence. Detailed provisions are laid down in the Public Procurement Act and in the Decision on the publication of thresholds for public procurement procedures.

This Act also created a single central administration for public procurement – Public Procurement Office. It is in charge for implementation of all kind of procurement procedures, provides analyses of the procurement situation in the country and abroad and co-operates with EU, WTO and other international governmental organisations as well as with the NRC.

Slovenia has a completely developed and fully operational single information portal on public procurement managed by the Ministry of Finance. The state and local authorities are obliged by the Law to publish on that portal all public tenders- related information. The portal provides standardised web application and variety of administrative elements in electronic format as receipt-and-delivery system application, e-payments, e-serving, e-signature, e-awarding of contracts and e-auction. Ac-

According to web-based information,²¹²¹ on the procurement portal have to be published announcements for:

- Procurement of goods and services by Public Procurement Act subject, with a value equal to or greater than EUR 20,000;
- Works contracts awarded by Public Procurement Act subject, with a value equal to or greater than € 40,000;
- Procurement of goods and services by Public Procurement in the Water, Energy, Transport and Postal Services Sector Act subjects, whose value is equal to or greater than € 40,000;
- Works contracts awarded by Public Procurement in the Water, Energy, Transport and Postal Services Sector Act subjects, whose value is equal to or greater than € 80,000.

Announcements should include:

- Prior information notice or periodic indicative notice
- Contract notice small value,
- Contract award notice small value,
- Notice of contract by tendering procedure with prior publication,
- Notice of award of the contract by tendering procedure with prior publication,
- Contract notice,
- Contract award notice,
- Notice of competition,
- Results of the competition,
- Voluntary ex-ante transparency notice,
- Simplified contract notice on a dynamic purchasing system
- Notice of the system of qualification
- Notice of award of individual contracts based on framework agreement
- Notice for additional information, information on incomplete procedure or corrigendum.

In terms of exception from the general public procurement regulations, the Law on Protection Against Natural and Other Disasters (Art. 85, paragraphs 4 - 6) provides a Civil Protection commander or incident commander with the right to order urgent construction, technical and other works to commercial companies, institutions or other organisations with which the national or local authority has signed a contract on the performance of specific operational protection and rescue duties. In the absence of such entities, a Civil Protection commander or incident commander might order that private or legal subjects, who have adequate equipment or capabilities, perform these duties. The order shall be written, or if the circumstances do not allow, in exceptional circumstances, oral. In this case, a written order shall be issued as soon as possible. The order shall determine the type and scope of work that needs to be done. For decisions with bigger financial implications, written orders shall be issued.

5.5 Niche capabilities

The Slovenian civil protection system has specifics that make it different from the European experience, but they reflect the country's realities and traditions. There are several principal areas of excellence that may be used within EU context and format:

²¹²¹ Available in Slovenian language only at <http://www.enarocanje.si/?podrocje=portal>.

- Slovenia has a well-established disaster management planning process for the nine separate hazards, based on scenarios. Especially advanced is the emergency response plan covering disasters.²¹²²
- Public engagement on a regular basis in the disaster preparedness and response is a national tradition and value. Legal acts, guides and instructions support the specific focus on both individual capacities and collective assistance.
- Education and training on behaviour in an emergency is life long and well managed. The European Emergency Number association has acknowledged the training in Slovenia on the use of 112.
- The communication and information sharing and the alerting systems are at the highest European level of quality.
- Slovenia has well established and maintained capacity for mountain and cave rescue operations.

Driving Innovation in Crisis Management for **E**uropean **R**esilience

SPAIN

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: ATOS (Diego Alexander Chanto García, Alejandro Afonso Spinola, Darío Ruíz)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by CSDM and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

A new law on Civil Protection, Law 17/2015 of 9 July of Civil Protection, has entered into force in Spain on 10 January 2016. This law aims to strengthen the operating methods that improve the functionality of the national system of civil protection, coordinated by the General Directorate of Civil Protection, in emergency or catastrophe cases set by the Law 2/1985, of 21 January of Civil Protection.

New means of effective intervention, such as the Military Emergency Unit (EMU), have also been created. On the other hand, the autonomous communities and also the local entities have deployed their own operating methods in terms of Civil Protection.

This Spanish system of civil protection is understood as a public safety instrument, integrated into the National Security policy.

The law 17/2015 defines the civil protection as a public service and establishes the operating methods of the General Directorate of Civil Protection and Emergencies (GDCPE). The Law 2/1985 described a series of steps in case of catastrophe or emergency, such as prevision, prevention, planning, intervention and recovery; law 17/2015 complements the previous law by adding general coordination of the political actions through the definition and monitoring of strategies in terms of civil protection. This law regulates a minimum set of rights and duties of citizens in the field of civil protection as well as principles for action by public authorities. Law 17/2015 also includes the training of the human resources of the General Directorate of Civil Protection.

In Spain, the General Directorate of Civil Protection is responsible of the civil protection actions in all the public administrations in terms of improving and guaranteeing an efficient and coordinated response in case of a severe risk, catastrophe or public calamity through the following operation methods:

- To foresee collective risks using a series of actions dedicated to anticipate them and avoid them; and in some cases reduce damages that this type of risks may produce;
- To plan the necessary method to fight a risk situation;
- To carry out the operative intervention that allows an immediate response in an emergency case;
- To adopt the recovery methods to establish the infrastructures and all the essential services;
- To coordinate, trace and evaluate the system to guarantee and effective operation.²¹²³

On the other hand, according to article 19 of Royal Decree 872/2014, of 10 October, which establishes the basic organisation of the forced army, the Emergency Military Unit (UME) is a special branch of the forced army and which main missions are to act anywhere in the national territory to protect people in any situation of disaster, serious risk or catastrophe. The Minister of Defence will dictate the rules to operate in this type of situations.

²¹²³ Article 3 of the law 17/2015 of Civil Protection. Accessed February 8, 2016.

National crisis management & disaster response concept:

National crisis management could be describe as a set of political and administrative decisions and also as a set of operative interventions carried out in the different steps of a National crisis or a disaster not only acting but also anticipating to that situation. Those steps are: disaster prevention, disaster preparedness, relief, rehabilitation and reconstruction.

According to article 1 of the Current Spanish Law on Civil Protection:

*Civil Protection is a public service that focuses on the study and prevention of serious collective risks, extraordinary catastrophes or public calamity situations which can massively endanger the life and safety of people, their goods and the environment in cases where these situations occur*²¹²⁴.

Paying attention to this definition, the actions of Civil Protection are not only limited to take part in simple and ordinary accidents but also take part in serious collective risks, extraordinary catastrophes or public calamity situations.

The article 30.4 of the Spanish Constitution establishes

*Citizen duties may be regulated in serious risks, catastrophe or public calamity cases*²¹²⁵.

As a consequence of this article, the main participants of Spanish Civil Protection System are:

- All the Public Administration such as local, autonomic and state administration and all the public organism and private entities.
- All citizens by fulfilling of their duties imposes by article 4 of civil protection law that establishes:

*All citizens will be subject to the obligation to cooperate personally and materially in civil protection actions in case of requirement by the competent authorities, after they are of legal age*²¹²⁶.

Volunteers, security, protection and fighting fire services and media are considered the main participants that have to cooperate in emergency situations.

The National Civil Emergency Planning Committee (NCEPC), an interministerial support function to the Crisis Cabinet, is mainly concerned with tasks related to the provision and implementation of resources in situations of crisis or emergency.

The NCEPC has a coordinating role in the Spanish Civil Protection and sits at the top of Civil Defence's organisational structure. It can meet either in plenary or permanent sessions. The Committee is composed of the Crisis Cabinet Secretary (President), the Director General for Defence Policy (First Vice President), the Director General for Civil Protection and Emergencies (Second Vice President) and the Under Director for Civil Preparedness (Secretary). Some of the other members are the Director of the Crisis Staff Department and the Committee President's Advisor on Defence and Security.

²¹²⁴ Article 1 of the current Spanish law on Civil Protection. Accessed January 28, 2016. <https://www.boe.es/boe/dias/2015/07/10/pdfs/BOE-A-2015-7730.pdf/>

²¹²⁵ Article 30.4 of the current Spanish Constitution. Accessed January 28, 2016. <https://www.boe.es/buscar/pdf/1978/BOE-A-1978-31229-consolidado.pdf/>

²¹²⁶ Article 4.4 of Law 2/1985 of 21 January. Accessed January 28, 2016. <https://www.boe.es/boe/dias/1985/01/25/pdfs/A02092-02095.pdf/>

Spain has bilateral agreements with Italy, France, Germany, Israel, Mali, Morocco, Portugal, Russia, and Senegal in terms of civil protection.

Key stakeholders: The main stakeholders in Spain are the Senior Civil Emergency Planning Committee (SCEPC), the National Civil Emergency Planning Committee (NCEPC), the Emergency Military Unit (EMU) and Civil Protection Agents (e.g. fire brigades, security forces, armed forces, maritime and aeronautical authorities, health services, etc.).

Niche crisis management capabilities of interest to the EU and other MSs:

The European Centre of Social Research of Emergency Situations (CEISE²¹²⁷) is a dependency of the General Directorate of Civil Protection that according to Royal Decree 991/2006 of 8 September has as a mission the development of researches and studies about sociologic, juridical and economic aspects. These areas of research are relevant to Civil Protection.

The CEISE fully maintains the functions previously performed by the European Research Centre for Information Technology to the population in Emergencies situations.

On the other hand the Spanish Society of Radiological Protection (SSRP) is a scientific association which main function is the scientific promotion and dissemination of radiological protection.

²¹²⁷ CEISE. Accessed January 28, 2016. <http://www.proteccioncivil.es/web/dgpcye/ceise/>

1 Policy

1.1 Risk Assessment

A risk may be defined as the probability that a determinate natural or technological phenomenon takes place and due to the vulnerability of any exposed element may produce harmful effects on people or their goods.

Risks use to be divided in:

- Natural risks that can be defined as a series of natural phenomena that can be potentially dangerous. This groups is composed by floods, forestall fires, avalanches, tsunamis, earthquakes, droughts and volcanos;
- Technological risks. This type of risks are the result of the use of new technologies such as nuclear, radiologic, chemical risks and risks related to the transport of dangerous goods.

In Spain, there are three different climatologic zones (the first one of them is marked by the Atlantic influence, the second one has a Mediterranean influence and the last one has a continental influence, apart from the specific singularity of the Canary Island). This is the result of the meteorological conditions that predominate in the general atmosphere in Spain.

The different meteorological phenomena that may occur in Spain and produce a risk situation are: high temperatures, heavy rains, intense cold, storms, wind and snow.

A forest fire can be defined as the fire that spreads with no control through a forest land that was not intended to burn.

Sunlight but mainly the use of forest zones as a workplace (agriculture, forestall works) and also as entertainment places are the principal causes of fire. If fire is not fought on time, it can generate large losses in the environment, in material goods and even people.

Geological accidents are represented by avalanches, earthquakes and volcanos; and hydrological accidents are mainly represented by floods.

In the technological side, the production of electricity in nuclear power plants is authorized in most industrialized countries because it brings profits to society activity, however it should be done under strict requirements of nuclear safety and radiation protection, throughout the life of the nuclear power plant, since it is first open until it is finally closed.

There are many objects, materials and products that people use every day and help to improve their life style, providing services and facilities. All this is possible due to the improvements in technology.

However, industrial processes that require the use of a series of substances and dangerous conditions are needed to produce these objects, products and materials that make people lives easier.

These activities, even if they are very simple, carry certain risks. The quantification of those risks depends on the probability that an accident appears and how much damage it is capable of generate.

The most important disasters in Spain in the last 30 years are:

Year	Disasters
2016	Earthquakes in Melilla
2015	Forest fire in Asturias
2015	Military helicopter crashes in Atlantic, Gran Canaria, 3 dead
2015	Violent hailstone storm in Albacete
2015	Oil slick, Gran Canaria
2015	Greek fighter jet crashes, Albacete, 10 dead
2014	Nurse infected with Ebola, 2 dead
2013	Train accident, Santiago, Galicia, 79 dead, 140 injured people
2012	Floods, Malaga, Almeria, Murcia, 10 dead
2011	Earthquakes, Lorca, Murcia Region, 9 dead
2011	Volcanic eruptions, El Hierro, Canary Island
2009	Storm, 14 dead
2009	Wildfire, 6 dead
2008	Fatal aerial crash, 153 dead
2007	Forest fire, Gran Canaria, Canary Island
2006	Extreme temperature, 21 dead
2005, 2005	Forest fires.
2004	Extreme temperature, 26 dead
2003	Extreme temperature
2003	Wildfire, 5 dead
2002, 2001, 2000	Floods in the Spanish East Coast
2001	Storm, 10 dead
1996	Mass movement wet, 84 dead
1985	Tanker explosion in Algeciras, 32 dead

Table 34: Major disasters in Spain in the last 30 years

1.2 Policy and Governance

The National Security Strategy document states that

Security is an essential fundament to reach the development and the progress of a free society.

...

*To the traditional risks and threats are added new transnational nature risks, which are interconnected and enhance their dangerousness.*²¹²⁸

The National Security is defined as a public service that needs the cooperation of the society as a common organisation. Under the direction and leadership of the Prime Minister, the national security is responsibility of the Government and involves all the Public Administrations.

As one of the principal organisms responsible of the civil protection actions in all the public administrations in terms of improving and guaranteeing an efficient and coordinated response in case of a severe risk, catastrophe or public calamity, the civil protection structure coincides with the administrative structure. The civil protection has the following structure:

- The National Civil Emergency Planning Committee (NCEPC) that has the following functions:
 - Issuing of planning directives for different emergency plans, related to objectives, alternatives, and determination of time limits in order to plan for the different hypothetical crisis situations;
 - Coordination of the different plans for resource contribution formulated by the Sectorial Committees;
 - Representation of Spain in NATO's Senior Civil Emergency Planning Committee (SCEPC) and participation in their work.
- The Civil Protection structure at the state level starts at the Directorate General of Civil Protection and Emergencies, under the Minister of the Interior. The representation of this structure in the Autonomous Communities is the responsibility of the delegations and sub-delegations of the Government. Each of them has a Civil Protection Unit.

Most competences in civil protection (except for nuclear issues) are transferred to the autonomous communities and municipalities, which have their own structure for the protection of citizens and goods. The communities and municipalities are responsible for integrated civil protection planning including risk assessment plans and for operational units.

1.2.1 Strategy scope and focus

According to article 4 of Law 17/2015, of 9 July, of the Civil Protection,

- *The National System of Civil Protection Strategy (NSCPS) consists in analyse every risk that may affect people or goods protected by the civil protection system, and also formulate all the strategic lines of actions to align, integrate and prioritize efforts to optimize the resources available to mitigate the effects of emergencies.*

²¹²⁸ National Security Strategy document. Accessed January 29, 2016
http://www.lamoncloa.gob.es/documents/seguridad_1406connavegacionfinalaccesiblebpdf/

- *The NSPCS integrates and aligns all the ways of action that the General Administration of the State uses in terms of civil protection. All these ways of action are approved by the National Security Council, after the Prime Minister proposes them.*

The main tasks of Civil Protection are:

- **Anticipation:** Anticipation determinates the risks in a territory based in the conditions of vulnerability and the possible threats and comprises analysis and studies that allow obtaining information and predictions about dangerous situations.
- **Prevention:** Prevention comprises all the methods and actions used to avoid or mitigate the impact of risks and threats in the different emergency situations.
- **Planning:** Civil Protection plans are the main instruments of prevention and mechanisms that allow mobilizing all the human resources and materials needed to protect people and goods in emergency cases.
- **Immediate response:** It involves all the public and private services that must intervene in an emergency case as fast as possible to reduce damages, rescue and protect people and goods.
- **Recovery:** This is the set of actions and operating methods used by public and private entities and that are aimed to establish normality in any catastrophic zone.
- **Evaluation and control**

In other words, the civil protection activities mainly concern the provision or mobilisation of civil resources and services that are needed to respond to an emergency in any autonomous community.

There are two main areas of support: protection of the population and protection of specific resource sectors.

The plans aimed for civil protection are approved at the different levels: the state, the autonomous communities and the local authorities. The role of the national civil protection authority is to verify that all the plans are carried out and are also updated.

1.2.2 Monitoring and analytical support to policy making; R&D

According to the article 167C of the Lisbon Treatment of 17 December, 2007 all the Member States (MS) must cooperate in any emergency case that involves any country that belongs to the MS. The European Union has to mobilize all the available instruments even military services to help any country of the MS.

The main role of the Community Mechanism for Civil Protection is to facilitate the cooperation in civil protection assistance interventions in the event of major emergencies which may require urgent response actions.

The operational heart of the Mechanism is the Emergency Response Coordination Centre (ERCC). The ERCC operates within the European Commission's Humanitarian Aid and Civil Protection department (ECHO) and it was set up to support a coordinated and quicker response to disasters both inside and outside Europe using resources from the countries participating in the European Union Civil Protection Mechanism. The ERCC replaces and upgrades the functions of the previous Monitoring and Information Centre (MIC).

The ERCC has the capacity to deal with a series of several and simultaneous emergencies in different time zones. One of the main missions of the ERCC is provide a response during emergencies helping to cut unnecessary and expensive duplication of efforts.

It collects and analyses real-time information on disasters, monitors hazards, prepares plans for the deployment of experts, teams and equipment, and works with Member States (MS) to map available assets and coordinate the EU's disaster response efforts by matching offers of assistance to the needs of the disaster-stricken country.

The ERCC also supports a wide range of prevention and preparedness activities, from awareness-raising to field exercises simulating emergency response.

The Mechanism also works towards enhanced preparedness. It is supported by a database with information on the national civil protection capabilities available for assistance interventions.

Experts and team leaders included in the civil protection database are invited to participate in a training programme with courses, exercises and an exchange of experts system.

The Common Emergency Communication and Information System (CECIS) is a web-based alert and notification application. It provides an integrated platform to send and receive alerts and notifications, details of assistance required, to make offers of help and to view the development of the ongoing emergency as they happen in an online logbook.

Its main task is to host a database on potentially available assets for assistance, to handle requests for assistance on the basis of these data, to exchange information and to document all action and message traffic.

To achieve its objective of emergency management, CECIS essentially provides a communication platform for e-mail like message exchange. Specific functionality is available for matching requests with offers, and for managing resources (experts, teams, modules, individual resources).

Apart from CECIS, there are other systems used for monitoring natural risks such as:

- European Community Urgent Radiological Information Exchange System (ECURIE) (Radiological/Nuclear)
- Rapid Alert System used for exchanging information on health threats due to deliberate release of chemical, biological and radio-nuclear agents (RAS BICHAT)
- Industrial Accident Notification System (IANS) (UNECE- Industrial accidents)
- Emergency Notification and Assistance Convention (ENAC) (Atomic Energy).

1.2.3 Policy for Prevention

- State level
- Autonomic level
- Local level

At the State level, the Government plays a relevant role in Civil Protection activities. The Minister of Interior performs the management of the civil protection in every autonomic or provincial territory.

For the coordinated adoption of the specific policies in the matter of civil protection, the National Civil Protection System counts on the National Civil Protection Commission and represents the three administrations (Central, Autonomic and Local).

The Decree 1125/1976:

- Establishes civil-military cooperation rules during emergencies
- Settles procedures of request for the cooperation of the Armed Forces
- Specifies that the Military Authorities are to be informed of and participate in the emergency plans produced by the Civil Authorities (at state, regional and local levels) and that they shall have prepared response plans.

The Organic Act 1/1980 on National Defence:

- Stipulates that the Government shall arrange the contribution of whatever kind of resource that is necessary (human, material, etc., public or private)
- Defines the Civil Defence concept (Civil Preparedness), i.e. the standing availability of all human, material and non-military resources in order to manage major disasters
- Establishes that the Armed Forces will cooperate at the request of civil authorities.

At the Autonomic level, the autonomous communities must lead and manage the emergencies of civil protection that take places in their territories and also develop the Emergency Plans of Civil Protection (EPCP).

In the autonomous communities exists an Autonomic Commission of Civil Protection (ACCP) in which all the public Administrations are represented. The ACCP is formed by representatives of the State Administration, the autonomous communities and local corporations.

At the Local level, there is a Territorial Plan depending on every autonomous community. In any case, the local authorities should develop and approve their own Civil Protection Plans that must be approved by the relevant Regional Commission for Civil Protection.

In general all the forces of intervention that could be involved in a major emergency are:

- Civil protection organisms of the Public Administrations;
- Forces of State Security;
- Emergencies Military Unit;
- Firefighting and rescue bodies;
- Local and Regional Police;
- Emergency health response bodies;
- Private organizations and other groups that help in tasks of logistical support;
- Civil Protection volunteers;
- Citizens;
- Support of the countries of the European Union.

In terms of prevention, planning and operation, the General Branch for Plans, Operations and Emergencies has some functions: Realize studies and analysis of risks; prepare state plans for civil protection; prepare guidelines which main goal is the prevision, prevention and planning of civil protection and emergencies; prepare and disseminate warnings to the civil protection organisations.

1.2.4 Policy for Preparedness

According to the Royall Decree 1181/2008, of 11 July, the General Directorate of Civil Protection and Emergencies (GDCPE) has a series of functions:

- Preparing state plans for civil protection or guidelines approved by the current legislation;
- Preparing accident drills;
- To study and analyse risks to develop emergency and catastrophe prevention plans.
- To prepare and disseminate warnings to civil protection organisations and, when necessary, to citizens;
- To process grants and aids to facilitate the implementation of the civil protection plans at the state level;
- Theoretical and practical training in risk and emergency management, including the training of officers and personnel of the different services and organizations involved in emergency actions, in particular services of firefighting and rescue, health services and security forces;
- Organise and maintain a specialised documentary that allows the maximum dissemination of the information;
- Development of studies and information programs;
- Request assistance from the Emergency Military Unit under the action protocols established for it.

To develop all these functions the GDCPE is structured in three levels:

- The General Branch of Planning, Operations and Emergencies;
- The General Branch of Resources and Grants management;
- The Division of Training and Institutional Relations.

1.2.5 Policy for Response

There are technological and natural risks. Depending on the type of the risk, different actions must be taken.

Technological risks are formed by chemical risks, nuclear risks and risks transporting dangerous products.

- Actions related with chemical risks. The main activities realize in this field are based on:
 - Prepare State Plans for Civil Protection in terms of chemical risks, organising support techniques to civil protection plans;
 - Prepare technique documentation related with risk analysis and communication, methodologies to analyse environmental risks and also develop technical inspections;
 - Develop technologic risks research projects.
- Actions related with transport of dangerous products accidents. The main activities realize in this field are:
 - Prepare State Plans for Civil Protection in terms of transport of dangerous products.

- Provide technical advice to emergency response services and the management bodies through the National Institute of Toxicology (NIT).
- Preparation of technical documents that are made continuously and are published periodically.
- Develop national statistics on accidents in the transport of dangerous products by road and rail.
- Actions related with nuclear risks. The main activities realized in this field are:
 - Planning;
 - Communication to citizens;
 - Training.

In the other hand, Government implements a series of actions to fight natural risks. Parallel to actions of prevention and planning, campaigns to fight natural disasters are developed.

Every year, Directorate General of Civil Protection and Emergencies under the orders of the Directorate of Plans and Operations prepares and coordinates exercise programmes. This is done independently or with the support of the National Civil Protection School. Exercise planning is based on risk analysis and prevention. The principal areas of action are:

- Forest fires;
- Winter road campaign;
- National Surveillance Plan of adverse weather.

1.2.6 Policy for Relief and Recovery

Through the task of rehabilitation, actions aimed at restoration of essential public services and environmental and socioeconomic conditions necessary for the return to normality of the affected populations are made.

According to article 20 of law 17/2015, of 9 July,

- *Rehabilitation methods have to be applied in aid operations to restore normality in the affected areas.*

The rehabilitation begins as soon as emergency ends, and its main function is providing economic and financial support to develop construction operations or food supply actions to alleviate damages caused by the disaster in those areas catalogued as catastrophic zones by the Government.

The process of rehabilitation is a fully Government and Civil protection obligation.

In all the phases of a catastrophe cycle, reconstruction is probably the longest, most expensive and complex action.

Reconstruction may be defined as an opportunity to realize the long term changes to reduce vulnerabilities in terms of urbanism and infrastructure, for example, and also to improve the social, economic and cultural capacities.

This phase needs that local, regional and national authorities work together depending on the extent of the damages.

In Spain, the General Directorate of Civil Protection and Emergencies (GDCPE) also has the mission of rehabilitation in a situation of emergency after a natural or technological disaster. The GDCPE has to assist the competent institutional bodies in the planning and implementation of

measures for the restoration of the essential public services and also the economic and environmental conditions necessary to normalize life conditions in the affected areas.

The State Plan for Civil Protection incorporates the Emergency Military Unit (EMU) in its organisational provisions and also the emergencies intervention situations, all this according to the Royal Decree 1097/2011 of 22 July by which the protocol of the EMU intervention is approved.

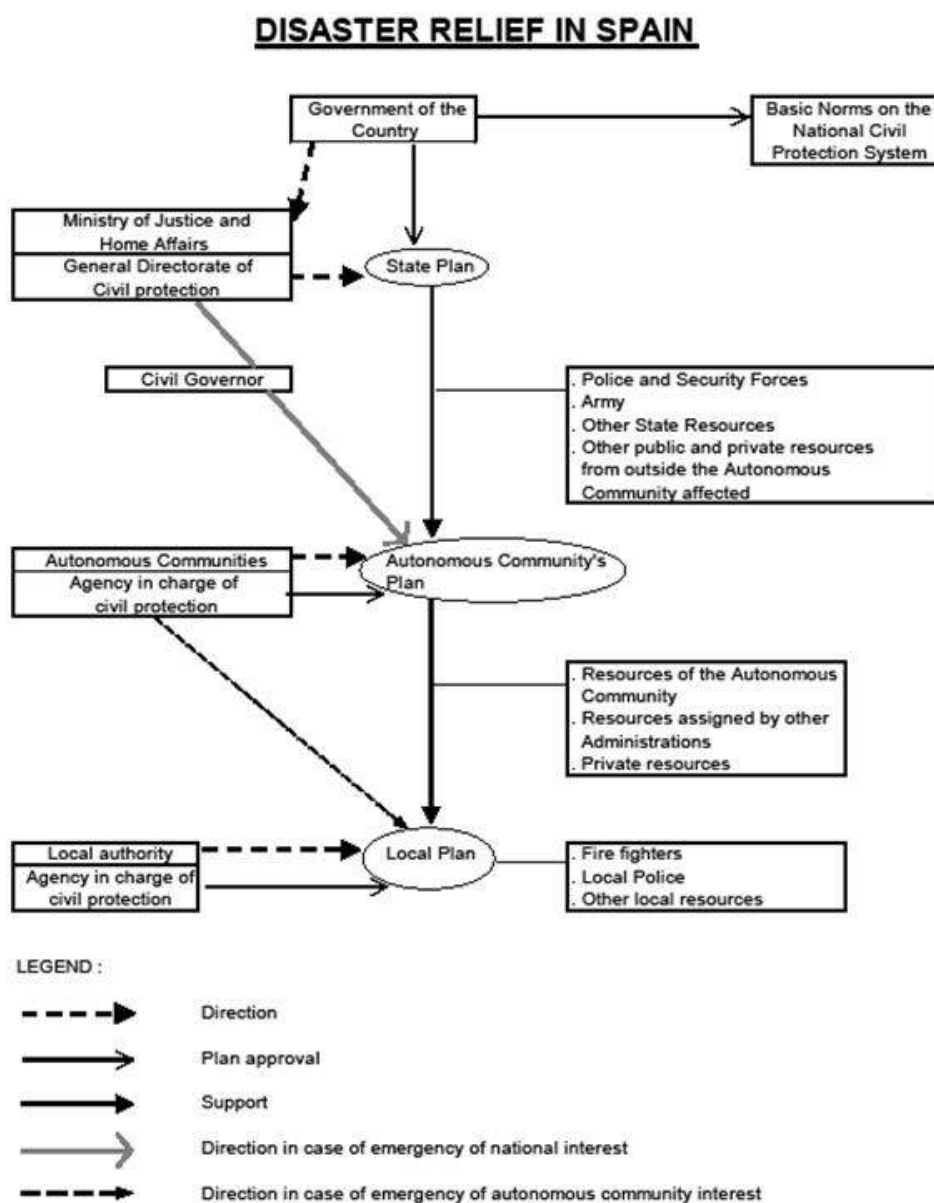

Figure 46: Disaster relief structure in Spain²¹²⁹

2 Legislation

2.1 Crisis (emergency, disaster) management concept

In Spain, there are a series of manual of good practices that defines emergency plans. An emergency plan can be defined as the planning and human organisation used to reduce all the possible human or economic consequences produced by a disaster or emergency situation.

The General Directorate of Civil Protection and Emergencies (GDCPE) has a specific plan for civil protection that establishes

The organisational and functional prevision of the mechanisms for mobilizing the necessary human and material resources for the protection of persons and properties in a serious collective risk, catastrophe or public calamity situation, and also the scheme of coordination between the different public administrations called to intervene²¹³⁰.

The civil protection scope depends on three axes:

- The type of risk that has to be managed;
- Which part of the catastrophe cycle includes (prevision, planning, etc.);
- The level of responsibility it has.

The GDCPE has different plans depending on every situation; in natural risks it has forest fire, earthquakes, volcanos and water dams special plans; in technological risks it has nuclear, chemical and radiological risks plans.

The scope of GDCPE may be national, autonomic or local depending on the severity of the risk or disaster and also depending on where it is located.

2.2 General crisis (emergency, disaster) management law

In Spain, legal basis are divided in different levels:

- National level. At national level exist a series of laws that describes operating method in a crisis situation:
 - Law 17/2015 of Civil Protection:
 - This new law aims to strengthen the mechanisms to enhance and improve the functioning of the national system of protection of citizens in emergency and disaster cases foresaw by the previous law;
 - The civil protection system is understood as an instrument of public safety, integrated into the national security policy²¹³¹.

²¹³⁰ Basic rule of Civil Protection. Royal Decree 407/1992, of 24 April.

²¹³¹ Law 17/2015, of Civil Protection. Accessed February 10, 2016 https://www.boe.es/diario_boe/txt.php?id=BOE-A-2015-7730

- Royal Decree 385/2013:
 - Establishes the Delegate Commissions of the Government;
 - Modifies the Royal Decree 1886/2011, of 30 December;
 - Its main objective is the preservation of national security through optimal, integrated and flexible operation of all the resources available for that purpose²¹³².
- Royal Decree 393/2007 of Basic self-protection rules of the centres and establishments that could lead to accident:
 - This Royal Decree defines and develops self-protection and control mechanisms established by the Government. Provides a gradation of self-protection obligations and respects the rules of sector-specific activities that, by their potential dangerousness, importance and potential adverse effects on the population, the environment and property, should have a singular treatment²¹³³.
- *Royal Decree 1883/1996:*
 - *Establishes the new structure of the Ministry of Defence. This document defines the functions of the Policy of Defence Directorate, i.e., concerning Civil Preparedness, Civil Emergency Planning and the Armed Forces cooperation in disaster relief operations.*
- *Ministers Council Agreement, dated 15 January, 1988:*
 - Creates the National Civil Emergency Planning Committee, its composition and functions
 - *Creates the Sectorial Working Committees, dependent upon the National Civil Emergency Planning Committee (CNPCE), for the following sectors: food and drinking water, industry and raw materials, energy, health, civil landing, shipping and aerial transports, civil communications and shelter (protection of the population).*
- *Royal Decree 163/1987:*
 - *Creates a Crisis Management Directorate, as a working support of the system.*
- *Royal Decree 2639/1986:*
 - *Creates the Crisis Cabinet, its composition and its functions. The Crisis Cabinet is the leading authority of the Crisis Management National System.*
- *Prime Minister's National Defence Guideline 1/1986:*

²¹³² Royal Decree 385/2013. Accessed February 10, 2016 <https://www.boe.es/boe/dias/2013/06/01/pdfs/BOE-A-2013-5771.pdf>

²¹³³ Royal Decree 393/2007 of Basic self-protection rules of the centres and establishments that could lead to accident. Accessed February 10, 2016 https://www.boe.es/diario_boe/txt.php?id=BOE-A-2007-6237

- *Creates a Crisis Management National System and a Civil Preparedness National System, compatible and comparable with those of the Atlantic Alliance.*
- *Act 2/1985 about Civil Protection, and the legal arrangements derived of that act:*
 - Defines the Civil Protection concept
 - Establishes guidelines for planning.
- *Organic Act 4/1981 about warning, exceptions and siege situations:*
 - *Defines the above-mentioned situations, establishing the procedures for declaring those situations and the measures that are to be taken in each case.*
- *Organic Act 1/1980 on National Defence:*
 - *Stipulates that the Government shall arrange the contribution of whatever kind of resource that is necessary (human, material, etc., public or private)*
 - *Defines the Civil Defence concept (Civil Preparedness), i.e. the standing availability of all human, material and non-military resources in order to manage major disasters*
 - *Establishes that the Armed Forces will cooperate at the request of civil authorities.*
- *Decree 1125/1976 :*
 - *Establishes civil-military cooperation rules during emergencies*
 - *Settles procedures of request for the cooperation of the Armed Forces*
 - *Specifies that the Military Authorities are to be informed of and participate in the emergency plans produced by the Civil Authorities (at state, regional and local levels) and that they shall have prepared response plans²¹³⁴.*
- At an autonomic level, every autonomous community has its own legislation
- At a local level, every municipality also has its own legislation.

2.3 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

In Spain, in the General Directorate of Civil Protection, every administrative level (local, regional, central) needs to have in place a preparedness plan for its focus area. In respect to the local and regional plans, the central government sets minimum criteria for their drafting. This fact is a clear evidence that even though local and regional level have some sort of autonomy, the main responsibility lies with the central government and specifically with the Ministry of Interior.

The local civil protection plan establishes the operating methods depending on the severity of the risks, where the risk is located and also the available resources. There are different phases:

²¹³⁴ Legal basis of General crisis (emergency, disaster) management in Spain. Accessed February 3, 2016 http://ec.europa.eu/echo/files/civil_protection/vademecum/es/2-es-1.html#lega/

- Alert: In this situation citizens have to receive information about the situation and the ways of acting.
- Alarm: In this situation all the local operative services have to be mobilized.

There are also 4 different levels of emergency:

- Level 0: Local emergency controlled by local authorities.
- Level 1: Local emergency that affects an important part of the local territory and needs the mobilization of emergency and security resources.
- Level 2: Local emergency that affects almost all the local territory and needs the mobilization of emergency and security resources and also needs to adopt extraordinary local operating methods to protect citizens.
- Level 3: Local emergency that exceeds the possibilities of the local authorities and requires the help of the autonomic authorities.

There are 4 different levels of severity:

- Level 0: Declared when the situation is controlled by local authorities and does not generate damage to citizens or properties.
- Level 1: Declared when the situation produces considerable damages to properties or the environment.
- Level 2: Declared when the situation produces considerable damages to citizens, properties or the environment.
- Level 3: Declared when the situation produces severe damages to properties or the environment.

2.4 Legal regulations on the involvement of volunteers and specialised NGOs

The Law 6/1996, of 15 January, of volunteering and the different volunteering rules of the autonomous communities agree that volunteering has to be marked by solidarity, wilfulness and liberty, gratuity and a link to volunteer organizations and volunteer programs.

In order for an activity to be considered as volunteering, 4 characteristics must be met:

- Solidarity and altruism – related to the beneficiaries of the benevolent activities
- Freedom – interpreted as the autonomy and good will in order to be part of such activities
- Free of charge – interpreted as the main difference between a working relationship and a volunteering relationship
- Organization – under which such activities are going to be performed within an overall program or project

Law does not cover any activity which main philosophy is different to a disinterested goal as a volunteering activity. In other words, volunteering is out of scope when involving activities with any kind of relationship with relatives, friends, or neighbours, since altruism may be missing from this type of relationship.

3 Organisation

3.1 Organisational chart

The civil protection structure coincides with the administrative structure. The Spanish system consists of three main components:

- The National Security Council (NSC) in his capacity as Delegate Commission of the Government for National Security (DCGNS) that operates under the Royal Decree 385/2013 of 31 May which modifies the Royal Decree 1886/2011, of 30 December where the Delegate Commissions of the Government are established;
- The National Civil Emergency Planning Committee (NCEPC), an inter-ministerial support body;
- The Department of Civil Defence.

The Royal Decree 385/2013 replaces the Delegate Commission of the Government for Crisis Situations (CDGSC) by the National Security Council (NSC). The NSC is formed by:

- The President of the Government;
- The Deputy Prime Minister and Minister of the Presidency;
- The Ministers of Foreign Affairs and Cooperation, Defence, Finance and Public Administration, Home Affairs, Development, Industry, Energy and Tourism and the Economy and Competitiveness;
- The Director of the Office of the Prime Minister, the Secretary of State for Foreign Affairs, the Chief of Staff of Defence, the Secretary of State for Security and the Secretary of State-Director of the National Intelligence Centre.

The NSC has the following functions:

- Assisting the Prime Minister in the direction of the National Security Policy;
- Issue the necessary guidelines for planning and coordination of the National Security Policy;
- Lead and coordinate the activities of crisis management;
- Monitoring the proper functioning of the National Security System;
- To approve the Annual Report of National Security before its presentation in Parliament;
- Promote policy proposals necessary to establish the National Security System and integration within it (i.e. the National System of Crisis Management).²¹³⁵

The National Civil Emergency Planning Committee (NCPCE), an inter-ministerial support function to the Crisis Cabinet, is mainly concerned with tasks related to the provision and implementation of resources in situations of crisis or emergency. The NCPCE has a coordinating role in Spanish Civil Protection and sits at the top of Civil Defence's organisational structure. The Committee is composed of the Crisis Cabinet Secretary (President), the Director General for Defence Policy (First Vice President), the Director General for Civil Protection and Emergencies (Second Vice President) and the

²¹³⁵ Royal Decree 385/2013, of 31 May of the Delegate Commissions of the Government. Accessed February 8, 2016 https://www.boe.es/diario_boe/txt.php?id=BOE-A-2013-5771

Under Director for Civil Preparedness (Secretary). Some of the other members are the Director of the Crisis Staff Department and the Committee President's Advisor on Defence and Security.

The Department of Civil Defence or Civil Protection provides a series of tools that facilitate the ways of action in any risk, emergency or catastrophe situation.

The Civil Protection structure at the state level starts at the General Directorate of Civil Protection and Emergencies (Dirección General de Protección Civil y Emergencias -GDCPE), under the Minister of the Interior. The GDCPE is the State administrative unit in charge of the preparedness and response in case of natural and technological disasters.

In Spain, civil-military cooperation is undertaken in cases of emergency and upon request by civil authorities (Royal Ordinances Act and Basic Judgement Act from the National Defence). A request for cooperation can be made by civil authorities through the Minister of the Interior. In cases of emergency, the request can be made verbally, but needs subsequent written confirmation. Refusal to cooperate is regarded as a criminal offence (Military Penal Code).

The Spanish contribution to the international humanitarian assistance and disaster relief operations is provided through the Monitoring and Information Centre (MIC) operated by the European Commission in the framework of the Community Mechanism to facilitate reinforced cooperation in civil protection assistance interventions and the Euro Atlantic Disaster Response Coordination Centre (EADRCC NATO).

The Directorate General of Civil Protection and Emergencies is responsible for these matters, including the bilateral agreements with France, Portugal and Morocco in general civil protection items. International assistance is offered/requested on a case-by-case basis.

Figure 2 gives an outline of the organisational structure of the disaster relief in Madrid, but it may be used in almost every autonomous community in Spain.

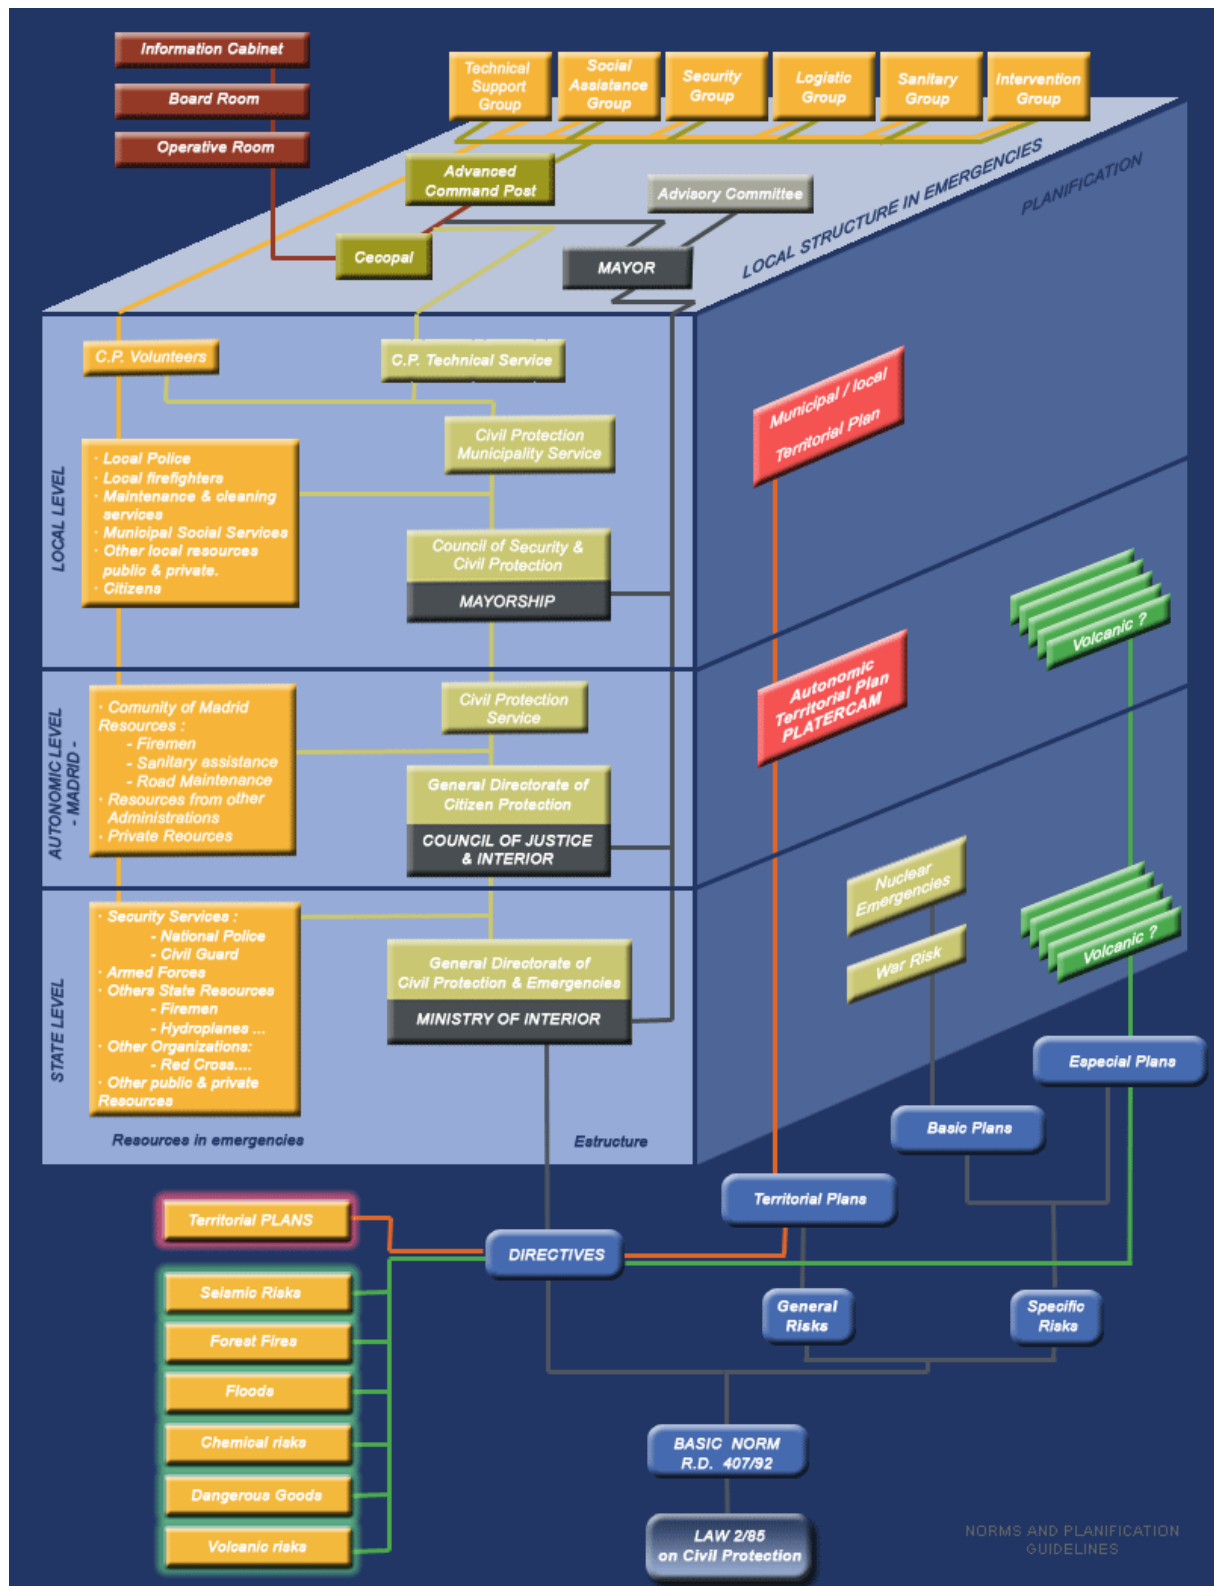

Figure 47: Organisational Chart of the Emergency Management Agency of Madrid, Spain²¹³⁶

²¹³⁶ Organisational Chart of the Emergency Management Agency of Madrid, Spain. Accessed February 3, 2016. <http://www.civilprotection.net/index.phtml?id=124/>

3.2 Organisational cooperation

The Emergency Military Unit (EMU) is a branch of the Spanish Armed Forces which main mission is to intervene anywhere in the country to contribute to the safety and welfare of citizens, along with the public administrations in a serious risk, catastrophe or calamity situation, according to the Organic Law 5/2005, of 17 November²¹³⁷.

The operating methods of UME are centred in save, protect and rescue people, their goods and also the environment.

The EMU intervention may be ordered when a severe emergency situation take place. Those emergency situations are:

- Natural risks such as floods, earthquakes, severe snows and other adverse weather events of great magnitude;
- Forest fires;
- Technological risks such as chemical, nuclear or radiological risks;
- Situations that are consequence of terrorism for example;
- Environmental pollution;
- Those situations President considers as a critical situation.

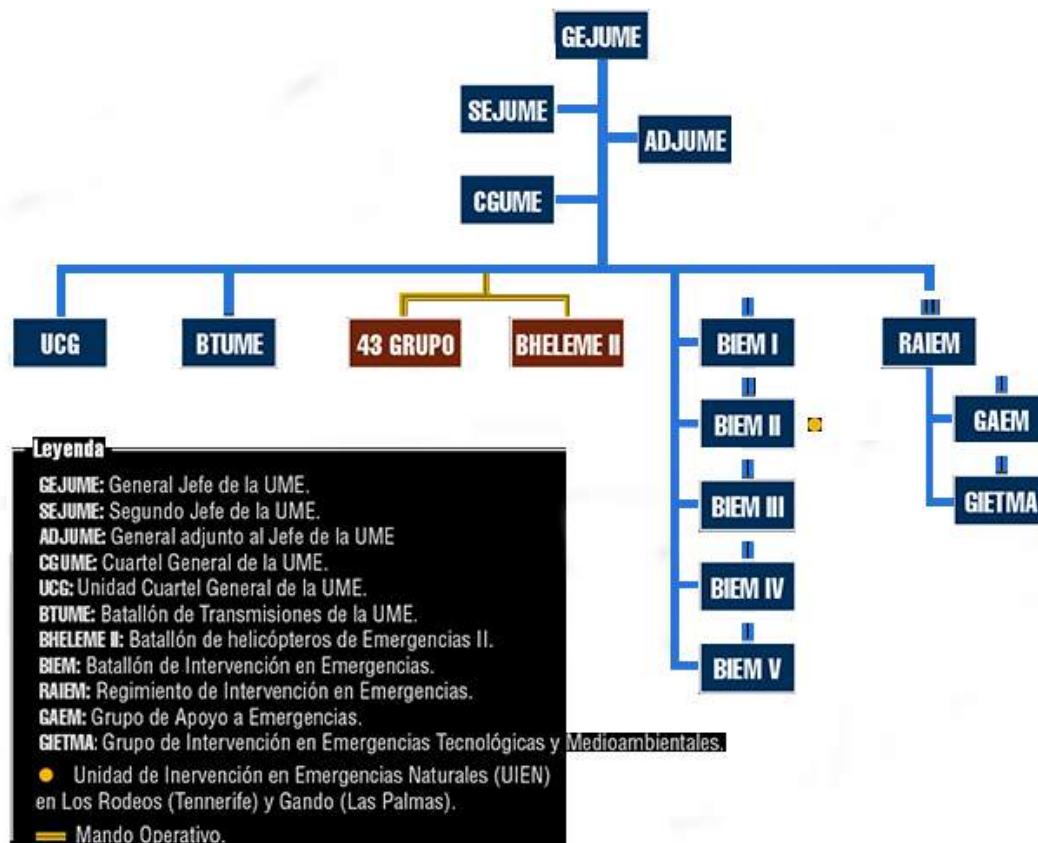

The UME is formed by:

- Headquarters, in Torrejón de Ardoz (Madrid);
- Headquarters unit (UCG), in Torrejón de Ardoz (Madrid);
- Intervention and Support Regiment in Emergencies (RAIEM), in Torrejón de Ardoz (Madrid);
- Transmissions Battalion (BTUME), in Torrejón de Ardoz (Madrid);
- First Emergency Intervention Battalion (BIEM I), in Torrejón de Ardoz (Madrid);
- Second Emergency Intervention Battalion (BIEM II) in Morón (Sevilla). This battalion also has a special unit dedicated to natural emergencies in Canary Island, specifically in Los Rodeos (Tenerife) and Gando (Gran Canaria);
- Third Emergency Intervention Battalion (BIEM III) in Bétera (Valencia);
- Fourth Emergency Intervention Battalion (BIEM IV) in Zaragoza;
- Fifth Emergency Intervention Battalion (BIEM V), in San Andres de Rabanedo (León).

For its operation, the RAIEM is formed by a Command and General Staff a Services and Emergency Support Group and an Emergency Intervention Group in Technological and Environmental situations (GIETMA).

In figure 3, the operational structure of the EMU is shown.

²¹³⁷ Organic Law 5/2005, of 17 November of National Defence. Accessed February 10, 2016. <https://www.boe.es/buscar/pdf/2005/BOE-A-2005-18933-consolidado.pdf>

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

The technical coordination and monitoring of the activities of the National Commission for Civil Protection stands out as actions linked to the Institutional Relations, as well as preparing and supporting its ordinary meetings and its working groups.

The National Commission for Civil Protection (NCCP), regulated by the Royal Decree 967/2002, is an organism that depends on the Minister of Interior.

Its main function is to establish an appropriate coordination in terms of civil protection between the organisms of the General State Administration and the Autonomous Communities Administrations to guarantee an effective operation method of study and prevention of severe risks, catastrophe or public calamity and the protection and rescue of people and goods.

The functions of the NCCP, established by the Law 2/1985, are:

- *Homologate civil protection plans;*
- *Report civil protection rules at a national level;*
- *Report civil protection regulations that may produce damages to people or goods;*
- *Participate in the coordination actions of organism related to civil protection;*
- *Propose normalization and homologation of techniques and tools that may be used in situations of civil protection.*

Other activities of the Institutional Relations at a national level are:

- Elaborate techniques and civil protection programs for public entities such as General, Autonomic and Local Administrations and also public and private entities;
- Provide technique support and cooperate with Volunteer Civil Protection Groups.

4.2 Operations planning

The National Security may be defined as a State action aimed at protecting liberty and wellness of citizens to guarantee the defence of the country.

The National Security Policy requires permanent planning and definition of the principles and lines of action to respond to nowadays challenges. In Spain, there is a National Security Strategy (NSS).

The NSS is the fundamental articulation of Homeland Security as State Policy. It contains guidelines to allocate all available state resources efficiently for the preservation of the National Security.

The main operation methods are:

- Unity of action. This unit is dedicated to coordinate and engage the national resources under the direction of the President;
- Anticipation and prevention which main actions are to detect and anticipate situations that represent a potential risk for National Security;

- Effectivity and sustainability in the use of the resources;
- Resilience and recovery establish the principle related to the attitude of the human and material resources to cope with flexibility and strength crisis situations and overcome them minimizing their negative consequences.

The National Security has to face a series of risks and threats such as armed conflicts, terrorism, cyber threats, organized crime, economic instability, energetic vulnerability, irregular migratory flows, espionage, emergencies and catastrophes, vulnerability of maritime space and also vulnerability of critical infrastructures.

The National Security provides twelve lines of strategic action, one for each potential risks registered by the government. This document centres its study in emergencies and catastrophes protection. It has a series of operation methods described in the following lines:

- Adoption of an integrated approach and support of actions between central government, the autonomous communities and local authorities, particularly in the areas of detection, planning and development of actions to emergencies and catastrophes for preventive action, a proper response and an efficient use of the limited resources available.
- Development of a framework to encouraging and coordinating efforts, prioritize and optimize resources to achieve common goals.
- Updating and improving the legal framework for protection from emergencies and disasters, with an emphasis on prevention approach to avoid or mitigate the potential adverse impacts of these situations.
- Promoting a culture of prevention among citizens, including knowledge and attitudes of self-protection, strengthening the capacities of resilience to sudden and unexpected emergencies.

There also a series of operation methods described to protect critical infrastructures:

- It is imperative that both the government and private operators take the corresponding responsibility and work in a coordinated way in protecting critical infrastructure in every moment;
- A system of staggered planning, to identify, assess, prevent and mitigate the risks that we face, from the global and strategic perspective, to those assets that are under the responsibility of an operator or organization will be promoted;
- The Government is pursuing a consistent methodology that will allow focusing efforts on the most vital areas.
- Critical infrastructure protection should promote the necessary actions in order to achieve an increase in system capacity that allows Government to continue the operating actions, despite to be subjected to an attack or incident, even if it is in a degraded or weakened state.
- Crisis management at government level organizes all tasks, responsibilities and resources taking into account critical infrastructure as an integral part in the phases of preparedness, response and recovery.

At a local level there are some alert and mobilization procedures. All alert and mobilization procedures to be carried out in each of the phases of the emergency shall be specified. They must ensure at least the following:

- The reception and confirmation of the notice or warning, carrying out its first assessment and establishing the necessary mechanisms for verification;
- The classification of the scope and the emergency phase;

- The notification to the Coordination Centres of different areas, and also to the authorities and bodies that participate in these tasks;
- The organization of alert and mobilization of operational services, as well as the means and special funds;
- Monitoring and control of the actions carried out by the participant services;
- Obtaining all the information related to the development of the situation;
- The transmission of information to authorities and agencies involved;
- Provide information to the citizens;
- Notify the end of the emergency.

4.3 Logistics support in crises

In Spain, the National Hall of Emergencies (NHE) is the department through which the General Directorate of Civil Protection and Emergencies performs management operations and emergency situations. It operates 24 hours a day. The functions of the National Hall of Emergencies are aimed, firstly, to the management of common issues or emergency situations and, second, to have mechanisms for coordination and mobilization of adequate means to deal with, effectively, these situations, which can be summarized as follows:

- Monitoring of alert systems;
- Receiving, evaluating and recording information from the Civil Protection Units and Sub-delegations of the Government and other agencies both domestic and foreign;
- Tracking emergencies that occur anywhere in the country; as well as emergency situations that occur out of the country;
- Provide the necessary support to the activities of the Civil Protection Units and Sub-delegations of the Government in the management of emergencies;
- Mobilization of the existing human and material resources of intervention in the country in emergency situations, in coordination with the delegations and sub-government.
- Extraordinary mobilization of human and material resources (not attached to the territorial plans) intervention, existing in the country in emergency situations, in coordination with the delegations and sub-government. Among them is remarkable the Emergency Military Unit (EMU);
- Provide information on the evolution of emergency and intervention of the General State Administration and other administration;
- Participation in drills related to State Civil Protection Plans at national level.

The EMU is operative and logistical self-sufficient. EMU moves to the affected area with all necessary tools and resources. The resources that belong to EMU are the result of a deep and thorough study that guarantees success in operations by support between units.

The capacity and speed of response, mass employment, sustained effort, flexibility in their deployments and redeployments are characteristics that allow EMU concentrate its resources at any point of the country to deal with any emergency with a total self-sustainment.

There is a branch of the UME called Emergency Support Group (ESG) that provides UME and its specific units the ability of operational and logistical reinforcement supply, maintenance, transport, health, material recovery and logistics management to perform their duties.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

The General Directorate for Civil Protection and Emergencies has a series advanced communication systems that make possible the flow of information in any situation of severe risk or disaster.

The Emergency Management System is formed by:

- Portal of Information to citizens (*INFORIESGOS*) the General Directorate of Civil Protection and Emergencies, through this portal, reports timely warnings of civil protection and issues recommendations that enable people to adopt appropriate protective measures and caution. It offers information, maintenance and daily update on the status of risks in Spain, according to the information provided by the competent bodies.
- The Information System of Emergencies Management (ISEM) is a support tool in risk management and emergency situations, facilitating the rapid assessment and risk management, and therefore making decisions.
- The Common Emergency Communication Information System (*CECIS*) is a system developed by the European Commission and is based in a computer application to communicate the National Authorities and Civil Protection organisms in an easier way. With this application any of the 27 Member States of the European Union can ask and also offer resources to the other Member States.

In terms of communication, the Emergency Radio Network (ERN) in Spanish REMER²¹³⁹. REMER is the structured organization in the national territory, constituted by Spanish radio amateurs who lend their collaboration to the official Civil Protection services when it is requested. In other words these people are volunteers that cooperate with civil protection services. Its main objectives are:

- Constitute a radio communication system based on private resources to provide, when necessary, the performance of the public nature of the Radio Network Controller of Civil Protection, supplementing or replacing, as appropriate;
- Provide Spanish radio amateurs, integrated into the network, their collaboration at the operational level and coordination between them and the inclusion, if necessary, of those amateurs who do not belong to the network when their cooperation is necessary.

The Spanish Red Cross shall perform, in cooperation with the other agents and in accordance with its own constitution; civil protection functions in the areas of intervention, support, relief and health and social care.

In terms of radioactivity, the Radioactivity Alert Network (RAR) is the responsible of the communication actions.

The General Directorate for Civil Protection has its own Emergency Communication Network that is called RECO SAT. Its main mission is to ensure the existence of a communication channel in emergencies with the Coordination Centres of the affected areas to monitor the situation, to provide operational coordination and support the necessary actions to protect and save human lives and properties.

²¹³⁹ REMER <http://www.proteccioncivil.es/web/dgpcye/remer/>. Accessed February 3, 2016

5 Capabilities

5.1 Human resources

In Spain, in case of emergency there are different organisations that provide human resources to protect, saving and rescue people. Those organisations are:

- Civil Guard. The Civil Guard is leaded by local or provincial authorities;
- The National Police is leaded by the Operational Centre (CECOP) and also by local or provincial authorities;
- The Military Units are the principal example of organism that cooperate in disaster situations;
- Red Cross;
- Emergency Military Unit (EMU). The EMU is formed by a headquarters and six battalions with a total of 2985 people.

5.2 Materiel (non-financial) resources

The resources of the UME for intervention include 14 air means, 2 ambulances (one advanced life support ambulance Uro VAMTAC and one advanced life support ambulance), 4 fire engines, mobile shelters, 2 boats, 2 snow removal vehicles, 12 vehicles of transport, material CBRN-E and specific means for flooding and communications.

5.3 Training

The Division of Training and Institutional Relations has the following functions:

- The theoretical and practical training in risk management and emergencies;
- The organization and maintenance of a specialized documentary collection;
- The development of education and information programs for the population;
- The development of research and studies on sociological, legal and economic aspects relevant to the activities of civil protection and emergency issues;
- Coordination of relations with the Civil Protection Units and Sub-delegations of the Government and with relevant bodies on civil protection of the autonomous communities and local administrations as well as the organization and maintenance of the Secretariat of the National Commission for Civil Protection.

The National School for Civil Protection (NSCP), created by the Royal Decree 901/1990, of 13 July, is a branch of the General Directorate of Civil Protection and Emergencies that plays, in accordance with the provisions of the article 32 of the Law 17/2015, of 17 July, the following functions:

- Educate and train staff of civil protection services of the General Administration of the State and other public and private institutions;
- Develop actions of R & D +i in the field of civil protection training;

- Cooperate with training centres for civil protection of the other public administrations;
- Cooperate on training activities that are expected under the Civil Protection Mechanism of the European Union or other European initiatives to promote the interoperability of equipment and services.

The functions assigned to the National School of Civil Protection are fit into the General Directorate of Civil Protection and Emergencies.

From the strategic point of view, the mission of the National School of Civil Protection is to implement training policies adopted by those responsible for national civil protection system.

The public training system for civil protection aims to build and maintain skills that people need to effectively play its role.

The mission of the National School of Civil Protection, within the public education system for civil protection, concrete strategies to structure the activities of the National School and they are:

- Design plans focused on the training needs;
- Investigate, design and validate didactic materials that contribute to a participatory homogenization of the system;
- Cooperate with the teaching public systems for civil protection of other countries in order to improve the capabilities of the national system for civil protection;
- Follow quality standards in training and accredited and accepted national and internationally.

5.4 Niche capabilities

One of the focus points of Spain which could be interesting for EU crisis management is the experience with flooding. Spain has a long history of flooding. Floods in Spain are the natural risk that over time has produced the biggest both material damage and loss of life.

There are records of episodes of flooding with serious consequences for the population since ancient times.

Although the hardest hit area is focused on the Mediterranean and Cantabrian coasts and river areas of the great peninsular rivers, the risk of flooding affects practically all the Spanish geography.

In order to minimize the damage caused by flooding, it is necessary to establish hydro meteorological warning systems to enable early decision making necessary to the authorities of the National Civil Protection System.

The system of Hydro meteorological Information and Monitoring will aim to establish procedures to introduce the most relevant on the hydrological phenomena and / or meteorological data that may have an impact on people and / or property in the Spanish territory.

The irregularity of rainfall patterns in Spain has made necessary the construction of a large number of dams and reservoirs to regulate river flows and to prevent flooding.

The period of greatest construction activity of large dams in Spain is between 1960 and 1980. Nowadays in Spain there are more than 1,200 large dams, ranking fifth in the world after China, EEUU, India and the former USSR.

There are a series of operating methods to protect people and their properties:

- Warnings and information to the population;

- Access control and maintenance in the affected areas;
- Rescue and saving people;
- Evacuation and shelter;
- Lifting of temporary dykes and other obstacles that prevent or hinder the passage of water.

According to the article 9 of the Royal Decree 903/2010²¹⁴⁰, of 9 July, of evaluation and manage of floods, flood risk maps for areas identified in the preliminary risk assessment are made. The flood risk maps shall include at least the following information:

- Number of population that may be affected by floods;
- Protected areas for the abstraction of water intended for human consumption, water bodies and recreational areas for the protection of habitats or species that may be affected;
- Type of economic activity of the area potentially affected.

There are hazard and flood risks maps; according to the Royal Decree 903/2010 the hazard and flood risks maps should be subject to public consultation for a minimum period of three months and once they are analysed they has to be sent to the Ministry of Agriculture, Food and Environment for their inclusion in the National System of Flood Zone Mapping.

The Methodological Guide for the development of the National Flood Zone Mapping develops methodologies to generate the mapping of public water resources and flood areas, and also the risk maps.

²¹⁴⁰ Royal Decree 903/2010, of evaluation and flood risk management,

Driving Innovation in Crisis Management for **E**uropean **R**esilience

SWEDEN

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: MSB (Kristen Arnell, Marie Norrby)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by ATOS and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

Sweden has three level of governance:

- Local level with 290 municipalities
- Regional level with 21 counties. County boards are the government's regional representatives. County Councils are independent elected bodies
- National level with the Swedish parliament and the government

All three levels have their own elected political assemblies. One level has no jurisdictions over another.

Three main principles:

The responsibility principle

The persons or organisations that are responsible for an activity under normal conditions are also responsible for such operations in an emergency situation.

The equality principle

Operations should, as far as possible, be organized in the same way during emergency situations as under normal conditions.

The proximity principle

Emergencies should be handled at the lowest possible level in society. On a central level the Government is the body responsible for this area, on the regional level it is the County Administrative Board and on the local level it is the municipalities.

First responders

Each of the three first responder organisation have their respective mandate and responsibility during an incident. They are obliged to cooperate with other organisations when deemed necessary.

Police

The Police are a Governmental organisation and responsibility, which is also represented at the regional level. The Police's responsibilities include to prevent and detect criminal activity and other disruptions of public order or safety, monitor the public order and security and intervene when disturbances have occurred, investigation and prosecution of criminal offences which fall within the General prosecution, provide public health, information and other assistance, when such assistance is best given by the police.

Fire and Rescue service

The Fire and Rescue Service are a local and municipality responsibility. Some municipalities cooperate and have a common Rescue Service. The incident commander has the mandate to call in all the resources that he or she needs to handle the incident to save life, environment and properties as long as it is in proportion to the incident.

Ambulance and healthcare

Health care is a County councils responsibility.

MSB's role

MSB is responsible for issues concerning civil protection, public safety, emergency management and civil defence as long as no other authority has responsibility. Responsibility refers to measures taken before, during and after an emergency or crisis

The Swedish structure for civil emergency planning is coordinated by the MSB, which holds the mandate for a holistic and all hazards approach to emergency management. This includes the entire spectrum of threats and risks, from everyday accidents up to major disasters.

Civil protection is defined as public safety in the form of protection from incidents, accidents and other types of emergencies and disasters. The Swedish emergency preparedness system aims to protect life and health, critical infrastructure and fundamental values from all types of hazards and risks through a comprehensive, risk-based, emergency preparedness programme including prevention, planning, preparedness, response and recovery.

MSB works:

- via knowledge enhancement, support, training, exercises, regulation, supervision and our own operations
- in close cooperation with the municipalities, county councils, other authorities, the private sector and various organisations
- to achieve greater security and safety at all levels of society, from local to global level

1 Policy

1.1 Risk Assessment

Risk assessments are done by all public sectors.

Local level: 290 municipalities

Regional level: 21 County Boards, 21 County Councils and 21 Regional Police authorities

National level: 250 governmental agencies

Risk assessments are also done by the private sector in sectors that can affect the population like Seveso and Energy sector.

1.2 Policy and Governance²¹⁴¹

Three main principles roll the Swedish way to handle an incident. It can be small or a large scale incident.

The responsibility principle

The person who is responsible for an activity under normal conditions should also be responsible for such operations in an emergency situation.

The equality principle

Operations should, as far as possible, be organized in the same way during emergency situations as under normal conditions.

The proximity principle

Emergencies should be handled at the lowest possible level in society. On a central level the Government is the body responsible for this area, on the regional level it is the County Administrative Board and on the local level it is the municipalities.

Handling the incident

The incident commander at the local The Fire and Rescue Service has the mandate to call in all the resources that he or she needs to handle the incident to save life, environment and properties as long as it is in proportion to the incident. If more than one municipality are affected, the Incident commanders can ask the Regional County Board to appoint a common incident commander for the major incident.

1.2.1 Strategy scope and focus

All citizens, public and private sector are obliging by law, to prevent, prepare, response and recover from accidents and incidents. It is an all hazardous approach. On the other hand the quality is entire

²¹⁴¹ National Guidelines for managing societal disruption, ISBN: 978-91-7383-507-7

up to each and every one. The municipality have the main responsibility for the people staying in their area, permanent and temporary. They also audit the private sector to ensure that they have sufficient CM.

The County Board is responsible for auditing Seveso plants and other more dangerous industries in their geographical area including the municipalities to ensure that they have sufficient CM.

MSB, as a governmental agency audit the county boards and also arrange exchange of experience activities among the county boards.

1.2.2 Monitoring and analytical support to policy making; R&D²¹⁴²

Monitoring and analytical support is organised at respective level and actor. In the public sector there are channels for reporting incidents from the municipalities to the County Board to MSB to the Ministry of Interior and the Prime Ministers Crisis Coordination Secretariat. Every national agency reports to their respective ministry. If any actor in an incident needs help they just need to ask for it.

Examples of funding opportunities:

- from MSB funding for research project in the area of Crisis Management, approx. 2 m€/year.
- from MSB project funding for national agencies and county boards aiming to improve cooperation and methods to improve the ability to coop with major incidents, approx. 100m€/year.

1.2.3 Policy for Prevention²¹⁴³

Public Sector

Local level:

The 290 municipalities are responsible to do preventive action and ensure common safety for the population. The area of responsibility goes from safe drinking water, sanitation, schools, elder care, local roads to Fire and Rescue Services. The municipalities are also responsible to audit the private sector.

Regional level:

The 21 County Councils are responsible to do preventive action and ensure common safety for the population in the area of health care.

The 21 County Boards are responsible to audit the municipalities within the county and the private sector that has a higher risk category like Seveso plants. They are also responsible to help and support the municipalities and coordinate prevention action in the region.

The Police are a Governmental organisation and responsibility, which is also represented at the regional level. The Police's responsibilities include to prevent and criminal activity

²¹⁴² Publ.nr: MSB860, april 2015, www.msb.se/rsa

²¹⁴³ Publ.nr: MSB860, april 2015, www.msb.se/rsa

National level:

The 250 national agencies are responsible for their respective area of responsibility. In all agencies that affect or can affect the environment, people or properties shall have implemented activities that aim to reduce the risks.

Private sector

All companies and organisation that affect or can affect the environment, people or properties shall have prevention activities that aim to reduce the risks.

Voluntary sector

All organisations that affect or can affect the environment, people or properties shall have prevention activities that aim to reduce the risks from their activities. Some voluntary organisations are active in preventing activities towards the general public such as giving first aid courses, swimming lessons and safety on water.

1.2.4 Policy for Preparedness²¹⁴⁴

Public Sector*Local level:*

The 290 municipalities are responsible to do preparedness action and ensure common safety for the population. The area of responsibility goes from safe drinking water, sanitation, schools, local roads to Fire and Rescue Services. The municipalities are also responsible to audit the private sector.

Regional level:

The 21 County Councils are responsible to do preparedness action and ensure common safety for the population in the area of health care.

The 21 County Boards are responsible to audit the municipalities within the county. They are also responsible to help and support the municipalities and coordinate prevention action in the region.

The Police are a Governmental organisation and responsibility, which is also represented at the regional level. The Police's responsibilities include detecting criminal activity and other disruptions of public order or safety.

National level:

The 250 national agencies are responsible for respective area of responsibility. All agencies and that affect or can affect the environment, people or properties shall have activities that aim to reduce the risks. All agencies are responsible in their respective are

Private sector

²¹⁴⁴ National Guidelines for managing societal disruption, ISBN: 978-91-7383-507-7

All companies and organisation that affects or can affect the environment, people or properties shall have activities that aim to reduce the risks and have preparedness to handle known risks.

Voluntary sector

All organisations that affects or can affect the environment, people or properties shall have preparedness activities that aim to reduce the risks and handle the consequences. Some voluntary organisations are prepared to act in case of emergency both with personal and other recourses like SSSR, Swedish Sea Rescue Organisation that handle 70% of the rescue operations at sea in Sweden.

1.2.5 Policy for Response²¹⁴⁵

Public Sector

Local level:

The 290 municipalities are responsible to respond to accidents and incidents Fire and Rescue Services.

Regional level:

The 21 County Councils are responsible to respond to accident and other health related issues and incident to ensure the emergency capacities for the population.

The 21 County Boards are responsible to audit the municipalities within the county. They are also responsible to help and support the municipalities in the region during an incident.

The Police are a Governmental organisation and responsibility, which is also represented at the regional level. The Police's responsibilities include monitor the public order and security and intervene when disturbances have occurred, provide public health, information and other assistance, when such assistance is best given by the police.

National level:

The 250 national agencies are responsible for respective area of responsibility. All agencies and that affect or can affect the environment, people or properties shall have activities that aim to reduce the risks. All agencies are responsible in their respective area.

Private sector

All companies and organisation that affects or can affect the environment, people or properties shall have activities that aim to reduce the risks. Seveso plants needs to be able to respond to known risks. It can be organised like as a rescue service brigade in the industry.

Voluntary sector

All organisations that affects or can affect the environment, people or properties shall have ability to handle known risks that their own activity causes. Some voluntary organisations act in response to

²¹⁴⁵ National Guidelines for managing societal disruption, ISBN: 978-91-7383-507-7

emergency both with personal and other recourses like SSSR, Swedish Sea Rescue Organisation that handle 70 % of the rescue operations at sea in Sweden.

1.2.6 Policy for Relief and Recovery²¹⁴⁶

Public Sector

Local level:

The 290 municipalities are responsible to have pre planned actions and ensure common safety for the population after an incident. The area of responsibility goes from safe drinking water, sanitation, elder care, schools, local roads to Fire and Rescue Services. The municipalities are also responsible to audit the private sector that can affect the population and nature negative, for example Seveso plants. Temporary shelters or housing to the effected and help for recovery are also part of the responsibility of municipalises.

Regional level:

The 21 County Councils are responsible to do preventive action and ensure common safety for the population in the area of health care.

The 21 County Boards are responsible to audit the municipalities within the county. They are also responsible to help and support the municipalities and coordinate prevention action in the region.

The Police are a Governmental organisation and responsibility, which is also represented at the regional level. The Police's responsibilities include to investigate and prosecution of criminal offences which fall within the General prosecution.

National level:

The 250 national agencies are responsible for respective area of responsibility. All agencies and that affect or can affect the environment, people or properties shall have activities that aim to reduce the risks. All agencies are responsible in their respective are

Private sector

All companies and organisation that affects or can affect the environment, people or properties shall have activities that aim to reduce the risks.

Voluntary sector

All organisations that affects or can affect the environment, people or properties shall have prevention activities that aim to reduce the risks.

²¹⁴⁶ National Guidelines for managing societal disruption, ISBN: 978-91-7383-507-7

1.3 Financing²¹⁴⁷

1.3.1 Investing in preparedness

At the national level the investment in preparedness is mostly done by education, training and pre-arranged cooperation, as well as the sharing of knowledge. The states own material resources have been phased out to a large extent. Some of the agencies have duty officers that can be reached 24/7, like the police and 112 –Alarm Centres.

At the local level the investment in preparedness is in the Rescue services and the technical department, to be prepared to deal practical to incidents.

1.3.2 Investing in consequence management

The management of the consequences of incidents is a logical part of being prepared. The major responsibility is at the local level in the municipalities and the rescue services. The investments are in the employees and the resources they need, to be able to handle the risks that exists in the municipality. Exercise and training is the main tool to be prepared.

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

Individuals receive help from the municipality and the county council. POSOM groups and other personal help are organised so that, if need, the affected get for example a temporary shelter and psychosocial support.

1.4.2 Departmental Lessons Learned systems

The municipalities and county council have a common organisation the share different experience.

1.4.3 Centralised (national) Lessons Learned system

There is not one centralised system. Every sector and agency has their own responsibility. SCB, Statistics Sweden, is the national agency that collects statistics from a variety of sectors. Some sectors like dangerous goods have several agencies and actors that collect statistics and experiences. Below are some examples.

In the spectra of social and health care there is a national lessons learned system, both for the municipalities and county councils.

²¹⁴⁷ www.msb.se

To investigate major accidents and incidents there is a special agency, Swedish Accident Investigation Authority. They provide reports and recommendation to improve and provide opportunities for lessons learnt.

MSB has a project going on called After Action Revue towards the Rescue Service Sector, which has been well received. The result will be voluntary for the municipalities to implement.

1.4.4 International exchange for Lessons Learned

Some examples:

MSB, together with other governmental agencies, arrange observation studies when they identify incidents of interest to learn from.

The Nordic countries have ongoing cooperation in different areas. Nordred Agreement, HAGA declaration, Nordhels are some of them.

CTIF is an international organisation that has national sub-organisation. The purpose is to learn from each other and incidents that has append, from fire to hazardous materials. <http://ctif.org/>

1.4.5 Regular policy reviews

After every election there is a review of the Risk and vulnerability analysis and action program. The level of ability is then reviewed and the new policies are set at the local level.

1.5 Resilience

The implementation of the concept resilience is done in Sweden.

Responsible for working with the protection of vital services and critical infrastructure rests in accordance with the principle of responsibility of each sector, as well as the owners and proprietors of businesses.

At the national level a national strategy and action plan for the protection of vital infrastructure as well as guidelines has been produced. A committee has also been established with representatives from local, regional and national level to share experience and evolve the resilience in the society.

Swedish Standard Institute SS-ISO 22301 decision in SIS/DK 494 based on ISO 22301 has been adopted as a Swedish standard.

1.6 Information sharing and data protection

1.6.1 Information classification – a support for information sharing

Central government authorities are required to introduce a management system for information security (LIS). This process consists of several components, including the operational analysis, which is of directly beneficial when sharing information. This operational analysis should contain: information identification, requirements identification and information classification. Both information identification and information classification can serve as a support when working out whether or not certain information is protected by secrecy. In the event of societal disruptions, all information is not always classified, but classification should still be able to provide good support in many contexts where information is shared.

Personal information Law (PUL) and Inspire directive are implemented.

Each municipality have responsibility to ensure the safety of it citizens. The Social office, in the municipality is always involved when evacuation needs to be done.

Each sector is responsible to arrange within the law how information can and need to be shared.

Even when there is a crisis the sharing of personal data is still restricted. Therefore the responsible agency is a vital actor in the handling of the incident.

Each citizen has the right to know what kind of threats that normally exist within the municipality, like the risks for flooding or Seveso plants.

1.6.2 Registration of volunteers

Every Voluntary organisation in itself has its own register of members.

One example is FRG, Voluntary Recourse Group, that organizes several voluntary organisations in each municipality. Local FRG have signed an agreement with 125 of the 290 municipalities. The agreement is about how and when the FRG group can assist during an incident.

1.6.3 Information gathering on social media

There is no national plan to gather information during crisis from social media. Krisinformation.se that MSB host does however use scanning as a way to update the information on the web site on regular bases.

2 Legislation

2.1 Crisis (emergency, disaster) management concept

2.1.1 Summary

The following is a summary of the central regulations in the area of emergency preparedness and other regulations that are relevant to the management of societal disruptions; the latter is here referred to as sectoral legislation. Sectoral legislation comprises regulations concerning a specific area such as emergency services, social services or police activities. With some of the regulations, there are also descriptions of central terms. In addition to that a set basic principle has been developed to guide the actors on how to act.

2.1.1.1 Basic principles

The Swedish system for civil contingencies is fundamentally regulated by the principles of responsibility, proximity and similarity. This is evident in various official reports, preparatory works and government bills, but the principles as such are not defined in law. They should instead be understood as a background to the current regulatory framework and the actors' missions and mandates.

Principle of responsibility

The principle of responsibility means that those actors who are responsible for a certain activity under normal circumstances retain this responsibility in the event of societal disruptions. The Government has made it clear that the principle of responsibility also means that all actors affected either directly or indirectly by a disruption that have the capacity to assist in managing its consequences have a responsibility to act, even in uncertain situations. The principle of responsibility also means that actors are obliged to support and collaborate with each other. This has come to be called the “expanded principle of responsibility”.

Principle of proximity

The principle of proximity means that societal disruptions are to be managed where they occur and by those actors most closely affected and responsible.

Principle of similarity

The principle of similarity means that actors are not to make changes to their organisational structure that are more substantial than the situation demands. Accordingly, in the event of societal disruptions, operations are to continue to function as they do under normal circumstances, to the extent possible.

2.1.2 Regulations

2.1.2.1 The Instrument of Government (1974:152)

The Instrument of Government contains regulations on how Sweden is governed, on the central actors and their function and mandates, and on the regulations concerning fundamental rights and freedoms. The Instrument of Government is one of Sweden's fundamental laws and therefore takes precedence over all other provisions. Two central themes in the Instrument of Government particularly affect the management of societal disruptions, namely the principle of legality and the role of the Government.

The principle of legality means that all exercise of public power shall ultimately be supported in law. In practice, this means that all public-sector actors must have constitutional support in order to act. This also applies to decisions by the Government.

The role of the Government is to have the highest executive power in the country. The Government has primary responsibility for the structure of state administration building and decides, among other things, on the conditions for each authority's activities. However, it is not permitted for the Government to interfere in authority matters concerning the exercise of authority or the application of law.

2.1.2.2 Decision No 1313/2013/EU of the European Parliament and of the Council on a Union Civil Protection Mechanism

The EU's new civil protection legislation entered into force in December 2013. It thus replaces the earlier decision on the Community's civil protection mechanism from 2007 and the decision on the financial instrument from the same year. The new legislation captures recent years' developments in the area of civil protection, which covers such things as an increased focus on preventive measures and risk management. Civil Protection Cooperation today covers the entire disaster management cycle, including preparatory measures in the form of training, exercises and a programme for experience feedback. Response cooperation has also undergone development, and the new legislation establishes, among other things, a new initiative in the form of a voluntary pool of response capacities (modules) and of experts that are pre-committed by Member States for operations inside and outside the Union. Sweden intends to register a number of modules for the new pool.

2.1.2.3 The Act (1992:1403) concerning Total Defence and Heightened Alert

The Act concerning Total Defence and Heightened Alert regulates, among other things, what total defence and heightened alert are, and establishes that total defence resources are to be designed in a way that can also strengthen society's capability to prevent and manage severe stresses on society. In a state of heightened alert, municipalities and county councils are to take special measures to complete their total defence tasks under the prevailing circumstances.

2.1.2.4 The Emergency Management and Heightened Alert Ordinance (2006:942)

The Emergency Management and Heightened Alert Ordinance (the Emergency Management Ordinance) regulates, among other things, how central government authorities are, through their activities, to reduce society's vulnerability and develop a good capability to manage their tasks, both during crisis situations in peacetime and during periods of heightened alert.

An appendix to the Emergency Management Ordinance states which central government authorities have a special responsibility for emergency preparedness, before and in a state of heightened alert, respectively. According to this, every central government authority whose area of responsibility is affected by a crisis situation is to take the measures necessary for managing the consequences of the crisis situation. The authorities are also to collaborate and support each other in such a crisis situation.

The Emergency Management Ordinance also establishes the geographical responsibilities of the county administrative boards and the obligation of the authorities to provide information to the Government and MSB in a crisis situation.

According to the Emergency Management Ordinance, *emergency preparedness* is the capability to prevent, resist and manage crisis situations through training, exercises and other measures and through the organisation and structures created before, during and after a crisis. The term crisis is not defined in the Ordinance, but an explanation is given in preparatory works.

2.1.2.5 The Act (2006:544) on municipal and county council measures prior to and during extraordinary events in peacetime and during periods of heightened alert

The Act on municipal and county council measures prior to and during extraordinary events in peacetime and during periods of heightened alert (LEH) regulates, among other things, how municipalities and county councils are to reduce the vulnerability of their activities and establishes that they are to have a good capability to manage crisis situations in peacetime. In doing so, municipalities and county councils are also to achieve a basic capability for civil defence. LEH also establishes the geographical responsibilities of municipalities and their reporting obligation to the county administrative board in an extraordinary event.

According to LEH, an *extraordinary event* is such an event that deviates from the normal, entails a serious disruption or imminent risk of a serious disruption in important societal functions and requires urgent action by a municipality or a county council.

2.1.2.6 The Ordinance (2006:637) on municipal and county council measures prior to and during extraordinary events in peacetime and during periods of heightened alert

The Ordinance on municipal and county council measures prior to and during extraordinary events in peacetime and during periods of heightened alert contains, among other things, more detailed provisions on how municipalities and county councils are to report prior to and during extraordinary events.

2.1.2.7 The Civil Protection Act (2003:778) (LSO)

The Civil Protection Act (LSO) regulates, among other things, the responsibility of municipalities and central government to carry out rescue operations. LSO also contains special mandates for emergency service bodies, the right to encroach on the rights of others, the right to compel individuals to help in an operation through the duty to serve and emergency service bodies' right to request central government and municipal assistance. The Act also contains provisions on emergency services during heightened alert.

According to LSO, *emergency services* are the rescue operations for which municipalities and central government are responsible in accidents and the imminent danger of accidents in order to prevent and limit harm to people, property or the environment.

2.1.2.8 The Civil Protection Ordinance (2003:789)

The Civil Protection Ordinance contains, among other things, more detailed provisions about which actors are responsible for central government emergency services and emergency services upon the discharge of radioactive substances and remediation. The Ordinance also regulates when the county administrative board may assume responsibility for rescue operations in municipal emergency services.

2.1.2.9 The Police Act (1984:387)

The Police Act establishes, among other things, that the police service is to work to maintain public order and safety, and otherwise ensure the general public protection and other assistance to promote justice and security. The police also to collaborate with other authorities whose operations concern police activities. This particularly applies to social services authorities.

2.1.2.10 The Social Services Act (2001:453)

The Social Services Act is the legislation that ultimately regulates people's right to basic needs such as a roof over their head, food and water. The Social Services Act states that the municipality has the ultimate responsibility for persons that are in the municipality. This means that the municipality's responsibility is thus not limited to residents of the municipality, but covers all those who for some reason are in the municipality.

2.1.2.11 The Health and Medical Services Act (1982:763)

The Health and Medical Services Act regulates the tasks and obligations of health care providers to offer care. Under the Act, it is the county council's responsibility to offer good health and medical care to its residents and to plan its health and medical care so as to maintain disaster medicine preparedness.

2.1.2.12 The Swedish Local Government Act (1991:900)

The Swedish Local Government Act regulates, among other things, the forms for the organisation of municipalities and the activities they may conduct (*municipal competence*).

2.1.2.13 The Ordinance (2007:825) with Instructions for the County Administrative Boards

The Ordinance with Instructions for the County Administrative Boards regulates the general tasks and mandate of the county administrative boards. The county administrative boards have, among other things, tasks that have to do with civil protection, emergency preparedness and civil defence. The instruction also establishes the geographical responsibilities of the county administrative boards under the Emergency Management and Heightened Alert Ordinance (2006:942).

2.1.2.14 The Swedish National Board of Health and Welfare's regulations and general advice (SOSFS 2013:22) on disaster medicine preparedness

These regulations state, among other things, which capability the county council is to have in a serious event, that each county council is to have a disaster medicine preparedness plan and the functions of duty officer (TiB) and special health care command.

2.1.3 The terms crisis, accidents and extraordinary events

The central regulatory frameworks for crisis management and sectoral legislation regulate partly different societal disruptions, and the regulatory frameworks also use different terms. The Emergency Management Ordinance speaks of “crisis”, while LEH speaks of “extraordinary events”. In addition to this, the sectoral legislation regulates various events, such as the LSO term “accidents”. When referring to specific legal regulation, it is important to use its terminology. This also applies to this material, which means that terms such as “crisis” and “emergency preparedness” are used when referring to a specific regulation or a preparatory work in which these terms appear. The term societal disruptions, in turn, is not a legal term but is used to encompass the various events that the regulations might cover.

2.2 General crisis (emergency, disaster) management law

Please refer to Section 2.2.

2.3 Emergency rule

Municipalities' Rescue Services always have to have an incident commander. The incident commander has, according to Extra Civil Protection Act, LSO, far reaching powers to engage people and resources that he/she need to handle the incident, but not without paying for it.

The County Councils' representative in the health care authorities during a pandemic or for specified dangerous diseases also have far reaching powers to for example isolate people.

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

During peacetime the society's institutions have the same mandate regardless if it is a crisis, large scale incident or a minor incident.

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

During peacetime the society's institutions have the same mandate regardless if it is a crisis, large scale incident or a minor incident.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

There is no specific legislation regarding NGO's involvement during a crisis. The municipalities and the volunteers can cooperate if they find a mutual understanding. There are many volunteer organisations in Sweden with a vast variety of capacities and interests. The municipalities have a good local knowledge and a lot of what the inhabitants do during their spare time is done in one of the local voluntary organisation.

2.7 Legal regulations for international engagements of first responders and crisis managers

To engage first responders in the Nordic countries have already been dealt with threw multilateral agreements. Cross border cooperation is done on regularly bases directly between the municipalities and the County Councils. Some regions also have Cross boarder councils including County boards and municipalities, rescues services and healthcare.

Point of Contact for EU/ERCC is MSB and the Swedish Coast Guard. If an incident commander needs these recourses they need to contact MSB. MSB needs to inform the government before contacting ERCC.

If UN needs to be invited to assist Sweden, both of the government and the municipality needs to agree on the invitation.

The incident commander and the municipality still have the responsibility for the incident.

3 Organisation

3.1 Organisational chart

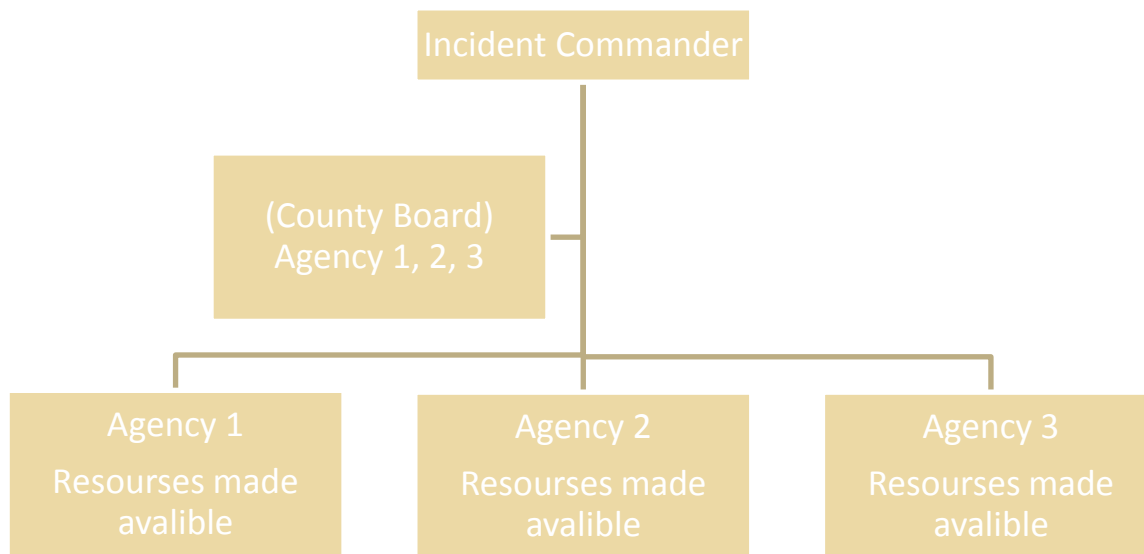

Figure 49: A schematic diagram of how a major rescue operation can be organised

- National/ IO authority for emergency and disaster management; chain of command and high-level decision-making:
The incident commander is the commander during a rescue operation. The Commander can request more resources and help. All tactical and operational decisions rest at the local level even when there is a crisis. The politicians may need to make funding available to handle the incident.
- Interdepartmental (inter-ministerial) emergency and disaster management authority:
The ministries have a group to keep them informed. MSB and other affected agencies inform the government on regular base during a major incident. The government can decide, if needed, to allocate more resources, if necessary.
- National permanent emergency and disaster management unit(s)/ formations; first responders:
There are no national First responders, except for Special police forces, mountain rescue, sea rescue, nuclear plants accidents and maritime environment rescue operation.
- Planned/ anticipated use of specialised military assets :
Civil agencies and rescue service can ask for the resources that the military have, but it needs to be approved by the military. The local first responder's organisations may also have pre planned cooperation, and then the military, if they agree to help, is under the command of the incident commander.

- Departmental emergency and disaster management arrangements:
Each department need to have their own disaster management arrangement, including pre planned cooperation with others. It is each organisations own responsibility.
- Other national civil service organisations:
MSB is appointed to coordinate and encourage cooperation between national civil service organisations: special police forces, mountain rescue, sea rescue, nuclear plant accident and maritime environment rescue operation.

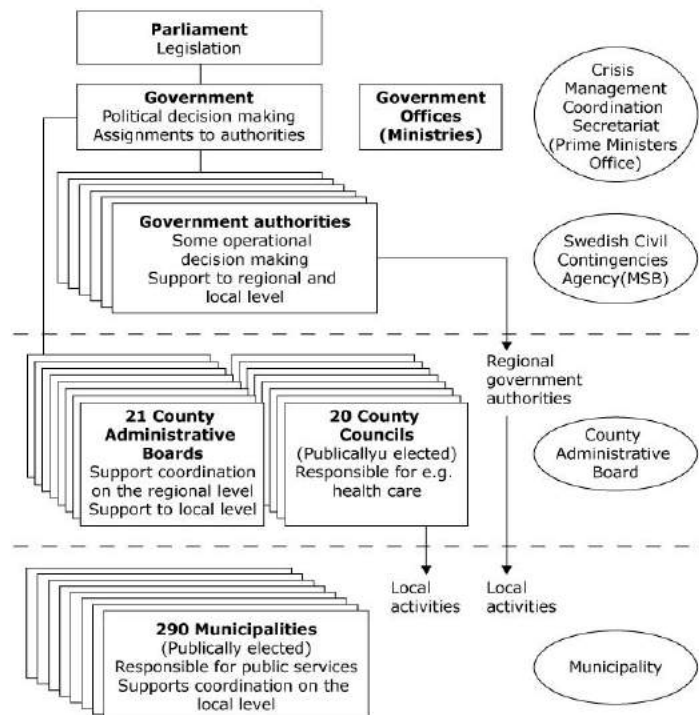

Figure 50: Organisational chart on the Crisis Management structure in Sweden

Source: VADEMECUM http://ec.europa.eu/echo/files/civil_protection/vademecum/se/2-se-1.html#orga

- Provincial (regional) authorities and arrangements for emergency and disaster management (e.g. crisis HQ):
County Boards, Hospital Areas and municipalities are obliging to plan. Local (municipal, town) authorities have arrangements for emergency and disaster management County Boards, Hospital Areas and municipalities are obliging to plan. Local (municipal, town) authorities have arrangements for emergency and disaster management
- Local (municipal, town) authorities and arrangements for emergency and disaster management:
County Boards, County Councils and municipalities are obliging to plan. Local (municipal, town) authorities have arrangements for emergency and disaster management.
- Volunteers and volunteer organisations; specialised NGOs

FRG, Voluntary resource Group organises voluntary organisations, as well as voluntary civil defences group. They have capacity to be engaged in search and rescue operations both on land at sea. They also have flying capacities. SRSS handle 70 % of the sea rescue operations.

- Private businesses:

As private business you are obliged to protect yourself and your property. You are also obliged to prevent further damages, if possible.

In some sectors there are more regulations, transport of dangerous goods, Seveso plants, energy sector etc.

Below is a scheme of the society. The support is going towards the incident commander at the local level. The levels are not chain of command or a hierarchy it is a way of describing local, regional and national agencies and their respective responsibilities.

3.2 Organisational cooperation

- Operational cooperation (e.g., coordinated CM operations planning and response at national level, cross-border operational cooperation, operational cooperation within the EU)

Each incident commander prioritises within the municipality. The County Board may priorities national and international recourses that is available.

Nordred agreement is a foundation for Nordic cooperation. The municipalities on both side of the border do in a practical way. Examples of local agreements and procedures are found at www.nordred.org MSB is the focal point to interact with EU civil protection mechanism.

- Cooperation and coordination in CM capability development (coordinated departmental CM capability planning, nationally centralized CM capability planning, multi-nation/ EU-level coordination of capability planning and capability development)

Cooperation is vital to handle all incidents. The incident commander is responsible to organise the cooperation and all parties are responsible to cooperate and make resources available for the incident commander. Every sector is responsible to handle their part of the incident. Cooperation is a vital part of the legislation in the Nordic countries legislation. The Nordred agreement and Haga declaration means that there exists several on gong cooperation, both at local regional and national level. CM is a challenge since the decentralised local CM system. There is an ongoing exchange of experience and sharing of knowledge.

On EU-level MSB is represented in the Module group discussing mainly HNS and the Voluntary Pool. MSb frequently engage itself in different EU-project with aim developing capabilities that are not only specific to the Swedish context.

MSB has an ongoing developing agreement with DHS in the USA.

4 Procedures²¹⁴⁸

4.1 Standing Operating Procedures (SOPs) and Guidelines

Until recently a common SOP has not been implemented in Sweden, each and every actor has been responsible to implement SOPs within their own responsibility. During 2015 MSB has started to implement “Common Guidelines for Collaboration and Command in Societal Disruptions” as a foundation for joint SOPs between several actors.

4.2 Operations planning

Depending on the risk and responsibility each organisation has its own operations planning. The auditing that the County Boards and MSB do of the plans for operation, highlight the organisations that don’t meet a minimum level of safety that the public can expect.

4.3 Logistics support in crises

Depending on the risk and responsibility each organisation has plans for their own needs of logistics support.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

Each municipality, county board and governmental agency has to plan and implement their own crisis communication plan.

At the local level, the municipality has a Crisis Board. They also have a command centre; which can be used during a crisis.

At the regional level, the County Board has a command centre. The County Board have a telephone- or video conference with the municipalities in the region at regular intervals, to test the systems and to keep one on other informed.

Emergency alerts can be sent out through the radio and television, both locally and nationally. MSB have a website for crisis communication and an e-mail tool to facilitate sharing of information.

MSB host a web site, with www.krisinformation.se, collect information from the municipalities’ web pages. The web site can also host information during major incidents, to help municipalities and county boards since it is more robust and built to withstand crisis.

²¹⁴⁸ National Guidelines for managing societal disruption, ISBN: 978-91-7383-507-7

The local incident commander has access to use the emergency alert system via media. Alerts can be sent out through television and radio. The system is tested 4 times a year. (VMA – Warning Messages to the Public)

MSB and The Swedish Coast Guard is point of contact to EU/ERCC. MSB is also responsible to have equipment to facilitate telephone conference among effected agencies.

Other sectors have their respective focal point. For example is SSM focal point for new clear plants accident threw to IAEA and

5 Capabilities

5.1 Human resources

Each organisation is responsible to oversee their own needs for competencies, there is no organisation responsible to have human resources in reserve. When a disruption causes strain on human resources different organisations volunteer to pool and share resources.

5.2 Materiel (non-financial) resources

- What specific non-financial resources (dedicated equipment etc.) have been allocated to crisis management (central, regional, local preparedness and response)?
 - All sectors and levels have their own pre planning to handle an emergency. Municipalities, county boards, county councils, emergency hospitals, appointed governmental agencies; all have a secure command centre that can operate during a crisis.
 - Some examples:
 - MSB has some specific recourse for flooding, forest fires, chemical accidents and oil spill.
 - The energy sector has their recourses, like personnel on call.
- Permanent reserve stocks (fuel, food, medicines, tents, blankets, etc.)
 - Stock of medicines (National founded)
 - Municipalities and County Council may have their own.
- Planned /anticipated/ involvement of specific military assets (e.g. reconnaissance assets, search and rescue helicopters, fire-fighting planes/helicopters, CBRN, etc.)
 - These assets exist among civil agencies like the Swedish Coast Guard, Police, and Swedish Maritime Administration. The military is not allowed to act in the civil domain.
- Is provision made for governments to mobilise or commandeer private assets during crises?
 - No it is provision made for the local municipality and the incident commander during a rescue operation, to mobilise or commandeer private assets during crisis.

5.3 Training

- National, local and departmental exercises:
 - MSB organise a table top crisis management exercise every third? year for national agencies.
 - Every County Board organise on regularly base table top exercise in their respective region.
 - Every municipality organise on regularly base table top exercise in their respective region.
- Centralised specialist training:
 - MSB organise training for UN, EU, Swedish national, regional and local agencies.

- Training of volunteers and NGO personnel
-FRG among other voluntary organisations organises training, with funding from MSB. SSSR have regular training for their volunteers.
- Cross-border and multinational training activities
-Barents Rescue is a major exercise between Sweden, Norway, Finland and Russia every third year. There are many exercises done every year.
- Is there a certification system? What standards are used to define specialists' training requirements?
Sweden don't have a certification system for specialists training requirement. The employer may implement ISO standards if they find it appropriate.
- Are there specialised training programmes for high-level decision makers?
One example is the course called "Solbacka kursen" that engage High Level decision makers in Crisis coordination and cooperation.
<http://www.fhs.se/sv/utbildning/uppdagsutbildningar/krishantering/solbackakursen/>,
- Training centres
MSB have two training colleges. The Police College, Swedish Coast Guards training center and the national Defence College are some of the others.

5.4 Procurement

5.4.1 Procurement regulation

Procurement regulation in the public sector is strict. Best value for many is the basic rule. Cooperation between the different agencies in the public sector is however encouraged

Procurement regulations at an EU-level:

All articles are implemented and needs to be followed. If it is a sudden unexpected crisis you are allowed to buy what you need to handle the situation.

5.4.2 Procurement procedures

The public sector at all levels has their own procurement organisation that deals with procurements. Since 2011, certain public procurement activities have been centralized in a new agency, the National Procurement Services, which *provides central government authorities coordinated framework agreements for goods and services of general use*²¹⁴⁹.

²¹⁴⁹ Coordinated framework agreements in Sweden <http://www.avropa.se/topplankar/In-English/>

5.5 Niche capabilities

JRCC has flying and sea going capacities for sea rescue operations.

The police have Special Forces for rescue operation in mountainous areas.

The Swedish Coast Guard has ships and flying capabilities for environment operations at sea.

Resources

Legislative acts

Please refer to Section 2.2.

Other normative acts

The national agencies can write normative acts in their area of competence.

For example MSB gives out recommendations MSBFS:

<https://www.msb.se/sv/Om-MSB/Lag-och-ratt/Gallande-regler/Skydd-mot-olyckor/MSBFS-20125/>

Socialstyrelsen –The National Board of Health and Welfare has recommendations in a series SOSFS.

<http://www.socialstyrelsen.se/sosfs>

Official documents (white papers, strategies, etc.)

<http://www.sou.gov.se/> collects all the finished and ongoing policy investigations ordered by the government.

PREPARING FOR EMERGENCIES
WHAT YOU NEED TO KNOW

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by MSB and amended according to reviewer's comments and recommendations.

Overview

Crisis management in the UK has grown and matured considerably over the last fifteen years, galvanised in part by the 9/11 terrorist attacks and 7 July 2005 London bombings which served to catapult the field up the political agenda.

The UK's approach to crisis management is founded on Integrated Emergency Management (IEM), a holistic approach to preventing and managing emergencies that entails six key steps: anticipation; assessment; prevention; preparation; response; and recovery.

IEM advocates a bottom-up approach, with operations managed and decisions made at the lowest appropriate level. Preparation, response and recovery should be undertaken as an extension of a local responder's normal day-to-day activities.

This principle underpins the Civil Contingencies Act 2004, which overhauled existing legislation to provide a single framework for civil protection. It divides local responders involved in crisis management into two categories. Category 1 organisations are "first responders" (emergency services, local authorities, NHS bodies etc.) and have substantial civil protection responsibilities including risk assessment, emergency planning, and warning and informing the public. Category 2 organisations are "co-operating bodies" (transport providers, utility companies etc.) that are involved in planning for and responding to emergencies that affect their sector.

Most emergencies in the UK are dealt with at local level, but if necessary the government's central response framework would be initiated. Cabinet Office Briefing Rooms (COBR) - comprised of ministers and senior officials from relevant UK government departments and agencies - would be activated to provide overall strategic planning. Overall crisis management is typically supervised by one Lead Government Department (LGD) which works closely with the Cabinet Office's Civil Contingencies Secretariat, the principal governmental authority responsible for coordinating crisis management.

Crisis management in the UK is of a civilian nature with military involvement sought only in extreme cases. Volunteer organisations play an important role in augmenting capabilities and are involved in Category 1 responder training exercises. There is minimal evidence of significant private sector involvement in crisis management in the UK, with ad hoc agreements signed as necessary when emergencies occur.

It is difficult to calculate the amount of money allocated for crisis management in the UK because budget issues are not centrally managed by the government. Funding streams are often diverse and there is significant variation in resources between counties. What is clear is that funding has increased since the 7 July 2005 London bombings. Local authorities are generally responsible for financing emergency preparedness, though may apply to the government for financial support in bearing the costs of emergency response and recovery.

It is uncommon for the UK to cooperate bilaterally with other countries; instead the UK participates in intergovernmental organisations and a limited number of multilateral frames of cooperation in crisis management, such as the EU Civil Protection Mechanism. The UK rarely seeks help from other countries to manage internal emergencies, but is at the forefront of political initiatives in the EU context and is active in EU and NATO training and expert exchange programmes.

The Foreign and Commonwealth Office is responsible for managing the UK's relationship with other countries through its network of embassies and High Commissions, as well as the UK's overall relationship with international organisations such as the UN, NATO and the EU. However, the Civil Contingencies Secretariat is responsible for liaising with the civil emergency response and mutual aid systems of the EU and NATO. Government departments can also have bilateral relationships with specific international or multilateral institutions that will be used when appropriate.

1 Policy

1.1 Risk Assessment

Central government

The UK government conducts a National Risk Assessment (NRA) to monitor the most significant emergencies the UK could face in the next five years. This confidential assessment is conducted each year and utilises the expertise of a wide range of departments and agencies of government. It focuses on three broad categories of risk: natural events, major accidents and malicious attacks.

The National Risk Register (NRR) is the public version of the NRA. It was first published by the government in 2008, fulfilling a commitment made in the National Security Strategy, and last updated in July 2013. It was created to provide businesses and the public with information regarding how they should prepare for civil emergencies. Cabinet Office guidance published in February 2013 states that the government is conducting a review of the NRR in consultation with risk communication experts to improve these guidelines.²¹⁵⁰

The risks posed to national security and human welfare by longer-term trends, such as technological advances and climate change, is considered by the classified National Security Risk Assessment, which informs the UK's National Security Strategy.

Local government

Different geographical areas of the UK face different risks. A person's likelihood of exposure to emergencies such as coastal flooding, industrial accidents or terrorist attack is obviously heavily dependent on where in the country they live. For that reason the government provides guidance on how to interpret the NRA and NRR to Local Resilience Forums, *the principal mechanism for local multi-agency cooperation (LRFs, see section 3.1)*, so that they can produce specific risk assessments that reflect the unique characteristics of their surrounding area.

The Civil Contingencies Act also requires emergency responders in England and Wales to maintain a public Community Risk Register. These are approved and published by LRFs and made available on local council websites.

Key risks and areas of concern

The NRA estimates the likelihood of different emergencies, typically using a mixture of data (including historical analysis and numeric modelling) and scientific expertise. The likelihood of terrorist or other malicious attacks is assessed more subjectively, with assessments focusing on the

²¹⁵⁰ Cabinet Office website: <https://www.gov.uk/risk-assessment-how-the-risk-of-emergencies-in-the-uk-is-assessed>

willingness and capabilities of those who might wish to carry out an attack, and the vulnerability of potential targets.

The NRR lists the highest priority risks (based on both likelihood and impact) facing the UK as: pandemic influenza, coastal flooding, catastrophic terrorist attacks, and severe effusive (gas-rich) volcanic eruptions abroad.

Other, less severe, risks include inland flooding, new and emerging infectious diseases, severe weather, severe space weather, wildfires, explosive volcanic eruption styles emitting mainly ash, animal diseases, major industrial and transport accidents, disruptive industrial action, malicious attacks and public disorder.

Pandemic Influenza

Pandemic influenza is considered by the government to be the most significant civil emergency risk facing the UK. The 2009 H1N1 influenza pandemic did not match the severity of the scenario the government plans for, and has no bearing on the probability of another, potentially more severe, pandemic occurring in the future. The three pandemics of the previous century (1918-19, 1957-58 and 1968-69) were all more deadly than the 2009 outbreak. The NRR anticipates that a severe pandemic could cause hundreds of thousands of deaths in the UK and would result in widespread social and economic disruption; significant threats to the continuity of essential services; lower production levels; shortages; and distribution difficulties.

Coastal flooding

The most severe example of coastal flooding occurred in 1953 – the last occasion a national emergency was formally declared in the UK – when a combination of high tides, a major tidal surge and onshore gale force winds devastated the east coast of England. While investment in coastal flood defences has reduced the risk of a similarly severe emergency occurring, the number of people living and working in east coast flood risk areas has increased, as has the range of critical infrastructure. The NRR warns that the impacts of overtopping and breaching of flood defences could be more serious than in 1953.

Catastrophic terrorist attacks

The NRR stresses that while major-impact terrorist attacks such as 9/11 are unlikely, they cannot be ruled out. The likelihood of terrorists obtaining effective mass impact biological agents or a functioning nuclear device is low, but not negligible. Accordingly, CONTEST, the Government's counter- terrorism strategy, is tasked both with stopping terrorists gaining access to the expertise and materials they need to deliver catastrophic attacks, and with preparing for the consequences should they succeed.

Severe effusive (gas-rich) volcanic eruptions abroad

The 2010 eruption of the Eyjafjallajökull volcano in Iceland highlighted the disruptive consequences of a volcanic eruption abroad. Ash-emitting eruptions of this type remain a concern, but the NRA and NRR are significantly more concerned by the prospect of a major effusive volcanic eruption, which

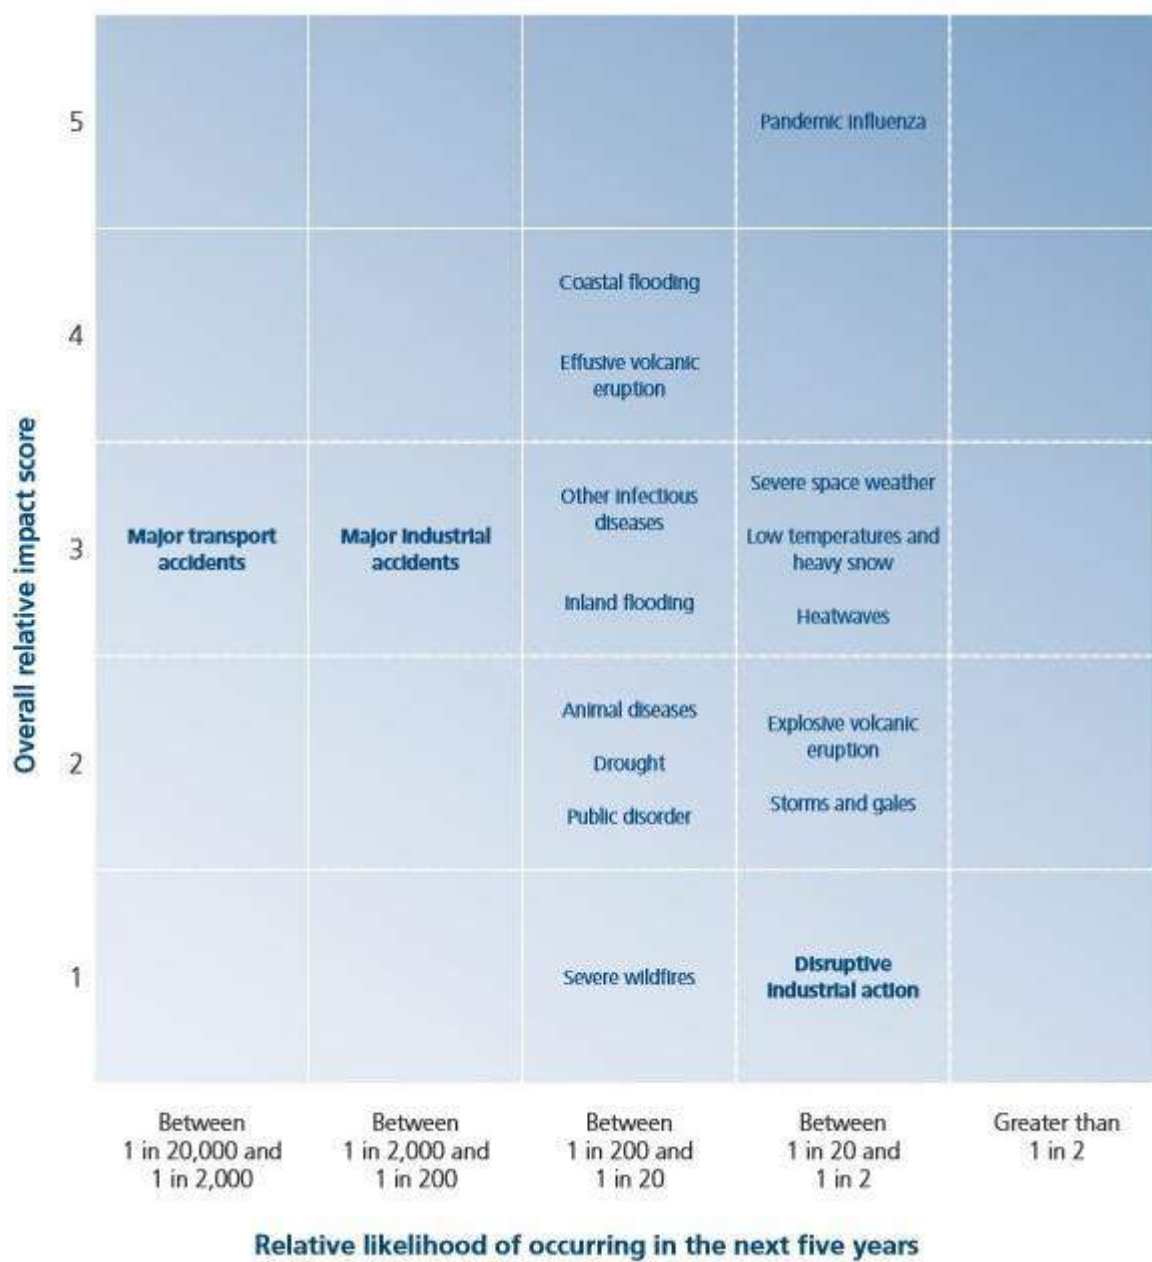

could emit large volumes of gases into the atmosphere over months or years, and the widespread impact on health, agriculture and transport this would have. The 1783-84 Laki eruption from Grimsvötn volcano in Iceland is the best understood example of this type of eruption, in which significant levels of sulphur dioxide, chlorine and fluorine were released. The effect was visible pollution across the UK and Northern Europe, mass crop failure and excess deaths, with the mortality rate in England for summer 1783 10-20% above average.

1.2 Policy and Governance

The UK's crisis management framework is premised on Integrated Emergency Management (IEM), a holistic approach to preventing and managing emergencies that entails six key steps: anticipation; assessment; prevention; preparation; response; and recovery. This section explains key terms, processes and principles.

Key terms

The terms 'emergency', 'response' and 'recovery' are used frequently in UK government guidance on crisis management. They are defined as follows:

Response

Response encompasses the decisions and actions taken to deal with the immediate effects of an emergency. It is the decisions and actions taken in accordance with the strategic, tactical and operational objectives defined by emergency responders. At a high level these will be to protect life, contain and mitigate the impacts of the emergency and create the conditions for a return to normality. In many scenarios it is likely to be relatively short and to last for a matter of hours or days – rapid implementation of arrangements for collaboration, co-ordination and communication are, therefore, vital. Response encompasses the effort to deal not only with the direct effects of the emergency itself (e.g. fighting fires, rescuing individuals) but also the indirect effects (e.g. disruption, media interest).²¹⁵¹

Recovery

In contrast, recovery may take months or even years to complete, as it seeks to support affected communities in the reconstruction of the physical infrastructure and restoration of emotional, social and physical well-being. The process of rebuilding, restoring and rehabilitating the community following an emergency or disaster, continues until the disruption has been rectified, demands on services have been returned to normal levels, and the needs of those affected have been met. Recovery is defined as the process of rebuilding, restoring and rehabilitating the community following an emergency. Although distinct from the response phase, recovery should be an integral part of the response from the very beginning, as actions taken during the response phase can influence the longer-term outcomes for a community.²¹⁵²

²¹⁵¹ Emergency Response and Recovery: Non statutory guidance accompanying the Civil Contingencies Act 2004, revised October 2013, p.10.

²¹⁵² Ibid.

Emergency

The Civil Contingencies Act 2004 establishes a coherent framework for civil security and civil protection in the UK. Part 1 defines an emergency as:

- *an event or situation which threatens serious damage to human welfare in a place in the UK;*
- *an event or situation which threatens serious damage to the environment of a place in the UK; or*
- *war, or terrorism, which threatens serious damage to the security of the UK.*²¹⁵³

The definition of ‘emergency’ is concerned with consequences, rather than the cause or source. Therefore, an emergency inside or outside the UK is covered by the definition, provided it has consequences inside UK territory (up to 12 nautical miles off the UK coast).

Government guidance uses the term emergency:

*...to encompass all challenges that require the use of assets beyond the scope of normal operations and require a special deployment. The term “major incident” is commonly used by emergency services personnel to describe events or situations which would constitute an emergency as defined in the CCA regime; this is the threshold of event or situation that will initiate a response under their major incident plans. These terms refer to the same threshold and are essentially interchangeable.*²¹⁵⁴

Integrated Emergency Management

The UK’s crisis management framework is founded on Integrated Emergency Management (IEM), a holistic approach to preventing and managing emergencies that entails six key steps: anticipation; assessment; prevention; preparation; response; and recovery.

²¹⁵³ Civil Contingencies Act 2004, Part 1, Article 1, Paragraph 1.

²¹⁵⁴ Emergency Response and Recovery: Non statutory guidance accompanying the Civil Contingencies Act 2004, revised October 2013, p.11.

Figure 53: Integrated Emergency Management cycle

The principles of IEM were agreed upon following a spate of emergencies in the late 1980s and early 1990s, which included the London King's Cross underground station fire, terrorist bombings, air crashes, oil rig explosions, floods, the 1987 hurricane, the sinking of the *Machioness* pleasure boat and the 1989 Hillsborough stadium disaster.

Under IEM, the preparation for, response to, and recovery from emergencies focuses on the consequences and wider impacts of events rather than their causes. IEM emphasises the development of flexible emergency plans that enable organisations to deal effectively with an incident, whether foreseen or unforeseen.

Principles of effective emergency response and recovery

Accordingly, while the UK government has published a common set of underlying principles to govern emergency response and recovery in the UK at all levels (both local and national), it emphasises that arrangements must be flexible and that these guidelines are “not intended to be prescriptive or an operations manual as there is no single approach that will meet the needs of every area, nor is there one single set of organisational arrangements that will be appropriate to each and every type of emergency.”²¹⁵⁵ Government guidance sets out eight principles to govern response and recovery efforts for every emergency in the UK:

Anticipation is crucial to both the pre-emergency and post-emergency phases. As with the first phase of the IEM process, it is important for organisations to actively ‘horizon-scan’ for risks and potential emergencies. During emergencies, it is important to anticipate the disparate direct and indirect impacts of emergencies may not be immediately apparent in high pressure, uncertain and demanding circumstances. Finally, an important aspect of anticipation is addressing recovery issues

²¹⁵⁵ Ibid. p. 8-9.

at the earliest possible opportunity, ensuring that the response and recovery effort is fully integrated.

Preparedness: All individuals and organisations that might play a part in the response and recovery effort should be appropriately prepared. They should have a clear understanding of their roles and responsibilities and how they fit into the wider, multi-agency picture.

Subsidiarity: The UK's approach to emergency response and recovery is founded on a bottom-up approach in which operations are managed and decisions are made at the lowest appropriate level. National and sub-national tiers often have little or no input and will become involved only when necessary.

Direction: During an emergency, those responsible for managing the response and recovery effort often face a plethora of competing demands and pressures. In some cases an array of organisations from across the public, private and voluntary sectors will be involved in responding to an emergency and their activities will need to be co-ordinated. It is therefore essential to establish clearly defined and unambiguous aims and objectives so as to create a shared set of priorities and focus resources. This is usually the responsibility of the Strategic Co-ordinating Group (SCG, see section 3.1).

Information: Maintaining the flow of information during an emergency (within organisations and also to partners and the general public) can be challenging but is crucially important to its successful resolution. The collation, assessment, verification, translation and dissemination of information should therefore be underpinned by appropriate information management systems. This will help decision-makers strike an appropriate balance between ensuring that decisions are well informed and acting swiftly and decisively. It will also help to furnish the public with appropriate advice, warnings and information to provide reassurance and a basis for any necessary action.

Integration: Responding and recovering from emergencies can involve multiple organisations and agencies from local, sub-national and national levels, each of which will have different roles and levels of involvement. It is therefore crucial that their contributions are integrated and clearly defined structures put in place to ensure that they combine and act as a coherent multi-agency group and are able to consult, agree and make decisions on key issues.

Co-operation: Emergency response and recovery brings together organisations with no formal or established relationship and it is therefore important to foster trust and understanding. Organisations must understand each other's functions, ways of working, priorities and constraints. Decision making should be inclusive and information sharing and openness encouraged.

Continuity: Emergency response and recovery should be grounded in tried and tested arrangements and established structures should be preserved as much as possible. Organisations working on a day-to-day basis in the relevant field have a large role to play because their experience, expertise and resources are invaluable.

1.2.1 Strategy scope and focus

The principles of IEM used to formulate the UK's strategic approach to crisis management recognise the importance of emergency prevention, preparedness, response, and recovery. This is reflected in the Civil Contingencies Act, which obliges local responders to have emergency plans in place for each of these phases.

The government has been criticised, however, for focussing insufficiently on the prevention and preparedness phases of emergency planning. Britain's level of participation in major EU and NATO exercises has been criticised in the past by the House of Lords European Union Select Committee as "unacceptably low" (see section 3.2). While in March 2011, the House of Commons Science and Technology Select Committee highlighted the volcanic ash emergency of April 2010 as "a clear example of how a lack of risk assessment and preparation can hamper the emergency response".²¹⁵⁶

The May 2013 peer review of the UK's implantation of the Hyogo Framework for Action - a ten-year guideline to reduce vulnerabilities to natural hazards - argued that the UK should strengthen both emergency prevention and preparedness: "A new momentum should enlarge the focus of the UK resilience approach from emergency preparedness and response towards more prevention and vulnerability reduction"²¹⁵⁷ (see section 1.2.3).

1.2.2 Monitoring and analytical support to policy making; R&D

When conducting risk assessment the government may elect to seek scientific expertise, both from internal and external experts. A combination of this advice, expert judgement and historical and statistical data can then be used to estimate the approximate likelihood of an emergency occurring (see section 1.1). Local responders and LRFs can also use local experts to help meet their CCA responsibilities to conduct risk assessment.

In the emergency planning phase, LGDs and the Devolved Administrations can use Science Advisory Groups (departmental or national led scientific or technical advisory groups focused on or used to inform emergency management) to commission new research and draw on a range of experts to ensure that their preparation is informed by science. As of 2011, every individual government department has a departmental Chief Scientific Adviser. They sit on the Chief Scientific Adviser's Committee, along with the Government's Chief Scientific Advisor (the personal adviser on science and technology-related activities and policies to the Prime Minister and the Cabinet; and head of the Government Office for Science).

SAGE can review and validate existing research and identify areas where new research should be commissioned. Cabinet Office *Enhanced Sage Guidance* states:

To ensure quality advice that can be provided in a timely fashion, the aim should be to avoid this situation by formulating scientific and technical advice during the planning phase. The

²¹⁵⁶ House of Commons Science and Technology Committee Report: Scientific advice and evidence in emergencies, March 2011, p.73: <http://www.publications.parliament.uk/pa/cm201011/cmselect/cmsctech/498/498.pdf>

²¹⁵⁷ Building resilience to disasters: Assessing the implementation of the Hyogo Framework for Action (2005-2015): Peer review report United Kingdom, May 2013, p.12. http://www.unisdr.org/files/32996_32996hfaukpeerreview20131.pdf

*commissioning of new research will need to be considered and authorised by the relevant department which will take in to account the provision of funds.*²¹⁵⁸

The guidance also suggests that it is good practice for all scientific and technical advice to be frequently reviewed in order to reflect the latest evidence and lessons learned. *“Where possible advice provided during an emergency should build - upon advice, evidence and research formulated during the risk assessment, planning and preparation phases and should be reviewed and incorporated into plans and guidance following the emergency.”*²¹⁵⁹

However, the government has been criticised in recent years for failing to utilise scientific expertise in the preparation phase of emergencies. In March 2011, the House of Commons Science and Technology Select Committee published a report titled *Scientific advice and evidence in emergencies* which stated: *“we are concerned that the Government's attitude to scientific advice is that it is something to reach for once an emergency happens, not a key factor for consideration from the start of the process. We conclude that scientific advice and an evidence-based approach must be better integrated into risk assessment and policy processes early on.”*²¹⁶⁰

In terms of scientific support for other Crisis Management policy areas, the UK Economic and Social Research Council has funded academic research into various topics related to emergency prevention, preparedness, response, and recovery. This includes topics such as “Detecting Terrorist activity”,

“Enhancing resilience across all aspects of national infrastructure”, “Global Uncertainties” and “Ritual, community and conflict”.²¹⁶¹

1.2.3 Policy for Prevention

Like most facets of the UK’s crisis management framework, emergency prevention is grounded on the day-to-day work of local responder organisations. The CCA requires Category 1 responders to maintain plans for preventing emergencies. This refers primarily to the sort of prevention possible during the short period of time before an emergency occurs when it might be averted by prompt or decisive action. CCA statutory guidance states:

“Plans should be maintained for the purpose of ensuring that if an emergency is likely to occur, the organisation can perform its functions to prevent the emergency...emergencies under this aspect of the Act should be ‘nipped in the bud’ in the way that fire-fighters stop a fire from spreading.”²¹⁶²

The other form of prevention included in the CCA is that based on pre-emptive actions, such as the emergency services’ decision to mobilise proactively on New Year’s Eve to deal with potential incidents. Public health organisations immunising the public against the spread of influenza is cited as another example of emergency prevention. The CCA does not impose a duty on Category 1 responders to prevent all emergencies, nor does it oblige organisations to undertake remedial works which might prevent future emergencies.

The May 2013 peer review of the UK’s implantation of the Hyogo Framework for Action identified areas for improvement in the current crisis management framework’s capacity to prevent emergencies. The report advised that “additional dissemination of information to the public would help to strengthen not only preparedness but also prevention”²¹⁶³ and proposed that:

A new momentum should enlarge the focus of the UK resilience approach from emergency preparedness and response towards more prevention and vulnerability reduction. In particular, risks with potentially large impacts and high likelihoods, especially when these are growing, could be better managed through vulnerability reduction than through preparing and responding to the event. Floods and droughts are examples of the types of risks that may require more long-term, whole-of-society approaches to their reduction, as climate change may have an impact on those in the future.”²¹⁶⁴

²¹⁶⁴ Ibid.

1.2.4 Policy for Preparedness

The UK's crisis management framework emphasises local preparedness. Category 1 responders have comprehensive emergency planning duties under the CCA. They are required to: conduct risk assessment (through the Community Risk Register); formulate emergency plans and business continuity plans; regularly test the effectiveness of these plans through exercises; train key staff and the staff of appropriate voluntary organisations; and provide the public with information on the risks posed by emergencies. Local communities are also encouraged to make plans for emergencies that complement the role of the emergency services as part of community resilience.

The Cabinet Office's Civil Contingencies Secretariat (CCS), the principal governmental authority responsible for coordinating crisis management, has overall responsibility for ensuring emergency preparedness at both national and local level and manages the National Resilience Capabilities Programme (see section 1.5). It is tasked with improving government systems "for identifying new challenges, for assessing risks, for anticipating, planning, preparing and exercising for crises, for building up our resilience to them, and for systematically applying the lessons learned from particular incidents."²¹⁶⁵ The core function of the CCS is to enhance UK resilience by bolstering the national capacity and capability to deal with emergencies. It works in close partnership with government departments to:

- *enable and protect their own decision takers;*
- *develop their own early warning systems;*
- *prepare plans against various eventualities and make sure those plans are properly integrated with those of other departments and agencies;*
- *identify the training and exercises needed to test the plans and enable continuous improvements;*
- *build up the necessary management and professional expertise to maintain and activate the plans and to know where to turn for reinforcement and augmentation;*
- *learn, and share their learning, with other departments.*²¹⁶⁶

Government departments also have individual responsibilities for emergency planning, staff training and exercising, and may be the LGD for a National Resilience Capabilities Programme workstream.

²¹⁶⁵ The Role of the Lead Government Department in Planning for and Managing Crises, January 2011, p.3. https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/61356/lead-government-department-framework.pdf

²¹⁶⁶ Ibid. p.4.

1.2.5 Policy for Response

The UK's approach to emergency response and recovery is bottom-up, with operations managed and decisions made at the lowest appropriate level. Government guidance emphasises that “local agencies are the building blocks of response and recovery operations” and indeed, most emergencies are dealt with at local level with little or no input from sub-national or national levels.

*The role of central government and the devolved administrations is to support and supplement the efforts of local responders through the provision of resources and co-ordination. The central and sub-national tiers will only become involved in emergency response and recovery efforts where it is necessary or helpful to do so.*²¹⁶⁷

See section 3 for detailed information on the organisational arrangements of emergency response.

1.2.6 Policy for Relief and Recovery

Guidance

The CCS's non-statutory guidance to the CCA, *Emergency Response and Recovery*, details the multi-agency structures and processes that can be used during the recovery phase of an emergency. It emphasises that recovery is a complex, long running and resource intensive process that requires the involvement of many more agencies and participants than the response phase. The recovery phase should be based on tried and tested structures and procedures and begins at the earliest possible opportunity, operating in tandem with the response phase to an emergency.

National Recovery Guidance aimed primarily at local responders was produced by the Cabinet Office's National Recovery Working Group in 2007. Updated frequently with recent case studies and new best practice policy, the guidance is developed in accordance with the CCA and contains topic sheets on a wide range of recovery issues, a recovery plan guidance template, and over 100 case studies from incidents and exercises.

Policy

Emergency Response and Recovery identifies recovery support as an enabling and supportive process designed to assist affected communities towards management of their own recoveries. It is most effective when conducted at the local level with the active participation of the private sector, the voluntary sector and the wider community. The Cabinet Office outlines four interlinked categories of impact that individuals and communities will need to recover from: environmental; economic; infrastructure; and humanitarian assistance (including health needs). Recovery capability, planning and training, is built around these four key themes.

²¹⁶⁷ Emergency Response and Recovery: Non statutory guidance accompanying the Civil Contingencies Act 2004, revised October 2013, p.18.

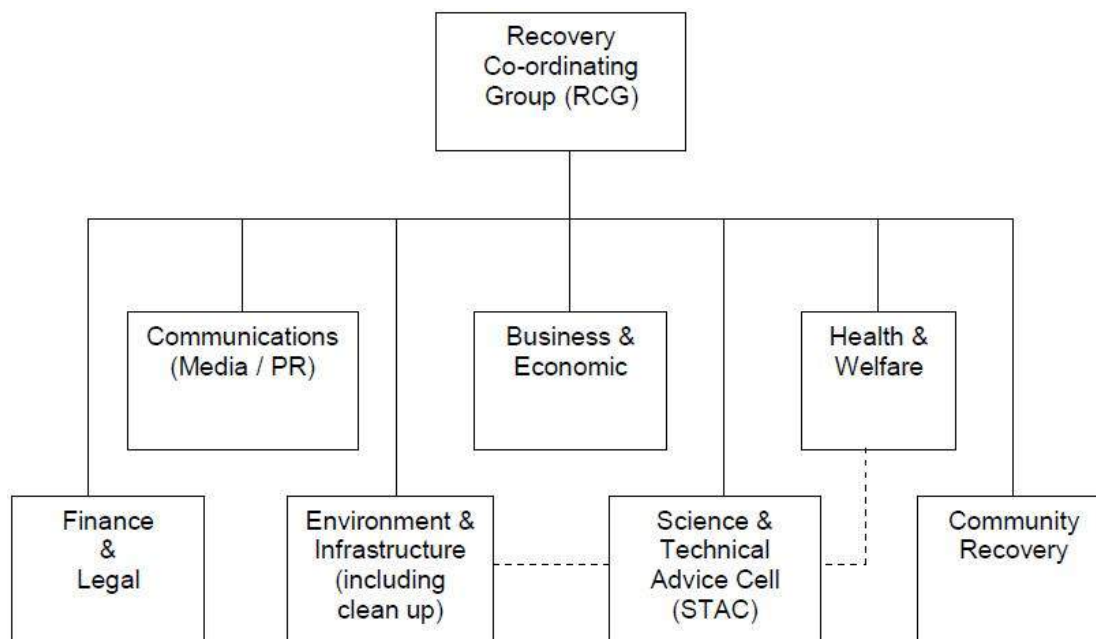

Organisational roles and responsibilities at local level

Local authorities are responsible for planning for the recovery of communities in the aftermath of emergencies. Government guidance recommends that a Recovery Co-ordinating Group (RCG) be set up by a local authority on the first day of an emergency to run in parallel with the SCG. The RCG is principally responsible for developing a recovery strategy and will report to the SCG. When the initial crisis response is complete, responsibility for coordinating the recovery phase will be passed from the SCG to the RCG at a formal meeting.

Local authorities are responsible for planning for the recovery of communities in the aftermath of emergencies. A local authority will usually chair and provide the secretariat for the RCG, coordinating the multi-agency response with help from Category 1 and 2 responders, voluntary organisations and any other relevant agencies via the LRF. Government guidance states that the size and organisation of an RCG varies according to the practicalities of each emergency, but suggests the structure shown in Figure 4.

Neighbouring local authorities are required to have organisational arrangements in place setting out how the recovery response will be coordinated for emergencies that cross local authority boundaries. Typically a single RCG will be created with a designated lead local authority acting as chair. Similarly, if an emergency crosses LRF boundaries guidance recommends that a Multi-LRF RCG be created to ensure “consistency of approach, reducing duplication of effort, minimising the burden on responders, and facilitating the sharing of information, support and mutual aid.”²¹⁶⁸ As with all crisis management arrangements in the UK, the RCG would observe the principle of subsidiarity whereby all recovery related decisions would be taken at the lowest possible level.

Figure 54: Recovery structures and organisations

Source: *Emergency Response and Recovery*, non-statutory guidance accompanying the Civil Contingencies Act 2004

²¹⁶⁸ Ibid. p.91.

Organisational roles and responsibilities at national level

If the Cabinet Office agrees that ongoing national support is required, a formal handover will take place between the LGD for response and the LGD for recovery. The same department may retain responsibility for both phases, but often the evolving nature of the challenge, the different issues that arise and the expertise required mean that a different department is better situated to lead the recovery phase. In emergencies that effect wide geographical areas it is possible that response and recovery activity will be occurring simultaneously in different parts of the country under the leadership of two different LGDs. Consideration can also be given for the establishment of Ministerial cross-departmental Recovery Group. As with crisis response, a Department for Communities and Local Government's Resilience and Emergencies Division or LGD liaison officer(s) will act as the main point of contact between local responders and central government.

When an emergency has occurred in, or affected, a devolved administration and the UK government has retained responsibility for leading the emergency response, the Cabinet Office and the LGD will agree with the affected devolved administrations how the recovery process should be managed.

1.3 Financing

1.3.1 Investing in preparedness

The government operates The Bellwin Scheme of Emergency Financial Assistance to Local Authorities to provide financial assistance for the costs incurred during the response phase of an emergency. Any local authority can claim under the scheme if they incur expenditure in the course of responding to an emergency that involved the destruction of or danger to life and property.²¹⁶⁹ Enhancements were made to the scheme in 2014 "to reflect the exceptional nature of recent storms and the role councils play as first responders". Bellwin grants are now paid at 100 percent above threshold instead of 85 percent.²¹⁷⁰

The Bellwin scheme applies only to the response phase, with local authorities generally responsible for financing emergency preparedness themselves. The same is true for LRFs which are not fully staffed or supported by a secure funding stream, and in most cases must rely on a voluntary subscription scheme from its members if it is to appointment a full-time coordinator or manager (as CCA statutory guidance suggests).

With regard to total UK funding for emergency preparedness and response, the ANVIL study, an EU co-funded security research project, found that:

British policy-makers certainly agree upon one thing: that it is extremely difficult to calculate the exact amount of money allocated for civil security in the UK. None of the interviewees of

²¹⁶⁹ Full details of how the scheme works are available on the Department for Communities and Local Government website: <https://www.gov.uk/government/publications/bellwin-scheme-2013-to-2014-guidance>

²¹⁷⁰ Department for Communities and Local Government, Flood Support Schemes - Funding available from central government, March 2014, p.8. https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/312180/Summary_of_Support_Guide.pdf

the present study has presented us with a clear answer on this matter. This is mainly because budget issues on civil security are not centrally managed by the government. In each county, there is a certain amount allocated by the local authorities for crisis management and risk assessment. Apart from that, each category 1 responder can have funds coming from the government department to which they belong (for instance the police can be aided by the Home Office). This also means that funds for civil security may not come exclusively from the Home Office; for example, the Ministry of Defence sponsors 'Search and Rescue' (SAR) operations, which can be conducted not only abroad but also in the homeland. Last but not least, emergency services at the local level may be distinct legal entities with the ability to impose local taxation, a portion of which can be dedicated to emergency preparedness and response. All these result in a rich variation of the available resources and of respective civil security capacities from county to county in the UK.²¹⁷¹

What is clear to the study is that after the 2005 London bombings, government counter-terrorism funding increased significantly, and that this spilled over to civil security issues. Increased funding led to the modernisation of civil security infrastructure, "always with a high emphasis on preventing a major civil crisis due to a terrorist attack".

Although not providing a breakdown of how resources are allocated between government departments, the ANVIL study cites national statistics for total government expenditure (expressed in GDP percentages) in fields associated with civil security as an indicator of total financing.

Table 37: Eurostat Indicators of government expenditures 2007-2011

Category of Expenditure	2007	2008	2009	2010	2011

1.3.2 Investing in consequence management

An independent review of 2007's exceptionally severe flooding, chaired by Sir Michael Pitt, reaffirmed local authorities' responsibility to make arrangements to bear the costs of the recovery phase in the majority of emergencies. Councils are responsible for conducting their own risk assessments and putting in place the right balance of insurance, self-insurance and reserves, to provide both security and value for money for their communities.

However, in response to the Pitt Review the government did put together, for the first time, a financial package to assist affected local authorities with the costs of recovery in the event of an "exceptional emergency". In such circumstances, individual government departments (namely the Department for Communities and Local Government, the Department for Education, the Department for Environment, Food and Rural Affairs, and the Department for Transport) will consider at ministerial level whether to provide financial support for aspects of the recovery effort.

Recovery phase funding can also be applied for under the EU Solidarity Fund which was established in 2002 to provide financial assistance in the aftermath of major natural disasters. To be eligible for funding total direct damage caused by the disaster must exceed 3.2 billion euros or 0.6% of the country's gross national income, whichever is the lower. The UK has benefitted from the fund once, when it was granted 162.3 million Euros to help with damage caused by the June 2007 floods.

If the armed forces are called on to support the response and/or recovery phases of an emergency, Treasury rules stipulate that the cost of this activity cannot come from the defence budget and instead must be recovered by the Ministry of Defence (MoD). The only exception is that where there is a direct threat to life, MoD Ministers may, at their discretion, decide it is in the national interest to waive part or all of the costs incurred for assistance provided in the response phase. When human life is not at risk, civil organisations will be required to meet all or some of the MoD's costs. In some cases the MoD is only prepared to provide niche capabilities on the understanding that other departments or agencies are prepared to fund all or part of the costs (see section 4.3). Military assistance in the recovery phase will be charged for at rates determined by the MoD.

1.4 Policy review, Evaluation & Organisational Learning

Debriefing

Cabinet Office CCA non-statutory guidance emphasises the importance of record-keeping during emergencies to facilitate operational debriefing and provide evidence to any enquiries that may later be held. Single-agency and inter-agency debriefing processes should therefore be in place to capture information while memories are fresh. All debriefs should be effectively chaired, preferably by someone who has not been involved in the emergency or exercise. A secretary should also be appointed to ensure a record of the discussion is produced.

There should also be a continual process for debriefs throughout the recovery phase to capture issues identified, recommendations to be implemented, and planning assumptions to be reviewed. It should identify issues from all partners involved in the recovery process and involve the local

community (including businesses) at all stages. However, there is no specific guidance on how to carry out recovery debriefs. Instead the non-statutory guidance makes a series of general recommendations for good practice based on the experiences of recent emergencies. It suggests that internal debriefs within each organisations should be held first, with findings then brought together in a multi-agency debrief (at the RCG or LRF). A strategy for canvassing public opinion should be developed and agreed upon. This might include the use of questionnaires, focus groups, websites and existing networks (community groups and parish councils for example). Any documents produced should be held for five years and a recovery debrief report released into the public domain in a timely fashion.

Lessons learned

In January 2011, the Cabinet Office published the policy paper *Lessons identified from UK exercises and operations: a policy framework* to formalise existing arrangements for identifying, acting upon and implementing lessons learned from emergency operations and training exercises. How well these lessons are incorporated into civil contingency policy is uncertain and it is perhaps telling that government guidance generally refers to ‘lessons identified’ rather than ‘lessons learned’ (see below).

The policy framework reaffirms the CCA’s requirement of Category 1 responders to “capture and assess lessons emerging from exercises and emergencies” and recommends a formal role for LRFs “in reviewing on a regular basis lessons emerging from significant emergencies and exercises in their area.”²¹⁷² Accordingly, lessons learned from debriefing processes can be collated and distributed in a multi-agency environment at local and regional forums such as an LRF or [Department for Communities and Local Government Resilience and Emergencies Division \(DCLG RED\)](#). Lessons learned that are relevant at a national level can be passed by a DCLG RED to the CCS in the Cabinet Office where subsequent action by government departments can be coordinated.

Where lessons learned would be of interest to other LRFs or responders in other parts of the country, they can be flagged by the DCLG RED or relevant devolved administration authority and disseminated via their networks. The Cabinet Office policy framework suggests that “for emergencies of national significance, a lessons learned workshop or conference should be organised by either the local or regional resilience forum, as appropriate, in order to share learning with other responders.”

For emergencies that require intervention by central government, *The Central Government Arrangements for Responding to an Emergency - Concept of Operations* requires LGDs to “account to Parliament and lead in the submission of evidence to any subsequent Government-appointed or independent inquiry” and to “identify, learn and share the lessons” from the planning, response and recovery stages of an emergency. Following an emergency the LGD is required to produce a post-incident report within three months of the end of the response phase and should consider publishing a separate report on lessons learned from the recovery phase of the emergency.

²¹⁷² Cabinet Office policy paper - Lessons identified from UK exercises and operations: a policy framework, November 2011. https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/61349/lessons-learned-exercises-framework.pdf

Where lessons are identified, all government departments have a responsibility to consider how the defined areas of policy, planning and procedure for which they are responsible might be reviewed and revised accordingly.

The CCS has overall responsibility for lessons learned at government level and, according to the Cabinet Office policy framework, should facilitate an annual lessons learned seminar with national, regional and local stakeholders. The seminar is designed to “present key lessons from exercises and operations in an environment that will facilitate learning and ensure lessons identified are shared as widely as possible.”

The policy framework also requires the CCS to establish a system for collating “strategic or cross-cutting” lessons learned that have been submitted by individual government departments. The system should allocate responsibility to “act upon, investigate or clarify individual lessons” and ensure that it is implemented at national level (by amending LGD plans and procedures and the Central Government Concept of Operations for the response to an Emergency) and at local level (through informal guidance, amendment to statutory guidance and the revision of training courses).

Examples of Lessons learned

The Pitt Review of 2007’s exceptionally severe flooding published its final report in June 2008. In April 2010 the government passed the Flood and Water Management Act 2010, which implemented many of his recommendations including the introduction of a strategic overview role for the Environment Agency and a new leadership role for local authorities.²¹⁷³ His recommendation of greater oversight of flood risk plans by scrutiny committees was incorporated via the Local Democracy, Economic Development and Construction Act 2009, and was reaffirmed in the Localism Act 2011. The review also prompted considerable scrutiny of flood management plans at the local level, for example in Devon in 2009²¹⁷⁴, in South Staffordshire in 2010²¹⁷⁵, and in Gloucestershire in 2011.²¹⁷⁶ Each county produced their own review, the findings of which were implemented.

The Pitt Review also led, for the first time, to government financial aid to assist affected local authorities with the costs of recovering from emergencies (see section 1.3.2). Sector Resilience Plans for UK critical infrastructure were also introduced under Recommendation 51 of the Pitt Review (see section 1.5).

Lessons identified after the 7 July 2005 London bombings found that the effectiveness of emergency response had been undermined by the misinterpretation and overzealous application of the Data Protection Act 1998. Accordingly, in February 2007 the Cabinet Office published detailed non-statutory guidance titled *Data Protection and Sharing - Guidance for Emergency Planners and*

²¹⁷³ The UK government had implemented 43 of the Pitt Review’s 92 recommendations by January 2012. https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/69489/2012-01-31-pb13705-pitt-review-progress.pdf

Criticism

A November 2012 study by the National Institute for Health Research found flaws in the UK civil contingency system's capacity to transfer knowledge and experience and to implement lessons identified by debriefing processes. The study talked to 17 experts working in the field and found that:

*"From the interviews, a common and recurrent theme was concern voiced with regards to whether the emergency planning community learnt from emergencies. For example, not all events were reviewed. Where some reviews are conducted following emergency events, some debriefing may occur and lessons are identified. However, these do not always translate into enduring organisational change."*²¹⁷⁷

Further, when lessons were considered to have been learned "there was little evidence of these lessons being revisited later to confirm changes in organisational or individual behaviour."²¹⁷⁸ An emergency planning academic and technical expert interviewed by the study said:

"I was once interviewing an emergency planner as part of a panel for a job and he said, 'Lessons learned - we've dealt with all of them.' So I just looked at him and said, 'What do you mean you've learned the lesson?'
'Well we had an action plan.'
'But how do you know it was learned?'
'Well because we had an action plan.'
'No, how do you know that learning was embedded? How do you know that meant changed behaviour, changed attitudes, changed culture?'
*'Ah well, erm' is what you got from them. So I firmly believe if you talk about lessons learned you embed this feeling that you've actually learnt the lesson when actually all you've done is identify it."*²¹⁷⁹

Explanations given for this lack of reflecting learning included lack of time, competing organisation pressures and attempts to avoid blame for operational failures. The report identifies the need for a "professional culture shift towards a much more evidence-based approach to emergency management" in which international evidence could be integrated to fill gaps in local knowledge. Currently there is a "tendency to disregard knowledge from sources outside the UK as irrelevant to the local context. This view ignores a substantial body of knowledge on emergency planning from around the world, and in particular the United States."²¹⁸⁰

1.5 Resilience

The government defines resilience as “the capacity of an individual, community or system to adapt in order to sustain an acceptable level of function, structure, and identity.”

The National Security Strategy states that one of the UK government’s key tasks is to improve the resilience of the infrastructure most critical to keeping the country running against attack, damage or destruction. Accordingly, Cabinet Office guidance promotes the building of a more resilient society that is better prepared for and more able to recover from emergencies. It emphasises the collective nature of this endeavour:

“This responsibility needs to be shared between central and local government and the emergency services, the private sector (particularly those providing essential services to the public), civil society and communities. Our efforts to improve our ability to prepare for, respond to, and recover from emergencies therefore go beyond those organisations with legal obligations in this area.”²¹⁸¹

The National Resilience Capabilities Programme is the core framework through which the government seeks to build resilience across all parts of the UK. It identifies challenges and monitors current levels of capability in policy areas covered by 22 different workstreams. A LGD is responsible for each workstream, with the CCS responsible for the overall management of the programme and oversight coming from the National Resilience Capabilities Programme Board and, ultimately, from the Ministerial Sub-Committee on Resilience, which is chaired by the Prime Minister. Each LGD must gather information available at local and national levels and assess the level of workstream capability, before reporting their findings to government ministers.

Infrastructure resilience

The Infrastructure and Corporate Resilience Programme was established in March 2011 under the remit of the CCS to enable public and private sector organisations to develop the resilience of their infrastructure, supply and distribution systems to disruption from all risks.

In October 2011 it published the guide *Keeping the country running: natural hazards and infrastructure* “to support infrastructure owners and operators, emergency responders, industry groups, regulators, and government departments to work together to improve the resilience of critical infrastructure and essential services”.²¹⁸²

Since 2009, the LGD sponsoring each infrastructure sector has been required to produce an annual Sector Resilience Plan, setting out the resilience of the UK’s most important infrastructure to the relevant risks identified in the NRA. The plans are then placed before ministers to alert them to any perceived vulnerabilities along with an action plan for improving resilience where necessary. Sector Resilience Plans were introduced under Recommendation 51 of the Pitt Review and “are now a key

²¹⁸¹ Cabinet Office website: <https://www.gov.uk/government/policies/improving-the-uks-ability-to-absorb-respond-to-and-recover-from-emergencies/supporting-pages/building-a-resilient-society>

²¹⁸² Cabinet Office guidance - Keeping the Country Running: Natural Hazards and Infrastructure, October 2011, p.5. https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/61342/natural-hazards-infrastructure.pdf

driver within Government to support and enable the continuous improvement in the resilience of critical infrastructure.”²¹⁸³ Individual plans are classified, but the Cabinet Office produces an annual summary of all departments’ plans into one overall sector resilience plan for critical infrastructure²¹⁸⁴:

- *In 2010, sector resilience plans focused on the resilience of the UK’s critical national infrastructure to flooding.*
- *In 2011, sector resilience plans extended the scope to allow assessment of other natural hazards and/or less critical assets.*
- *In 2012, sector resilience plans extended the scope to allow assessment of the sector’s most important infrastructure to all risks (hazards and threats)*

Community resilience

Community resilience involves “communities and individuals harnessing local resources and expertise to help themselves in an emergency, in a way that complements the response of the emergency services”.²¹⁸⁵ Cabinet Office guidance proposes that by using local area risk assessments published by LRFs under the CCA to identify and plan for the risks posed by severe emergencies, communities can be better prepared, quicker to respond and in many cases better equipped to recover from an emergency. A community resilience programme has been in place since 2008 to support existing community initiatives, disseminate these successful activities in other areas and raise awareness and understanding of local emergency response capability.

The May 2013 peer review of the UK’s implantation of the Hyogo Framework for Action found that:

*Despite efforts by the Government to educate and provide detailed information, changing people’s behaviour and making individuals personally responsible remains a challenge: the culture of prevention and risk awareness is still seen as low (reportedly around 12 per cent among the general population).*²¹⁸⁶

Business Continuity Management

Business Continuity Management (BCM) involves identifying a business’s main products and services, along with the critical activities necessary to produce them, and devising strategies to ensure continuity of service in the event of disruption caused by an emergency, and for effective recovery afterwards. Guidance emphasises the vital role businesses play in assisting the public during and after an emergency.

The government aims for all businesses to have a clear understanding of how they can become more resilient under BCM and has produced a BCM Toolkit²¹⁸⁷ and a *Business Continuity Guide for*

²¹⁸⁷ Business Continuity Management Toolkit:

Dummies, in partnership with the Business Continuity Institute and Emergency Planning Society.²¹⁸⁸ A Business Continuity Plan should be devised, frequently reviewed, and tested through regular exercises. The CCS's Corporate Resilience Strategy promotes effective but inexpensive ways for smaller businesses to implement BCM.

The CCA requires Category 1 responders to have Business Continuity Plans in place to ensure that they can continue to exercise all functions - not just those that relate to emergency planning - in the event of an emergency, so far as is reasonably practicable. The Act also requires local authorities to provide advice and assistance to businesses and voluntary organisations in relation to business continuity management - an integral part of the Act's wider contribution to building resilience in the UK.

The Business Continuity Management standard ISO 22301:2012 (*Societal security - Business continuity management systems - Requirements*) is widely acknowledged as industry best practice and provides a generic framework that is applicable across the public, private and voluntary sectors. It is supported by ISO 22313:2012 (*Societal security - Business continuity management systems – Guidance*) which provides pragmatic guidance concerning the implementation of BCM. The standards, or their equivalent in the water industry, the Security and Emergency Measures Direction (SEMD), establish the process, principles and terminology of BCM.

1.6 Information sharing and data protection

Category 1 and 2 responders have a duty under the CCA and Contingency Planning Regulations to share information with each other in order to aid emergency planning, response and recovery. CCA statutory guidance considers information sharing to be “a crucial element of civil protection work, underpinning all forms of co-operation.”²¹⁸⁹

*Information sharing is necessary so that Category 1 and 2 responders are able to make the right judgements. If Category 1 and 2 responders have access to all the information they need, they can make the right decisions about how to plan and what to plan for. If they do not have access to all the information, their planning will be weakened.*²¹⁹⁰

Guidance states that “the initial presumption is that all information should be shared”, but that Category 1 and 2 responders must, at all times, have regard for their responsibilities under relevant legislation, such as the Freedom of Information Act 2000 and the Data Protection Act 1998. This includes understanding what information should be controlled, how to obtain consent, how to categorise information, and what the limits of its disclosure are.

An appropriate level of understanding of these obligations was deemed to be lacking in the aftermath of the 7 July 2005 London bombings. The government’s lessons learned programme found that in some parts of the emergency response the requirements of the Data Protection Act were either “misinterpreted or over-zealously applied”.²¹⁹¹ Accordingly, in February 2007 the Cabinet Office published detailed non-statutory guidance titled *Data Protection and Sharing - Guidance for Emergency Planners and Responders* to complement the CCA regime’s existing statutory and non-statutory guidance for Category 1 and 2 responders.

During any emergency, Category 1 and 2 responders must balance the potential damage to the individual against the public interest in sharing the information. Inevitably the balance struck will depend on the specific nature of the emergency in question, and guidance notes that “in emergencies, the public interest consideration will generally be more significant than during day-to-day business.”²¹⁹²

The only circumstances in which the provisions of the Data Protection Act could be disregarded entirely would be through emergency regulations made under Part 2 of the CCA.

Social media

²¹⁸⁹ Emergency Preparedness, statutory guidance to Part 1 of the Civil Contingencies Act: Chapter 3 (Information Sharing), March 2012, p.4. https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/61026/Chapter-3-Formal-information-sharing-revised-March-2012.pdf

²¹⁹² Ibid. p.10.

Social media plays an increasingly prominent role in emergency response, both as a means of warning and advising the public (see section 4.4) but also to “help responders gain a more accurate picture.”²¹⁹³ In policing terms this means using “monitoring tools currently available on the market ...to track online conversations, identify emerging issues and monitor the online communities most influential to the police.”²¹⁹⁴ National Police Improvement Agency guidance *Engage: Digital and Social Media Engagement for the Police Service* claims:

*“These tools continue to help us to understand the policing issues that people are talking about online and how we can best engage with these communities to impact upon confidence in the police.”*²¹⁹⁵

2 Legislation

2.1 Crisis (emergency, disaster) management concept

The principle legal instrument in the field of crisis management is the *Civil Contingencies Act 2004*. This is supplemented by the *Emergency Response and Recovery Non statutory guidance accompanying the Civil Contingencies Act 2004*, published by the CCS. As explained in the previous section, the Central Government's *Concept of Operations* sets out crisis management principles and arrangements in the UK for responding to and recovering from emergencies.

2.2 General crisis (emergency, disaster) management law

Background to the Civil Contingencies Act (CCA) 2004

Following a series of emergencies in 2000-2001 (the fuel crisis and severe flooding in late 2000 and the outbreak of Foot and Mouth Disease in 2001) the government initiated a review of emergency planning regulations. It concluded that existing legislation no longer provided an adequate framework for modern civil protection efforts and that new legislation was required.

Following public consultation on a draft Bill from June to September 2003, the Civil Contingencies Bill was introduced to Parliament on 7 January 2004. The Bill received Royal Assent on 18 November 2004 and henceforth became known as the Civil Contingencies Act 2004.

Statutory basis of the CCA regime

The Civil Contingencies Act 2004 provides a single framework for civil protection in the UK. It sets out the relationship between the central, regional and local tiers within England, as well as covering the relationship between UK central government and the devolved administrations in Scotland, Wales and Northern Ireland.

Accompanying Regulations flesh out the detail of the Act, and it is also supported by statutory guidance *Emergency Preparedness*, published by the CCS and revised in 2012, which sets out how the CCA's duties and supporting regulations should be implemented. The Act, regulations and guidance are together referred to as the CCA regime.

The CCS has also published *Emergency Response and Recovery non-statutory guidance* "to establish good practice based on lessons identified from responding to and recovering from emergencies, both in the UK and internationally." The Cabinet Office has published many more official documents on crisis management and civil security stakeholders often create their own guidance relevant to their particular field. For example, the London Emergency Services Liaison Panel has published eight

editions of a Major Incident Procedure Manual to summarise the responses and responsibilities of each of the emergency services at a major incident in London.

To keep the CCA updated, the government created The Civil Contingencies Act Enhancement Programme. It assesses whether there are aspects of the Act where original intentions are not being met, whether the Act needs updating, how to reflect best practice in the Act and supporting guidance and whether the scope of the Act should be broadened. This has led on several occasions to *Emergency Preparedness Guidance* being updated.

Specialised legislation

Severe specialised risks are covered by Regulations that pre-date the CCA. These Regulations have established multi-agency emergency planning regimes in place. To avoid duplication, CCA Regulations stipulate that the duty to maintain plans under the Act does not apply to emergencies which are dealt with by these pieces of legislation.

- Control of Major Accident Hazards Regulations 1999 (as amended 2005 and 2008) impose requirements with respect to the control of major accident hazards involving dangerous substances. They implement Council Directive 96/82/EC on the control of major accident hazards involving dangerous substances (except Article 12 which relates to land use planning). Site operators are required to produce on-site emergency plans for establishments where a dangerous substance is stored.
- The Pipelines Safety Regulations 1996 are enforced by the Health and Safety Executive to ensure that Major Accident Hazard Pipelines are designed, constructed and operated safely. The Regulations task local authorities with the production of emergency plans or the modification of existing plans, to cover certain major accident hazard pipelines within their area.
- Radiation Emergency Preparedness and Public Information Regulations 2001 implement in Great Britain the articles on intervention in cases of radiation emergency in Council Directive 96/29/Euratom, except where they apply to transport by road, rail, air, sea or inland waterway. The Regulations also partly implement Council Directive 89/618/Euratom on informing the general public about health protection measures to be applied and steps to be taken in the event of a radiation emergency. The Regulations establish a framework of emergency preparedness measures to ensure that members of the public are properly informed and prepared, in advance, about what to do in the unlikely event of a radiation emergency occurring, and provided with information if a radiation emergency actually occurs.

The Energy Act 1976 also contains emergency power provisions which allows for the regulation or prohibition of the production, supply, acquisition or use of fuel during an emergency affecting fuel supplies.

Other legislation regarding industrial emergency planning and safety at sports grounds and events includes:

- Nuclear Installations Act 1965

- The Ionising Radiations Regulations
- The Energy Act (Carbon Capture and Storage) 2008
- Safety of Sports Grounds Act 1975
- Fire Safety and Safety of Places of Sport Act 1987
- The Health and Safety at Work Act 1974
- The Flood and Water Management Act 2010

2.3 Emergency rule

Part 2 of the CCA repeals the Emergency Powers Act 1920 and sets out the government's generic emergency powers legislation. It allows the government to create temporary special legislation (emergency regulations) as a last resort in the most serious of emergencies when both the CCA regime's legislative framework and the emergency provisions of other existing legislation are judged to be insufficient to respond to an emergency in the most effective way.²¹⁹⁶

Emergency regulations can make any provision that could be made by an Act of Parliament or by exercise of the Royal Prerogative and can extend to the whole of the UK including devolved territories. The only Act of Parliament which may not be amended by emergency regulations is the Human Rights Act 1998. This means that, in theory, emergency powers could be used to suspend core constitutional legislation such as the Habeas Corpus Act 1816 and the Parliament Act 1911 (which restricts a parliament to five year terms). This concerned the House of Lords which in 2004 proposed without success an amendment to exempt important legislation from the CCA's emergency power provisions.

Section 22 of the CCA states that "emergency regulations may make any provision which the person making the regulations is satisfied is appropriate for the purpose of preventing, controlling or mitigating an aspect or effect of the emergency." However, the Act's non-statutory guidance emphasises that: "all those powers listed in Section 22 of the CCA will not be collectively available in any specific emergency; the powers actually used must be tailored to the emergency if they are to meet the robust legal tests and safeguards set out in the CCA".

Responsibility for proposing the introduction of emergency regulations and drafting their content falls to the LGD in collaboration with other government departments. The government must then satisfy itself that the conditions of the CCA are being met. The Act stipulates that emergency regulations can only be introduced if the UK or a devolved territory faces serious damage to human welfare, serious damage to the environment or a threat to security from war or terrorism. If these criteria are met the emergency must then satisfy the Act's two additional safeguards which state that emergency powers can only be considered if:

- it is necessary to make provision urgently in order to prevent, control or mitigate an aspect or effect of the emergency when existing powers are insufficient and it is not possible to

²¹⁹⁶ Emergency powers exist in other UK primary legislation such as the Energy Act 1976 which allows for the regulation or prohibition of the production, supply, acquisition or use of fuel during an emergency affecting fuel supplies.

bring forward a Bill in the usual way and there is a need to make the provision by other means;

- and emergency regulations must be proportionate to the aspect or effect of the emergency they are directed at.²¹⁹⁷

Emergency Regulations are made by the Queen by Order in Council on the advice of her ministers. If this is not possible without serious delay, a senior minister may make the regulations by Order. A regulation must be presented to parliament and approved (with or without amendment) within seven days or it will be considered invalid and cease to have effect. If approved, a regulation stays in force for 30 days but can be renewed for a further 30 days at any point if it is considered necessary and proportionate to do so.

CCA guidance emphasises that the timescale for introducing emergency regulations is likely to vary dramatically depending on the scale of the emergency and the number of regulations it requires. In some cases complex legal issues surrounding liability, human rights protection and devolution may be raised, all of which would need to be resolved before emergency regulations could be made. For this reason guidance advises:

*It should be assumed that it will take a minimum of six hours to bring the regulations into effect, or, more likely, a number of days. This must be borne in mind when considering whether it is appropriate to request the use of the powers - if the effects of an incident are expected to be felt in a matter of minutes or to be over in just a few hours, it is extremely unlikely that emergency regulations could be put in place quickly enough to be of any use. In these situations existing “normal” powers, or the Royal Prerogative, can provide legal cover for any action taken.*²¹⁹⁸

When emergency regulations are introduced, the CCA stipulates that the government must appoint a Regional Nominated Coordinator for each region in England to which the regulations relate, and an Emergency Coordinator for each of the relevant devolved administrations. Their primary role would be to facilitate coordination under the emergency regulations, although Coordinators could also be afforded special powers of direction over organisations and the general population and be allowed to requisition property. A body may need to be created to support them in the exercising of their duties.

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

As described in Section 3.1, the UK operates a Lead Government Department principle for emergencies that require intervention by central government. One department typically assumes overall responsibility for crisis management; assessing the circumstances of the emergency, ensuring

²¹⁹⁷ Emergency Response and Recovery: Non statutory guidance accompanying the Civil Contingencies Act 2004, revised October 2013, p.200.

²¹⁹⁸ Ibid p.201.

that its ministers and other relevant ministers are briefed, handling media and parliamentary interest, and providing co-ordinated policy and other support as necessary to local responders. Other government departments, agencies and, if appropriate, the devolved administrations, provide support to the LGD as necessary to ensure a co-ordinated response. The LGD collaborates particularly closely with the Cabinet Office, and the News Co-ordination Centre when activated (see section 4.4).

Often the LGD for recovery is different to the LGD for response. In such cases government guidance emphasises that they would need to work closely from the outset to ensure a smooth transition of responsibilities and that objectives are shared. The LGD for recovery may call on other government departments for support, both for specialist technical and policy advice as well as local knowledge of the area and key contacts to augment their resources. During the transition from response to recovery, DCLG REDs – which advise the LGD, cabinet office and other relevant government departments and provide a liaison function on crisis management and resilience issues below the national level (see section 3.1) – play an important role in ensuring a smooth handover of information, contacts and ongoing actions.

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

While the principles of emergency response and recovery are the same throughout the UK, the management of emergencies that occur in Scotland, Wales or Northern Ireland varies according to the terms of each country's devolution settlement and local administrative arrangements. Consequence management and recovery is generally devolved to the relevant administration in the aftermath of all emergencies.

Each devolved administration has its own emergency planning and lead organisation arrangements including protocols for local responders and systems for coordinating a multi-agency response. Accordingly, even when the UK government reserves competency over an emergency they will typically liaise closely with the relevant devolved administration.

Part 1 of the CCA operates in Scotland and Wales much as it does in England, while in Northern Ireland the Act applies only to a limited number of organisations. Were emergency powers ever to be introduced under Part 2 of the Act, the UK government would be required to appoint an Emergency Coordinator for each of the relevant devolved administrations to facilitate coordination of emergency regulations (see section 2.3).

Scotland

Responsibility for civil protection is largely devolved in Scotland with responsibility resting with the Scottish Resilience Division of the Scottish government. If an emergency relates to an area of devolved responsibility (such as law and order or the environment), the Scottish government will lead the response, liaising as appropriate with the UK government. If the emergency relates to an

area of reserved responsibility (such as national security or nuclear energy) the UK government's lead department will head the response, working closely with the Scottish government.

Even in cases relating to reserved matters, such as terrorism, the Scottish administration will play a full role in response and recovery because a range of devolved matters, such as the emergency services and the NHS, remain the responsibility of Scottish Ministers, and the prosecution of crime is a devolved responsibility of Scotland's Lord Advocate.

At local level, responder organisations coordinate under the auspices of eight SCGs, each formed on the basis of a Scottish Police Force area. They play a similar role to LRFs in England and Wales with responsibility for risk assessment, steering emergency planning initiatives, engaging with the community, running training exercises and overseeing the response to an emergency.

At government level, in the event of an emergency the Scottish Government Resilience Room would be established to inform decision making, ensure cross government coordination of the response and support responders as necessary. If the emergency is UK-wide the Resilience Room would coordinate closely with COBR.

Wales

Responsibility for civil protection is largely non-devolved in Wales, remaining primarily the responsibility of UK government departments. However, the Welsh government has functional responsibility for a number of policy areas (such as health, the environment and fire and rescue) and is primarily responsible for a number of Category 1 and 2 responders. There is a dedicated Welsh government team for handling multi-agency cooperation and engaging with the UK government on issues of emergency planning and response.

The objectives and arrangements for response at the local level in Wales match those in England but take into account devolved functions. LRFs remain the principle mechanism for multi-agency co-operation on civil protection issues.

At government level, Welsh government officials liaise with their UK government counterparts and act as the main point of contact with local responders and SCGs. This structure is set out in the Pan-Wales Response Plan.

When an emergency with a Level 1 impact has occurred or is likely to occur in Wales, the Welsh government will convene the Civil Contingencies Group to provide strategic leadership to emergency response, linking into both the local and national levels as appropriate. The group is chaired by a senior Welsh Government official and comprised of Welsh Government department officials and representatives from organisations relevant to the emergency.

In the event of a Level 2 emergency, or if the Civil Contingencies Group decides that the emergency should be escalated to Level 2, the group will be re-constituted as the Wales Civil Contingencies Committee (WCCC). The WCCC is an advisory body comprising senior government officials and senior experts from Category 1 and 2 responders. Its functions include maintaining a strategic picture of the

evolving situation within Wales, supporting the Government Liaison Team that by this time will have been deployed, and assessing and advising on issues that cannot be resolved at local level. The Welsh Government may also activate the Emergency Co-ordinate Centre (Wales) to link with SCGs and provide briefing and advice to the WCCC, LGD and any other Welsh or UK government department involved in the emergency.

The Welsh Resilience Forum - a non-statutory advisory body - provides a national forum for multi-agency strategic advice on civil protection and emergency planning. The forum meets quarterly and is chaired by the First Minister or the Minister for Social Justice and Regeneration. It provides collective strategic direction to the Wales Capabilities Programme and individual member leadership to the various capabilities sub-groups co-ordinated through a Wales Resilience Partnership Team. It also oversees the Wales Risk Assessment Group which undertakes risk assessment at a pan-Wales level.

A number of other groups provide forums for discussion and the co-ordination of emergency preparedness and response procedures in Wales, including: the Joint Emergency Services Group; the Welsh Borders Resilience Group; the Welsh Government Emergencies Branch and the Wales Media Emergency Forum.

Northern Ireland

Civil protection is largely devolved in Northern Ireland. Responsibility for the strategic coordination and management of most emergencies rests with Northern Ireland government departments (following the LGD principle – see section 3.1) and overall policy and strategy co-ordination lies with the Office of the First Minister and Deputy First Minister. This excludes emergencies relating to terrorism, policing, criminal justice and security, which remain the responsibility of the UK government's Northern Ireland Office. In emergencies of this nature the Northern Ireland Office would activate its Northern Ireland Office Briefing Room arrangements, although the Northern Ireland executive would also activate its own crisis management arrangements because many of the responses required in such emergencies fall within devolved responsibilities.

Emergencies in Northern Ireland are first dealt with locally by the emergency services, district councils and other public services organisations. If an emergency cannot be managed effectively at local level and requires cross-departmental strategic coordination, the Northern Ireland Crisis Management Arrangements will be invoked.

The Crisis Management Group is responsible for setting the overarching strategy of the Northern Ireland government's response to an emergency and has the power to direct the response and commit the resources of the Northern Ireland civil service. It is normally chaired by the First Minister and deputy First Minister acting jointly, and is comprised of other Executive Ministers and departmental senior officials.

The strategic direction set by the Crisis Management Group is supported by the Civil Contingencies Group (Northern Ireland), a pan-Northern Ireland multi-agency forum comprised of senior representatives from Northern Ireland government departments, the Northern Ireland Office,

emergency services, district councils and other organisations relevant to the emergency. The group's functions also include periodically reviewing, researching and briefing member organisations on civil protection policy.

The Crisis Management Group and Civil Contingencies Group (Northern Ireland) are supported by a range of administrative and advisory groups, including a Central Operations Room, a scientific and technical advisory group and liaison arrangements with other co-ordination groups.

These strategic crisis management arrangements, together with provisions for emergency preparedness, are maintained by the Civil Contingencies Policy Branch, located in the Office of the First Minister and Deputy First Minister. The Branch also represents Northern Ireland in policy discussion at UK and international levels.

London

London's patterns of public service provision and government mean that some aspects of civil protection are organised differently. One pan-London LRF covers the whole city, incorporating the Metropolitan Police and City of London Police areas. Each London borough is represented on the LRF by a Borough Resilience Forum which facilitate co-operation and information sharing at the operational level between local authorities and the emergency services. Local authorities are supported in exercising their duties by the London Fire and Emergency Planning Authority which, among other things, helps to develop, maintain and exercise emergency plans for category 1 responders and trains their staff.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

A wide range of voluntary organisations and NGOs, both at local and national level, support the statutory services in the planning, response and recovery phases of most emergencies. These arrangements are generally ad hoc, although their role was clarified by Part 1 of the CCA which requires category 1 responders "to have regard to the activities of bodies whose activities are not carried on for profit" in the course of carrying out their emergency and business continuity planning duties.²¹⁹⁹ CCA guidance states:

*Statutory responders should be aware of the capabilities and capacity of local voluntary organisations and the means of accessing their services, whether as individual volunteers or as members of local or national volunteer organisations. Statutory responders should develop and implement agreed processes for activating call-out mechanisms, and systems for organising, managing, briefing and debriefing volunteers. The voluntary sector should also be included in post-response review and evaluation activity.*²²⁰⁰

Category 1 responders are obliged to consider how the voluntary sector can be involved at every stage, including training and exercising for emergency preparedness. Cabinet office guidance

²¹⁹⁹ Civil Contingencies Act, Part 1, 2, (2) (k)

²²⁰⁰ Emergency Response and Recovery: Non statutory guidance accompanying the Civil Contingencies Act 2004, revised October 2013, p.142.

emphasises that advance planning is essential if the voluntary sector's diverse array of skills and expertise is to be effectively integrated and utilised during the response phase of an emergency. *Emergency Preparedness* guidance states:

*Sound co-operation through the Local Resilience Forum (LRF) processes and directly with individual Category 1 responders should be based on an agreed framework. This structure needs to suit local circumstances, be understood by all concerned and have clearly identified points of contact. These contact arrangements must be kept up to date by regular formal and informal dialogue between each of the participants at local level.*²²⁰¹

Statutory agencies that use volunteers may become responsible for their health and safety, and as such CCA guidance states that "volunteers should be appropriately equipped, trained, supervised and supported by their own organisations."²²⁰² Agencies can use Service Level Agreements, Memorandum of Understanding or other forms of protocol to establish arrangements to identify the level of insurance cover provided by voluntary organisations, the training provided to voluntary sector personnel, or the use of Personal Protective Equipment. When involved in emergency response, the activities of voluntary organisations and NGOs will be subsidised by category 1 responders. *Emergency Preparedness* guidance states that a Memorandum of Understanding should be in place to describe financial arrangements.

The CCS and the British Red Cross established the Voluntary Sector Civil Protection Forum to identify and maximise the voluntary sector's contribution to UK civil protection arrangements and to provide a framework for engagement between the government, emergency services, local authorities and voluntary organisations. The Voluntary Sector Civil Protection Forum is made up of representatives from the voluntary sector, central and local government, devolved administrations, statutory authorities and professional organisations.

2.7 Legal regulations for international engagements of first responders and crisis managers

There are no statutory regulations for deploying first responders and crisis managers overseas. The 2010 Strategic Defence and Security Review commits the UK to working "to ensure that EU civil protection arrangements focus on shared risk assessment and prevention, coordination of mutual assistance, and maximised awareness of critical infrastructure dependencies" (see further section 3.2).²²⁰³ In the event that UK civil servants or civilian experts are committed to overseas missions they are usually seconded, either directly to the governmental agencies of the country in which the programme is being carried out or to international organizations involved in the programme.

²²⁰³ Securing Britain in an Age of Uncertainty: The Strategic Defence and Security Review, October 2010, p. 63.

3 Organisation

England consists of 34 two-tier counties, 32 London boroughs and 1 City of London or Greater London, 36 metropolitan counties and 46 unitary authorities. Northern Ireland consists of 26 district council areas and Scotland and Wales has 32 and 22 unitary authorities respectively.

England is subdivided into nine administrative regions. Greater London has an elected Assembly and Mayor, but the other regions have a minor role, with unelected regional assemblies and Regional Development Agencies. Below the regional level and excluding London, England has two different patterns of local government in use. In some areas, there is a county council responsible for services such as education, waste management and strategic planning within a county, with several district councils responsible for services such as housing, waste collection and local planning. These councils are elected in separate elections. Some areas have only one level of local government, and these are dubbed unitary authorities. The City of London and the Isles of Scilly are sui generis authorities, predating recent reforms of local government.

3.1 Organisational chart

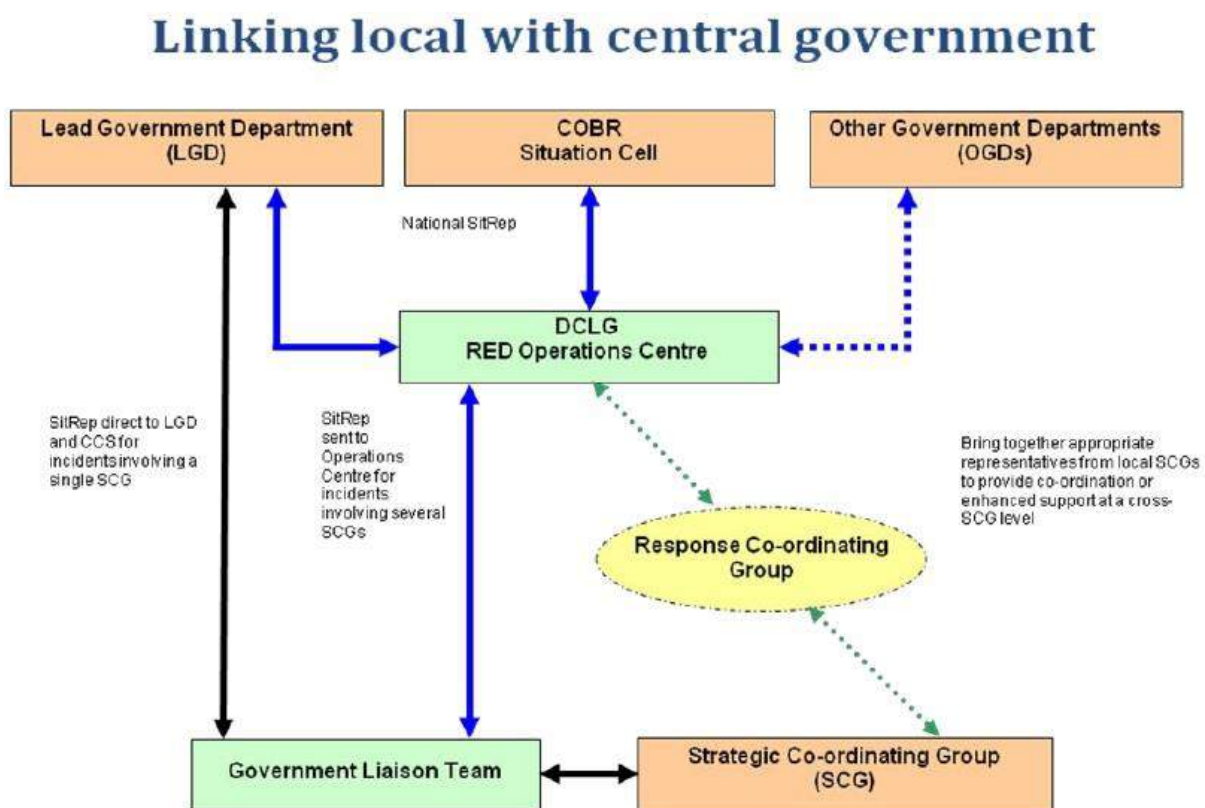

Figure 56: Linking local with central government

Source: Department for Communities and Local Government

Local arrangements for civil protection

Part 1 of the CCA, together with supporting regulations and statutory guidance, establish a clear set of roles and responsibilities for those organisations involved in emergency preparation and response at the local level. The Act divides local responders into two categories and imposes a different set of duties on each.

Category 1 responders are organisations that collectively form the core of the response to most emergencies. They include:

- Emergency services: police forces including the British transport police; fire services; ambulance services; HM coastguard
- Local authorities: all principal local authorities (i.e. metropolitan districts, shire counties, shire districts, shire unitaries)
- NHS bodies: primary care trusts; hospital trusts; foundation trusts (and Welsh equivalents); Health Protection Agency
- Government agencies: Environment Agency; Scottish Environment Agency

Given their front-line role, category 1 responders are subject to the full set of civil protection duties under the CCA. They are required to:

- assess the risk of emergencies occurring and use this to inform contingency planning;
- put in place emergency plans;
- put in place Business Continuity Management arrangements;
- put in place arrangements to make information available to the public about civil protection matters and maintain arrangements to warn, inform and advise the public in the event of an emergency;
- share information with other local responders to enhance co-ordination;
- co-operate with other local responders to enhance co-ordination and efficiency; and
- provide advice and assistance to businesses and voluntary organisations about business continuity management (Local Authorities only).²²⁰⁴

Category 1 responders are excluded from these CCA responsibilities in cases of severe specialised risks and emergencies that are covered by other legislation (for example, the Control of Major Accident Hazards Regulations 1999, the Pipelines Safety Regulations 1996 and the Radiation Regulations 2001), although their help could still be required if appropriate.

Category 2 responders are less likely to be involved in front-line response and planning work, but may be heavily involved in emergencies that affect their sector. They include:

- Utilities: electricity distributors and transmitters; gas distributors; water and sewerage undertakers; telephone service providers (fixed and mobile)

²²⁰⁴ Responding to Emergencies: The central government's concept of operations, April 2013, p.65.
https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/192425/CONOPs_incl_revised_chapter_2_4_Apr-13.pdf

- Transport: Network Rail; train operating companies (passenger and freight); London Underground; Transport for London; Highways Agency; harbour authorities; Airport operators
- Health: NHS strategic health authorities; Health and Safety Executive

The CCA imposes two responsibilities on these responders: cooperation and information sharing with other category 1 and 2 responders.

The intention is to foster cooperation and understanding and cement local-level partnerships and accordingly senior representatives of category 1 and 2 organisations also come together to form Local Resilience Forums (LRFs), the principal mechanism for local multi-agency cooperation under the CCA. LRFs have no legal personality or powers to direct their members, but are obliged to meet at least once every six months and are expected to ensure effective delivery of CCA duties. They also provide specific risk assessments for their geographical area (see section 1.1).

The local response to an emergency

As outlined in Section 1.2, emergency management and response in the UK is founded on a bottom-up approach in which operations are managed and decisions are made at the lowest appropriate level. Local organisations are always the first responders and act as the “essential building block” for the response to an emergency.²²⁰⁵ Indeed, the Cabinet Office emphasises that:

*Most incidents are handled at a local level by the emergency services and by the appropriate local authority or authorities with no direct involvement by central government (though government departments with a potential interest would keep themselves informed on developing events and the handling of the media).*²²⁰⁶

Category 1 responders are required by the CCA to have procedures in place for determining whether an emergency has occurred. Once identified, if the scale and nature of an emergency is deemed to require strategic guidance, an SCG will be formed to coordinate the local multi-agency response. It is located in the Strategic Co-ordination Centre and comprised of senior representatives with executive authority from each of the key organisations involved in the local response. The chair of the group, typically a senior police officer but occasionally a Local Authority Chief Executive, is known as the Strategic Coordinating Group Chair (although this role is often colloquially referred to as a ‘Gold Commander’). The SCG will take strategic decisions on managing the emergency locally. The command structures of individual agencies operate alongside but separate from the SCG.

Three levels of command at single agency level operate below the SCG: operational (Bronze), tactical (Silver) and strategic (Gold). They can often be implemented without the need for multi-agency co-ordination through the SCG, with any necessary co-ordination taking place at silver or bronze level.

²²⁰⁵ Ibid. p.13.

²²⁰⁶ The Role of the Lead Government Department in Planning for and Managing Crises, January 2011, p.1. https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/61356/lead-government-department-framework.pdf

Incidents are normally handled at the operational level, moving to the tactical or strategic level if required depending on the scale or nature of the incident.

The Central response framework

While most emergencies are managed at the local level, the government has identified three types of emergency that might necessitate the involvement of the sub-national tier in England, a devolved administration, or UK central government:

- *Significant emergency (Level 1) has a wider focus and requires central government involvement or support, primarily from a lead government department (LGD) or a devolved administration, alongside the work of the emergency services, local authorities and other organisations. There is however no actual or potential requirement for fast, inter-departmental/agency, decision making which might necessitate the activation of the collective central government response, although in a few cases there may be value in using the COBR complex to facilitate the briefing of senior officials and ministers on the emergency and its management.*

Examples of emergencies on this scale include most severe weather-related problems. In addition, most consular emergencies overseas fall into this category with the FCO providing advice and support to those affected alongside the authorities in the country affected.

- *Serious emergency (Level 2) is one which has, or threatens, a wide and/or prolonged impact requiring sustained central government co-ordination and support from a number of departments and agencies, usually including the regional tier in England and where appropriate, the devolved administrations. The central government response to such an emergency would be co-ordinated from the Cabinet Office Briefing Rooms (COBR), under the leadership of the lead government department. Examples of an emergency at this level could be a terrorist attack, widespread urban flooding, widespread and prolonged loss of essential services, a serious outbreak of animal disease, or a major emergency overseas with a significant affect on UK nationals or interests.*

Examples of emergencies on this scale, include the H1N1 Swine Flu pandemic, the 2007 summer floods, and the response to the 7th July bombings in London.

- *Catastrophic emergency (Level 3) is one which has an exceptionally high and potentially widespread impact and requires immediate central government direction and support, such as a major natural disaster, or a Chernobyl-scale industrial accident. Characteristics might include a top-down response in circumstances where the local response had been overwhelmed, or the use of emergency powers were required to direct the response or requisition assets and resources. The Prime Minister would lead the national response. Fortunately, the UK has had no recent experience of a Level 3 emergency, but it is important to be prepared for such an event should the need arise.²²⁰⁷*

²²⁰⁷ Responding to Emergencies: The central government's concept of operations, April 2013, p.8-9.

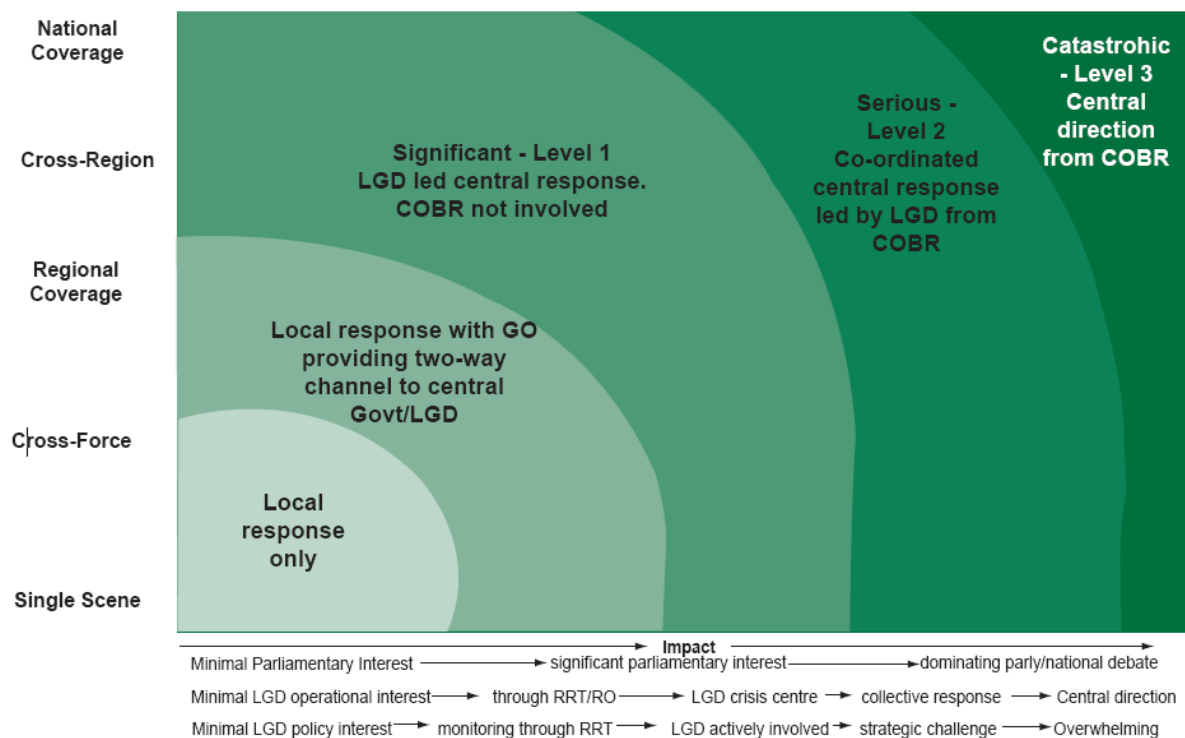

Figure 57: Likely form of central government engagement based on the impact and geographic spread of an emergency in England

Source: Responding to Emergencies: UK Central Government Concept of Operations

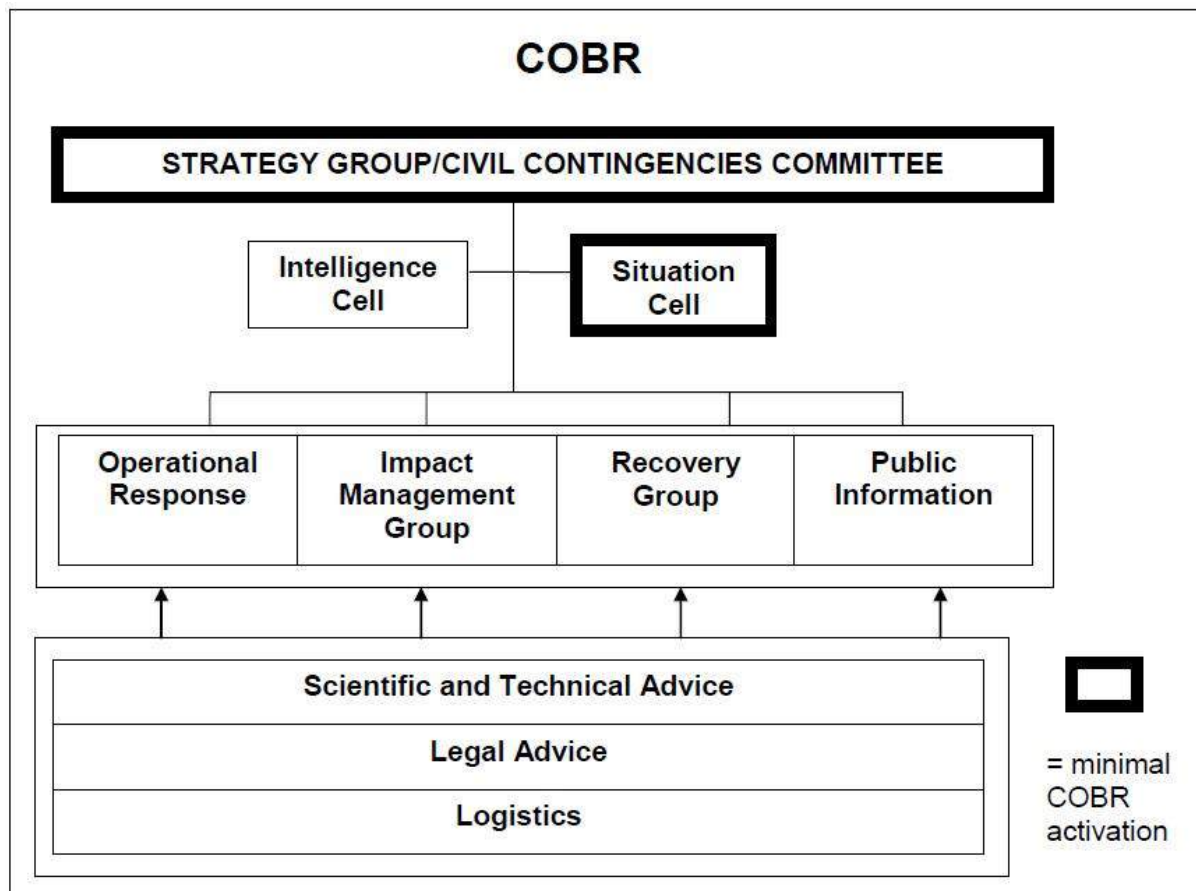

In the event of a Level 2 or 3 emergency, the government's central response framework would be initiated. This would involve the activation of central government's crisis management facilities - the Cabinet Office Briefing Rooms (COBR). COBR is comprised of ministers and senior officials from relevant UK government departments and agencies along with representatives from other organisations as necessary. COBR is responsible for overall strategic planning and its activation is intended to facilitate rapid co-ordination of the central government response and effective decision-making. It also provides an authoritative source of advice for local responders.

COBR is designed to be flexible to adapt to the specific circumstances of an emergency. Within COBR, a senior decision making body oversees the government's response and is supported as necessary by a number of separate cells and supporting blocks of activities. These can be grouped into five broad areas and are supported by sources of specialist advice as required. There is often no need for all of the supporting structures to be activated; a full activation is likely only in the most complex emergencies, particularly where there is a need to manage a mix of highly and unclassified material or there are potentially wide ranging consequences flowing from the initial event (some terrorist scenarios, for example). On many occasions, the senior decision making body is likely to meet with only the Situation Cell for support with operational response considerations the responsibility of the Lead Government Department (see below).

Examples of COBR being initiated within the last year include a series of meetings throughout February 2014, chaired by Prime Minister David Cameron, on the government's response to severe

weather and flooding. COBR also met to discuss the threat posed by the Ebola virus to the UK in July and October 2014.

Figure 58: Structure of Cabinet Office Briefing Rooms

Source: Responding to Emergencies: UK Central Government's Concept of Operations

Overall crisis management is typically supervised by one government department: the Lead Government Department. The LGD takes overall responsibility for assessing the situation, ensuring that its ministers and other relevant ministers are briefed, handling media and parliamentary interest, and providing co-ordinated policy and other support as necessary to local responders. Other government departments provide support to the LGD to ensure a co-ordinated response.

The Cabinet Office publishes a list of pre-nominated lead departments for as many potential emergency situations as possible to ensure clarity in times of crisis.²²⁰⁸ In England, Scotland and Wales, the Home Office is the LGD responsible for terrorist related emergencies and assumes responsibility for all emergencies where the cause is uncertain or until such a time when terrorist activity can reasonably be ruled out.

²²⁰⁸ A breakdown is available on the government website:

https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/61354/lead-government-department-march-2010.pdf

The LGD is responsible for alerting the CCS as soon as it considers any incident (or potential incident) to likely require collective consideration by a range of departments. The CCS was created in July 2001 and is the cabinet office department responsible for emergency planning. It works under the leadership of the Civil Contingencies Committee, a cabinet office committee chaired by the Home Secretary, and in the event of an emergency its role is to provide central focus for cross-departmental and cross-agency commitment, coordination and cooperation (see section 1.2.4 for the CCS's role in orchestrating emergency preparedness).

When it is unclear which government department should take the lead, the CCS will take the immediate lead until the Prime Minister has endorsed its selection of LGD.

Liaison between local responders and central government

When an emergency requires central government intervention, a Government Liaison Officer is dispatched to act as the primary liaison between government departments and the SCG. The Government Liaison Officer is normally from the relevant government office or the LGD, and is supported when necessary by a Government Liaison Team.

If local responders are overwhelmed or an emergency affects a wide geographical area and would benefit from greater coordination, a multi-SCG Response Co-ordinating Group (RCG) may be convened to bring together representatives from different SCGs. Both SCGs and, when formed, the RCG, report to their local Department for Communities and Local Government Resilience and Emergencies Division (DCLG RED – England is divided into four REDs whose seats are in London, Birmingham, Bristol and Leeds) which acts as conduit for communications between central government and the local level.

REDs are responsible for supporting local response and recovery efforts, and ensuring that there is an accurate picture of the situation in their area (see Figure 6). They advise the LGD, cabinet office and other relevant government departments on what support is likely to be required by local responders to recover from an emergency. REDs are also responsible for liaising with government in emergencies below the national level that don't require intervention by central government and are the first point of contact between government and all LRFs in England.

Scientific support during emergencies

The effective management of most emergencies requires access to specialist scientific and technical advice, for example regarding the public health and environmental implications of a flood or the spread of a disease.

At local level, the SCG is advised to establish a Science and Technical Advice Cell (STAC) at an early point of the response phase to provide a common and coordinated source of scientific and technical advice. The STAC's designated lead usually comes from the health community and will work with the SCG to select the cell's core membership, typically from government agencies.

At national level, COBR and government departments receive advice from the Scientific Advisory Group for Emergencies (SAGE) which is responsible for coordinating and peer reviewing scientific and

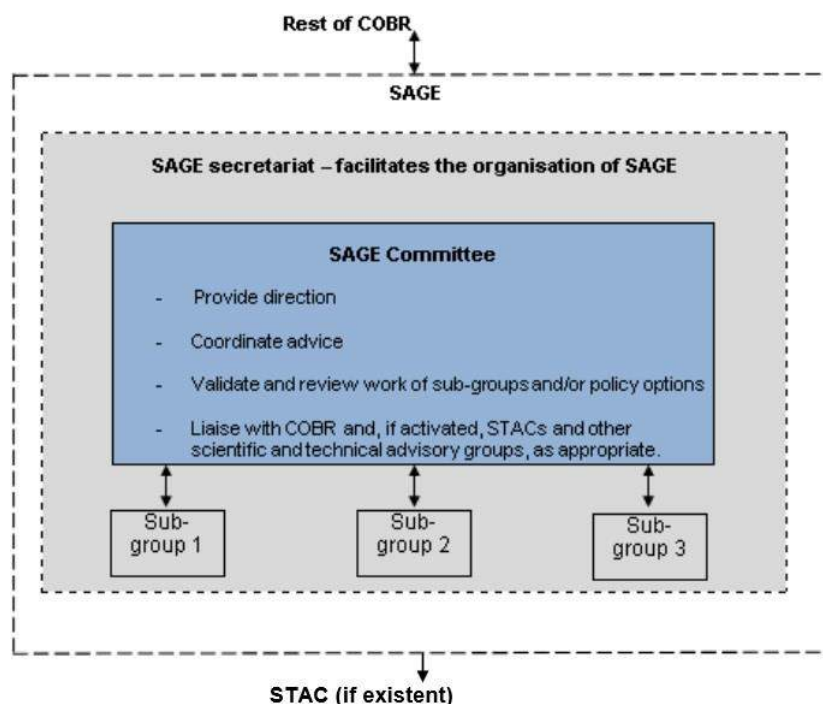

technical advice to inform evidence-based ministerial decision making. SAGE can be scaled up or down in size depending on the nature of the emergency (similarly to COBR) and is usually chaired by the Government's Chief Scientific Advisor.

SAGE representatives report to the ministerial and official groups within COBR. The Government's Chief Scientific Advisor usually represents SAGE at ministerial meetings. A SAGE committee oversees the work of SAGE's sub-groups - which can be many depending on the nature and scale of the emergency - established to focus on specific issues. A SAGE secretariat, typically provided by the LGD, has the role of activating and deactivating SAGE and supporting its functions.

To ensure consistency, SAGE will liaise with STAC(s). Interaction arrangements are defined by the LGD in consultation with the Cabinet Office and the Government Office for Science, and can vary depending on the nature of the emergency. The standard interaction model, designed to embed scientific advice provision into both local and central government decision-making is outlined in Figure 9.

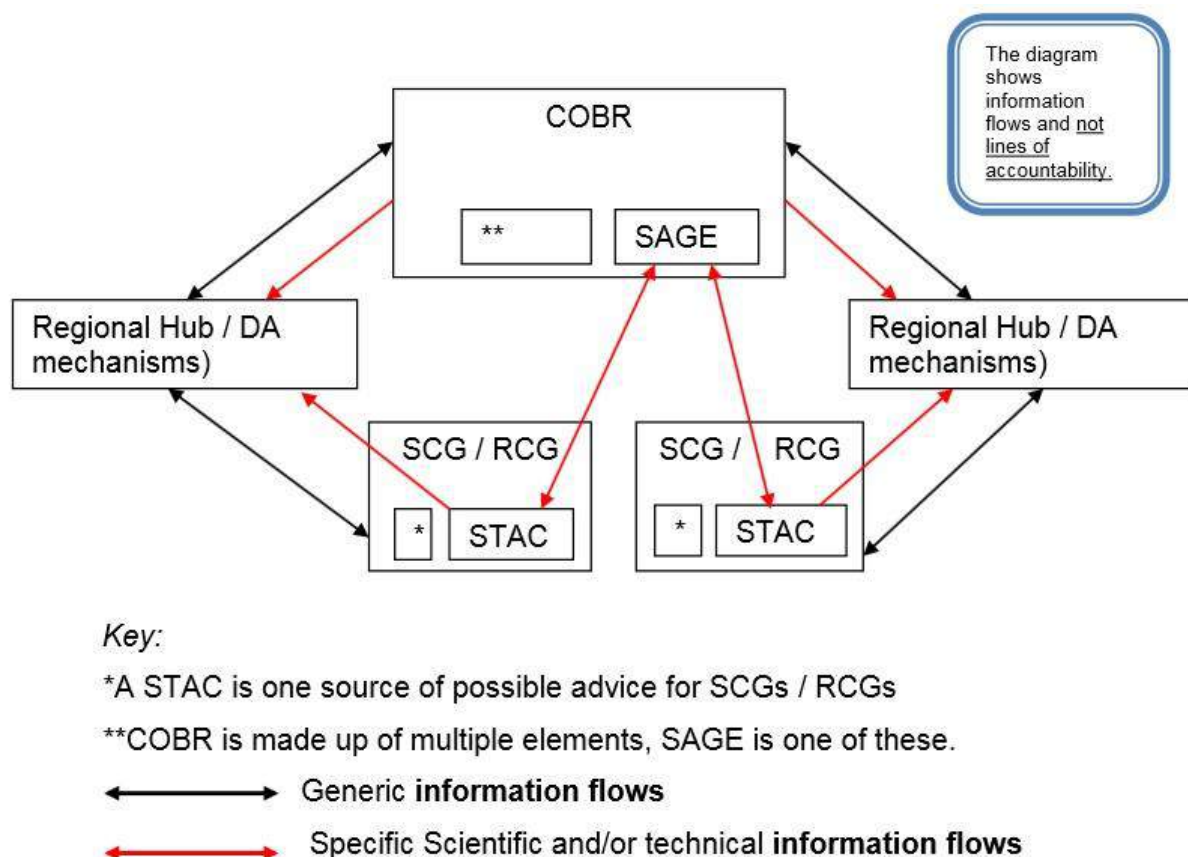

Most recently, SAGE was activated during the 2009 H1N1 influenza pandemic, during the 2010 volcanic ash disruptions and the Fukushima nuclear incident in 2011. STACs have been activated for a number of events, including the 2008 Cumbrian flooding.

3.2 Organisational cooperation

Operational cooperation within the EU

The UK can cooperate with other countries bilaterally, although this happens very rarely. The ANVIL study found that “the UK has not invoked a bilateral agreement with regard to crisis management in the period 2000-2012.”

More commonly, the UK participates in intergovernmental organisations and a limited number of multilateral frames of cooperation in crisis management. This includes facilitating mutual aid between countries in the event of an emergency, and sharing good practice and training to better prevent or mitigate the consequences. The UK participates in the EU Civil Protection Mechanism (CPM) which, since its creation in 2001, has functioned as an institutional framework for all ad hoc agreements with other European countries following the occurrence of an emergency. The UK is also:

...a member of the ‘Bonn Agreement’ which, among other issues, engages with pollution as a maritime disaster; within the EU Civil Protection Mechanism, it participates in a working group of 6 member states discussing key aspects of the Mechanism; it also has membership in the ‘Regional Environmental Centre for Central and Eastern Europe’, in the ‘International Organisation of Fire & Rescue Service’, and in the ‘Regional Coordination Council for South

*Eastern Europe’.*²²⁰⁹

However, it remains a very rare phenomenon for the UK to seek help from other countries to manage emergencies. This can be attributed both to the self-sufficiency of the UK’s crisis management system and the fact that, in the UK, crisis management is tied closely to the sensitive subject of national sovereignty. There is a general reluctance among UK practitioners to engage in operational collaboration with EU countries and institutions on internal emergencies. An interviewee told the ANVIL study: “EU institutions do not really play a role in emergency response internally in the UK’.”

The ANVIL study identified only two instances for the period 2000-2012 when the UK considered and accepted external assistance: the Buncefield fire at the Hertfordshire Oil Storage Terminal in December 2005 and the severe snowfalls of winter 2009, during which the government referred to the EU Monitoring Information Centre, for the first and only time, to request grit-salt through the EU Civil Protection Mechanism.²²¹⁰ The UK is more willing to offer assistance, having contributed to requests for assistance on 13 occasions as of February 2014.

The ANVIL study found that while “the euroscepticism of British policy-makers extends to civil security issues”, at the level of political initiatives the UK has not lagged behind in the EU context. The UK is active in the CPM and is a member of an informal working group that discusses main aspects of EU civil protection. The ANVIL study interviewed a member of the CCS who affirmed UK support for the coordination of prevention measures: “The UK supports the general thrust to encourage risk assessment across member states and the sharing of best practice and expertise in this area.”²²¹¹ The British government has also proposed the introduction of a common EU Counter-terrorism strategy, adopted in 2007, and a Civil Contingencies Strategy.

Britain’s level of participation in major EU and NATO exercises has been criticised in the past by the House of Lords European Union Select Committee as “unacceptably low.” In 2009, the Committee found that “the United Kingdom has participated in only 11 of 31 EU or NATO exercises between 2000 and 2008” and often only as an observer. The Committee argued that “using the NATO criterion, ‘participated in the exercise by deploying teams’, it seems that the United Kingdom has participated in none of the annual NATO exercises, and in only one of the EU exercises.”²²¹² However, the UK appears to have become more active in recent years. It hosted the EU exercise Orion in September 2010, an earthquake scenario simulation, and participated in exercises in Greece in May 2010, Estonia in May 2011 and most recently a Denmark-Germany joint hosted exercise in October 2013.²²¹³

²²¹¹ Ibid. p.39.

²²¹² House of Lords European Union Committee Report: Civil Protection and Crisis Management in the European Union, March 2009, p.12. <http://www.publications.parliament.uk/pa/ld200809/ldselect/ldcom/43/43.pdf>

²²¹³ List of EU civil protection exercises: <http://ec.europa.eu/echo/en/funding-evaluations/financing-civil-protection/civil-protection-exercises>

The ANVIL study cites enthusiasm among British civil servants to participate in CPM training programmes and emphasises the fact that training on how to coordinate collaboration under the CPM is offered in Britain:

The UK's Emergency Planning College offers a unique, intensive seminar called 'Community Mechanism Introduction', with instructors from different European countries covering a variety of issues from basic knowledge of EU activities on civil protection to brief tabletop exercises. We were able to follow part of the training in November-December 2012 and can confirm the attendance of students/emergency planners from different European partners and their willingness to learn from each other, create networks and get accustomed to cooperation in case they have to operate together.

The UK is active in the CPM's Exchange of Experts in Civil Protection programme, having most recently sent CCS officials to Iceland in April 2014 to improve the UK's understanding of, and preparation for, an effusive volcanic eruption.²²¹⁴ Cabinet Office guidance also cites NATO Civil Emergency Planning as an example of the UK working internationally on emergencies.

The UK is also a member of the European Forum for Disaster Risk Reduction and is a signatory to the Hyogo Framework for Action 2005 to 2015, which it signed, along with 100 other countries, at the World Conference on Disaster Reduction in January 2005. The Framework "is the first plan to explain, describe and detail the work that is required from all different sectors and actors to reduce disaster losses" and commits signatories to reduce vulnerabilities to natural hazards. The UK was the first country to have its implementation of the framework peer reviewed in May 2013 and, although scope for improvement was identified, the UK was deemed to have "achieved a high level of preparedness."²²¹⁵

Transboundary crises

Unlike other European countries, the UK's crisis management system has not been tested by severe transboundary crises (and of course is less likely to be given the UK shares a land border with just one other EU Member State, Ireland). Nonetheless, the ANVIL study advises greater interaction with the civil security mechanisms of other European countries, and asks:

*How well would the British civil security system have reacted if the bombings in 2005 had taken place in the Channel Tunnel instead of the London underground? Our estimation is that in such cases the value-added of EU assistance can be significant and has not been sufficiently assessed by the British practitioners.*²²¹⁶

UK Organisational arrangements

The Foreign and Commonwealth Office (FCO) is responsible for managing the UK's relationship with other countries through its network of embassies and High Commissions, as well as the UK's overall relationship with international organisations such as the UN, NATO and the EU.

However, the CCS in the Cabinet Office is responsible for liaising with the civil emergency response and mutual aid systems of the EU (the CPM including the Monitoring and Information Centre, and the Community Emergency Communication and Information System) and NATO (the Euro-Atlantic Disaster Response Co-ordination Centre, which coordinates emergency planning).

Government departments can have bilateral relationships with specific international or multilateral institutions that will be used when appropriate. For instance, during a pandemic flu, the Department of Health would be best place to engage with the World Health Organisation as part of the UK response.

When an emergency occurs in the UK, the FCO representative in COBR is responsible for handling any requests of support from the UK government. They are also responsible for advising COBR on the concerns and handling of other governments. The FCO is responsible for ensuring that bilateral and multilateral obligations to identify neighbouring countries and/or partners of the emergency have been met, although another government department may have responsibility for making the notification.

For emergencies that occur overseas such as bombings or kidnappings, the FCO is the LGD and will chair COBR unless the emergency has significant direct consequence in the UK (for example the fallout from a nuclear accident or a pandemic) in which case the appropriate government department will lead. If an emergency necessitates the return or repatriation of British citizens the FCO will always be the LGD, although it may relinquish lead status once this process has been completed.

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

There is no single document setting out Standard Operating Procedures for crisis management in the UK, nor any compendium of the SOPs applicable to different agencies. Key procedures and guidelines have been set out in previous sections.

4.2 Operations planning

In the UK, emergency planning is predominantly carried out at the local level, in keeping with the country's bottom-up approach to crisis management. The police, local authorities, and all other Category 1 responders, have specific legal duties under the CCA to plan for civil emergencies in their geographical area, such as flooding, industrial accidents, severe weather etc. This also includes putting in place business continuity management arrangements to ensure continuity of service in the event of disruption caused by an emergency, and for effective recovery afterwards. This also applies to industrial action, where it is important for the emergency services in particular to maintain business continuity. All of these plans must be tested regularly through training and exercises.

For example, in London, the London Resilience Forum directs the work of the London Resilience Partnership, which is comprised of more than 170 organisations from Category 1 and 2 responders, the Greater London Authority, central government, the military and business representatives. The Partnership works to assess risks in London and prepare for major emergencies. It has plans and protocols in place outlining how different emergencies would be responded to and conducts multi-agency exercises to test these arrangements. Operational plans exist to cover flooding, pandemic influenza, mass casualties, mass fatalities, excess deaths, structural collapse, adverse weather, mass evacuations, mass shelter, and disease outbreaks.

At national level, the government and relevant government departments plan for specific risks.

Pandemic influenza: the government aims to stockpile enough antivirals to treat 50% of the population and has advanced purchase agreements for the supply of pandemic-specific vaccines. The UK Influenza Pandemic Preparedness Strategy 2011 provides UK-wide guidance on responding to an influenza pandemic.

New and infectious diseases: Public Health England, an executive agency of the Department of Health that was established in 2013, has plans in place for dealing with an outbreak of a new or emerging infection, whether arising abroad or in the UK. It would coordinate the investigation and management of any such outbreak and advise the government on public health risks and necessary

preventative and control measures. Existing Department of Health SARS and pandemic influenza contingency plans would form the basis for dealing with any future outbreaks should either of these diseases re-emerge. Government departments also have plans in place to manage the potential influx of British nationals that may occur in the event of this type of emergency.

Flooding: The government has a programme of flood risk management, which aims to reduce the likelihood and consequences of flooding. The Environment Agency works with the Met Office and the Flood Forecasting Centre to anticipate the risk of flooding and to provide early warning to the areas most likely to be impacted.

Major industrial accidents: Comprehensive plans are in place for handling shortages, or complete outages, of oil, gas and electricity (see section 5.2). Under the Security and Emergency Measures (Water and Sewerage Undertakers) Direction 1998, all water companies must have plans in place to provide alternative water supplies. The Maritime and Coastguard Agency plans for major and minor pollution incidents. A National Response Plan is also in place to deal with the effects an overseas nuclear accident would have on the UK population and infrastructure.

Malicious attacks: Long-standing and regularly activated major incident plans and structures are in place across government to respond to malicious attacks in both crowded places and on infrastructure. All transport sector operators are required to have plans in place to cover a range of malicious attack scenarios.

The government also plans, to varying extents, for all of the other risks identified in the National Risk Register. They include: volcanic hazards, severe weather, severe space weather, severe wildfires, animal diseases, major transport accidents, public disorder, and cyber-attacks.

4.3 Logistics support in crises

Private logistics providers

Private logistics providers likely to have an important role in emergency response and recovery are designated by the CCA as Category 2 responders. They have responsibilities under the Act to cooperate and share information with other Category 1 and 2 responders, and Category 1 responders must take into account how category 2 responders can be involved in crisis management whilst conducting emergency planning (see section 3.1). Both category 1 responders and central government can also sign ad hoc agreements with private companies if an emergency occurs (see section 5.1). During emergency response, privatised utility companies will often be recruited by local authorities.

Military logistics support

The armed forces' national structure, organisation, skills, equipment and training can be of benefit to the civil authorities in managing the response to and recovery from emergencies. Support is governed by Military Aid to the Civil Authority (MACA) arrangements, with detailed rules and procedures governing the employment of armed forces on MACA operations set out by the MoD in

Operations in the UK: The Defence Contribution to Resilience. Reserves, if available, can be deployed alongside regular personnel in most scenarios.

CCA statutory guidance emphasises that assistance is provided on the basis of availability and as such responding agencies should not formulate plans for specific emergencies on the assumption that the armed forces will be able to intervene. In general, the armed forces will intervene only when the scale of an emergency exceeds the capabilities of local responders or when the nature of the emergency requires obvious military intervention, for example in the event of a bioterrorist attack or an accident involving hazardous material.

Deployment

In most circumstances the provision of armed forces support must be requested by a government department and approved by a Defence Minister. The exception is when there is a requirement to save lives, alleviate distress or protect property in which case a commander can decide to provide urgent assistance without government approval. A local authority can also contact central government and request military involvement under the provision of Military Aid to the Civil Community. This happened during the 2009 floods in Cumbria but in general is a very uncommon occurrence. Part 2 of the CCA could also be used to enable the Defence Council to deploy armed forces under emergency regulations.

Organisational

The MoD's Standing Joint Command (United Kingdom) is the operational lead for the armed forces. It responds to MACA requests from government departments and provides advice through army regional brigades. Each brigade has a Joint Regional Liaison Officer who liaises with local responders and acts as their first point of contact. Military units and personnel remain under the MOD chain of command at all times and are not subordinated to the command of civil authorities.

Role

The armed forces can support civil authorities in two ways: by augmenting the capabilities of responders through regular and reserve forces, and by providing niche capabilities. In the case of the latter, Defence Minister may decide to devote specific armed forces and MoD assets to specific emergency response and recovery operations. These include:

- *a UK-based and UK-focussed Command and Control structure*
- *a UK focused Defence communications capability*
- *an Explosive Ordnance Disposal and Chemical Biological Radiological and Nuclear make-safe capability*
- *an air surveillance, policing and defence system*
- *Fishery Protection vessels*
- *a Special Forces capability*
- *a Search and Rescue capability*

A small number of armed forces personnel are available to brief COBR, and logistics specialists could also be deployed to other levels of command, although they are not held at readiness for such tasks. Logistics support could be provided in multiple areas:

Transport: the armed forces use commercial contractors, but may have a small number of helicopters and portable boats available in the UK which could be used to move limited amounts of stores or small numbers of personnel.

Engineering: armed forces engineering equipment is held centrally and amounts to about that typically available in a medium sized town. Relevant engineering expertise on subjects such as power generation, bridging or temporary flood protection, may be available depending on the situation.

Estate: military bases could be available during operational responses or for non-operational support, such as accommodation or training facilities.

Fuel: the armed forces hold sufficient fuel reserves to support military activities and a small number of fuel tankers in the UK.

Telecommunications: the military has its own resilient communications for use by the armed forces and may have some small scale capacity to augment civil capability with specialist engineers and communications staff if required.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

In the UK, responsibility for warning and informing the public depends on the nature of the emergency. Raising awareness on counter-terrorism, for example, is largely a task for central government. Other risks are addressed at both local and national level. In the event of a pandemic, local health authorities would inform and advise the public but information would also be available through the News Centre of the Health Protection Agency. If the Environment Agency issues warnings of coastal or inland flooding, local authorities are depended on to help warn and prepare the public.

Informing the public – traditional and social media

When an emergency occurs, local responders have immediate responsibility for alerting the public. Methods of information delivery available to them are extremely varied, but may include:

- *mobilising officers to go round on foot and knock on doors*
- *from car or helicopter, by loudhailer or other amplified means*
- *media announcements*
- *electronic/variable message boards, eg at the roadside or on motorways*
- *direct radio broadcasts to shipping (in maritime incidents)*
- *PA announcements in public buildings, shopping centres, sports venues, transport systems, etc*
- *automated telephone/fax/e-mail/text messages to subscribers*

- *site sirens*

Responders also increasingly make use of social networks including Twitter and Facebook as well as text messaging alert services such as the Floodline Warnings Direct Service, which is managed by the Environment Agency.

Cabinet office guidance advises that “social media should not be used in isolation but integrated into emergency communication strategies” and emphasises its function as “a method of widening their access to communities and engaging with people through their preferred method of communication”.²²¹⁷ In March 2012, the government published *Smart Tips for Category 1 Responders: Using Social Media in Emergency Management* to provide guidance.

For emergencies with national dimensions, the news media (radio, TV broadcasting and print) remains the government’s primary means of communication. Through the CCS, television stations can be used to alert the public, with the BBC the UK’s nominated “Emergency Broadcast System”. The Radio Amateurs’ Emergency Network, the UK’s national voluntary communications service, may also be used to alert the public.

The UK national siren system, a relic from World War II, was largely dismantled by the end of the Cold War in the late 1980s and early 1990s. However some coastal areas retain and regularly test their sirens to warn of flooding.²²¹⁸

Statutory obligations for Category 1 responders

The CCA includes public awareness and warning and informing as two distinct legal duties for Category 1 responders. The public must be educated on the probability and risks of emergencies (through the Community Risk Register – see section 1.1) and how responders are prepared to deal with them should they occur. If an emergency does occur, or is about to occur, the public must be warned and provided with information and advice as required.

Having warning systems in place is particularly important for organisations such as the emergency services and local authorities whose functions are likely to be seriously obstructed by an emergency. CCA guidance states that strategies for warning, informing and advising the public - either directly or through the media – must be fully integrated into a responder’s CCA emergency plans and tested regularly through exercises and staff training. Responders are responsible for making decisions about precisely when, how, about what and to whom warnings should be issued (see Figure 11).

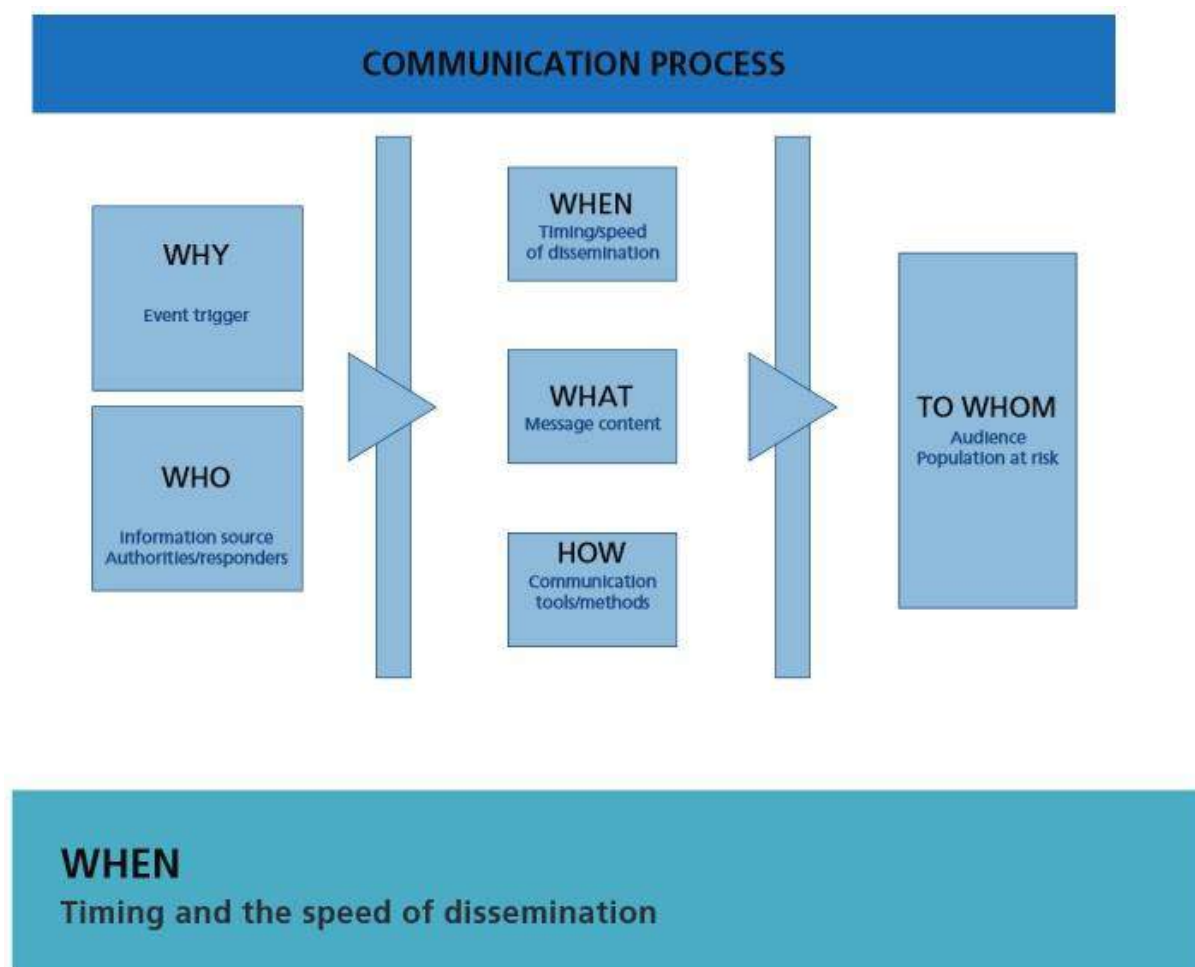

The Act allows for Category 1 responders to discharge their duties collaboratively. To avoid duplication of effort and potential confusion and alarm caused by inconsistent information, cross-agency coordination of information should be established at an early stage and in most cases responders should identify an organisation to take lead responsibility for warning and informing the

²²¹⁷ Cabinet Office guidance: <https://www.gov.uk/government/publications/national-recovery-guidance-generic-issues-social-media>

²²¹⁸ Two recent examples: The Times, 7 January 2014 <http://www.thetimes.co.uk/tto/weather/article3967956.ece>; BBC, 5 February 2014 <http://www.bbc.co.uk/news/uk-england-dorset-26045145>

public.

Figure 61: Public communications timeline: what responders' plans need to achieve

Source: Emergency Preparedness, Chapter 7: Communicating with the public

Other existing legislation also imposes a duty to provide information to the public. Under the Control of Major Accidents Hazards Regulations 1999 and the Radiation (Emergency Preparedness and Public Information) Regulations 2001, operators must provide information, through their local authority, to members of the public liable to be affected by a major accident at the operator's establishment.

News Co-ordination Centre

In the event of an emergency that requires the involvement of central government, the News Co-ordination Centre (NCC) will be established in Whitehall by information staff from the Cabinet Office. It functions alongside LGD and liaises with the Central Office of Information News and Public Relations at the scene of the emergency, if outside London.

Capable of functioning 24 hours a day, the NCC helps to coordinate the information activities of the government departments and agencies involved by compiling and organising expert briefings and overseeing interview bids for ministers. The NCC works closely with national and international media,

monitoring output to correct inaccuracies and identify when additional material would provide a better balance of coverage.

The NCC is also responsible for managing the delivery of public information and safety advice at the national level. Where necessary, it can invoke standing protocols with the media to issue Public Safety Information either nationwide or in specific geographical regions.

It is also responsible for communicating with local responders to ensure that strategic and high-level political decisions are based on accurate, up-to-date information. The NCC may deploy staff to the scene of an emergency for this purpose. It will also be directly involved in handling the influx of media organisations at the scene of an emergency and coordinating on site media arrangements.

Communicating bilaterally with other countries is the responsibility of the FCO, although the CCS in the Cabinet Office is responsible for liaising with the civil emergency response and mutual aid systems of the EU and NATO. Individual government departments can have bilateral relationships with specific international or multilateral institutions to be used when appropriate (see section 3.2).

Government policy

The government provides general advice to the public on a variety of types of emergencies from a number of sources. This includes: guidance on emergency preparedness, resilience and business continuity from the Cabinet Office; terrorism-related emergency guidance from MI5; advice on health emergencies from the Department of Health; travel advice from the FCO; weather warnings from the Meteorological Office; and flood warnings from the Environment Agency.

The National Steering Committee on Warning and Informing the Public furnishes the Cabinet Office with best practice advice on how to warn the public of possible, imminent and actual threats to life, the environment or property, and how to inform them of the appropriate action they can take. It is made up of professionals, practitioners and academics representing organisations that deal with community resilience at both a national and local level:

- devolved governments and administrations in the UK
- Civil Contingencies Secretariat
- Association of Chief Police Officers
- Chief Fire Officers Association
- health professionals/authorities - NHS
- professional institutions and societies
- Environment Agency
- Met Office
- Maritime Coastguard Agency
- Health and Safety Executive
- BBC
- SKY
- ITV

- academic institutions
- independent advisors as considered appropriate

The government also liaises with senior media editors and representatives of local responders in the UK Media Emergency Forum. The forum identifies and discusses strategic communication issues, the media's engagement in civil protection work at local and national level, and practical arrangements for media involvement during emergencies.

5 Capabilities

5.1 Human resources

Permanent emergency and disaster management personnel

Four emergency services in the UK maintain full-time emergency control centres:

- Police
- Ambulance service
- Fire brigade
- Coast guard

Other emergency services, that do not have permanent control centres but can be reached via any of the four principal services listed above, include:

- Lifeboat service
- Mountain rescue service
- Cave rescue service
- Moorland search and rescue service (particularly in Cornwall and Yorkshire)
- Quicksand search and rescue service (operating in the extensive quicksands of Morecambe Bay)
- Mine rescue service
- Bomb disposal (provided by the military)

Involvement of volunteers, volunteer organisations, and specialised NGO personnel

No official list exists of which voluntary organisations contribute to crisis management in the UK – arrangement vary from region to region – but a *Memorandum of Understanding between Members of the Voluntary Sector Civil Protection Forum Working Party* lists the following organisations as active in this field:

- British Red Cross
- Cruse Bereavement Care
- Radio Amateurs' Emergency Network
- St John Ambulance
- The Salvation Army
- Victim Support Service
- Royal Voluntary Service (an organisation that supports older people)

The ANVIL study found that the most prominent voluntary organisations in the field of crisis management are the British Red Cross and St John Ambulance, with the former taking the lead in

disaster relief and post-trauma support and the latter specialising in training of the public in first aid.²²¹⁹

Involvement of private businesses

The UK has no legal framework for outsourcing crisis management responsibilities to the private sector. Instead, central government and Category 1 responders sign ad hoc agreements with private companies when an emergency occurs; indeed most Category 2 responders are private companies. During emergency response, privatised utility companies will often be recruited by local authorities.

The ANVIL study found that no autonomous private agencies deliver crisis management in the UK and failed to discover any public-private agreements focussing exclusively on emergency response. There is, however, some involvement in administrative areas of crisis management: “there is some limited involvement of private companies in telecommunications, ensuring communication between the security services (e.g. Serco in the field of information systems).”²²²⁰

Education programmes

Local Resilience Forums have chief responsibility for educating citizens on the probability of an emergency occurring and the risks it poses. They can do so through local campaigns and social networks and will also educate children by visiting schools and addressing youth on emergency preparedness.

At a national level, the government seeks to build resilience across the UK through its National Resilience Capabilities Programme. A community resilience programme has been in place since 2008 to support existing community initiatives, disseminate these successful activities in other areas and raise awareness and understanding of local emergency response capability (see section 1.5). Government departments also have individual responsibilities for raising awareness about specific risks (for example, the Home Office has responsibility for raising awareness about the threat posed by terrorism) and can do so through nationwide information campaigns.

5.2 Materiel (non-financial) resources

Medicine reserve stocks

The government stocks medicine reserves in case of major health related emergencies. The largest, and most controversial, expenditure is over £600 million since 2006 to stockpile 40 million doses of the antiviral drug Tamiflu to be used in the event of an influenza pandemic; there is limited evidence to prove the drug is effective. Medicine to treat nerve agent poisoning, cyanide poisoning, thallium poisoning, opioid poisoning, anthrax, plague and tularaemia can be obtained by NHS Acute Trusts and Primary Care Trusts from either their local NHS Ambulance Service Trust Emergency Control Room or the Department of Health Major Incident Coordination Centre.

²²¹⁹ Evangelos Fanoulis, Emil Kirchner and Han Dorussen, "Country Study: United Kingdom" Analysis of Civil Security Systems in Europe (FP7 ANVIL project, February 2014), p.26. http://anvil-project.net/wp-content/uploads/2014/02/United-Kingdom_v1.1.pdf

²²²⁰ Ibid. p.27.

Military assets

If required, and when practical, the armed forces can aid emergency response and recovery operations by providing niche capabilities (see section 4.3). The Defence Minister can devote armed forces and MoD assets to specific emergency response and recovery operations, such as:

- *a UK-based and UK-focussed Command and Control structure*
- *a UK focused Defence communications capability*
- *an Explosive Ordnance Disposal and Chemical Biological Radiological and Nuclear make-safe capability*
- *an air surveillance, policing and defence system*
- *Fishery Protection vessels*
- *a Special Forces capability*
- *a Search and Rescue capability*

State control of energy sources

The Department of Energy and Climate Change's National Emergency Plan for Fuel contains a set of emergency response tools that can be used to regulate or prohibit the production, supply acquisition or use of substances as fuel. This applies to the oil, gas and electricity sectors. The tools can be implemented under Section 3 of The Energy Act 1976, which stipulates that if a domestic incident is likely to result in "an actual or threatened emergency affecting fuel supplies" in the UK, then an Order in Council may be made giving the Secretary of State exceptional powers for "controlling the sources and availability of energy". The National Emergency Plan for Fuel also maintains a capability within the armed forces to make fuel deliveries in the event of a serious disruption to normal deliveries due to industrial action by fuel tanker drivers.

In an electrical supply emergency, the Department of Energy and Climate Change can, as a primary measures, instruct power stations to use alternative fuel sources to generate electricity. This emergency power is supported by the Fuel Security Code. If a prolonged electricity shortage occurs rationing may be necessary, the process for which is outlined in the Electricity Supply Emergency Code.

5.3 Training

Cabinet Office guidance emphasises the importance of training and exercises to ensure that all organisations involved in emergency response are fully prepared for all types of emergencies.

Statutory requirements

CCA regulations oblige Category 1 responders to formulate plans for carrying out exercises and for training staff or other persons. The nature and frequency of these arrangements should be set out in a planning document. Training must be provided for:

- an appropriate number of suitable personnel of the Category 1 responder; and

- other persons whom the responder considers necessary. This could include contractors with a role in the plans and also civil protection partners, both statutory and non-statutory, who have a role in the plans.

Exercises

Cabinet Office guidance states that exercises serve three purposes: validating existing plans; testing well established procedures; and training because they develop responder staff competencies and give them an opportunity to practice their roles. Guidance states that emergency procedures cannot be considered reliable until they have been exercised and proven to be workable.

There are three main types of exercise:

- Discussion based exercises can be used at the policy formulation stage to ‘talk-through’ how to finalise the plan, but more often are used to develop awareness about a completed plan through discussion.
- Table top exercises are based on simulation and typically involve a realistic scenario and a time line against which the efficacy of existing emergency arrangements can be tested. They are run in either a single room or a series of linked rooms which simulate divisions between different responders who need to cooperate. Table top exercises play an important role in validating and exploring weaknesses in procedures.
- Live exercises test the logistics, communications and physical capabilities of emergency procedures and train staff through experiential learning. Responders can develop confidence in their skills and learn what it would be like to use the plan’s procedures in a real event.

At government level, a coordinated cross-governmental exercise programme is in place which covers a comprehensive range of potential emergencies, including accidents, natural disasters and acts of terrorism. It is “designed to test rigorously the concept of operations from the coordinated central response through the range of lead government department responsibilities and the involvement of the devolved administrations, from central government to local responders.”²²²¹

The ANVIL study reports that the government coordinates three or four exercises every year, two of which are necessarily in the field of counter-terrorism. However:

*Exercises in the UK do not involve all government departments. In other words, inter-departmental exercises are a rare phenomenon because of the difficulties in coordinating all departments together and because of the significant budget expenditures required for a national exercise involving all sectors of the government.*²²²²

Local authorities and emergency services are also responsible for developing and implementing their own exercises to test local level capabilities. Counties may choose to invite another region of the UK to conduct a joint exercise, but this would be based on local initiatives and it is not an obligation flowing from governmental or legal requirements.

²²²¹ Cabinet Office guidance: <https://www.gov.uk/emergency-planning-and-preparedness-exercises-and-training>

²²²² Evangelos Fanoulis, Emil Kirchner and Han Dorussen, "Country Study: United Kingdom" Analysis of Civil Security Systems in Europe (FP7 ANVIL project, February 2014), p.24. http://anvil-project.net/wp-content/uploads/2014/02/United-Kingdom_v1.1.pdf

The UK also observes or participates with international partners in exercises, either through multilateral fora, such as the G8, NATO and the EU, or on a bilateral basis (see section 3.2).

Training

Cabinet Office guidance states that organisations should provide appropriate training to members of staff, and to contractors and the staff of voluntary organisations, who could be involved in emergency planning or response.

Staff should be trained in two broad areas:

Training for emergency preparedness includes training to conduct risk assessment, business continuity management and emergency planning.

Training for emergency response should be given to anyone involved in emergency response and recovery. Each member of staff will need to be aware of the contents of the emergency plan, their role in implementing the plan and the key skills and knowledge that are required during an emergency response.

The Emergency Planning College

The Emergency Planning College is the government's leading provider of emergency preparedness training. Managed by the Serco group on behalf of the CCS, the college attracts over 6,000 delegates a year from the public and private sectors. The Emergency Planning College runs seminars, workshops and training courses on risk assessment, business continuity management, emergency planning and response and a range of specialist courses on subjects ranging from severe weather to communicating with the public in the digital age. It is the only permanent national forum for representatives of local and central government, the emergency services, the private sector and volunteer groups to network and share good practice. The ANVIL study found that: "the type of training on crisis management provided by the EPC [Emergency Planning College], for instance courses on the EU Civil Protection Mechanism, is unique in the British context; in other words there is no other public authority, private organisation or civil society group offering such intense programmes on civil protection."²²²³

National Occupation Standards

In 2008, Skills for Justice, a government licensed Sector Skills Council, developed 18 National Occupation Standards (NOS) for civil contingencies covering those areas considered to be essential to the practice of emergency management. NOS specify the knowledge, skills and understanding needed in a particular role and allow for a clear assessment of an individual's competence against nationally agreed standards of performance. The standards have been adopted by the Emergency Planning Committee, an organisation for professionals dealing with emergency planning, crisis and

²²²³ Ibid.

disaster management, which developed its Core Competencies Framework around the NOS for civil contingencies. The Emergency Planning College runs courses that correlate fully with specific NOS.²²²⁴

Central Government Emergency Response Training

Central Government Emergency Response Training exists for members of government departments, agencies and other response organisations who will work in or with COBR during a national emergency. Held in various Cabinet Office central London locations, its three overarching objectives are to:

- provide delegates with a good knowledge of the processes, procedures and allocation of responsibilities in crisis management
- help delegates consider the skills and techniques required to enable effective and timely pan-government crisis decision making
- illustrate the unique working styles and leadership qualities necessary when working in or with COBR

The programme has four modules:

Module 1: an e-learning module that provides an overview of key doctrine and guidance underpinning the organisation of crisis management.

Module 2: an introduction to UK central emergency response arrangements and the underpinning principles and doctrine. This familiarises delegates with the role of COBR, supporting structures and key procedures and processes.

Module 3: this module covers information management and support to crisis decision-making and explores the concept of shared situational awareness to working practices in COBR, and in departments and agencies working with COBR.

Module 4: an exploration of the strategic issues for senior civil servants arising from their input into national crisis management arrangements.

All delegates take modules 1 and 2, and then either module 3 or 4 depending on their grade and role.

Cabinet Office guidance states that: “Separate arrangements also exist to acquaint ministers and senior officials in some of the unique aspects of crisis management leadership and process management”.

5.4 Procurement

Public sector procurement in the UK is governed the Public Contracts Regulations 2006 (SI 2006 No.5), which implement the EU procurement Directives and apply to the majority of procurements. Public utilities i.e. certain operators in the water, energy, transport sectors) are subject to the Utilities Contracts Regulations 2006 (SI 2006 No.6).

²²²⁴ See: <http://www.epcollege.com/epc/training/courses/courselist/introduction-to-civil-protection>

In addition, the Public Services (Social Value) Act 2012 requires relevant authorities that are engaging in a procurement exercise to consider how the proposed procurement might improve the economic, social and environmental well-being of the relevant area, and how these improvements might be secured.

There are no dedicated rules on procurement for crisis management but special rules apply to procurement in the fields of defence and security. These are set out in Chapter 8 of the Defence and Security Public Contracts Regulations 2011.

Following the adoption of new EU public procurement Directives in 2014, the Cabinet Office has just completed (but not published the results of) a public consultation entitled “Transposing the 2014 EU Procurement Directives”.

Guidance to public bodies is set out in “An Introduction to Public Procurement” (2008). This document sets out the key concepts and principles of good procurement and is intended for senior officials. Although it focuses primarily on activities in central departments and closely associated bodies, it is also relevant where central government provides commercial governance, advice or support to what is described here as the ‘wider network’ (i.e. all devolved public sector bodies, including those in health, education, local government and the emergency services).

The Guidance is also relevant to the process of “Commissioning”. Commissioning is where the public sector decides the services or service outcomes (e.g. in adult social care or children's services) or the products that it needs, acquires them and makes sure that they meet requirements. The processes involved in commissioning and procurement are broadly the same.

Procurement in the field of defence and security typically uses restricted and negotiated procedures.

5.5 Niche capabilities

Training

The government's Emergency Planning College has leading courses on EU Civil Protection Mechanism: see sections 3.2 and 5.3, above.

Volcanic activity

According to the UK's National Risk Register:

The International Civil Aviation Organization has an established International Airways Volcano Watch consisting of nine Volcanic Ash Advisory Centres (VAACs) located around the world, each of which has the responsibility for coordinating and disseminating information on volcanic ash that might endanger aircraft. The London VAAC, run by the Met Office, has

responsibility for monitoring 20 3. Risk descriptions Iceland, the UK and the north-east area of the North Atlantic.

Under the auspices of the World Meteorological Organization, the Met Office is also one of eight global Regionally Specialised Meteorological Centres for modelling the dispersal of particles (including ash) in the atmosphere. Such models allow evidence-based judgements to be made to determine whether it is safe to fly and whether passenger safety can be protected.

Counter-terrorism

The UK is widely recognised as a leading authority on counter-terrorism in the European Union. It has played a significant role in the development of the EU's counter-terrorism strategy and is home to the European Police College.

ALBANIA

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: CSDM (Georgi Tsvetkov, Philip Spassov, Vesselin Petkov, Todor Tagarev)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by EOS and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

Albania has a total area of 28,748 km². It shares a border with Montenegro to the northwest, with Kosovo to the northeast, with Macedonia to the north and east, and with Greece to the south and southeast. It has a coastline of approximately 476 km. Administratively, the country is divided into 12 regions (Albanian: qark or prefekturë), 36 districts, and 28 municipalities, which are the basic units of local self-government.

Albania is one of the European countries particularly exposed to predominantly natural disasters. Its climate is shaped by the Mediterranean (Adriatic) sea to the East and the rugged mountainous landscape covering most of the territory to North, West and South. The main hazards are forest fires, floods, earthquakes and snowstorms. The high precipitation, combined with the high rate of seismic activity and anthropogenic factors (deforestation, urbanisation and a dam-burst risks) define floods and landslides as very likely and potentially devastating.

Crisis management is organised at three levels – national, regional and local. At national level, the Council of Ministers leads and governs the national system of civil emergency management in Albania, with the main role played by the General Directorate of Civil Emergencies (logo on Figure 1) in the Ministry of Interior.

Figure 62: Symbol of the Albanian Civil Protection.

Prefects in the prefekturës (regions) are responsible for planning and coping with civil emergencies at prefekturë (regional) level. A Commission of Planning and Responding to Civil Emergencies is established in each prefekturë with the task to coordinate activities of the respective authorities and volunteer organisations for planning and coping with emergency. Accordingly, the mayor or the head of commune is responsible for planning and responding to civil emergencies in the respective municipality or commune (local) level. Under the chairmanship of the mayor or the head of commune, a Commission of Planning and Responding with Civil Emergencies is established, and its main task is to coordinate all activities of the local government unit and volunteer organisations, responsible for planning and responding to emergencies.

The principal operational forces or active structures in Albania are comprised of the Armed Forces; Directorate of Fire Protection and Rescue (PMNZZH); the Ambulance Service; the State Police and other Police units; Directorate of State Reserves; Units specialised in mines and technical response; Monitoring and operational supportive structures.

Human resources dedicated to crisis management (excluding Armed Forces' personnel) include approximately 450 civil protection personnel at prefekturë level (app. 50) and personnel employed in civil protection at municipal or district level. Involvement of private companies and volunteers is limited to approximately 500 active personnel.

Overall, Albania has limited capacity to prevent and capability to react to natural or anthropogenic disasters. With legacy shaped by the autarkic communist dictatorship of Enver Hoxha and civil unrests in the 1990s, Albania has one of the lowest GDP per capita in Europe, despite the economic growth in the past several years.

The Albanian government has a clear understanding about the risk associated with natural or anthropogenic disasters. It has developed the necessary legal framework. However it faces considerable challenges in mitigating disasters, primarily due to socio-economic factors and inadequate organization. At the same time, the capacity for disaster response is also limited, due to financial constraints and the poor condition of the country's economy. In fact, any significant accident/ disaster would require international assistance.

1 Policy

1.1 Risk Assessment

The draft version of National Strategy for Disaster Risk Reduction and Civil Protection 2014-2018²²²⁵ contains a risk assessment based mainly on the UNDP Disaster Risk Reduction Capacity Assessment Report for Albania.²²²⁶

The four main hazards affecting Albania are forest fires, floods, earthquakes and snowstorms. Among other hazards available assessments make reference to landslides, drought, epidemics, avalanches, tsunami, technological hazards, dam burst and storms.

While information on risk of natural hazards in Albania remains a challenge, available data shows that the risk level is increasing and is comparatively higher in Albania than in neighboring countries.²²²⁷ Albania ranks 41st in the world in terms of vulnerability to landslides, 43rd in terms of earthquakes and 58th in terms of drought risks.²²²⁸

Risk of natural hazards is primarily driven by economic, social and environmental factors, as well as institutional and political context. Factors affecting earthquake risk are anchored in the application of building code and standards, the awareness and knowledge of engineers and builders, as well as in the incentives to ensure that non-engineered constructions are built to appropriate norms. A level of earthquake risk has accumulated over many years in Albania. This risk needs to be quantified and factored into emergency plans and future development policies and plans such as efforts to retrofit key buildings.

Other factors are driving the risk levels related to floods and forest fires, such as rapid deforestation, poor watershed management, low levels of preparedness of local population, insufficient monitoring and warning capacity and the need for better coordination between dam control and emergency flood managers.

A certain amount of risk will not be reducible in Albania and alternative mechanisms are required to offset the economic and social impact, such as catastrophic risk insurance schemes.

Climate change is a further compounding factor, as Albania's rain and snow fall occurrence has one of the highest levels of variability in Europe. Climate change is projected to further increase the variability and will result, for example, in a higher incidence of heat waves according to the Intergovernmental Panel on Climate Change (IPCC).²²²⁹ These factors may already be influencing the occurrence and intensity of floods and forest fires in Albania; and, both floods and forest fires are projected to occur more frequently in the future. Albania's National Communication under the UN Framework Convention on Climate Change (UNFCCC) identifies Albania's coastal zones, as well as water re-

²²²⁵ The draft is from 19 June 2014 and is available on <http://www.mbrojtjacivile.al>.

²²²⁶ UNDP, Disaster Risk Reduction Capacity Assessment Report for Albania (2011).

²²²⁷ Two reports outline the level of risk to natural hazards and capacities in disaster risk management in Albania (1) Disaster risk assessment in Albania, UNDP, 2003 and (2) Disaster Risk Reduction Capacity Assessment Report for Albania, UNDP 2011.

²²²⁸ Global Assessment Report on Disaster Risk Reduction, UNISDR, 2013 & 2015 editions. Cf. http://www.preventionweb.net/english/hyogo/gar/2015/en/gar-pdf/GAR2015_EN.pdf, p. 92.

²²²⁹ IPCC Special Report on Extreme Events (IPCC/SREX, 2011).

sources, ecosystems, agriculture, energy and tourism sectors as the most vulnerable to climate change.

From a statistical point of view, the most frequent natural disasters in Albania are floods and earthquakes, with the former also causing significant financial damage (see Table 1).

Examples of recent impacts include the forest fires of the summer of 2007. The fires affected 30,856 hectares of forests and 7,139 hectares of pastures. The floods of December 2010 in the Lower Drini-Buna River Basin cost the Albanian economy ALL 2.5 billion (EUR 18 mln), rising to ALL 4.4 billion (EUR 37 mln) when indirect losses were accounted. A report, produced in 2012, estimates the cost of reducing the risk in the lower Drini-Buna River Basin to an acceptable risk of 50 year return period at ALL 7 973 mln, equivalent to EUR 57 mln. Recently, in February 2015 the Albanian Government de-

Extracted from The International Disaster Database (EM-DAT), maintained by the Centre for Research on Epidemiology of Disasters at <http://www.emdat.be/database>.

clared a state of emergency and asked assistance from NATO, due to floods affecting most severely the districts of Vlora and Fieri.²²³¹

Very conservative estimates of economic losses due to floods, landslides and forest fires that occurred since 2002, put the direct cost to the national economy at ALL 13 bln (EUR 94 mln).²²³² If indirect costs were factored in and the projected losses due to earthquakes were accounted for, the projected costs of disaster to the national economy will be considerably higher.

Extreme temperature events have had severe impacts in the country, which is indicated by a large number of deaths per events. Landslides and earthquakes are the next most severe hazardous events in the country in terms of people killed.

The most severe technological accident recorded to date in Albania is the explosion which occurred at a munitions decommissioning facility on 15 March 2008, affecting more than 10 000 people. The accident caused 26 deaths, injuries to over 300 people, and the destruction of 2,300 buildings and displacement of 4,000 people (see also Table 2).

Some conclusions mentioned in *IPA Beneficiary Needs Assessment* (UNDP, 2011), are not included in risk assessment section of the *Strategy*, i.e. the conclusions emphasising the tendency that the less developed regions and social groups are the most vulnerable.

The South East European Climate Change Framework Action Plan for Adaptation acknowledges that the entire region of South East Europe will have to face increased annual mean temperatures, decreased annual number of precipitation days and increased magnitudes and frequencies of climatic extremes. The majority of SEE countries also share similar vulnerable groups: low-income groups in drought-prone areas with poor infrastructure and market distribution systems, low to medium-income groups in flood-prone areas due to the possible loss of stored food or assets and farmers who may have their land damaged or submerged by increased floods. The first impacts of climate change will likely be felt in the agricultural production, the availability of water resources, forestry and energy (since SEE countries are heavily dependent on hydropower).²²³³

The vulnerability of Albania's citizens and the impact of disasters in the country are significantly compounded by a relatively high degree of poverty, lack of infrastructure maintenance, unsafe build-

²²³⁴ Ibid.

ing and land use practices linked to rapid urbanisation, exploitation of natural resources (overgrazing of pasture, overexploitation of forests and riverbeds, etc.) as well as by the various consequences of the transition from a state-controlled to a free-market economy.²²³⁵ Nearly 47 percent of Albanians live below the poverty line. Socio-economically fragile groups being often disproportionately exposed to hazards, the effects of a disaster would negatively affect the prospects for long-term development.

Part of Albania's structural vulnerability stems from the obsolescence of some installations such as dyke systems, drainage channels, high water collection or flood-control facilities and pumping stations. Many of these have not been improved in recent times and their deterioration may easily aggravate the consequences of river flooding. During the winter 2009-2010, severe flooding created a critical situation at the River Drini hydro-power plants and water-reservoirs as well as downstream, in the area between Vau, Dejes and the Adriatic Sea. Albania's flooding potential is further increased by the proliferation of high earth dams constructed on rugged terrain that is subject to landslides and earthquakes. The 2003 Risk Assessment Study of Natural Disasters established that the greatest demand placed on the national civil emergency system would result from earthquakes occurring in Durres, Elbasan, Berat or Vlora. In these regions, only a few hospitals and school structures are designed appropriately and the safety of residential buildings is generally poor.

1.1.1 List of major hazards and risks in Albania²²³⁶

Seismic risk

Albania is characterised by a high rate of seismicity. Albania, together with Greece, Montenegro, Macedonia, southern Bulgaria and western Turkey (all located in the same region), experience almost annual occurrences of at least one earthquake of magnitude ≥ 6.5 . Albania is characterised by intense micro ($1.0 < M \leq 3.0$), small ($3.0 < M \leq 5.0$) and medium-sized ($5.0 < M \leq 7.0$) earthquake activity, and rarely by large ($M > 7.0$) earthquake events. Tirana accounts for more than one quarter of the urban seismic risk, perhaps considerably more if the official population figure is underestimated. The seven largest cities at risk in Albania account for more than 75 percent of the urban risk.²²³⁷ Earthquake risk reduction is crucial as most strong earthquakes have been accompanied by extensive land instability (such as liquefaction, ground subsidence, surface cracks, landslides and rock slides) and can, at times, be held accountable for small tsunamis.

Flood risk

The Albanian river system poses the highest risk of flooding to the country, generally of pluvial origin. The hydrographic basin encompasses an area of 43,305 km², of which 14,557 km² belong to the watersheds of the Drini and Vjosa rivers, which encompass parts of Greece, Macedonia and Kosovo. The eight main rivers in Albania are grouped into six watersheds that transverse the country from east to west. Their main annual discharge is 1,308 m³/sec, which corresponds to the discharge of 30 m³/sec/km². Floods are more frequent during the November–March period, when the country receives about 80–85 percent of its annual precipitation. Due to topographic patterns, these floods

²²³⁵ See www.ifrc.org/PageFiles/86599/Albania.pdf.

²²³⁶ All data in this section is drawn from the Disaster Risk Reduction Capacity Assessment Report for Albania (UNDP, 2011).

²²³⁷ Probabilistic seismic hazard maps for Albania, 13th World Conference on Earthquake Engineering, 2004.

occur rapidly after water has run through the main river hydrographic network for around 8–10 hours.

DRR primarily has to deal with preventive, preparative and reparative measures aimed at flooding of the Buna, Drini and Semani river basins. In these areas the expected number of flooded buildings (100 year returned period) ranges from 15,500 to 24,000 (± 10 percent), which would cause demands for shelter and/or other forms of assistance for an estimated 84,000 to 172,000 (± 10 percent) people. The implications of disaster related to other river basins are considerably lower, ranging from about 4,000–8,000 (± 10 percent) affected buildings corresponding shelter and/or other forms of assistance for 25,000 to 50,000 (± 10 percent) people.²²³⁸ The 100 year return period of West Plain Flooding would adversely affect 20 Districts (out of 36), 341 villages (out of 2,962), 110 Communes (out of 308), about 85,500 buildings covering 7,900,000 m² and 565,000 people.

Risks of Landslide

Albania is characterized by land instability caused by natural factors (e.g. mechanical action of surface and underground water, precipitation, seismic action, physical and chemical conveyance) and anthropogenic factors (e.g. engineering interventions on slopes, the construction of dams, large water retention reservoirs, roads, tunnels and other related infrastructure facilities). The Albanian territory is divided into three zones of natural slope stability – stable, relatively stable and unstable, corresponding respectively to 56.6 percent, 33.6 percent and 9.8 percent of the total territory of the country. Land instability in Albania occurs primarily after massive torrential rain or snowfall. Various types of landslide (rock falls, topples or torrent deposits) are often recorded along disturbed slopes on national and regional transportation routes, in the irrigation water usage or other engineering works.

In addition, hydro-technical works either interrupt the weak equilibrium of geological formations or accelerate existing landslides. Consequently, the largest landslides have developed in the basins of the main hydropower plants of Fierza (the Porava landslide), Vau i Dejes (the Ragami landslide) and Banja (the Banja landslide).

Dam-burst risks

Dams and reservoirs in Albania are primarily constructed for: agricultural and irrigation needs, flood control, hydropower and recreation. Presently there are 630 dam reservoir systems in the country, 307 of which are recognized as either high dams (height ≥ 15 m) or large dam reservoir systems.²²³⁹ Among the 82 ICOLD members, Albania ranks first in number of dams per 10,000 inhabitants. The height of the majority of dams ranges from 10–30 m (524 dams) to 30–60 m (77 dams). Six dams are higher than 60 m, of which two are higher than 100 m (the Koman Dam, 115 m and the Fierza Dam, 167 m). At a height of 167 m the Fierza Dam is the highest dam of this type in Europe. All high dams in Albania are earth-filled.

Migration and urban expansion have led to increased concentrations of populations and material property in such downstream areas. In the event of dam bursts: 246 (57 percent) could affect a population larger than 100; 56 (36 percent) could impact areas with more than 500 inhabitants; and any of the other 57 would affect areas with a population in excess of 2,500. Burst of eight out of those 57 dams could affect the entire towns of Elbasan (population over 100 thousand), Lushnje (population over 37,829) and Divjake (more than 10,000 inhabitants). Albania is planning to build new small hy-

²²³⁸ Risk Assessment Study of Natural Disaster in Albania, 2003.

²²³⁹ ICOLD World Register of Dams, 1998. See also www.icold-cigb.org/GB/World_register/world_register.asp.

dropower plants; currently only 40 percent of country hydroelectric potential is exploited. Therefore this risk is expected to increase in the near future.

Snowfall risk

Snowfall risk occurs mainly during the period from November to March, and in the mountainous northern, north-eastern, central and southern parts of the country. Typical high snow hazards are road blockage (due to the lack of maintenance and poor conditions of roads) and avalanches. The population residing in these areas (at least 30 cm snow-depth) ranges from 11.6 percent (355,000 \pm 10 percent) to 31.3 percent (1 million \pm 10 percent). Disaster preparedness planning is needed for such situations that last longer than 30 days (taking into consideration conditions like household food reserve levels or seriously ill patients).

Wild/Forest Fire risk

Forests occupy roughly 29 percent of Albania. Most of the forestland (77 percent) consists of low productivity degraded forests like oak forests (31.8 percent) and scrubland²²⁴⁰ (25.6 percent). Forest areas can be divided into two basic functional categories: productive forests (some 900,000 ha or 86 percent of the total area); and protected and recreational forests (some 140,000 ha or 14 percent). The forests of Albania are prone to fire, especially at the end of spring and during dry summers.

Among Mediterranean countries, Albania is one of the most affected by forest fires. The total area burnt during 2007 reached 127,000 ha, whereas the figure in 2008 was significantly lower at 19,254 ha (11,389 ha burnt in forest or wooded land and 2,080 ha of agricultural land). Fire causes are of both anthropogenic origin (human negligence, pasture burning and, to a lesser extent, arson) and natural origin (lightning). Human misuse of fire, accompanied with deforestation and grazing practices, are among the key reasons for the forest destruction. For DRR management, more training of fire-fighting personnel is considered necessary.

Technological risks

The main technological hazards for Albania are industrial pollution, toxic wastes, transport accidents, factory explosions and chemical spills. Although the country is well endowed with natural resources, such as oil, natural gas, coal, chromium, copper, nickel and timber, technological risks do not pose a significant threat to the population (except in the case of accidents) due to a low level of industrial activity. However, as hazardous materials, substances and products remain in stock in different parts of the country, DRR preparedness and response are still deemed necessary to properly manage the risk of technological disasters.

1.2 Policy and Governance

According to the Albanian disaster risk response legislation²²⁴¹ the national crisis management framework consist of three levels – national, regional and local.

At national level, the Council of Ministers leads and governs the national system of civil emergency management in Albania. This includes endorsing strategies, policies, programmes that aim to prevent, mitigate, prepare and respond to civil emergency situations.

Each line ministry is responsible for planning and handling civil emergencies according to their area of expertise. To be effective, this requires coordinated inputs from a number of line ministries. The

²²⁴⁰ Or 'shrubland.'

²²⁴¹ To be reviewed at section 2 "Legislation."

Inter-Ministerial Committee of Civil Emergencies coordinates the appropriate actions of all concerned institutions through all the phases of response to civil emergency situations. A *General Directorate of Civil Emergencies* ²²⁴² was established in the Ministry of Interior.

Prefects in the prefekturës (regions) are responsible for planning and coping with civil emergencies at prefekturë (regional) level. Under the chairmanship of the prefect, a Commission of Planning and Responding to Civil Emergencies is established whose task is coordination of activities of the prefekturë authorities and volunteer organisations for planning and coping with emergencies. The 12 prefekturës of Albania have one full-time civil emergency officer.

The mayor or the head of commune is responsible for planning and responding to civil emergencies in the respective municipality or commune (local) level. Under the chairmanship of the mayor or the head of commune, a Commission of Planning and Responding with Civil Emergencies is established, and its main task is to coordinate all activities of the local government unit and volunteer organisations, responsible for planning and responding to emergencies.

The main non-governmental organisation that provides volunteer services for local risk and capacity assessments, public education and community-level disaster planning is the Albanian Red Cross (ARC).

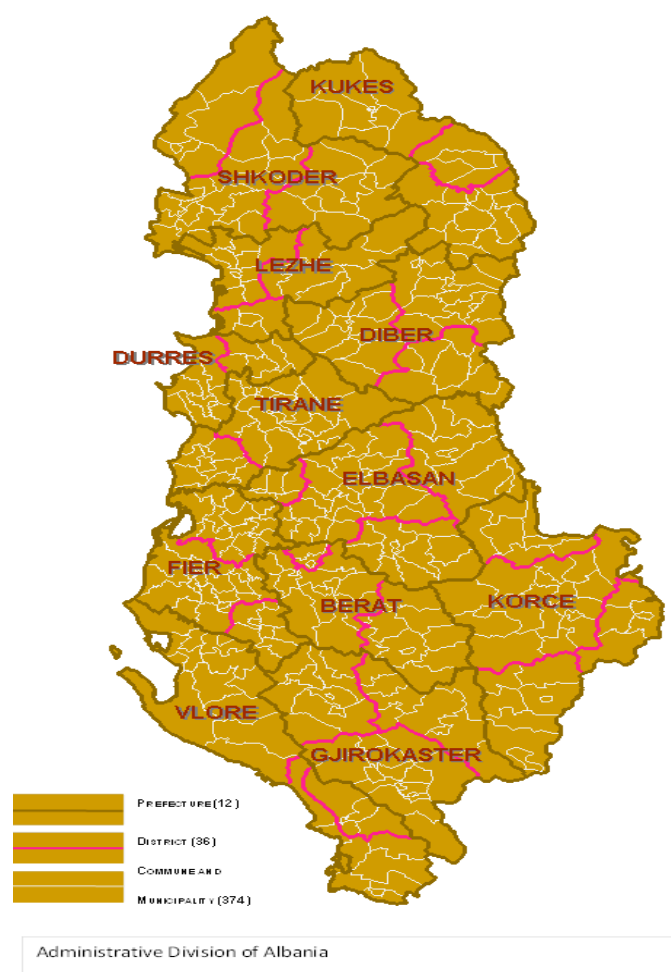

Figure 63: Administrative Division of Albania. Source: IPA Beneficiary Needs Assessment Albania.

²²⁴² The original name of the structure was Department of Civil Emergency Planning and Response, and many documents and pieces of legislation consulted for the report's drafting use that name. It could also be found as General Directorate of Civil Protection.

When describing the Albanian DRR Institutional Framework, the authors of Albania's Needs Assessment report ²²⁴³ concluded that:

Although there are powers and responsibilities assigned to the regional and local governments in DRR, the system in Albania remains highly centralised. Regional and local governments do not receive sufficient funding and in practice are excluded from decision-making. Moreover, legislation does not yet specifically encourage community participation in disaster risk reduction.

1.2.1 Strategy scope and focus

The draft version of *National Strategy for Disaster Risk Reduction and Civil Protection 2014-2018* introduces a comprehensive approach toward DRR and DRM including prevention, preparedness, response and recovery. The document contains a conclusion that *"The main challenge is increasing the level of understanding of disaster risk reduction concepts – in order to shift perception of disaster risk reduction from "disaster response" towards "risk reduction" this needs to be addressed within long-term development plans."*²²⁴⁴ However, it seems that the scope of 'Prevention' is the monitoring of hazards and the early warning. It is hard to find a true "risk reduction" through, for example, requirements and/or actions addressing respective infrastructure, urban and rural development.

1.2.2 Monitoring and analytical support to policy making; R&D

According to the Strategy,²²⁴⁵ the Institute of Geoscience, Energy, Water and Environment (IGEWE) is the institution in Albania for national monitoring and warning structure for natural hazards of meteorological origin, including floods, wildfires and earthquakes. IGEWE is endorsed by the World Meteorological Organization as the National Meteorological and Hydrometeorological Service for Albania. According to IPA Beneficiary Needs Assessment,²²⁴⁶ Albania monitors and assesses its risks from natural hazards through several relevant institutions (see Table 3).

However, the DRR Capacity Assessment Report ²²⁴⁷ states that:

²²⁴³ IPA Beneficiary Needs Assessment, UNDP, 2011, p.10.

²²⁴⁴ Draft version of National Strategy for Disaster Risk Reduction and Civil Protection 2014-2018, June 2014, quote on p. 12.

²²⁴⁵ Draft version of National Strategy for Disaster Risk Reduction and Civil Protection 2014-2018, June 2014, quote on p. 11.

²²⁴⁶ UNDP, 2011, p.13.

²²⁴⁷ Disaster Risk Reduction Capacity Assessment Report, UNDP, 2011, p.15.

Table 40: Albanian institutions monitoring and assessing risks.

Seismic risks	Department of Seismology within the Institute of Geo-sciences (Tirana Polytechnic University)
Floods, avalanches, heavy snow	Primarily by the Institute of Water, Environment and Energy (Tirana Polytechnic University)
Landslides	Institute of Geo-sciences (Tirana Polytechnic University)
Forest fire	Department of Forests and Pastures (Ministry of Agriculture, Food and Consumer Protection)
Epidemics	Institute of Public Health (Ministry of Health)

At University level there is no faculty that supports the education of seismic or hydrology experts. Seismologists and hydrologists are usually drawn from the faculties of mathematics, civil engineer, physics and geophysics and are then trained in seismology or hydrology. A project of the Institute of Geoscience to collaborate with IIZIS (based in Macedonia) and other university institutes in the region, for providing postgraduate education in seismology, has not yet been implemented due to a lack of funds.

Under the Albania Disaster Risk Mitigation and Adaptation Project (AL-DRMAP)²²⁴⁸ project three main activities were financed. One of them was the complete digitalisation of Hydrometeorological data. 20 years of hydrological data and 10 years (2001-2011) of meteorological data have been digitised. The data was undergone quality analysis and has been published on the IGEWE (Institute of GeoSciences, Energy, Water and Environment) website for user access. 40 hydrometeorological observing stations have been installed, and the real-time data from the majority of these stations are now flowing. 3-day and 7-day bulletins are published and posted on the website for user access. Forest Fires Warning Bulletin during the summer and a Meteorological Warning Bulletin during the wet seasons are issued.

Under the Program for Prediction, Prevention and Mitigation of Forest Fire and Flood risk in Albania an advanced system for hydro-meteorological monitoring, DEWETRA,²²⁴⁹ was donated by the Italian Civil Protection Department and the CIMA foundation. The system was implemented in 2010-2012. Out of this program, CIMA also supported the development of disaster loss database in Albania and Serbia, using the Disaster Inventory System (DesInventar)²²⁵⁰.

²²⁴⁸ Albania Disaster Risk Mitigation and Adaptation Project (under the World Bank Disaster Risk Mitigation and Adaptation Project). The project was for over \$9M for 2012-2014. The object is to strengthen institutional capacities (a) to reduce Albania's vulnerability to natural and man-made hazards; and (b) to limit human economic, and financial losses due to these disasters, www.worldbank.org/projects/P110845/disaster-risk-mitigation-adaptation-project?lang=en.

²²⁴⁹ The DEWETRA platform is a real-time integrated system for hydro-meteorological and wildfire risk forecasting, monitoring and prevention. The system is based on the rapid availability of different data which help establish up-to-date and reliable risk scenarios. Available at <http://www.cimafoundation.org/en/cimafoundation/dewetra/>.

²²⁵⁰ <http://www.cimafoundation.org/en/cimafoundation/desinventar/>.

1.2.3 Policy for Prevention

As noted in the *National Civil Emergency Plan* of Albania²²⁵¹ the Prevention and mitigation for existing structures, facilities and environmental areas in Albania is a shared responsibility, requiring:

a) *Information*. Essential information includes:

- Seismological, hydrological and meteorological data;
- Technical information on the conditions of maintenance, repair and safety of: housing and transport infrastructure, and essential installations including dams, mines, public and private sector land and marine industrial installations, complexes and stores;
- Technical information regarding the state of environmental areas, such as drainage basins and watersheds, including forests, rivers, primary, secondary and tertiary channels, unstable slopes, wetlands and reclaimed areas;
- The level of pollution, hygiene and epidemiological data as well as level of civic order.

b) *Observing and Applying Standards*. Developing, resourcing and implementing appropriate schedules and standards include:

- Regular agreed maintenance schedules;
- Agreed forecast repair schedules;
- Attaining and maintaining minimum agreed national standards of safety installations and internal and external inspection procedures.

c) *Improvements*. Planning and resourcing improvements include:

- Repair, upgrading, improving and retro-fitting up to or above original minimum standards of use;
- Taking into account new hazards and risks posed to or by the structure or facility;
- Aiming towards European Community approved standards.

d) *Emergency Prevention Plans*. Developing specific emergency prevention plans from relevant sectors for existing structures, facilities and environmental areas, comprising:

- Identified personnel roles and responsibilities;
- Establishing a monitoring and information system;
- Making clear and known early warning steps and procedures;
- Agreeing on clear public information procedures;
- Developing and testing emergency checklists, key emergency contacts and simulation exercises.

e) *Training*. Investing in appropriate training of identified emergency situation personnel and joint training with related partners in civil emergency matters.

f) *Investment*. Actively soliciting investment in prevention and mitigation through new and existing partnerships, coherent planning and attainment of industry and EU norms.

The Plan also envisages additional general measures for prevention and mitigation, related to:

- New structures, facilities and developing environmental areas;
- Review and enforcement of legislation;

²²⁵¹ Prepared by the Ministry of Local Government and Decentralization and adopted by the Council of Ministers with Decree no. 835 (2004).

- Inspectorates, Secretariats and Diverse Polices; and
- Responsibilities and planning at various levels.

More specifically, the National Civil Emergency Plan (p. 25) states that it is necessary to establish of an efficient structure for civil emergency prevention – National Inspectorate of Civil Protection (NICP). As part of prevention and mitigation structures, NICP will be present in planning, projects implementation and providing licenses. With a structure at both central and prefekturë level, this inspectorate will take the role for monitoring and reporting on the progress in monitoring all the territory. The National Inspectorate of Civil Protection will have monitoring, controlling and reporting roles through supervising the work in progress of all structures relevant to civil emergencies. The NCIP will control the work for planning and implementation of prevention measures for civil emergencies of all state and private subjects. NICP will also control the status, i.e. the level of manning, equipment and the level of preparedness of the operational forces to respond to civil emergencies.

In its work, the NCIP will pursue competences and responsibilities foreseen in legal and sublegal documents/acts such as for undertaking measures against the institutions, structures and subjects which have not correctly implemented rules, regulations, standards and legal bases for prevention, preparedness and response to civil emergencies, as well as the activities for recovery and development of the affected area.

By now such an Inspectorate has not been established. In fact, there is no single authority coordinating the disaster prevention policy. The draft of the National Strategy for Disaster Risk Reduction and Civil Protection 2014-2018 (p.10) states that the General Directorate of Civil Emergencies needs to be promoted to an Agency, functioning under the Prime Minister's Office.

According to Annex 2 of the Draft Strategy, there are 15 Key Institutions with responsibility in civil emergencies. These are 13 Ministries, the Albanian Academy of Science and the Albanian Red Cross. Five ministries have responsibilities for the policy for prevention.

The leading *Ministry is that of Agriculture, Food and Consumer Protection*. It has a wide range of prevention responsibilities, including for flood, landslide, dam-burst, epidemic, and wild/forest fire risk reduction. The *Ministry of Public Works and Transportation* is the principal structure that shoulders core problems as maintenance, repairing and construction of highway and railroad infrastructures, ensures support and organises assessments of damages and resistance of structures in residential and public facilities, water-supply facilities, and channels. The *Ministry of Economy, Trade and Energy* is responsible for collecting information in relation to emergency needs to determine intervention in public investments of critical infrastructure. The *Ministry of Health*, the *Ministry of Labour, Social Affairs and Equal Opportunities* and the *Ministry of Finance* also have some limited responsibilities.

Under the already cited AL-DRMAP project, an National plan of revisions of building code has been developed. A special decree has been issued by MOPWT (Ministry of Public Works and Transport) to integrate Eurocode 8, 0-3 into national legislation based on the national plan. Key sections of the Eurocode 8 for earthquake resistance were prepared with project funds and Eurocodes 0, 1, 2, and 3 were transferred with MOPWT budget.

As part of IPA (Instrument of Pre-accession Assistance) Adriatic Cross-border Programme – Under this EU program (2007-2013) Albania participated in two projects – ADRIARadNet and HAZADR.²²⁵² The HAZADR project – Strengthening common reaction capacity to fight sea pollution of oil, toxic and hazardous substances in Adriatic Sea, was about the common training of personnel. The main goal of

²²⁵²

http://www.adriaticpacbc.org/index.asp?page=interna&level=project_list.

the project was the setting up of a training and research centre for combating oil spills, and spills of hazardous and noxious substances – with the task of training personnel, especially response teams, involved in the implementation of contingency plans. The total budget was over 3M Euro, of which over 217 thousand for Albania.

1.2.4 Policy for Preparedness

The National Civil Emergency Plan defines preparedness as “undertaking of any measures to prepare people and property to withstand as effectively as possible, the effects of an identified potential threat or hazard.”

The policy for preparedness is based on several pillars:

- Institutions and Civil Emergency Plans
- Sectorial and Contingency Plans
- Identifying Hazard and Risk
- Awareness of Risk
- Monitoring and Trigger Mechanisms
- Early Warning
- Emergency Public Works and Other Measures
- Seasonal Preparedness and Protection Measures
- Clear roles and responsibilities at National, Prefekturë and Municipality levels
- Developing Preparedness and Protection Priorities for Albania

Plans

Departments and organisations with responsibilities for civil emergency issues are obliged to draw up their own civil emergency plans to meet their responsibilities and obligations under NCEP.

In addition to that, specific problems, which may be of national, regional or local importance are treated by Sectorial Plans. The disaster management structure at the central, regional and local level is responsible for developing Contingency Plans for specific disasters. There are also specific plans developed to cover important Installations and facilities pertaining to private or public juridical or physical subject.

Early warning

Under this platform is enabled the Early warning System for Floods and Early Warning System for Wildfire and daily bulletins on the related risks for all territory are produced by IGEWE and disseminated to all stakeholders.

Most of the international assistance programs in which Albania participated were focused of DRR preparedness.

Under the AL-DRMAP project, the CRIF (Catastrophic Risk Insurance) Facility has been established and catastrophic insurance infrastructure and regulatory framework are in place. More than half of the existing private insurance companies in Albania have already registered with the Europe Re. A regional arrangement, especially operationalization of the Europe Re (the reinsurance company under SEE-CRIF), has also been completed as of the end of March 2014. Comprehensive earthquake and flood insurance packages have been fully developed with view to provide homeowners and SME's with high credit quality coverage. An innovative underwriting platform and consumer education website on disaster risk and disaster risk insurance have been developed and is made available to the government and the public.

Under The Global Facility for Disaster Reduction and Recovery (GFDRR) initiative, managed by the World Bank, 40 automated hydro-meteorological stations in Albania were modernized.²²⁵³

As part of IPA (Instrument of Pre-accession Assistance) Adriatic Cross-border Programme – Under this EU program (2007-2013) Albania participated in the project ADRIARadNet²²⁵⁴ - ADRIAtic integrated RADar-based and web-oriented information processing system NETwork to support hydro-meteorological monitoring and civil protection decision. The total budget was over 2,8M Euros, of which over 350 thousand for Albania.

With the financing of the EU under UNESCO, Albania was included in IncREO Project - EarthObservation (EO)-based map for disaster risk reduction (floods)²²⁵⁵. The goal of the project is to increase disaster mitigation and response preparedness through simulations²²⁵⁶.

1.2.5 Policy for Response

The NCEP defines response as “actions of forces and means for rescuing people’s lives, livestock and property in a territory stricken by a disaster, as well as providing the basic living conditions for the population affected by disaster.”²²⁵⁷

The plan distinguishes between four stages of the response phase, namely:

- Stage 1: Alert. All measures on first notification or information on an emergency situation and serves as a signal to increase readiness.
- Stage 2: Standby. Readiness of all post notification measures or information that an emergency situation or disaster is imminent or has started.
- Stage 3: Activate. Activation arises when an emergency situation has occurred.
- Stage 4: Stand Down. Stand Down represents the closure of the Response Phase, irrespective of how many previous stages have actually occurred.

Albania has a National Operations Centre for Civil Emergencies (NOCCE), under the General Directorate of Civil Emergencies to which all new information relating to a real or potential civil emergency situation must be addressed, where it will be collected and analysed.

NOCCE inform the Director of the General Directorate of Civil Emergencies who informs the Minister of Interior each emergency situation or possibility for occurrence, and depending on the situation issue the activation of the National Civil Emergency Service System (NCESS).

NCESS comprises structures, human and material resources, governmental and nongovernmental, which are involved in the response to civil emergencies. NCESS is composed of both permanent and temporary structures, depending on the activation of the capacities to respond to emergencies. The activation of the NCESS ensures an appropriate and immediate response to all the types of potential emergency situations, whether or not the Alert stage has occurred.²²⁵⁸

Roles and responsibilities in the response phase are listed by the NCEP. At Regional or local level, the Civil Emergency Officer, Prefect or designated official will commence similar stages of activation to support and complement the NCESS. Public information will be provided by the NOCCE. Any requests

²²⁵³ <https://www.gfdr.org/area/Pillar3>.

²²⁵⁴ http://www.adriaticpacbc.org/index.asp?page=interna&level=project_list.

²²⁵⁶ <http://www.increo-fp7.eu/project-overview/>.

²²⁵⁷ National Civil Emergency Plan, p.31.

²²⁵⁸ National Civil Emergency Plan, pp.32-35.

for international assistance are made when it is decided that the level of needs cannot be met from national resources and capacities. International Appeal is prepared by Inter-Ministerial Committee of Civil Emergencies.

The NCEP details financial considerations in the response phase (immediate, secondary and tertiary financial implications), as well as four series of standard assessment tools for the purposes of analysis and reporting. These include: First Notification Form (Prepared at Prefect Level); First Disaster Information Report (Prepared by Joint Assessment Team); Disaster Situation Report to OCHA; Request for Line Ministries in Case of Emergencies.

1.2.6 Policy for Relief and Recovery

All the line Ministries and agencies have duties and responsibilities during the recovery phase. It starts with a declaration that the civil emergency situation is over and that the affected public and organisations can start to return to their normal situation.

The NCEP envisages the following steps to be taken in the recovery phase:

- Removal or Reduced Force of Primary Hazard
- Stabilization of Risk of Secondary Hazards
- Procedures for Safe Return or Resumption of Normal Access
- Restoring Essential Public Utilities
- Activities related to Destroyed and Damaged Structures.

1.3 Financing

1.3.1 Investing in preparedness

National financing

The Law on Civil Emergency Services defines (Art.32) that the state budget is the primary financial resource for civil emergency planning and crisis management, as well as that ministries are to be allocated an annual budget for civil emergency planning and response within their respective field of activity.

Specifically, four types of budgetary provisions are available: the civil emergency budget of the Ministry of Interior, the emergency budgets of local government, reallocated budgets of line ministries and the Council of Ministers Reserve Fund.²²⁵⁹

The Civil Emergency item (within the Ministry of Interior's budget) in the State Budget for 2014 amounts to ALL 788.8 mln, app. EUR 5.62 mln.²²⁶⁰

Most of the funds are allocated for disaster preparedness and post-disaster recovery. These budgets are primarily intended for emergency situations, although there are training and development budgets within line ministries. However, the funding for disaster preparedness and response in Albania is limited, particularly at the local level.²²⁶¹

²²⁵⁹ IPA Beneficiary Needs Assessment Albania, pp.10-11.

²²⁶⁰ Data is available in Albanian at www.financa.gov.al/al/legjislacioni/buxheti-thesari-borxhi/buxheti/buxheti-ne-vite/buxheti-2014.

²²⁶¹ IPA Beneficiary Needs Assessment Albania, pp.10-11.

With respect to personal obligations, the NCEP makes note that the lack of buildings insurance in Albania means that the home, security and livelihood of a previously self-reliant household can be instantly destroyed by a civil emergency event, leaving them destitute and dependant on state and humanitarian assistance.²²⁶²

International assistance

Due to the limited national financing, most of the investments in DRR are funded by international projects (programs).

The international assistance and cooperation could be divided into two groups:

1. Disaster Mitigation and Preparedness programs/ Regional coordination and cooperation
2. Disaster response assistance

Albania has been a beneficiary of several disaster mitigation/ preparedness projects²²⁶³. These are: AL-DRMAP project, GFDRR initiative, Program for Prediction, Prevention and Mitigation of Forest Fire and Flood risk in Albania, DesInventar, IPA (Instrument of Pre-accession Assistance) Adriatic Cross-border Programme – (ADRIARadNet and HAZADR projects) and the IncREO Project (with the financing of EU, under UNESCO).

At least important as these projects is the Disaster Response assistance received by NATO and EU countries.²²⁶⁴

1.3.2 Investing in consequence management

The Law on the State Budget allocates a yearly reserve fund. The Council of Ministers is entitled to use this fund in the event of a civil emergency situation, as well as for disaster reduction measures. In Albania, the fund amounted to app. USD 17 mln in 2006, which, according to ISDR estimates, could cover only 0.3% of damages from an earthquake with a return period of 250 years.²²⁶⁵

Within the AL-DRMAP project, Albania's membership in SEE Catastrophic Risk Insurance Facility was secured. Operationalisation of Europe Re was completed as of the end of March 2014. As a result, comprehensive earthquake and flood insurance packages were developed with view to provide homeowners and SMEs with high credit quality coverage.

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

In Albania, the institutions responsible for ensuring thorough review following a major emergency situation are the General Directorate of Civil Emergencies, the Prefekturë Commission for Civil Emergency Planning and Response, the Local Commission for Civil Emergencies and the Civil Emergencies Commissions in the line Ministries. Following operational debriefings to be performed as soon as possible after the end of the crisis situation, a review process is launched, which normally involves inputs from all stakeholders including the affected population and organisations. The review

²²⁶² National Civil Emergency Plan, p.45.

²²⁶³ Cited earlier in this report (pp. 18-22).

²²⁶⁴ See Chapter 5 on capabilities in this report.

²²⁶⁵ Mitigating the Adverse Financial Effects of Natural Hazards on the Economies of South Eastern Europe.

should be documented and shared with stakeholder agencies in a round table meeting. Such review is an essential aspect as it can accurately highlight issues that could be incorporated in future planning.

The review's aim is to provide clear action points to be taken by stakeholders in order to prevent and to mitigate future crisis events, as well as to improve preparedness and protection. The format of the review has to be as comprehensive as possible and to take into account the following:

- The status of prevention and mitigation plans before the event, and impact of any prevention and mitigation measures used;
- The effectiveness of preparedness, protection and response plans during the event;
- Effectiveness of communications procedures;
- Implementation of the National Civil Emergency Service System;
- Effectiveness of early warning and public information procedures;
- Effectiveness of national and local level civil emergency coordination arrangements, including acquisition and analysis of information, decision making and provision and dissemination of information to concerned agencies and to the public;
- Effective undertaking of roles and responsibilities by identified stakeholders;
- Effective drawing on national capacities and their use in response;
- Information flow and effectiveness of coordination at National and local levels;
- Speed and effectiveness of combined responses for: Search and rescue (SAR), Mass Casualty Management, evacuation, providing safe access, clearing roads and transport access, making safe and restoring essential services.
- Effectiveness of arrangements for emergency health, safe shelter, food and non-food assistance;
- Use and effectiveness of international assistance arrangements and relationships with international organisations;
- Impact and value of training programmes in strengthening response;
- Effective provision of information and resources for recovery;
- Special additional factors presented by this civil emergency situation;
- Conclusions and action points to be followed by identified responsible stakeholders;
- Presentation of the review to the Technical Consultative Commission.²²⁶⁶

The IPA Beneficiary Needs Assessment study on Albania reveals that:

The current legislative system does not have any law that defines a possible disaster recovery process or how to conduct a post disaster needs assessment. After each event, institutions in charge realize systematic reports for their field of operation but no detailed analysis of socio-economic and environmental impacts and losses is conducted. The first efforts to prepare standard post event reports are underway, but capacity is presently lacking to conduct more detailed analyses of this nature.

In order to unify the various reports on disaster situations prepared by various institutions, the Ministry of Interior has developed a series of standard assessment tools to be applied: a First Notification Form (prepared at the Prefect level), the First Disaster Information Report (prepared by a Joint Assessment Team), a Disaster Situation Report to OCHA, and Request for Line Ministries in Case of Emergencies.

²²⁶⁶

National Civil Emergency Plan, pp.49-50.

The Rapid Needs Assessment Reports are practical tools presented in the Civil Emergency Manual that have to be completed by the respective authorities to help them get immediate information on the level of damage and the needs.

In the case of a large-scale civil emergency situation, a Joint Assessment Team undertakes a Rapid Needs Assessment. However, prior to this, any contribution should be made by the NOCCE, the Qark Civil Emergency officer or Prefect and communal and municipal authorities using the same format. In extreme situations, initial interventions (mass medical care and other priority activities such as evacuation, search and rescue) can be conducted before or during the Rapid Needs Assessment. Successive follow-up assessments will be made using the same approach, but with greater detail as information becomes available and the situation stabilizes.²²⁶⁷

1.4.2 Departmental Lessons Learned systems

There is no information about a departmental lesson learned system. Although, the fact is that Albanian DRR organizations have gained experience in the last years and their coordination (both inter-agency and internationally) had been improved.

1.4.3 Centralised (national) Lessons Learned system

The action-points or recommendations that have been agreed in the evaluation review are used to create follow up steps. It is the responsibility of the Department for Civil Emergency Planning and Response to pursue the implementation of these action points and recommendations, which should be reported back to the Technical Consultative Committee.

The follow up steps may include:

- Amendments, revision or updating of the National Civil Emergency Plan;
- Amendments to existing measures and new measure to be introduced in:
 - Prevention and Mitigation
 - Preparedness and Protection
 - Response
 - Recovery
- Changes to the operational structure of the Civil Emergency System;
- Revision of specific issues within civil emergency management, such as; early warning, public awareness, primary roles and responsibilities, coordination mechanisms, links with international response mechanisms and training initiatives;
- Specific factors to feed into local and national development plans, including those with international support.²²⁶⁸

1.4.4 International exchange for Lessons Learned

A number of international projects provide (policy) recommendations concerning the whole Albanian crisis management system or elements of it.

²²⁶⁷ IPA Beneficiary Needs Assessment – Albania, p.12.

²²⁶⁸ National Civil Emergency Plan, p.50.

Back in 2008, the United Nations Disaster Assessment & Coordination (UNDAC) issued an Assessment and recommendations following the Gerdec Explosions. The recommendations concerned immediate actions to be undertaken to mitigate the consequences of the blast (such as Immediate clearing of UXOs in the three identified zones), as well as such with a long term effect, e.g. update of the National Civil Emergency Plan.²²⁶⁹

Importantly, a series of reports within SEEDRMAP provide important recommendations with respect to the crisis management system in Albania. For example, a report on “The Structure, Role and Mandate of Civil Protection in Disaster Risk Reduction for South Eastern Europe” concludes that the capacity of Albania to respond to major events is burdened with procedural operations which could be detrimental to effective emergency responses.”²²⁷⁰ Further on, the report expressed doubts as to the effectiveness of the chain of command, and notes that significant capacity gaps exist in terms of quantity and quality of resources.

In 2010, a capacity assessment mission for Albania was implemented at the request of the regional project for South-East Europe and Turkey on disaster risk management. Similar missions were also conducted for Bosnia and Herzegovina, Serbia, Turkey, Macedonia, Kosovo and Montenegro out of eight of the Instrument for Pre-Accession Assistance (IPA) beneficiaries of the project. The assessment was meant to complement the needs assessments conducted in all eight IPA beneficiaries of the project conducted in 2010 by both a regional and local consultant in each location.²²⁷¹ The purpose of the capacity assessment was to identify capacity gaps related to risk reduction, understand desired capacities and propose recommendations on how these capacities can be achieved.

The regional cooperation, including exchange of lessons learned is one of main goals of international projects of which Albania is a beneficiary. The most important of these projects is under *IPA (Instrument of Pre-accession Assistance) Adriatic Cross-border Programme – HAZADR*²²⁷² – Strengthening common reaction capacity to fight sea pollution of oil, toxic and hazardous substances in Adriatic Sea. The main goal of the project is the setting up of a training and research centre for combating oil spills, and spills of hazardous and noxious substances - with the task of training personnel, especially response teams, involved in the implementation of contingency plans. The total budget was over 3M Euro, of which over 217 thousand for Albania. The focus of the projects is namely the facilitation and development of regional Lessons learned network.

1.4.5 Regular policy reviews

Albania has not yet established a tradition of regular policy reviews. There isn't such procedure in the legislation. The National Civil Emergency Plan hasn't been reviewed since 2004, despite the fact that the intensity of natural disasters increased and the country became a member of NATO.

²²⁶⁹ Assessment and recommendations following the Gerdec Explosions.

²²⁷⁰ The Structure, Role and Mandate of Civil Protection in Disaster Risk Reduction for South Eastern Europe, available at http://www.unisdr.org/files/9346_Europe.pdf.

²²⁷¹ Disaster Risk Reduction Capacity Assessment Report for Albania.

²²⁷² Already cited in this report.

1.5 Resilience

The term resilience is not used in relevant legislation in Albania.

However, the country has been part of international projects aimed, among other goals, to strengthen particular elements.

1.6 Information sharing and data protection

No information was identified during the timeframe of the study to support research in this respect.

2 Legislation

The constitution of the Republic of Albania provides as the main judicial starting point in civil emergencies and the main principles for organising civil emergencies are stated. Part sixteen – “extraordinary measures”, Articles 170 and 174 of the Constitution of Albania addresses issues related to emergency and disasters, the acts issued and the measures taken under these circumstances.²²⁷³

In general, the civil emergency planning is established under Albanian Law 8756 on Civil Emergency Services of 26 March 2001 and governed by the Albanian National Civil Emergency Plan of December 2004.

The Law 8756 focuses primarily on response rather than on prevention and risk reduction, while the National Civil Emergency Plan (NCEP) covers in detail all stages of the disaster cycle, including prevention, mitigation and preparedness. The NCEP does not feature individual sectoral plans, but is nonetheless linked to sectoral strategies and contingency plans such as the National Environmental Action Plan, the Strategy related to Forest Fires, the Contingency Plan related to Radioactivity or the Initiative on Land Use and Watershed Management.

Other laws include the Law on Fire Protection and the Law on Local Government, which are completed by legal provisions dealing with environmental protection, environmental impact assessments, protection and development of forests and pasture, agriculture and rural area development, safety of dams and dykes, public health protection, urban planning and construction, etc. With regard to forest fires, the Government has issued extensive legislation that defines compulsory prevention measures for the protection of forests, such as the construction of fire prevention barriers, biological measures, construction of forest monitoring towers, the strengthening of the seasonal forest patrol system, prohibition of igniting fires in forests, etc.²²⁷⁴

2.1 Crisis (emergency, disaster) management concept

The National Strategy for Disaster Risk Reduction and Civil Protection 2014-2018 of the Republic of Albania aims at fulfilling five Strategic Components and priority activities:

- Strengthen national, prefect and local institutions and their regulatory frames;
- Compile and organize risk information and strengthen early warning systems;
- Increase national awareness, knowledge and facilitate the exchange of information on disaster risk reduction and civil protection;
- Increase preparedness, emergency services and recovery capacities;
- Increase financial protection.

The Strategy includes recommendation regarding the required financing and highlights the importance of regional and international cooperation. The Strategy contains a Results Table with the

²²⁷³ Albanian HFA Monitoring Report 2011-2013, General Directorate of Civil Emergencies of Albania.

²²⁷⁴ IPA Beneficiary Needs Assessment – Albania, pp. 8-9.

priority investments, responsible agencies for each activity and timeframes for their implementation.²²⁷⁵

The Strategy provides the basis for enhanced coordination between national institutions, sustained resourcing and even behavioral change, in particular, regarding the need to address disaster risk in national development and integration plans, the work of line Ministries, regions (Prefekturës), communes and cities. The Strategy builds on and strengthens already existing plans, institutions and regulatory frames in Albania and further recognizes the role of the private sector and civil society.²²⁷⁶

*The Strategy allows Albania to align its disaster risk reduction work with, and to position itself at the forefront of, regional and international agreements such as the Hyogo Framework for Action 2015: Building the Resilience of Nations and Communities to Disasters. The norms and standards to be elaborated under the Strategy for Albania, such as building codes and standard centralized emergency numbers, will also contribute to Albania's accession discussions with the European Union.*²²⁷⁷

2.2 General crisis (emergency, disaster) management law

The Civil Protection system and the structure of civil emergency planning are established under Albanian Law 8756 dated 26 March 2001 and governed by NCEP of 3 December 2004.

Law 8756 on Civil Emergency Services aims to prevent, mitigate and remedy any damage inflicted on people, animals, property, cultural heritage and environment by emergencies; to provide conditions for public institutions, economic entities and the population for the transfer from ordinary living and working conditions to an emergency situation with the smallest possible losses, for the keeping of order and preservation of human lives against the effects of an emergency; to guarantee the use of available state resources in order to ensure public security, maintain the continuation of the national economy, localise the emergency areas and alleviate the effects thereof.²²⁷⁸

The NCEP is the most important document regarding civil emergencies. It aims at improving the civil emergency structure of Albania, clarifying the division of responsibilities, and planning the best use of limited state resources to identify gaps and avoid duplication, in accordance with the established legal base.²²⁷⁹

The aim and objective of the Plan is to be an instrument which supports the Law on Civil Emergency Services. The National Civil Emergency Plan draws together and clarifies the roles and responsibilities of all stakeholders. This aims to channel the flow of relevant information, to strengthen decision making, and through coordination, to reinforce the capacity to respond through all phases of the disaster cycle. The National Plan is essentially a coordination tool.²²⁸⁰

²²⁷⁵ National Strategy for Disaster Risk Reduction and Civil Protection 2014-2018, Republic of Albania, Draft for consultation – version 19 June 2014.

²²⁷⁶ Ibid., p.5.

²²⁷⁷ Ibid., p.5.

²²⁷⁸ Law Nr. 8756 on Civil Emergency Services, dated 26/03/2001, art.1.

²²⁷⁹ National Civil Emergency Plan, p.5.

²²⁸⁰ National Civil Emergency Plan, p.6.

The National Civil Emergency Plan is an overarching initiative bringing together all Albanian and international stakeholders. Many ministries, directorates, and institutions have developed and maintain their own specific disaster preparedness plans.²²⁸¹

2.3 Emergency rule

Decision No 664 regarding Criteria and Procedures of Proclamation of the Civil Emergency Situation, dated 18 February 2002 states that civil emergency situation can be announced in a part of the territory of the country, or in the whole territory of the country.

The civil emergency situation is proclaimed when the possibilities and resources possessed in normal conditions cannot respond to the consequences deriving from the disaster. For proclamation of the emergency situation, the following data is necessary:

- The territorial extension of the damaged zone;
- Impact of the damages on distortion of the community normal life balance;
- Scientific data from the respective institutions on the concrete case of the disaster.

There are specific procedures that are set out in the document, for proclaiming civil emergency situation in case of an earthquake and floods. The procedures followed for proclamation of the civil emergency situation in cases of earthquakes are:

- The seismologic institute, within two hours, submits to the General Directorate of Civil Emergencies the preliminary registered data, and updates the data on a periodical basis, until termination of the seismic strikes;
- Civil Emergency Planning and Response Department presents the respective report to the Minister of Local Government and Decentralization after receiving the data the preliminary assessment of the damages caused from the seismologic institute, commune/municipality and the region;
- After collecting the necessary data, the Council of Ministers, decides on the proclamation of the emergency situation in the respective zones.

In cases of floods, the civil emergency situation can be proclaimed in the following situations: the water level reaches critical points in some measured zones; one or more rivers that run through the area have run out of the river beds, causing dangerous situations; reservoir dikes and lake dams are heavily damaged; the life of the civil population, of the livestock and of the property is seriously damaged.

The main criteria for proclamation of civil emergency on disasters caused by people, epidemics, industrial accidents and radio-active radiations, etc. are defined case by case according to the effects that will be produced in the stricken zone, and on the basis of existing possibilities for disaster response in the local government units’.

The proposal for proclamation of the civil emergency in these cases is undertaken by line ministries, according to the specifics of the occurring event and depending on the competencies and functions

²²⁸¹ Vademecum Civil Protection – Country Profile – Albania.

covered, in cooperation with the respective institutions and local government bodies affected by the disaster.²²⁸²

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

Decision No 532 on Liabilities and Tasks of the Civil Emergency Planning and Response Department, dated 1 August 2003 defines the specific responsibilities of the General Directorate of Civil Emergencies. They include:

- Cooperating with the other institutions for drafting and updating of the national plan on the civil emergency response;
- Drafting plans for completion and updating of reserves of civil emergencies in compliance with the national plan of civil emergencies;
- Management of the civil protection system and coordination of state and non-state structures connected with it;
- Preparation, pursuance and implementation of sub-statutory acts on planning and response against the civil emergencies;
- Organization of international bilateral and multilateral co-operation relations on civil emergency issues, fire protection and humanitarian aid.

The specific tasks of the General Directorate of Civil Emergencies include:

- Implementation, together with other institutions, policies of the Council of Ministers in the field of civil emergencies planning for response, fire protection and rescue and helps in creation, use, and distribution of reserve emergency goods, including food, material and monetary goods;
- Cooperation with domestic institutions and public enterprises to assess the emergency situations on the basis of the national plan of civil emergencies, and organisation of the work for updating the plan on a periodical basis;
- Monitors continuously the situation of protection from fire and the civil emergency situation all over the territory of the country, in the region and wider, and plans preventive measures;
- Plans funds for studies from the public enterprises for the civil emergency prevention and response;
- Prepares every six months a report for the overall situation of civil emergency planning and response;
- Provides all the necessary data on threatening risks and emergency situations to the Inter-ministerial Committee of Civil Emergencies, and provides possibilities for material support of operations for civil emergency response;
- Plans and defines the rules according to which the financial and material sources are used in the cases of civil emergencies;

²²⁸² Decision No 664 regarding Criteria and Procedures of Proclamation of the Civil Emergency Situation, dated 18 February 2002.

- Coordinates the work of central institutions with units of the local government on the civil emergency response;
- Coordinates the organization and equipment of the active and supportive structures of the civil emergency service;
- Requests data regarding the civil emergency response, communicating directly with the standing and temporary structures of civil emergency service in the central government level, in a regional and municipality/commune level;
- Organizes, implements and monitors the data system in a national level on the civil emergency situations;
- Enters into contracts with associations and bodies that offer assistance for realization of the tasks given in the plan on civil emergency response and on creation of reserves;
- Organizes and leads conferences, seminars and workshops for the national, regional and local civil emergency staffs;
- Processes the public education programs and of training of state and non-state structures in the field of civil defence;
- Guides the responsible structures on the way of realization of the public opinion awareness and sensitization on civil emergencies and fire fighting;
- Coordinates the work for assessment of the caused damages and rehabilitation from natural disasters or other disasters in compliance with the respective legal and by-law acts;
- Controls application of the protective and preventive measures from state and non-state subjects all over the territory of the country for civil emergency responses and fire fighting;
- Controls the way how the material and financial sources allocated by the state budget, or by other state bodies in the case of civil emergencies for the central and local bodies are used;
- Controls distribution and way the reserve emergency goods are used, making sure that distribution and usage is made in compliance with the National Plan on Civil Emergencies and with the legal and sub-statutory acts in power;
- Organizes inter-ministerial monitoring groups on management of the civil emergency system.²²⁸³

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

Law 8756 on Civil Emergency Services sets out the specific responsibilities of the Inter-Ministerial Committee of Civil Emergencies, the Ministry of Interior,²²⁸⁴ the Department for Civil Emergency Planning and Response, the technical consultative Commission, other public institutions and ministries, and defines the organisation of civil emergency planning and response on prefekturë (regional), municipality and at commune level.²²⁸⁵

²²⁸³ National Civil Emergency Plan, pp.10-11.

²²⁸⁴ Previously Ministry of Local Government and Decentralization.

²²⁸⁵ Law 8756 on Civil Emergency Services, Chapter II, Chapter III.

Further, the National Civil Emergency Plan specifies the organization of the National System of Management of Civil Emergencies in Albania at national, prefekturë and at municipal and commune levels.

It is the responsibility of authorities at prefekturë, commune and municipal levels to develop contingency plans of their own, which all feed into the National Civil Emergency Plan, and the procedures, roles and responsibilities which it describes.

Municipalities and communes have responsibility for preparedness, planning and undertaking civil emergency response for situations developing in their territories. Every municipality and commune, establish and maintain a system of:

- Early warning and notification of key structures,
- Alarm and evacuation of population,
- Squads and other active structures prepared to prevent, mitigate and respond to civil emergency situations,
- Undertaking and administering rehabilitation activities for affected area.²²⁸⁶

According to the Law, the Council of Minister calls for the creation of the Inter-Ministerial Committee of Civil Emergencies and appoints the appropriate staff for it. The Committee is responsible for coordinating the work of all other civil emergency services, decides on the usage of state resources to overcome the situation and in case of a national civil emergency appoints the leadership to manage the coordination.

The Ministry of Interior is responsible for a range of managerial and planning duties in cases of an emergency including the development and implementation of the national plan on civil emergencies. The Ministry also monitors, on a national level, the information system on civil emergencies and reports to the Council of Ministers every 6 months regarding the level of civil emergency preparedness of structures throughout the country. Many of the aforementioned duties of the Ministry are shared, if not regulated, by the Department for Civil Emergency Planning and Response, which is an organ established within the Ministry. The Department plays an important coordination role in the crisis management system and ensures the coordination between national, prefecture, commune and municipal level civil emergency structures.

The Department's role is supported by the Council of Minister's Decision No. 532 on the "Responsibilities and Duties of the Department of Planning for and Overcoming Civil Emergencies" adopted in August 2003.

The Director of the Department has the authority to call the Technical Advisory Commission of Civil Emergencies which includes specialists from ministries, various institutions and operational forces throughout the country. The Technical Advisory Commission has another source of legal basis, namely the Council of Minister's Decision No. 663, the "Constitution, Functioning and Responsibilities of the Technical-Advisory Commission of Emergency Specialists", adopted in December 2002.²²⁸⁷

²²⁸⁶ Vademecum Civil Protection - Country Profile – Albania.

²²⁸⁷ Comparative Research of Emergency Response Legislation: Albania, Macedonia and Bosnia and Herzegovina, p.5.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

Decision 533, dated 1 August 2003, on Citizen Involvement on Civil Emergency Prevention and Response defines the involvement of citizens in crisis situations. It specifies that in case of civil emergencies, the head of the operation at central/regional level, requests the region's prefecture the engagement of the capable citizens, according to the needs scale. The Prefect, in cooperation with the mayor/commune head, orders activation of citizens and plans their involvement in the operational structures, functioning for civil emergency prevention and response in the region's territory.

The Regional Prefect, through the civil registration offices in municipalities and communes, ensures data and keeps records on the citizens living in the territory of the region, aged 18 to 55 for the women and 18 to 60 for men.²²⁸⁸

According to article 24 of the Law 8756 on Civil Emergency Services, the service of volunteers is organised for responding to emergencies. Volunteers may be any Albanian citizens over 18 years old who have received basic training in responding to emergency situations and accept to participate. During emergency situations foreign citizens can also be admitted to participate as volunteers.

Persons who volunteer to participate in rescue operations have the rights for the period they are active in the rescue operation to keep their job, to receive full payment from their employers and to insurance in case of an accident.²²⁸⁹

Economic entities and institutions, which in the pursuance of their activities use, produce, transport or store hazardous substances are obliged to plan, organise and implement, on their own expenses, services for responding to emergencies within their area of activity.

In addition they have to develop plans for emergency situations and implement preventive measures within their area of activity; to notify their personnel as well as the respective municipal or commune authority about an imminent risk; to organise, when necessary, evacuation of their employees, set up their own organisation for responding to an emergency situation within their area of activity; and to provide training to their employees. The Council of Ministers determines in subordinate legal act what constitutes hazardous substances, which create threat of emergency situations.²²⁹⁰

2.7 Legal regulations for international engagements of first responders and crisis managers

The Council of Ministers has the overall responsibility for civil emergency planning and response in the Republic of Albania. Furthermore, it is responsible for arranging and specifying the procedures for international assistance in the event of emergencies.²²⁹¹

The Directorate for Civil Emergency Planning and Response can request the assistance of national and international organisations, nongovernmental organisations and private volunteer organisations to deal with civil emergencies.²²⁹²

²²⁸⁸ Decision no 533, dated 1.8. 2003, on Citizen Involvement on Civil Emergency Prevention and Response.

²²⁸⁹ Law 8756 on Civil Emergency Services, Chapter IV, art.24.

²²⁹⁰ Law 8756 on Civil Emergency Services, Chapter V, art. 30.

²²⁹¹ Ibid., Chapter I, art. 5.

3 Organisation

3.1 Organisational chart

The crisis management system in Albania consists of permanent and temporary structures at central level, prefekturë (county) and local level. Through these structures, each ministry, department or institution, has specific responsibilities for all the stages of the emergency management cycle.

At national level the Council of Ministers chairs the national management system of civil emergencies in Albania. It approves the strategies, policies and programs which aim at prevention, mitigation, preparedness and response to civil emergency situations. The Council of Ministers pronounces the state of civil emergency in a given area or all over the country. After the pronouncing of the state of civil emergency, the Council of Ministers establishes the Inter-Ministerial Committee of Civil Emergencies. The Inter-Ministerial Committee of Civil Emergencies coordinates the activities of all the institutions involved in all the stages of the response to the state of civil emergency. The Inter-Ministerial Committee involves key ministers (i.e., the Minister of Interior, Minister of Defence, Minister of Environment and Minister of Health) and usually acts for a period of 10 days.

The Ministry of Interior implements the policies of the Council of Ministers in the fields of planning and dealing with civil emergencies. The Department of Civil Emergency, Planning and Response is the key institution for disaster management. Through this permanent structure the Ministry monitors the state of the emergency in the entire territory of Albania, whereas in calm situations and in case of low scale emergencies cooperates with central institutions and structures, involved in the issues of civil emergencies. This Department has three subordinate units: Directorate for Civil Emergency Planning and Response,²²⁹³ Directorate of Fire-fighting and Rescue and the National Operations Centre for Civil Emergency.

At prefekturë or regional level, the regional prefect is responsible for planning and dealing with civil emergencies. Under the chairmanship of the prefect, the Commission of Planning and Responding to Civil Emergencies is established with the task of coordination of the activities of the regional authorities and volunteer organisations for planning and dealing with the emergency situation. At each of the 12 prefekturës in Albania, a civil emergency officer is appointed.

At local, municipality and commune level, the mayor or the head of commune is responsible for planning and responding to civil emergencies in the respective municipality or commune. Under the chairmanship of the mayor or the head of commune, the Commission of Planning and Responding with Civil Emergencies is established, and its main task is to coordinate all activities of the local government unit and volunteer organisations, responsible for planning and responding to emergencies.²²⁹⁴ Every municipality and commune in Albania has a designated official with responsibility for civil emergency matters, who benefits from instruction in the standardised training

²²⁹² Ibid., Chapter IV, art. 25.

²²⁹³ National Civil Emergency Plan, p. 9.

²²⁹⁴ Albanian HFA Monitoring Report 2011-2013, General Directorate of Civil Emergencies of Albania, pp. 2-3.

curriculum, and through the frequent necessity for early warning, standby and response in many areas.²²⁹⁵

Each Ministry is responsible for the planning and management of civil emergencies according to their scope of activity. Their activities are incorporated in all the stages of the emergency management cycle and as appropriate they play a leading or supporting part, depending on the nature of the emergency.

The principal operational forces or active structures in Albania are comprised of the Armed Forces; Directorate of Fire Protection and Rescue (PMNZZH); The Ambulance Service; The State Police and other Police units; Directorate of State Reserves; Units specialised in mines and technical response; Monitoring and operational supportive structures.

These structures have specific roles, tasks and responsibilities for all the phases of the civil emergency management cycle, and it is essential that they cooperate closely with each other to provide the most effective response possible (Figure 3).²²⁹⁶

The National Operations Centre for Civil Emergencies is at the very centre of civil emergency management in Albania. It plays an active role through all four stages of civil emergency management.

The Albanian Red Cross is the main non-government organisation dealing with emergencies and crises. It is a voluntary organisation, which operates in all the Albanian territory with its Head Quarters

²²⁹⁵ International CEP Handbook 2009, pp. 12-13.

²²⁹⁶ National Civil Emergency Plan, p.11.

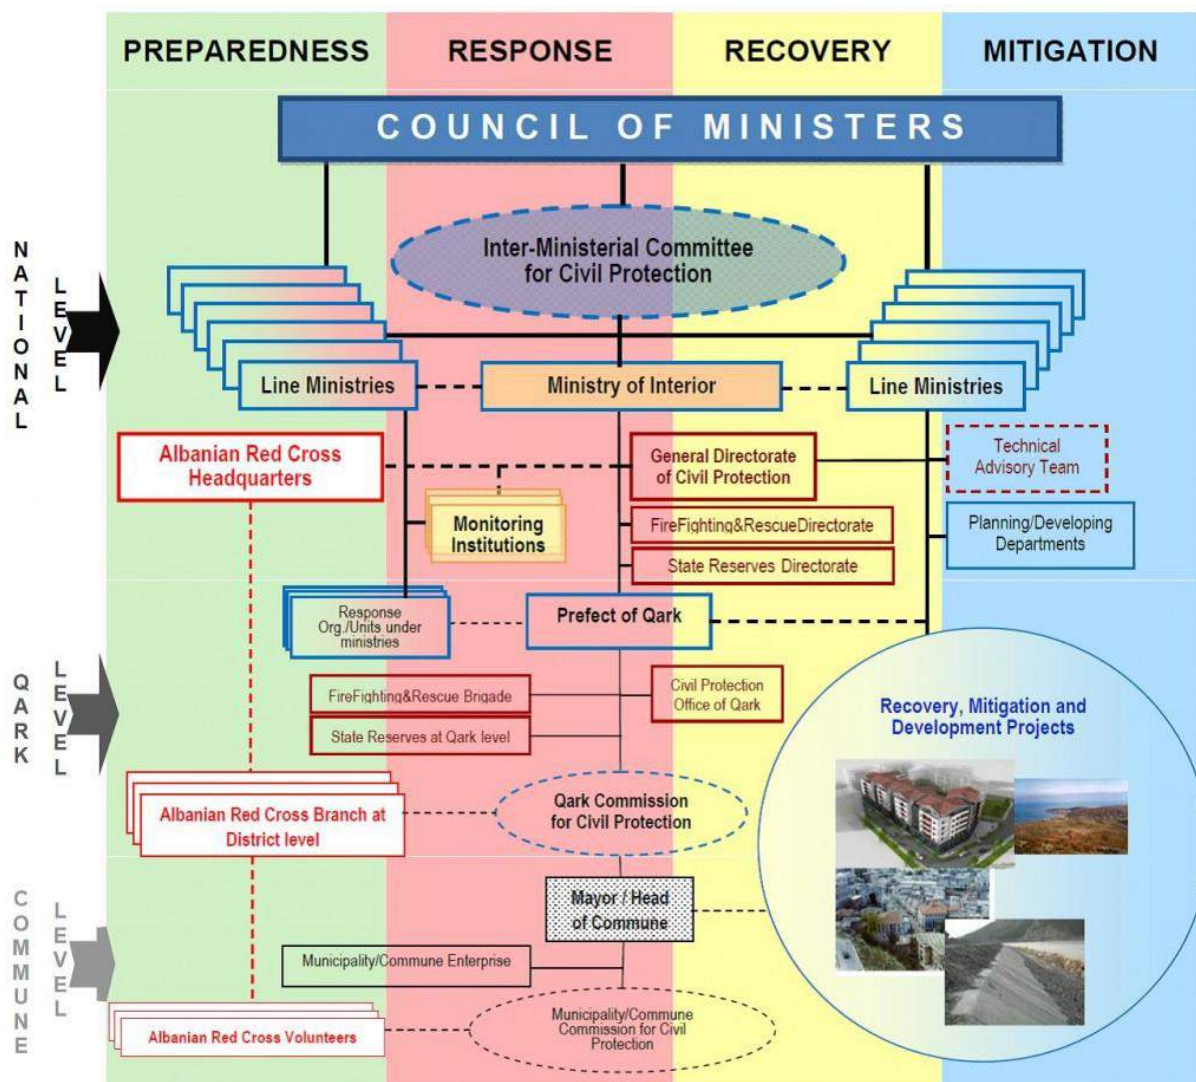

Figure 64: Organisational Chart of Civil Protection System in Albania.²²⁹⁷

based in Tirana, has 12 branches and 40 sub-branches at Prefekturë, Commune and Municipality and District levels.

3.2 Organisational cooperation

Inter-ministerial cooperation

The NCEP outlines the roles and responsibilities of line ministries and inter-ministerial bodies in the crisis management cycle.

The Inter-Ministerial Committee of Civil Emergencies coordinates the actions of all involved institutions through all the phases of response to civil emergency situations. The Inter-Ministerial Committee undertakes, among others, the following tasks:

- Prepares an appeal for international relief;

- Coordinates the actions and activities of national and local government institutions, the Albanian Red Cross, various volunteers and donors;
- Plans, and requests their engagement;
- Requests from the Council of Ministers to draw upon the State Reserves;
- Supervises the process of calculating and estimating the damage incurred by the disaster situation and identifies the potential means for the rehabilitation of the disaster-affected area, and propose possible solutions to the Council of Ministers;
- Appoints the Head of Operations, who shall be responsible for the administration and implementation of the civil emergency operation.

The Head of Operations is the leader of the response activities, and coordinates the management of the civil emergency operation in the affected area. The Head of Operations has the responsibility to:

- Supervises all the active operational and supporting structures necessary for responding to the civil emergency situation
- Is assisted by the Civil Emergency Management Team -task force that functions near the National Operations Centre for Civil Emergencies in managing the civil emergency operation
- Consults with heads of active operational structures, heads of monitoring structures and supporting operational structures, as well as other managers and specialists employed in the institutions involved in the National Civil Emergency Plan
- Follows the involvement of international relief teams and implement all necessary measures and requests to facilitate their intervention and achieve maximum results in civil emergency response
- Issue appropriate orders and directions for the management of operations of response to the civil emergency situation
- Briefs the Inter-Ministerial Committee and performs the tasks assigned by it
- Arranges the involvement of operational forces and other groups and individuals that are willing to contribute with their efforts to overcome the situation
- Cooperates with and coordinates the actions of other operations leaders at different levels and those of local government.²²⁹⁸

Upon a decision that the crisis response needs cannot be met by national resources and capacities, international assistance to Albania is requested. The international appeal is prepared by Inter-Ministerial Committee and procedures are implemented by the Ministry of Interior, Ministry of Foreign Affairs and Ministry of Defence. International assistance can be solicited, or offered, as financial contributions, in kind donations (food, tents, blankets, medical supplies etc.), or specialist services (Search and Rescue Teams, logistics handling teams etc.). The Head of Operations, Inter Ministerial Committee, closely supported by the General Director of Civil Emergency will determine the requirements for international assistance.

In case relief assistance arrives in the country unsolicited, it will be managed in the same way as requested assistance. Non-acceptance of unsuitable or unnecessary national and international assistance is the responsibility of Inter-Ministerial Committee/ Ministry of Interior advised by the Head of Operations and the Department of Civil Emergency.

²²⁹⁸

National Civil Emergency Plan, p.12.

The effective coordination of international assistance is challenging for the national response system. It is expected that United Nations Agencies, EU structures, NATO or individual countries will provide the necessary support to the coordination of relief efforts.

The Head of Operations is responsible for providing information on expected donor assistance to the Customs, Immigration and Quarantine Services to facilitate this process at entry points. In case of an emergency in neighbouring countries, involving displaced people crossing border, customs, immigration as well as quarantine must be prepared to facilitate the appropriate measures of the State.²²⁹⁹

International cooperation

Albania has signed numerous cross-border and international agreements for bilateral cooperation in regards to civil emergency support with Austria, Croatia, Greece, Italy and Turkey and also agreements are under discussion with Montenegro and the Former Yugoslav Republic of Macedonia.

Additionally, agreement for Cooperation in the Forecasting, Prevention, and Mitigation of Natural and Technological Disasters between the Governments of Austria, Croatia, Hungary, Italy, Poland, and Slovenia, was signed on 18 June 1992, to which Albania acceded later. Albania is also a member of the Disaster Preparedness and Prevention Initiative (DPPI), launched by the Stability Pact for South Eastern Europe.

Other multinational agreements in the area of civil protection, to which Albania is a party, include:

- Declaration on cooperation in disaster preparedness and prevention in south Eastern Europe signed 5 June 2002;
- Memorandum of Understanding on the Institutional Framework of the Disaster Preparedness and Prevention Initiative for South Eastern Europe, signed 24 September 2007;
- Council of Europe: Resolution 87(2): Open Partial Agreement on the Prevention of, Protection against, and Organisation of Relief in Major Natural and Technological Disasters, Albania signed the accession on the 15 May 1993;
- United Nations Environment Programme (UNEP) – Regional Seas Programme: Convention for the Protection of the Mediterranean Sea against Pollution. (The Barcelona Convention) Barcelona, 16 February 1976;
- Protocol concerning cooperation in combating pollution in the Mediterranean Sea by oil and other harmful substances in cases of emergency;
- United Nations Economic Commission for Europe (UN ECE): Convention on the Trans boundary Effects of Industrial Accidents, signed on 18 March 1992, ratified 05 January 1994.²³⁰⁰

On the civil-military cooperation side, EU and Albania signed a framework agreement for the participation of Albania in EU crisis management operations. On 5 June 2012 the European External Action Service and the Government of Albania inked an agreement, making Albania a partner in the area of the EU's Common Security and Defence Policy. The agreement set out a legal framework for possible future Albanian participation in the full range of EU-led military operations and civilian missions, and was a step towards more structured cooperation between the EU and Albania in the security field.

The World Bank is actively contributing to DRR goals in Albania, not only through the Albanian Disaster Risk Mitigation and Adaptation Project (under the UN International Strategy for Disaster Reduction (UN ISDR) supported by the Global Facility for Disaster Reduction and Recovery), but also

²²⁹⁹ Vademecum Civil Protection - Country Profile - Albania

²³⁰⁰ Vademecum Civil Protection – Country Profile – Albania.

through the Land Administration and Management Project and the Energy Community of South East Europe APL Programme (Albanian Dam Safety).

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

The National Civil Emergency Plan (NCEP) details seven procedures concerning the flow of information and notification in case of natural or man-made disasters. These concern the following cases:

- 1 Earthquakes;
- 2 Industrial Incident;
- 3 HAZMAT Transportation incident;
- 4 Sea incident;
- 5 Air incident;
- 6 Terrorist Attack;
- 7 Dam or Dyke collapse/

The NCEP contains²³⁰¹ a detailed description (checklists) of the National Civil Emergency Service System (NCESS) activation procedures during its different stages – Alert, Standby, Activate and Stand down. The responsibilities of the different elements of the national civil emergency system during the most critical phase of DRR – Response – are very strictly determined.²³⁰²

The specific example of the ammunition blast of 15 March 2008 shows how the Albanian crisis management system works in practice (see the box below).

4.2 Operations planning

NCEP stipulate that all departments and organisations, public, private sector and NGOs should have an emergency or contingency plan for protecting their property and assets in case of an emergency situation, as well as to provide the best possible service during the emergency situation, and the most rapid recovery afterwards. The outline and content of civil emergency, contingency and sectorial plans are provided in the Civil Emergency Manuals, which are part of the National Civil Emergency Curricula.²³⁰³

These plans could be:

- Sectorial Plans, covering specific problems, which may be of national, regional or local importance.
- Contingency Plans, designed by the disaster management structure of central, regional and local level for specific disasters, which may happen in the near future. Usually, contingency plans are used for transitory periods until the Emergency Plans are prepared. Contingency plans may be developed for seasonal or new risks/hazards or emergency that not covered by the main plan.

²³⁰¹ pp.32-35.

²³⁰² pp.36-40.

²³⁰³ NCEP, p. 27.

- Emergency Plans are specific plans developed to cover important Installations and facilities pertaining to private or public juridical or physical subject. These provide protection

Disaster response in the 2008 ammunition blast.

On 15 March 2008, a blast occurred in a factory located in the village of Gerdec, approximately 15 km west of Tirana. On site, there was an ongoing programme to dispose old military ordnance. The explosion sent artillery and mortar shells over nearby residential neighbourhoods destroying houses and shattering windows across the city of Vore and several villages. Many secondary explosions continued through the night until the early hours of the next day.

The Government declared the zone a “Disaster Area” and advised that inhabitants would not be allowed to return until the area was deemed safe. The Durres-Tirana highway was also closed to traffic whilst authorities assessed the situation. It was later reopened on the next day. Three risk zones (High, Medium and Low) were defined.

In accordance with the NCEP, an Inter-Ministerial Committee activated soon after the incident, chaired by the Deputy Prime Minister. The Albanian Armed Forces (AAF) and civil authorities cordoned off the area and started the search for victims as soon as it was relatively safe to access zone. Surface clearing in zone two and three is being carried out in cooperation by the AAF and Explosive Ordnance Disposal (EOD) teams/specialists from DanChurchAid, Italy and Sweden.

Approximately 600 evacuees from the affected areas are housed in three facilities in Durres – two owned by MoI and MoD and a privately owned hotel. The remaining affected population is staying with friends or relatives in the area of Vore according to the authorities and the Albanian Red Cross.

Through the Albanian Red Cross and local authorities, food and non-food items were made available. Furthermore, trauma counselling, teaching for primary school students and social activities for children were provided. Secondary school students as well as evacuees who had jobs were transported from the government facilities in Durres to and from Vore and Tirana on a daily basis.

The Albanian Red Cross engaged in a campaign for solidarity with the persons affected in Gerdec. 25 groups of volunteers were sent to help the persons injured, and their families, in the Military Hospital and the Hospital of Durres.

In addition to that, United Nations Disaster Assessment & Coordination (UNDAC) was deployed to Albania on 20 March to support the IMC.

The UNDAC team received the following mission objectives:

- to assess the overall situation with a focus on the needs;
- to evaluate the environmental impact of the explosion and provide analysis of samples of soil and ground water;
- to provide coordination support to the government of Albania;
- to provide the international community, UN and the government with short-mid- and long term recommendations.²³⁰⁴

The government carried out an initial damage assessment for all affected structures, refurbishing and livestock. The findings were forwarded the National Authority of Housing for economic evaluation. The evaluation was based on market prices. Discussions between the authorities and the affected population concluded that the affected population preferred to receive a cash grant for reconstruction rather than state-organized rebuilding. Between USD 600 and USD 2500 were made available per family. Further financial assistance was to be provided for domestic supplies. A special financial contribution was made to families who lost one or more of their members. A total of 156 mln Albanian lek had been provided by the government to the affected families as of 28

March 2008.

measures for human life and property and foresee activities to overcome civil emergencies through available capacities and provision of assistance from outside, if necessary.²³⁰⁵

4.3 Logistics support in crises

The logistic support is noted in the NCEP as essential to the successful disaster response operation²³⁰⁶. One of the four Civil Emergency Management Team sections on national and local level is the Logistic Section (the others are Information, Planning and Operations).²³⁰⁷ Under “logistic” the Albanian Government considers mainly “mobility”; the condition (if necessary – the repair) of the road system and the availability of vehicles and fuel. Such logistic capabilities assessment should be done periodically on regional and national level.²³⁰⁸ As noted in Section 5 Capabilities in this document (p.50), the specialized engineer vehicles and the condition (usability) of the road system is a serious issue for the Albanian government. The reason is the already mentioned poor condition of the road system and its vulnerability to natural disasters.

Other elements, related to logistics are stockpiles (food, cloths, tents etc.) and healthcare. The stockpiles are provided by governmental reserves, private companies (the authorities have to assess periodically the available quantities) and international assistance. The healthcare is provided by the standing facilities and the “crisis” assets of the Armed Forces and the Red Cross.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

In Albania three separate organisations provide national weather forecasting: the Institute of Environment, Water and Energy (IEWE), the Military Meteorological Service (MMS) under Albanian Ministry of Defence and the Meteorological Service under National Air Traffic Agency (MSNATA). Besides them, there is also one private company performing weather forecast.²³⁰⁹

Institute of Energy, Water and Environment (IEWE) produces general forecast for 24 hours, 3 and 5 days and 10 days outlooks. IEWE’s operational forecasting is based on use of printed analysis and forecast products from international forecasting centers and from the Montenegrin NMHS. The IEWE forecasters do not have access to any real-time data. IEWE has 2 duty forecasters and it does not have capacity to operate 24/7 weather forecasting services.

In addition, the IEWE does not produce special marine forecasts. Further, there is no capacity to download numerical weather prediction model products to be used for national weather forecasts, or to run any numerical weather prediction models. MMS maintains cooperation with the Italian

²³⁰⁷ Ibid., p.13.

²³⁰⁸ Ibid., p. 30.

²³⁰⁹ Strengthening Multi-Hazard Early Warning Systems and Risk Assessment in the Western Balkans and Turkey: Assessment of Capacities, Gaps and Needs, Chapter 2, p. 14.

meteorological service for the use for weather forecasting. On the other hand, the IEWE produces special forecasts for the agriculture and aviation sectors.

However, the IEWE does not produce any public warnings. It has a governmental role to produce updated maps and forecasts to the authorities. Hydrological studies for flood warnings have been developed for different basins, while flood forecasting is prepared for different river basins using meteorological forecasts and by monitoring water levels. MMS gives occasionally warnings in connection to its daily TV weather forecasts. Warnings to the aviation sector only are produced by the MSNATA.

Moreover, IEWE disseminates hazard monitoring data, forecasts and early warning to the Head of the National Committee for Disaster Reduction and other partners. The limited weather warnings produced are disseminated to the public via media. The MMS provides warnings through TV presentations and by disseminating advice to the media, in order to edit their own weather forecasts and warnings. Currently there are no specific procedures for interrupting TV or radio programs, or to have a continuous warning stripe on the TV screen in the case of emergency. Method to send warnings directly via SMSs to mobile phones located at site of danger is not in use in Albania. Sectors like Ministry of Health or NGOs like the Albanian Red Cross are not on the direct contact list of warnings of hydrological or meteorological hazards. Further, Albania is not member of the EUMETNET METEOALARM systems.²³¹⁰

International cooperation is key part for the successful operation of event forecast and warning. Weather forecasts and forecasting of natural hazards are based on products from global and regional scale state-of-the art numerical weather prediction models, use of satellite data and sharing of data from conventional and modern remote sensing systems.²³¹¹

²³¹¹ Ibid., p. 24.

5 Capabilities

5.1 Human resources

Earlier data show that in normal times the human resources dedicated to crisis management include the following: app. 450 personnel, including the employed in civil protection at prefekturë level (app. 50) and personnel employed in civil protection at commune or district level (app. 400).²³¹²

There are thirteen people, comprising the General Director and the managers of the directorates, compose Albanian Civil Protection at central level in the General Directorate of Civil Emergency. Each prefekturë dispose of some permanent staff, incl. a set of technicians and a Civil Emergency Officer. Each municipality and commune has a designated officer with responsibility for civil emergency matters.

In times of crisis, the human resources engaged also comprises the fire brigade (app. 480), private companies contracted by the authorities (app. 400) plus forest service personnel (app. 100).

Albanian Red Cross is the main non-governmental stakeholder with 80 000 members, 2 000 volunteers and 39 branches. Founded in the 1920s, its current activities are based on Law No. 7864 on the Albanian Red Cross. According to the National Plan for Civil Emergencies the Albanian Red Cross has an important role in disaster prevention, preparedness, response and recovery. The Albanian Red Cross has developed its own disaster plans and its structure for responding to disasters is organised in two levels: central, which manages the main human and material resources; and local/district, where 39 disaster-trained volunteer teams comprising between 25 and 30 people have been established throughout Albania. In 2002 a partnership agreement was signed between the Ministry of Interior, the Albanian Red Cross and UNDP Albania.²³¹³

5.2 Materiel (non-financial) resources

According to the National Civil Emergency Plan (NCEP), the key civil emergency response capacities in Albania include:

Albanian Special Forces Teams:

- Civil Protection Base, MoD, Tirana – Earthquake Search and rescue (SAR) 2 teams; Flood SAR 2 teams; Firefighting/SAR 2 teams; Chemical Pollution/SAR 2 teams; Mountain SAR 2 teams; Road clearance from snow and landslide 3 teams;
- Air Force Search and Rescue Service, MoD - National airborne SAR Service: 56 persons and 6 Helicopters;
- Special Commando Battalion, MoD, Tirana - Air and Marine accident SAR team 1 team;
- NBC Battalion, MoD - Chemical, bacteriological, ecological hazard rescue team 1 team 25 specialists;

²³¹² The Structure, Role and Mandate of Civil Protection in Disaster Risk Reduction for South Eastern Europe.

²³¹³ IPA Beneficiary Needs Assessment Albania, p. 11.

- National Military Hospital, Tirana - Emergency Surgical Teams (each of Surgeon, traumatologist, anaesthetist, 3 support staff) 2 teams;

Specialist Technical Services

- Ministry of Industry and Energy - Mines Inspectorate, mines SAR team 52 Specialists; Environmental Protection and Rehabilitation 55 Specialists; Electrical Sector Emergency Response 60 Specialists (KESH);

Transport Capacities and Specialist Equipment

- Ministry of Tourism and Territory Regulation - Tankers 5 water tankers, 5 sewage tankers, Welding/cutting equipment 5 units, Bulldozer 1 unit, Transport Capacity (people) 16 vehicles (total 469 people);
- Transport Capacity (Freight) 29 Trucks (total 166 mt), Tipper Trucks 8 units (total of 100 mt),
- Earthmoving Equipment/Bulldozers 11 units (total of 450 m3), Snow Clearing Equipment 3 Units, Motor Boats 8 units (total of 80 persons), 14 units for freight, Fire Trucks 2 Units at 5 mt each, Civil.
- Protection Base, MoD - Generators 8 units (total 396 kw);
- Military Engineers Brigade, MoD - Specialists: 50 Specialists, Tipper trucks 5 units, Earthmoving Equipment/Bulldozers 10 units excavators, 5 units, tracked bulldozers; Crane 1 unit at 15 mt; Medium capacity vehicles 8 units.
- NBC Battalion, MoD - Decontamination 6 vehicle units and 25 specialists;
- State Reserves - Transport 20 light vehicles of 9 mt
- Albanian Red Cross - Transport 4 heavy trucks, light vehicles in 12 branches in 12 prefekturës.

Assistance Services

- Civil Protection Base, MoD - Operational Forces 170 persons, Field Hospital I unit 50 beds, 4 treatment rooms, Potable Water 7 Tankers (total 67 mt) and 11, pumps (total 12 m3/hour), Water Purification 2 units (total 6,000 l/hour), Bakery units 2 units (total 2,400 kg/day), Mobile kitchens 12 units (total 3,000 rations/day), and 1 kitchen truck 300, rations/day, Shelter Tents for 17,000 people, Shower Trucks 2 units (total 200 persons/day),
- State Reserves - Temporary shelter 28,000 m2 for 6,000 people in warehouses, Tents for 30,000 people, Warehouse storage Total of 43,000 m2 for goods, Fuel storage for 14 mt
- Albanian Red Cross - Food Rations 8,000 people for 1 month, Shelter and Non-Food Items 8,000 people, Family links Tracing service linked to ICRC international tracing system.²³¹⁴

However, in the case of a wildfire, service personnel attend the scene but are active during the operational phase only as observers or technical advisors. At present, the Service has no vehicles suitably equipped to cope with wildfire. The present fire-fighting capacity of local and national forces in Albania is not sufficient to tackle large wildfires, especially in the presence of multiple simultaneous events. The only way of tackling such emergencies is to address a request for assistance to the Moni-

²³¹⁴ National Information on Disaster Risk Reduction: Albania, Annex: Reference Guide for Preparation of National Information, pp. 11-12.

toring and Information Centre (MIC, now Emergency Response Coordination Centre (ERCC) or to the Euro-Atlantic Disaster Response Coordination Centre (EADRCC) of NATO.²³¹⁵

The general conclusion of most of the UN reports about Albania are very similar, stating that the Government has limited capabilities and the DRR system is relatively poor organized.

A series of reports within SEEDRMAP provide important recommendations with respect to the crisis management system in Albania. For example, a report on “The Structure, Role and Mandate of Civil Protection in Disaster Risk Reduction for South Eastern Europe”²³¹⁶ concludes (p.152) that „the capacity of Albania to respond to major events is burdened with procedural operations which could be detrimental to effective emergency responses.” Further on, the report expressed doubts as to the effectiveness of the chain of command, and notes that significant capacity gaps exist in terms of quantity and quality of resources.

In 2012, the World Meteorological Organization published a report on “Strengthening Multi-Hazard Early Warning Systems and Risk Assessment in the Western Balkans and Turkey: Assessment of Capacities, Gaps and Needs.”²³¹⁷ The report assesses (p.9) that the

Albanian hydro-meteorological sector is more or less disordered and does not have the technical, human and financial resources to meet the needs for hydro-meteorological services in order to provide expected information and products to the Government, the socio-economic communities, to protection of human life, and to improve human and environmental safety. It neither has the capability to properly fill the international commitments of producing hydro-meteorological data to promote regional and global cooperation in production of better hydro-meteorological modelling and services to promote the human safety and well-being.

The conclusions of the UNDAC report Assessment and recommendations following the Gerdec Explosions Albania (20 March – 3 April 2008)²³¹⁸ are similar:

The institutional structure for disaster management needs strengthening at the national, regional and municipal levels. National disaster funds are very small compared to the potential economic and fiscal damages that may be caused by large disaster events in Albania. ...

Since previous initiatives and recommendations have not been operationalised, an implementing body must be identified, established and made sustainable at the highest possible level to deal with the issue.

Due to the fact that Albania has “inadequate”²³¹⁹ disaster response capabilities, the government very often has to rely on such provided by its allies. Even before the membership in NATO (2008), the

²³¹⁹ Duro F., Albania’s civil protection system and its related regional cooperation, IDM, 2014, p. 9.

Alliance was a very important element of the Albania DRR system. Since 2002,²³²⁰ the NATO assistance has been requested by Albania 7 times (more than assistance requests by any other country): 2002 –Floods, 2007 – Forest fires, 2008 – Massive explosion in ammunition storage site, 2010 – in January and in December – Floods, 2012 – Snow storms, 2015 – Snowfall and Floods. Albania has needed most of all First Aid materials – food, medicaments and other supplies (tents, sleeping bags, cloths, boots etc.) and Equipment/Machinery. For example, during the floods in 2002 Albanian Government requested such vehicles as bulldozers, boats, cranes, fire trucks etc. In general the NATO allies (and some other countries) are providing first aid supplies and materials, but limited quantity of heavy machinery. In several cases SAR, MedEvac and Fire Fighting aircrafts and helicopters were provided, together with specialist teams – medical staff, SAR teams, Firefighters. Usually most of the countries are providing materials and some of them – financing – USD 20-50 thousand. There are some exceptions, however. During the 2002 floods Italy provided between 1.5 and 2 mln. EUR for emergency rehabilitation of the electric network.

The best example to understand how much dependant of foreign aid is Albania is the 2015 flood. The initial request was for almost EUR 63.5 mln. . Slightly over 912 thousand Euro of them were for First Aid – food, sleeping bags, tents, pumps, coats etc. The rest of over EUR 62 mln. was for Equipment/Vehicles, including EUR 30 mln. for the reconstruction of 300 km of roads. NATO countries provided almost all of the requested first aid and some equipment. Additional over USD 1.5 mln. were donated by the UAE, the USA, the Dutch Red Cross and the European Commission, some smaller transfers not included.

5.3 Training

According to the Law on Civil Emergencies the Ministry of Interior is tasked to elaborate educational and training programmes in the area of protection against natural and other disasters. In fulfilling these requirements the Ministry of Interior has designed and implemented the National Civil Emergency Training Curriculum, comprised of eight training manuals containing national and international civil emergency standards and guidelines, undertaken training activities and organised conferences at the national and regional level. Institutions responsible for designing and conducting training and simulation activities on specific issues relevant to civil emergency management, are obliged to inform and coordinate their activities with the Civil Emergency System Service.

The Directorate for Civil Emergencies has established a national training centre, the Albanian Red Cross actively cooperates through its four training centres for volunteers and the General Directorate of Civil Emergencies regularly conducts training courses for fire brigades at the Fire Brigade Training Centre in Tirana. Through the Training of Trainers initiative, Albania has established a core group of civil emergency trainers. They have increased the capacities related to the design and organisation of training activities for different target groups at both national and local level.²³²¹

Tabletop Exercises, Functional Exercises, and Full-scale Exercises are carried out.

Albania's Department of Seismology of the Geo-sciences Institute is participating in the project *Harmonization of seismic hazard maps for the Western Balkan Countries* launched in 2007 in the framework of the Disaster Preparedness and Prevention Initiative of the Stability Pact for South Eastern

²³²⁰ The data available on http://www.nato.int/cps/en/natohq/topics_117901.htm?selectedLocale=en is for requests after 2002.

²³²¹ IPA Beneficiary Needs Assessment Albania, p. 16.

Europe with the support of the NATO Science for Peace and Security Programme. The main aim of the project is to prepare the ground for joint preparedness and prevention activities in disaster management among the countries of the region. The process of harmonization of the earthquake terminology and of the seismic risk maps targets improvement of scientific collaboration between the project partners and enhancing the cooperation and coordination in the field of seismic hazard management.

Moreover, bilateral activities have been organised between relevant Albanian institutions and counterparts in neighbouring countries. Albania has established bilateral cooperation with the Italian Government, particularly in respect to disaster risk reduction training activities. Additional memorandum of understanding was agreed with Greece, FYROM, Turkey, Croatia and Austria, especially regarding support in case of large scale disaster response operations.²³²²

Albania has participated in several regional and local exercises with structures of line ministries, local power structures, foreign agencies and volunteers. These include table top exercises, such as main planning conference, (CMEP), Tirana, 2006; Table top exercise, (CMEP), Durrës, 2006; and Intergovernmental table top exercise, (with support US Army), Tirana, 2009.²³²³

5.4 Procurement

5.4.1 Procurement regulation

Public procurement in Albania is governed by Law No. 9643 dated 20 November 2006 as amended (PPL). The PPL defines the Public Procurement Agency (PPA) as the central body responsible for public procurement. The PPA operates as a regulatory authority and manages the national procurement system.

The PPL applies to all contracts for supplies, services or works awarded by contracting authorities, unless explicitly exempted.

Art. 5 of the PPL deals specifically with defence procurement, stating that the PPL “shall apply to all public contracts awarded in the field of defense, subject to para 2 of this Article.” The PPL shall not apply in the cases of “(a) when CA (Contracting Authority) shall be obliged to supply information whose disclosure is contrary to the essential interests of national security; (b) for the purchase of arms, munitions and war material, or related services. This exception shall not adversely affect the conditions of competition regarding products not specifically intended for military purposes; (c) in specific circumstances caused by natural disasters, armed conflicts, war operations, military training and participation in military missions outside the country.”²³²⁴

5.4.2 Procurement procedures

The PPL provides for two levels of thresholds: low and high. Furthermore, the PPL provides that the level of each threshold will be adjusted on a two-year basis. The high thresholds are approximately EUR 8 mln for works and EUR 1.3 mln for goods and services. The low-value thresholds are app. EUR 80,000 for works and EUR 50,000 for goods and services.

²³²² IPA Beneficiary Needs Assessment Albania, pp. 19-20.

²³²³ Vademecum Civil Protection – Country Profile – Albania.

²³²⁴ Public Procurement Law, available at <https://www.app.gov.al/ep/Legislation.aspx>.

For contracts above the low value thresholds, contracting authorities shall use open procedures, restricted procedures, design contests. Negotiated procedures may be used only in the specific circumstances set forth in Art. 32 and 33 of the PPL.

For contracts of a value lower than the low value thresholds, contracting authorities may use negotiated procedures with or without prior publication and requests for proposals in accordance with the conditions provided in the law.

The contracts are advertised on the website of the PPA and are fully accessible to any bidder, wherever it is located, and the time limits are a minimum of 30 days from publication on the website (for open procedures).

5.5 Niche capabilities

Albania is a relatively small country with limited capabilities. It is hard to find any specialization (niche) in its DRR capabilities. But if we analyse its defence capabilities as a whole, we can assume that the DRR is one of the area of specialization of Albanian Armed forces, together with the asymmetric warfare.²³²⁵

²³²⁵ For an overall assessment of AAF capabilities –see the annual edition of Military Balance, published by Routledge, <https://www.routledge.com/series/MB>.

Driving Innovation in Crisis Management for **E**uropean **R**esilience

ISRAEL

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: FhG-INT (Maik Vollmer, Isabelle Linde-Frech)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by CSDM and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

The Israeli approach to emergency management is based primarily on the need to prepare for and respond to attacks against the nation. The strongest danger facing Israel is war related, and thus out of DRIVER's scope, while the respective development of the emergency management system also strongly affects the management of other types of crisis ("single-hazard based approach" – counting on overlaps and spinoffs from preparation for one type of hazard that can also be applied to managing other types of hazards). The Israeli emergency management system has also been called a "military-centric" model (Rozdilsky 2009).

Among natural disasters, earthquakes are the major field of concern, and organisations put strong efforts in respective risk assessments, and approaches to prepare for and cope with consequences of earthquakes. In addition, also wildfires and storms have caused major disasters.

Main involved organisations in emergency management are the following: In the event of a non-war emergency, the *Israel Police* are the first responders and have operational responsibility over all the rescue services such as *Magen David Adom (MDA)* and the *Fire Service*. In these cases, the Police is in charge (incident commander), and the *National Emergency Authority (NEMA)*, established in 2007 as part of the *Ministry of Defense*, is taking care of the inter agency coordination.

The *Ministry of Public Security* is responsible for the operational preparation and the readiness for emergencies and crisis, of all the authorities subjected to it: the Israel Police, the Israel Prison Service and the Fire and Rescue services.

In case of a large scale event, the incident management can be handed over from the Police to the *Home Front Command (HFC)*, a section of the *Israel Defense Forces (IDF)*, by a governmental decree (which has never happened to date). In other events, HFC is involved with tasks such as Search & Rescue (Ministry of Public Security 2014; expert interview).

Regarding international assistance to Israel, main involved institutions are the *Ministry of Foreign Affairs*, the *Primary Office*, and NEMA. NEMA provides recommendations to the Primary Office, and the Ministry of Foreign Affairs sends out requests for international support.

Volunteers in emergency management are active at the Israel Police, the Fire and Rescue Services, and MDA.

MDA	Magen David Adom in Israel
NEMA	National Emergency Management Authority

1 Policy

Israel operates under a parliamentary democracy.

The legislative branch is the Knesset, which is the parliament of the State of Israel. It has parliamentary sovereignty, and enacts legislation on every issue.

The executive branch includes the government and government ministries.

The judiciary includes the system of courts: the Supreme Court, the District Court, Magistrates Court, Court for Local Affairs, Religious Court, Traffic Court, Labour Court, Juvenile Court, etc.

The President is elected by the Knesset every seven years, and his main duties are representational.

The incumbent President is Reuven Rivlin.

The incumbent Prime Minister is Binyamin Netanyahu.

Local authorities are the municipalities, local councils, and regional councils. These authorities have governmental and administrative powers in their areas of jurisdiction, and are responsible for provision of services to their constituencies .

There are six main administrative districts of Israel (see figure 1): Center, Haifa, Jerusalem, North, Southern, and Tel Aviv Districts. The Judea and Samaria Area, as well as parts of the Jerusalem and North districts are not recognized internationally as part of Israel (Wikipedia 2014).

Figure 65: Districts of Israel (Source: Wikipedia 2014)

1.1 Risk Assessment

The primary danger facing Israel is war related, and thus out of DRIVER's scope – the danger from missile or rocket attack (HFC 2014b).

Following disaster statistics of EM-DAT, the following events belong to the most severe natural disasters in Israel: Storm in December 2013 (> 2 Mio. people affected), wildfire in December 2010 (> 20.000 people affected, assistance through EU Civil Protection Mechanism was provided), and flood in December 1998 (1.000 people affected) (EM-DAT 2014; EC 2013).

Even though earthquakes do not appear in these statistics, they are a major concern, they are the threat considered most likely among natural hazards.

The national assessment of risk is an ongoing process and conducted as follows:

The National Emergency Management Authority (NEMA, see chapter 3.1) *is responsible for preparing a national risk profile of security issues that might occur during peace or war times – both conventional and CBRN events. The results of the risk assessment are distributed to all government ministries, which are then required to prepare a sectoral risk assessment report aligned with the overall national programme, covering areas that are under their responsibility. The preparation of the national risk profile is performed by system analysis professionals, based on protocols and procedures developed to ensure in-depth collection and management of relevant information from numerous sources. The profile is reviewed periodically and updated as needed, in accordance with changes in the region (WHO 2012).*

The National Inter-Ministerial Committee for Earthquake Preparedness *was given responsibility for preparing a national risk profile of natural disasters focusing on earthquakes, which are considered to be the most likely threat (among natural causes) to Israel. In order to do so, information from various sources was collected and analysed and the national risk defined, including references to forecasted casualties, damage to infrastructure, implications for the population, and so on. The risk assessment was formally adopted by the government and disseminated to all ministries to serve as the basis for developing a response. Discussions are currently taking place regarding the appropriateness of the risk profile: various experts have expressed their view that with the advancement of risk assessment methodologies, as well as lessons learned from earthquakes in different parts of the world and in the region, it may be that the present profile is too severe. As a result, the national risk profile for earthquakes is undergoing a process of re-evaluation (ibid).*

Overall coordination of risk assessments, national risk profiles and emergency preparedness planning is conducted by NEMA, which also prepares annual reports on the activities implemented by all agencies as part of emergency management programmes (ibid.).

1.2 Policy and Governance

1.2.1 Strategy scope and focus

The strategic approach to crisis management seems to cover all necessary activities for prevention (incl. resilience actions), preparedness, response (incl. mitigation), and recovery.

NEMA's responsibilities, for example, "cover all components of emergency management, including disaster risk reduction, prevention, mitigation, response, reconstruction and rehabilitation activities" (see chapter 3.1). Further verification of the strategy scope and focus was not possible in the framework of this study.

1.2.2 Monitoring and analytical support to policy making; R&D

A comprehensive overview was not possible in the framework of this study. Main research institutions with regard to the main hazard earthquakes are the Geological Institute of Israel, the Geophysical Institute of Israel, and the National Building Research Institute of the Technion (Laor 2005). Further, the Institute for National Security Studies can be named.

The Ministry of Public Security "conducts research in the field of public security through the Ministry's Bureau of the Chief Scientist and the newly established Research unit of Strategy and Policy Planning Department.

The Bureau of the Chief Scientist is a professional scientific agency within the Ministry of Public Security, whose principal responsibility is to develop, formulate and promulgate science-driven law enforcement policy as it relates to public security and combating crime in the State of Israel.

The Ministry works in conjunction with the research division in the Israel Police and the Israel Prison Service" (Ministry of Public Security 2014e).

R&D activities at the Home Front Command comprise a) crisis management, situation awareness and disaster resilience, b) critical infrastructure protection, and c) communication technologies and interoperability (HFC 2014d).

Also MDA is involved in respective research activities.

1.2.3 Policy for Prevention

Aim of this and the following sub chapters was to describe lead responsibilities and further contributing organisations differenced by the different parts of the crisis management cycle. Anyways, specific policies in Israel distinguished by prevention, preparedness, response, relief and recovery have not been identified. However. the overall organisation, lead responsibilities etc. in emergency management in Israel is described in chapter 3.1 and 3.2.

1.2.4 Policy for Preparedness

See chapter 1.2.3.

1.2.5 Policy for Response

See chapter 1.2.3.

1.2.6 Policy for Relief and Recovery

See chapter 1.2.3.

1.3 Financing

Concrete figures can not be named, as too many issues and types of budgets from several organisations would need to be included (expert interview).

However, “emergency preparedness in Israel is a national priority: extensive efforts and resources are continuously invested to ensure readiness for all anticipated potential hazards” (WHO 2012).

MDA as an example spends max. 0.5 million € on training and preparedness (expert interview).

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

See chapters 1.4.2 – 1.4.5.

1.4.2 Departmental Lessons Learned systems

While it could not be verified for each single organisation (see chapter 3.1), in general the involved organisations have their own internal lessons learned system (expert interview).

1.4.3 Centralised (national) Lessons Learned system

For missions under Police control (no war-like or large scale events), the Police conducts an evaluation in the aftermath of the event. Results are shared with all organisations involved in the mission (expert interview).

For the overall picture, NEMA collects all available lessons learned reports, compiles and evaluates them (expert interview).

1.4.4 International exchange for Lessons Learned

Israel participates in international trainings and exercises, while no specific information on international exchange for Lessons Learned could be obtained in the framework of this study.

1.4.5 Regular policy reviews

The WHO report on “Assessment of health-system crisis preparedness – Israel” states in the context of health crisis preparedness that “National management policies are closely and frequently reviewed to ensure their appropriateness and their modification is disseminated to all concerned parties” (WHO 2012).

1.5 Resilience

Israel implements the concept of resilience, there is an overall written strategy (only in Hebrew), which has influence on several sectors, including e.g. education. In further documents, needs or gaps with regard to resilience are mapped for different levels, and respective answers are mapped to these gaps. Specific guidelines for the public on how to behave in hazardous situations, are supposed to enhance public awareness and thus overall resilience (expert interview).

No specific standards being used could be identified, but there are efforts to standardize processes, and to implement international standards (ISO) (expert interview).

A method for assessing community resilience has been developed in Israel – a result of the accumulation of over 30 years’ experience of society’s exposure to emergencies and threat. This method, the Conjoint Community Resiliency Assessment Measure (see Leykin et al. 2013), is being adopted by various government ministries as well as the Home Front Command (HFC) in order to assess, monitor, and evaluate the resilience of the population and its systems for coping with disasters. It enables the identification of weak points – such as leadership, knowledge, social cohesion or security – in order to direct intervention to strengthening these areas (WHO 2012).

1.6 Information sharing and data protection

Specific policies, measures or derogations from EU law with regard to data protection, adapted by Israel, could not be identified. The same accounts for overall registers/databases of volunteers.

Regarding social media, it can be stated that in general, the use of social media seems to play a minor role. It is mostly not actively used by emergency managers – but activities and published information or statements are monitored (expert interview).

Most emergency services instruct the public not to turn to social media to report emergencies or request assistance, but the emergency agencies are nevertheless asked to monitor all their digital platforms for signs of distress and respond when necessary, as well as update them with accurate information in a timely matter.

In terms of reaching the public using social media, it should be considered that part of the Israeli population does not speak Hebrew. Further, Israel has a large Jewish ultra-Orthodox community that does not have much exposure to new media (Ministry of Public Security 2014h).

However, the Israel Police runs a Facebook page, which has been proved useful also in crisis situations, as described on the website of the Ministry of Public Security:

Yamincha, who runs the internet and new media desk at the Israel Police with a staff of 15, manages the Israel Police Facebook page. With over 100,000 followers and climbing, an active

Twitter account with over 1,500 followers, a YouTube account and a new and improved website, the Israel Police's presence on the internet and social media sites is a powerful tool for fighting crime and serving the public. [...]

Beyond fighting crime, the Facebook page is a valuable tool in reaching the public and providing it with up-to-date, sometimes vital information. In December 2010, Israel experienced one of its deadliest fires ever, when the Mt. Carmel forest fire tore through Northern Israel for four days. Forty-four people were killed, 25 square kilometers of forest land was burned, and 100 homes were destroyed. "First, people started posting pictures of smoke from outside their windows," Yamincha says of the beginning of the fire. Once pictures were posted and the word got out, residents near the fire and concerned family members began inundating the emergency hotlines. Once the phones crashed, everyone turned to Facebook. "We realized it was going to be a long night," says Yamincha.

For the next four days, the Facebook page fielded, on average, a question every two minutes. "We replaced the hospitals, the army and the home front command. People couldn't get in touch with them so they contacted us; and we answered each of their questions. And if we didn't know the answer, we had contacts who could find out for us," says Yamincha.

Instead of having to disseminate information through typical media sources, the Israel Police had access to the public directly through their Facebook page, where they posted official guidelines and information. Additionally, as part of the spokesperson's office, the staff running the Facebook page had information streaming in from all other spokespeople, and was the most up-to-date source. As Yamincha puts it, "The media would update themselves based on our posts and answers" (Ministry of Public Security 2014f).

Also during a heavy snow storm in 2013, in which many cities lost power and had inaccessible roads, many citizens and even municipal representatives used social media to report power outages and blocked roads to the relevant emergency authorities (Ministry of Public Security 2014h).

Besides these "success stories", the Israel Police also states challenges of Facebook:

According to Yamincha, managing an official police Facebook page is a challenge, which requires constant attention. He says the most important thing is to have adequate staff. "You need people; and they have to be experts – experts at writing content, and experts at new media. You have to know how to write, what to write, when, and how often."

Additionally, there is the challenge of allowing users freedom to post whatever they want. Yamincha says the police's Facebook wall is open to the public and uncensored. However, it does uphold Facebook's terms of use, which forbid hateful, pornographic, unlawful or discriminatory content; and Yamincha blocks users who leave posts that violate those terms. So far, Yamincha says he has only had to block 140 users.

Moreover, Yamincha says the constant presence of the police on the internet – working from 6 a.m. to 1 a.m. – creates a false sense that they can respond to anything. "I'm scared that we won't be in time when something happens," he says. "Almost everyday people tell us that they've seen another user post something about wanting to commit suicide, and we try to locate them. We deal a lot with that."

What was once a platform for friends to post pictures and stay in touch is now an entire world, where users exchange information, and can affect real change in the world. The police prevent crimes, save lives, and catch criminals through Facebook, and citizens now have a new place to turn in times of emergency, or when they have a question. While there are risks and dangers to Facebook and other social media applications, the Israel Police has managed to harness the power of Facebook for the good of society, and is always improving (Ministry of Public Security 2014f).

For further information on crisis communication, including a planned development of an “Emergency App”, see chapter 4.4.

2 Legislation

2.1 Crisis (emergency, disaster) management concept

A dedicated crisis management concept, other than the structures and documents described in this report, has not been identified.

2.2 General crisis (emergency, disaster) management law

The WHO “Assessment of health-system crisis preparedness – Israel” compiled essential attributes on the legal framework for national multisectoral emergency management:

Legal framework for multisectoral emergency management

Israel has had to deal with emergency situations since the declaration of its independence in May 1948. As a result, the national laws, decrees, regulations and guidelines provide extensive authority to the different ministries, clearly delineating roles, responsibilities and managerial tools for emergency preparedness and response. Several laws and government policies, as well as binding guidelines and regulations designated to ensure provision of vital services during emergencies, have been legislated and enacted during the 64 years of the country’s existence.

Emergency Regulations

The Emergency Regulations were enacted by the Israeli Parliament in May 1948. The regulations authorize ministers to activate emergency measures that are required to ensure provision of vital services to the state’s population. The regulations are very powerful tools: upon their application they supersede most other laws. Because of their potential strength, since 2010 these regulations have been under review by all ministries, coordinated by the Ministries of Defense and Justice which are designated to maintain the necessary authority to direct emergency management procedures. Nevertheless, efforts are being made to limit the measures that will be integrated in the Emergency Regulations, to avoid as far as possible any violation of human rights.

Civil Defense Law

The Civil Defense Law of 1951 authorizes implementation of all actions pertaining to the well-being of Israel’s population during periods of emergency. The law establishes the civil defence service; mandates the construction and upkeep of shelters in all buildings, both residential and industrial; enables the state’s authority to make use during emergencies of infrastructure, resources or equipment, regardless of their ownership (whether private or public); and provides the Ministry of Defense with the authority and responsibility for directing the overall smooth operation of all vital services, in order to ensure their provision to the population. The law also

defines a civil state of alert and lays down regulations regarding the use of toxic and hazardous materials. [...]

The declaration of a state of emergency can be activated for the whole state or can cover a specific territory (referred to as “special situation of the home front”). The emergency that triggers this declaration can result from various types of threat, such as war or limited military confrontations, major terror attacks, epidemic outbreaks, natural disasters or operational incidents (with the potential of becoming mass disasters).

Modification of the Police Ordinance

The Police Ordinance was modified in 2005 in order to authorize the Minister of Internal Security to declare a state of “mass disaster” for a period of up to 48 hours. Upon its application, police officers are responsible for the control and command of all on-site operations during the event. Accordingly, the police are authorized to direct operations of all first responders, to confiscate any resource needed by rescue agencies (regardless of ownership) and to close areas or prohibit entrance or exit.

Risk reduction – National Master Plan 38

One of the threats faced by Israel is the potential occurrence of a severe earthquake. As part of the risk reduction programme, rigid building codes were implemented in 1975 as a modification of the Planning and Building Law enacted in 1965. Since many buildings were constructed before the modification of the law, National Master Plan 38 was legislated in 2005, encouraging property owners to implement measures designed to strengthen buildings constructed before 1980 and to enhance their survivability during an earthquake. As part of this programme, in order to provide motivation for its implementation, building owners are eligible for additional building rights if they execute the strict regulations. The Plan, which was initially valid for five years, was extended in 2009 for an additional period of five years to 18 May 2015.

See also chapter 2.3 for laws depending on the existence of a state of emergency.

2.3 Emergency rule

Following article 38 of the Basic Law, the Government determines how an emergency is declared and who has the authority to do so. Article 39 deals with the setting up of emergency regulation (Cabili et al. 2014). The state of emergency has been declared shortly after the inception of the state in 1948, and has been renewed annually, thus Israel has lived in a permanent state of emergency until today. Thanks to the state of emergency, the Israeli legislature (the Knesset) could pass emergency legislation which could violate normal principles of civil liberty as the Knesset saw fit or needed. It has passed and renewed emergency legislation covering a wide range of areas of Israeli society and commerce (Kirshbaum 2007).

Cabili et al. (2014) compiled the following regarding the general state of emergency:

Who may declare the state of emergency and under what conditions?

According to Article 38(a) of the Basic Law: The Government: "Should the Knesset ascertain that the State is in a state of emergency, it may, of its own initiative or, pursuant to a Government proposal, declare that a state of emergency exists". However, the Government itself has the power to declare a state of emergency, meeting the conditions of Article 38(c) of the Basic Law: The Government: "Should the Government ascertain that a state of emergency exists in the State and that its urgency necessitates the declaration of a state of emergency, even before it becomes possible to convene the Knesset, it may declare a state of emergency..."

Moreover, the Knesset's rules of procedure [...] set a number of conditions and procedures regarding the declaration (both by Government and the Knesset). For example, the Knesset's decision to declare a state of emergency will not be accepted without a recommendation from the joint committee, that includes the Knesset's Constitution, Law and Justice Committee and the Foreign Affairs and Defense Committee (hereinafter: the joint committee). The joint committee must submit her recommendation to the Knesset for approval. If the recommendation is regarding renewal of a state of emergency, the recommendation must be submitted to the Knesset's approval no later than 14 days before the state of emergency comes to end.

If a state of emergency has been declared by the government, the government must immediately notify the Speaker of the Knesset and the chairman of the joint committee. The committee should discuss the declaration and submit the recommendation to the Knesset for approval "as soon as possible".

According to Article 38(d) to the Basic Law: The Government, the declarations should be published in the official Gazette (Reshumot) and "should publication in Reshumot not be possible, another appropriate manner will be adopted, provided that notification thereof be published in Reshumot at the earliest possible date".

Statutes that come into force during emergency

The Validity of many laws that were passed over the years depends on the existence of a declaration of a state of emergency. If this declaration will be terminated, these provisions/laws will be repealed along with termination of the state of emergency. Hence, a state of emergency in Israel is consistently extended.

Among the above mentioned laws one can find specific provision of the Tort Ordinance; the Emergency Land Requisition (Regulation) Law, 1949; provisions of the Legal and Administrative Matters (Regulation) Law [Consolidated Version], 1970; the Emergency Powers (Detention) Law, 1979, that provides the legal framework for administrative detentions (see below); the Law Governing the Control of Commodities and Services, 1957, which enables to impose regulation on the market. The law enables that by using orders that allow for general control over commodities and services, including price control, control over sales and purchases of goods and services that were declared as "subjects to control" and control over the actions and conduct of factories engages in "crucial activity", as it is defined by the law; Prevention of Terrorism Ordinance, 1948; and more.

How does a state of emergency end?

The duration of a declaration of a state of emergency by the Knesset will be in accordance with the period prescribed in the declaration, but may not exceed one year.

The Knesset may repeatedly declare a state of emergency (renew the declaration as stated); as mentioned, every year she does so. In fact, since the declaration of independence in 1948, Israel has been under the declaration of a state of emergency, which is yet to be revoked.

As to a declaration made by the Government, according to Article 38(c) of the Basic Law: The Government, "the declaration's validity shall expire upon 7 days from its proclamation, if not previously approved or revoked by the Knesset, pursuant to a decision by a majority of its members; should the Knesset fail to convene, the Government may make a renewed declaration of a state of emergency as stated in this subsection".

As mentioned, the Knesset has the power to terminate a declaration of a state of emergency at any time, regardless the question what branch of the government declared it (such termination should be published in Reshumot)

Besides this, there is primary (Knesset) legislation that allows the declaration of specific states of emergencies, independently of the existence of a general state of emergency. For example, (see chapter 2.2,)

The Police Ordinance was modified in 2005 in order to authorize the Minister of Internal Security to declare a state of "mass disaster" for a period of up to 48 hours. Upon its application, police officers are responsible for the control and command of all on-site operations during the event. Accordingly, the police are authorized to direct operations of all first responders, to confiscate any resource needed by rescue agencies (regardless of ownership) and to close areas or prohibit entrance or exit (WHO 2012).

3 Organisation

3.1 Organisational chart

The following organisations have a crucial role in the Israeli crisis management (in terms of the DRIVER understanding of crisis):

- Government Ministries, especially
 - o Prime Minister's Office
 - o Ministry of Public Security
 - o Ministry of Foreign Affairs
 - o Ministry of Defense
 - o Ministry of Health
- Public security bodies
 - o The Israel Police
 - o (National) Fire and Rescue Authority
- Magen David Adom
- Israel Defense Forces, including the Home Front Command
- National Emergency Authority/ Reshut Heyrum Le'umit

Further institutions not dedicated to crisis management services might be involved, e.g. Israel Airports Authority, Israel Ports Company.

In the event of a non-war emergency, the Israel Police are the first responders and have operational responsibility over all the rescue services such as Magen David Adom (MDA) and the Fire Service. In these cases, the Police is in charge (incident commander), and the National Emergency Authority (NEMA), established in 2007 as part of the Ministry of Defense, is taking care of the inter agency coordination.

The Ministry of Public Security is responsible for the operational preparation and the readiness for emergencies and crisis, of all the authorities subjected to it: the Israel Police, the Israel Prison Service and the Fire and Rescue services. In case of a large scale event, the incident management can be handed over from the Police to the Home Front Command (HFC), a section of the Israel Defense Forces (IDF), by a governmental decree (never happened so far). In other events, HFC is involved with tasks such as Search & Rescue (Ministry of Public Security 2014; expert interview).

In the following, tasks and responsibilities of the Ministry of Public Security, the Police, the Fire and Rescue Authority, MDA, HFC, and NEMA will be described in detail.

Ministry of Public Security

Following an overview document provided by the Ministry of Public Security (Ministry of Public Security 2014c), the Ministry

was founded in 1948 as the Ministry of Police. Its Minister has three areas of responsibility – public security, law enforcement and corrections – as well as a number of operational bodies: The Israel Police, Israel Prison Service, Israel Fire and Rescue Authority, Israel Anti-Drug and Alcohol Authority and the Witness Protection Authority.

The Ministry's vision is

to bring about a significant improvement to the personal security, sense of security and communal security of the citizens of Israel; and create a law-abiding society that rejects violence and crime, all in order to provide a higher quality of life for the citizens and residents of the state of Israel.

The Ministry's mission is

to serve as the primary arm of the Israeli government responsible for law enforcement, crime prevention, safeguarding lives and property, maintaining public order, protecting the public from terror attacks, incarcerating and rehabilitating criminals, protecting witnesses, preventing violence in society, preventing drug and alcohol abuse, preventing and fighting fires and overseeing firearm licensing.

About the Ministry

The Ministry of Public Security carries out its public security operations and responsibilities through its operational bodies: The Israel Police, the Israel Prison Service, the Israel Fire and Rescue Authority, the Israel Anti-Drug and Alcohol Authority and the Witness Protection Authority.

The administration of the Ministry of Public Security is headed by a Director-General, under whom serve four Deputy Directors and other department heads. The main Deputy Director oversees various departments in the Ministry and takes over for the Director-General in his absence; while the other three Deputy Directors are responsible for operations, human resources, and the Planning, Budget and Monitoring Department.

The operational bodies of the Ministry coordinate their operations with the Minister through his Security Secretariat. The Security Secretariat also aids the Minister in formulating operational policy, monitoring the activities of the bodies and more. The Ministry collaborates with other organizations throughout the world to promote public security; and does so through its International Relations Department, which aims to promote cooperation and develop relations with parallel ministries, institutions and organizations abroad.

Policy targets of the Ministry

- *Significantly improving the level of personal and communal security*
- *Fighting organized crime, severe crime & public corruption*
- *Improving operational readiness for emergencies*
- *Reducing road accidents*

- *Improving rescue and recovery capabilities*
- *Improving security measures, detention conditions & the rehabilitation of prisoners*
- *Increasing the efficiency of the Ministry*
- *Strengthening international cooperation*

Emergency preparedness at the Ministry of Public Security

The Ministry of Public Security is responsible for the operational readiness of all the authorities subject to it in times of emergency and during crisis situations. The Ministry is responsible for Israel's first responders – the Israel Police and the Israel Fire and Rescue Authority. During crisis situations the Ministry is in contact with the various agencies and organizations that aid in emergencies, and coordinates operations with the operational bodies under its authority.

In times of emergency, the Ministry works to:

- *Establish a clear picture of the situation and aid the Minister in policy formation and decision making and to provide guidelines in the areas under his authority*
- *Carry out the instructions of the government and the military cabinet*
- *Preserve the normal fabric of life in Israel and keep essential institutions open*

Emergency Fusion and Operations Center

In order to provide the Minister with up-to-date information and aid him in formulating policies and decision making in times of crisis, the Ministry operates an advanced Emergency Fusion and Operations Center, which provides a common operating picture of the emergency and rescue agencies. The Emergency Fusion and Operations Center aids in evaluating risks, providing situational assessments and making recommendations for the best and most relevant policy.

The Emergency Fusion and Operations Center is manned by representatives of the Israel Police, the Israel Prison Service, the Israel Fire and Rescue Authority, the National Emergency Authority, the Home Front Command and others. In addition, the Ministry is assisted by a group of volunteers – former senior officers – that aid the Ministry with their professional and operational experience in dealing with emergency situations, and act as the Ministry's liaisons with other agencies in times of emergency.

Logistics and Continuous Functionality Forum

In addition to the fusion center, the Ministry also employs a forum which works to provide the Ministry with logistic solutions by overseeing the Ministry's operational bodies and responding to any logistical needs, with the goal of keeping essential institutions running and functional.

Emergency & Crisis Situation Think Tank

The Ministry has a Crisis Situation Think Tank which assists the Minister in decision making, risk management, formulating alternative courses of action and aiding in public relations and media strategy.

Israel Police

The Israel Police operates in compliance with the Police Act of 1971 and additional articles of legislation.

The Israel Police is under the Ministry of Public Security. It is a national level police force, comprised of some 30,000 sworn officers reinforced by 40,000 volunteers.

The Israel Police is the only police organization in Israel and therefore its work includes all aspects of conventional policing, from the local through the national levels. In addition, it has an important role in the fight against terrorism. Its work is guided by the values and principles of the democratic government of the state of Israel.

The task of the Israel Police is to maintain the quality of life, law enforcement and enforcement of traffic regulations, as well as providing guidance on preventive measures for the safety and protection of the population (information provided in context of expert interview, 2014).

Disaster management

Israel Police is the first responder to any emergency event and responsible for solving the immediate situation. In case of an on-going event the Israel Police is responsible for integration of all emergency forces & command & control of the event (ibid.).

Fire and Rescue authority

The Fire and Rescue services are in charge of preventing, extinguishing, and preventing the spread of fires; as well as rescuing people and salvaging property. The firefighters deal with fires in homes and open spaces; handle hazardous substances; rescue victims from road accidents; and any other life and property saving scenario.

The Fire and Rescue Commission operates under the authority of the Ministry of Public Security. The Minister of Public Security is the minister in charge of appointing the Fire and Rescue Commissioner. Currently, the commissioner is Shahar Ayalon. [...]

Background

According to the Firefighting Services law of 1959, the Fire and Rescue services are in charge of putting out and preventing fire, as well as rescuing people and property. The fire and rescue services are municipal services, provided within the framework of municipal unions and municipal firefighting units, and they are in charge of incidents that occur within their jurisdiction.

The Structure of the Firefighting Alignment in Israel

The Fire and Rescue services in Israel are made up of 24 authorities, 20 of which are municipal unions for fire and rescue services, and four which are municipal divisions. The firefighting services are spread across 95 fire stations all over the country.

The service is headed by a commander, who is responsible for the daily operational implementation of the service, and who is subjected to the management of the firefighting authority.

As of 2011 there were a total of 1,900 firefighters, engineers and administrative workers in the fire and rescue services (Ministry of Public Security 2014c).

Magen David Adom

Magen David Adom (MDA) in Israel was established in 1930.

MDA is a national organization, and works in cooperation with other emergency and security authorities (Israeli Police, IDF, Fire fighters etc.)

MDA's objectives and its legal status are defined in section 3 of the Magen David Adom Law passed by the Knesset (Israel's Parliament) on July 12, 1950:

- *to carry out the functions of a national society, to be an auxiliary service to the Israeli Defense Forces in time of war and to be prepared for this in times of peace;*
- *to provide pre hospital emergency medical services.*
- *to provide the national blood services incl. collecting, processing, distributing and storage services of blood, plasma and their by-products;*
- *to carry out any additional functions determined by the Society's By-Laws;*

MDA stats of 2012:

- *In 2012, MDA answered and treated 637,004 calls received from all over Israel.*
- *MDA Blood services collected 300,000 Blood Units from volunteering citizens.*
- *70,000 people (workers, volunteers and citizens) received MDA training courses*

Article 49 of MDA's By-Laws confers the following additional duties of the Society

- *instruction of first aid and pre-hospital emergency medicine;*
- *maintaining a volunteers infrastructure and training them in first aid, basic and advanced life support including Mobile Intensive Care Units;*
- *transportation of patients, women in labor, and evacuation of those wounded and killed in road accidents;*
- *transportation of doctors, nurses and medical auxiliary forces;*

MDA belongs to the International Red Cross and Red Crescent Movement and is Israeli Red Cross National Society.

In this capacity, MDA is providing training and humanitarian aid to countries in need, all over the world (MDA 2014).

Home Front Command

The Home Front Command (HFC) is a section of the Israel Defence Forces (IDF), created in 1992. Its objectives are

- *To constitute the main professional authority for civilian protection in the following areas: Extrication, rescue, the chemical and biological threat on the home front and hazardous materials*
- *To constitute a civilian protection service*
- *To constitute chief operational headquarters for army units intended for the home front*
- *To constitute the staff for forming the forces/ units for the Home Front Command*
- *To make up the command force (HFC 2014).*

The Home Front Command operates in various emergency situations, specializing in the field of civilian protection. In times of crisis or war, the Home Front Command operates to its fullest capabilities, using all its resources in order to instruct the civilian population on how to cope with the threats facing Israel. The purpose of the Home Front Command is to save lives. The Home Front Command operates search and rescue missions in Israel and around the world, aiding in rescue and recovery from incidents such as terror attacks, floods, conflagrations, etc.

Search and Rescue

The IDF National Search and Rescue Unit, under the Home Front Command, is a highly skilled force trained to execute special search and rescue missions, both in Israel and abroad. The unit was founded in 1983, and its' expertise is in rescuing people trapped under ruins.

The unit is comprised primarily of reservists who are always on call, with prepared kits to enable immediate departure, and a small core of soldiers in mandatory service. In addition to the rescue teams, the unit employs doctors, engineers, mechanical engineering equipment operators and rescue dog handlers.

In November 2003 the first Search and Rescue Company, the Shavit Company, was founded in response to the need for a large operational S&R force that would be available at all times. Subsequently, two additional companies, Hetz and Rotem, were established. The soldiers are all graduates of the Search and Rescue course, and are trained in first aid, Krav Maga, infantry, ABC (atomic, biological, chemical) warfare, and more.

The unit is on-call 24 hours a day and are deployed whenever there is a disaster – earthquakes, tsunamis, conventional or unconventional terrorist attacks. The S&R companies also assist IDF infantry forces during routine operations (IDF 2014).

National Emergency Management Authority (NEMA)

NEMA was established in 2007, as part of the Ministry of Defense, and is responsible for preparing Israel's home front for any potential emergencies. This is accomplished by directing and coordinating among emergency organizations, government offices, local authorities, and other relevant institutions.

NEMA is responsible for creating sustainable plans to ensure preparedness of the home front for all types of emergency; ensuring appropriate critical resource reserves (such as fuel, food, water and so on); initiating research in the field of emergency preparedness; promoting activities designed to improve the population's resilience to emergencies; centralizing information collection and distribution; and coordinating the activities of the various government ministries during emergencies. NEMA's responsibilities cover all components of emergency management, including disaster risk reduction, prevention, mitigation, response, reconstruction and rehabilitation activities.

As part of the coordination mechanism, NEMA operates a National Council for Emergency Management, headed by either the Deputy Minister of Defense or the Minister of Civil Protection (depending on the structure of the government at the time). Senior representatives from all government ministries serve as members on this Council. Its major role is to coordinate activities designed to prepare the nation for all hazards and to manage an emergency upon its occurrence. The policies mandated by the Council are implemented by NEMA, so regular evaluations of all government agencies are conducted by this body to assess the ongoing state of preparedness. The organization and structure established at the national level are mirrored at the regional district levels.

In order to ensure proper implementation of emergency preparedness and management, each government ministry has created and maintains a national authority that is responsible for directing operations of the agencies under its jurisdiction during emergencies. For example, the MoH [Ministry of Health] operates a Supreme Health Authority (SHA) that is responsible for coordinating the operations of all health agencies in preparation and management of emergency situations.

NEMA integrates the activities of all ministries, organizations and bodies relevant to effective emergency preparedness and management.

In routine times, NEMA coordinates on a national level several activities designed to ensure emergency preparedness. It prioritizes potential threats; conducts risk analysis; develops national emergency policies; presents to the government annual reports on home front preparedness levels; promotes and leads relevant legislation in the state cabinet and parliament; coordinates international cooperation including exercises and workshops as well as work information-sharing; and leads the building and enhancement of population resilience.

During periods of emergency, NEMA operates the National Emergency Management Center that serves as a supreme operations centre designated to monitor and report a real-time situation analysis to the government; supervises the fulfilment and implementation of directives/instructions disseminated by the Minister of Defense; coordinates with the National Information Directorate the general information dissemination activities; advises the Minister of Defense and the government regarding key decisions that need to be implemented in real

time to ensure effective emergency management; and activates the national resilience system (WHO 2012).

Emergency Economy

The Emergency Economy is a body created in 1955 to ensure continued activity of vital enterprises during an emergency. An Emergency Economy order allows the recruitment of workers for essential private and public services, such as emergency services, medicine, local authorities, food and equipment supply, communications, and any other service deemed vital. Until 2010 the Emergency Economy was responsible for preparing the local municipalities for emergencies, including absorption of evacuees from disaster stricken areas.

A Supreme Emergency Economy Committee was created in 1986, headed by the Minister of Defense or a senior deputy. The directors-general of all government ministries, the head of the Jewish Agency and the chairpersons of the local municipalities, IDF and police are members of this committee, which is responsible for the ongoing effective operation of similar structures in regional districts and local municipalities. In 2010, a few years after the establishment of NEMA, the Emergency Economy was integrated into NEMA as an integral component of the multisectoral emergency management system (ibid.).

Despite defined roles and responsibilities in laws and regulations, it has also been stated that situations in reality can be different, and that points of views concerning specific responsibilities sometimes differ between organisations (expert interview).

3.2 Organisational cooperation

As described in chapter 3.1, NEMA has strong responsibility on coordination among emergency organisations.

Regarding receiving international assistance to Israel, main involved institutions are the Ministry of Foreign Affairs, the Primary Office, and NEMA. NEMA provides recommendations to the Primary Office, and the Ministry of Foreign Affairs sends out requests for international support. Further involved institutions (e.g. Ministry of Health) depend on the type of crisis.

There are “National Guidelines for Receiving International aid in times of emergency” (see description of the national emergency exercise in chapter 5.3), while further information on these guidelines could not be obtained in the framework of this study.

The activations overview of the EU Civil Protection Mechanism 2007–2012 shows one request for assistance from Israel. Assistance was delivered for fighting severe forest fires in December 2010 (EC 2013).

Regarding giving assistance, the Search and Rescue unit of the HFC (see chapter 3.1), has been active all around the globe (expert interviews).

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

There are many written SOPs for specific occasions, but usually not available in English, and/or available in open sources. They are constantly activated and used in crisis situations. They are also tested in exercises (expert interview).

4.2 Operations planning

The operation planning process is not standardised (expert interviews).

4.3 Logistics support in crises

Private logistic providers are involved in all missions, they are needed for almost all services. Military logistics provide support in large crisis as well (expert interview).

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

Israel's communication system in general *is considered to be the most highly developed in the Middle East. Its domestic system comprises both coaxial cable and microwave radio relay; all systems are digital. Four privately owned mobile-cellular service providers offer countrywide coverage. International communications are supported by submarine cables to Europe, parts of the Middle East and satellite earth stations. There are nearly 10 million cellular/mobile lines and 3.3 million land lines. In 2009 there were 4.5 million internet users in Israel.*

The state broadcasting network, operated by the Israel Broadcasting Authority, broadcasts on two television channels in Hebrew and Arabic. There are five commercial channels and cable TV provides access to foreign channels. The Israel Broadcasting Authority also broadcasts over eight radio stations and Israel Defense Forces (IDF) Radio broadcasts over two. In addition, there are approximately 15 privately owned radio stations (WHO 2012).

Regarding crisis communication to the public, the spokesperson at the Prime Minister's Office (National Information Directorate) is responsible for crisis communication on the national level. He also coordinates to the different Ministries involved (expert interview).

At the Ministry of Public Security, *a Crisis Communication Team was recently established. The team constructs a situational picture of all the emergency agencies, monitors traditional and new media – both in Israel and abroad – and formulates messages and instructions to the public. The messages are*

formulated together with the Ministry's operational bodies as well as the National Information Directorate in the Prime Minister's Office.

The Crisis Communication Team is staffed by Ministry employees from the Ministry's Information and Knowledge Unit – responsible for the Ministry's digital presence – and members of the Ministry's Spokesperson's Unit. The team utilizes additional Ministry staff members who speak foreign languages, as well as retired police officers with professional experience in public information and community relations, who volunteer their time in emergency situations.

To more effectively reach the public, the Ministry is currently in the process of developing a smartphone application that will provide information and instructions for emergency situations, such as natural disasters, severe weather, forest fires and more. General instructions about these scenarios will be available at all times, while targeted messages with specific instructions will be sent according to the user's location. This is yet another platform aimed at preparing and informing the public in order to save lives and strengthen the community's resilience during a disaster (Ministry of Public Security 2014h).

By law, the HFC is responsible for instructing the public in specific cases, e.g. where to go, and where not to go. Constant assessments analyse using surveys, how the public perceives respective instructions, in order to adapt them in the best useful way (expert interview).

General instructions for the public on preparedness as well as on how to behave during different incidents (e.g. earthquake, fire, and flood events) is also provided on the HFC website (HFC 2014b).

To achieve situational awareness, a Command & Control system is in use, which is coordinated by NEMA and is being fed by all Ministries and all levels, from local to national (expert interview).

For information on the use of social media in emergency situations see chapter 1.6.3.

5 Capabilities

5.1 Human resources

Numbers of permanent emergency and disaster management personnel – staff and volunteers – are as follows:

Israel Police

- Staff: 30,000
- Volunteers: 40,000

Fire and Rescue Authority

- Staff: 1,800
- Volunteers: 1,000

Magen David Adom

- Staff: 1,600
- Volunteers: 10,000

HFC

- Classified

(expert interview; personal information 2014).

Some more information on volunteers at the Fire and Rescue Authority, MDA, and the Israel Police is provided at the respective websites:

Fire and Rescue Authority:

In the Israel Fire and Rescue Authority there are about 800 young volunteers (Fire Scouts) and some 1,000 adult volunteers. Fire Scouts are youth that volunteer in the Fire and Rescue Authority as part of their “personal commitment” hours in grades 10-12, and help out at fire stations and aid the firefighters (Ministry of Public Security 2014c).

Magen David Adom:

Volunteers have founded and been active in MDA since the organization got under way. Already at the first MDA convention, Dr. Yosef Koot, provisional chairman of the Executive Committee, spoke at length about the importance of volunteering in MDA - “MDA considers the volunteers a vital part of its’ activities. When new branches were opened, we didn’t see the importance in setting up ambulance positions alone. The main point was the volunteers: Our aim is to educate people to become volunteers who are ready and willing to devote their time, money and blood for the benefit of their fellow man.” Today over 13,000 highly trained volunteers are active throughout the country, of which half are youth volunteers serving as part of the crews on ambulances and Mobile Intensive Care Units and “MDA cadets”, who represent MDA’s humanitarian youth movement activities (MDA 2014).

Among the volunteers from the Israel Police, a specialist operational unit is the Israel's Volunteer Search and Rescue Team (Ministry of Public Security 2014g).

The Social Survey, a current annual survey, which has been conducted by the Central Bureau of Statistics (CBS) since 2002, revealed that in 2013, 20 % of the population aged 20 and over in Israel engaged in volunteer activity (covering all sectors): 25 % not permanent or one-time, 38 % 10 hours and more, and 37 % up to 9 hours (CBS 2013).

5.2 Materiel (non-financial) resources

Up to date information on material resources could not be obtained in the framework of this study.

According to a report from 2005, the government holds in storage a stock of blankets, mattresses and beds, to be used in emergencies. There is a yearly budget for renewing and buying of stocks such as: equipment, medicines, essential food items and fuel. There are many water containers for use in emergencies. The Electric Company and the Water Company have many power generators (Laor 2005).

5.3 Training

There is no specific certification system – each organisation sets its own standards on training of its personnel (expert interview).

The Israel Fire & Rescue Authority has a Training Department: “The Israel Fire and Rescue Training School was established in 1979 in Rishon Letzion. The school provides training for all types of firefighting roles, as well as for additional bodies, including prison service personnel, electric company employees and staff from the Nuclear Research Center” (Ministry of Public Security 2014c).

The Home Front Command also has a training center, the “Commanders’ Training Simulative Center” (CTSC). “Operational since 2010, CTSC offers complete training, debriefing, documentation and learning environment in Civil Defense and Homeland Security scenarios” (HFC 2014c).

Annually, national exercises e.g. on earthquake or tsunami scenarios, are conducted including all main players in the civilian area. International exercises, which are conducted especially on earthquake scenarios, include e.g. UN, and Red Cross organisations (expert interviews).

For example, the Ministry of Public Security describes on its website the national emergency exercise “Ends of the Earth”, which was held in November 2013 and focused on receiving international aid and collaboration between staff and organisations (Ministry of Public Security 2014d):

The exercise will examine the ability of government ministries to coordinate their operations and receive international aid, as well as allocate the aid to forces in the field and relevant agencies. “Ends of the Earth” will include the simulation of various systems that deal with the receiving of international aid in times of emergency and during destructive earthquakes.

The exercise is being conducted according to the National Guidelines for Receiving International Aid and will examine the staff work in various ministries and agencies involved, as well as field operations for receiving materials and aid.

Additionally, the exercise will examine the implementation of the National Guidelines for Receiving International aid in times of emergency, taking into account lessons learned from the Mt. Carmel fire and previous national emergency exercises.

Goal of the exercise

The idea behind the exercise is collaboration – collaboration between the staff in the field and between various ministries and agencies in order to efficiently receive international aid.

Participants in the exercise:

- *All government ministries, with an emphasis on the Prime Minister's Office, the Ministry of Home Front Defense, the Ministry of Defense, the Ministry of Public Security and the Foreign Ministry*
- *All public security bodies: the Israel Police, Israel Prison Service, National Fire and Rescue Authority and MDA*
- *The IDF, including the Home Front Command*
- *The Israel Airports Authority*
- *The Israel Ports Company*
- *Municipalities*
- *International representatives from the OSOCC, NATO, the EU and the Red Cross*

In light of recent regional changes and the constant threats facing Israeli, the Ministry of Public Security is responsible for preparing the home front and improving the Ministry's operational bodies' response capabilities for emergency situations and other threats. The Emergency Preparedness Department in the Ministry is headed by Police Brigadier General Chaim Cohen, who is leading the Ministry in improving its preparedness for emergency and crisis situations, and also is responsible for organizing the international aid operations within the Ministry and its operational bodies and for coordinating with other government ministries.

The "Ends of the Earth" exercise is the high point of intensive collaborative efforts of the Emergency Preparedness Department with aid agencies, the Ministry of Home Front Defense, the Home Front Command and other government ministries. "This exercise is an essential tool for us to examine the functioning of all systems so that we can be fully prepared and work at our best in a real life situation," says Brigadier General Chaim Cohen, head of the Emergency Preparedness Department.

5.4 Procurement

Only little information on procurement regulation and procedures in crisis management in Israel could be gained in the framework of this survey. There seem to be only few regulation (or not much implemented regulation), single crisis management organisations have their own rules, while general directives play a minor role (expert interviews).

In general, Israel publishes most public procurement information on its central procurement website: www.mr.gov.il. Furthermore, procurement laws and policies, specific guidance on application procedures such as templates and forms, procurement plans, and contract modifications are also published on the central procurement website. Meanwhile, information on contract awards (name and amount of selected contractor) is only published on the Regulations, Funds and Economy Ministry website (OECD 2011).

5.5 Niche capabilities

MDA (Magen David Adom), belonging to the International Red Cross and Red Crescent Movement and being the Israeli Red Cross National Society, provides training and humanitarian aid to countries in need, all over the world (MDA 2014). Further specific information on niche capabilities, which would be of interest to the EU crisis management, could not be gained in the framework of this study.

Driving Innovation in Crisis Management for *European* Resilience

MONTENEGRO

Policy, Legislation, Organisation,
Procedures & Capabilities (PLOPC) in
crisis management and disaster response

Responsible Partner: CSDM (Valeri Ratchev)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by FhG-INT and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

Despite its relatively small territory and size of population, Montenegro is highly exposed and vulnerable to natural hazards. The country has to address primarily earthquakes, wild fires and hydro-meteorological phenomena such as floods, droughts, heat waves, and heavy snowfall. Of particular concern are the frequent landslides and rock falls linked to the country's mountainous terrain.

As most of the other former Yugoslavia countries, Montenegro's authorities have been developing the national civil protection system since 2006 on what remained from the federal institutions, applying modern global and European practices and standards. Gradually, the civil protection mechanism has moved away from the former "civil defence." In result, the country's framework on civil protection and disaster relief is not contained in a single formal document. However, in terms of legal arrangements and policy statements, the harmonisation with international norms and standards is relatively successful.

At the policy level, the National Strategy for Emergency Situations defines the risks and responsibilities of different state, local, and private authorities to deal with such. Directorate for Emergency Situations has been established to implement mechanisms for prevention, preparedness and response. The Law on Rescue and Protection is the core legal act, supplemented by the Environment Law (1996), Law on Waters of (1995), Law on Protection against Natural Disasters (1992), Law on Protection of Air against Pollution (1980), and others. The principal political-managerial body on civil protection is the National Coordination, headed by the Prime Minister and the ministers are remaining members. The core administration of civil protection is provided by the Ministry of Interior and Administration (MoI).

Introduction of an emergency regime is a right and obligation of the Parliament.

The civil protection concept is comprehensive and relatively well balanced among the state, the municipalities (21 in numbers), business, and private citizens.

By way of comparison with best practices, the country's civil protection framework does not require development of hazard-specific contingency plans.

Montenegro is engaged in the Southeastern European international co-operation for risk reduction and disaster response.

On September 29, 2014, Montenegro and the European Union signed an agreement paving the way for Montenegro's membership in the EU Civil Protection Mechanism as the 32nd member of this community. According to the official statement, "Montenegro's membership in the EU Civil Protection Mechanism strengthens the Mechanism and enhances Montenegro's capacities to respond to natural disasters. It will also help the country with further harmonisation with the EU norms and procedures required under the EU legislation. In addition, the country will benefit from the ever-improving and developing European monitoring tools and early warning systems as well as satellite imagery and mapping services. It will be able to participate in the EU trainings and exchanges of experts programme and will be eligible for the EU co-financed disaster prevention and preparedness projects and civil protection exercises."²³²⁶

1 Policy

A national policy of civil protection has not existed in Montenegro until independence.²³²⁷ While the country has been in different state configurations,²³²⁸ all responsibilities for disaster risk management and civil protection had been assigned to various ministries, having neither a single political document nor legislation. After obtaining independence²³²⁹ in 2006, the new Government has adopted National Strategy for Emergency Situations, aimed to establish a ground for building an adequate system of protection and rescue in an emergency, and for policy on risk reduction based on prevention, mitigation and preparedness measures.

Figure 66. Montenegro in the region of the Western Balkans

Table 1 presents conclusions from a SWOT analysis made by an international needs assessment study of Montenegro's disaster risk reduction, protection and relief. (EU-UNDP, 2011).

²³²⁷ However, Dr. Petar Miljanić has conducted the first systematic measuring in Montenegro on 1 September 1882 in Podgorica. The measuring included basic climate elements, atmospheric temperature, precipitation, and humidity, atmospheric pressure and wind direction.

²³²⁸ For details see <http://www.britannica.com/EBchecked/topic/1251949/history-of-Montenegro>.

²³²⁹ Montenegro has a population of 620,145 people. The country, with a total area 13,812 km², is divided into 23 municipalities. The capital city Podgorica, which has a population of 185,937 and the city of Nikšić, with a population of 72,443, account for almost one third of the total national population. Populations of municipalities are small and the average is under 10,000 people.

Table 41 Strengths and weakness in Montenegro policy on disaster risk reduction, protection and relief. ²³³⁰

Strengths and opportunities	Weaknesses
<p>Experience with disasters;</p> <p>Documented damages;</p> <p>Easy and good communications flow;</p> <p>Relatively high level of autonomy of local governments in creating local development policies and measures;</p> <p>Existence of institutions such as the Institute of Hydro-meteorology and Seismology of Montenegro (IHMS);</p> <p>Network of online stations that connect Seismology Institute of Montenegro (SZCG) with the neighbouring countries;</p> <p>A single system for developing assessments and plans at all levels;</p> <p>Good relationship with NGO's and international organisations;</p> <p>Experienced and knowledgeable management staff;</p> <p>Excellent informal relations and communication between the members of Directorate for Emergency Situations with colleagues in the region and international community.</p>	<p>Montenegro's legal framework often lacks necessary disaster risk reduction (DRR) components. The country has no DRR National Action Plan and lacks the capacities to implement policies, strategies and mechanisms. To avoid overlaps and clarify responsibilities, standard operational procedures need to be developed for all stakeholders involved in disaster response;</p> <p>The absence of specific allocation mechanism for DRR in the national and local budgets leads to insufficient funding for many DRR-related areas. For instance, this prevents the IHMS to operate a 24/7 analysing forecasting system;</p> <p>There is no post-disaster data collection and no database of hazards. A country-level Geographical Information System (GIS) database should be created;</p> <p>Risk assessments taking into account vulnerability and capacity considerations need to be strengthened at local level;</p> <p>Information management lacks established protocols and mechanisms. Little information has been exchanged; hydro-meteorological data, for instance, is not integrated into development plans, agriculture sectorial plans and the like. It is important to define ways for better utilisation of the seismic and hydro-meteorological data produced;</p> <p>The building codes are not properly enforced. Roles and responsibilities regarding the legalisation and approval of constructions should be clarified;</p> <p>Gender issues are currently not mainstreamed into the Montenegrin DRR planning. To tackle this problem, gender sensitive DRR training programmes should be offered to planners in ministries;</p> <p>Climate change adaptation mechanisms are hard to find in the country's DRR approach and no cross-border partnerships for production and utilisation of climate change related data exist.</p>

²³³⁰ IPA Beneficiary Country Needs Assessment: Montenegro (EU-UNDP, 2011), p. 27. Available at <http://www.gripweb.org/gripweb/?q=countries-risk-information/documents-publications/ipa-beneficiary-needs-assessment-montenegro>.

1.1 Risk Assessment

The Strategy of National Security of Montenegro presumes that “Natural, ecological, technical and technological disasters, man-made accidents, and epidemics of human or contagious animal diseases may generate challenges, risks and threats against national security.”²³³¹

Risk identification, assessment and monitoring are mainly organised and implemented at the national level. However, a natural disasters risk assessment study for South East Europe concludes that, “...in many cases, the assessment team witnessed some confusion between hazard and risk identification. ...The Law on Rescue and Protection defines the hazard identification methodology, but very little reflects on risk identification. There are no risk assessments conducted at municipal level or at the level of companies and organizations.”²³³²

Threat assessments are to be developed according to the Ministry of Interior and Public Administration’s “Rulebook on the Methodology for the Development of Threat Assessment Studies of Natural, Technical-technological and Other Disasters.”²³³³ According to the Rulebook, the risk assessments should describe characteristics of threatened territory, assess the potential impact of different hazards (and thus vulnerability of the area to disasters), explain the human and material capacity to respond to the hazard and identify where material and technical resources, knowledge, organisational structures should be improved.

The Directorate for Emergency Situations (DES), using the Rulebook, drafts the National Plan for the Protection of Extreme Meteorological Occurrences. Along with the DES subordinated units, several ministries provide information and qualitative analysis of threats to DES. The Montenegro Red Cross (MRC) also has conducted vulnerability and capacity assessments in ten pilot communities.

Natural hazards

The National Security Strategy considers as the most significant natural hazards “earthquakes, fires and other natural and technical-technological catastrophes.”²³³⁴ The Rulebook on the Methodology for the Development of Threat Assessment Studies of Natural, Technical-technological and Other Disasters considers as natural disasters earthquakes, fires, floods, snow drifts, avalanches, landslides and subsidence, droughts, storms, hails, frosts, and all other natural phenomena that can endanger the health and lives of a large number of people and cause great material damage.”²³³⁵

The most dangerous natural disasters in Montenegro for the period 1900- 2014 are presented in the Table below:

Table 42 The most dangerous natural disasters in Montenegro 1900-2014.

Disaster	Date	Number of total affected people	Number of deaths	Financial lost
Earthquake	April 1979	100 400	136	US\$ 4 billion
Flood	3/12/2010	5000		EUR 44 million
Extreme low temperature with heavy snowfall	Jan.-Feb. 2012	4500		
Flood	12/11/2010	1350		
Flood	26/11/2007	1086		
Flood	25/12/2009	450		

Earthquakes

A thorough analysis on seismic risk was conducted in 1984 by the National Seismologic Institute of Montenegro in cooperation with the Institute for Geological Research of Montenegro and the Institute for Earthquake Engineering and the Engineering Seismology Institute of Skopje (now in FYROMacedonia), largely through research into the effects of the devastating earthquake of April 1979.²³³⁶ This study serves as the foundation for current vulnerability assessment of building stocks. The mentioned institutions constructed a first seismic zoning map of Montenegro and the whole region in 1982. From 1984 to 1988, the Institute for Geological Research of Montenegro realised seismic micro-zoning and maps showing the degree of suitability for constructions for urban areas within all municipalities in Montenegro.²³³⁷

From 1987 on, the seismologic institute of the former Yugoslavia has prepared a series of seismologic maps, which facilitated the establishment of building codes in seismic areas and the Regulations on Technical Norms for Building Construction in Seismic Areas²³³⁸ still in force in Montenegro. An isolated map for the seismogenic zone of Berane was also created. The last hazard map of 2005 is currently being updated, and as part of the NATO' Science for Peace Project it will be harmonised with the seismic hazard maps of other western Balkans countries. However, these are the only studies carried out in the field of hazard characterisation for Montenegro.

The DES considers as a critical priority to enlarge seismic risk assessments to cover the whole national territory, especially for the most populated municipalities located in high-risk zones such as Budva, Herceg Novi, Bar, Ulcinj and Podgorica.

One of the biggest challenges is a large number of informal settlements; these complicate the development of risk analyses because it is difficult to ensure that the data corresponds with reality. (EU-UNDP, 2011) The entire area of Montenegro, and especially its coastal and central part (Zeta-Skadar depression and the Berane basin) is a seismically active area, exposed to low- and medium-intensity earthquakes, and occasionally to devastating earthquakes of large magnitude.

²³³⁶ The Structure, Role and Mandate of Civil Protection in DRR for SEE, (UNISDR, 2008), available at http://www.unisdr.org/files/9346_Europe.pdf.

²³³⁷ Emergency and civil security Directorate of the Ministry of Interior, 2005, National Strategy for Emergencies.

²³³⁸ Official Gazette of SFRY no. 31/81 with amendments no. 49/82, 29/83, 21/88 and 52/90.

Modern research has confirmed the lasting existence of a high level of seismic activity and earthquake hazard in this part of the lithosphere, practically the entire region of Montenegro. The coastal area, the Zeta-Skadar depression and the Berane basin should be highlighted as significant seismically active areas of the country.

The earthquake of 15 April 1979 at the coast and wider area of Skadar Lake had a devastating effect. 101 people were killed in Montenegro and 35 more in Albania (in Shkodër and Lezhë counties), while the injured reached 1172 and 382, respectively. After the earthquake, 100,000 people were left homeless (of which 20% were in Albania).²³³⁹

Damage surveys of circa 58,000 buildings in the affected areas of Montenegro (6 coastal and 6 inland municipalities) showed that worst affected was Ulcinj municipality with 47% of its building stock classified as collapsed or destroyed, followed by the municipality of Bar (37%). Severely affected were also the municipalities of Budvar, Kotor and Cetinje (all three lost circa 22% of their building stock). In total almost 15,000 buildings were destroyed (16% of which in Albania) and another 25,000 were damaged (49% of which in Albania and 4% in Croatia). Damage to historic buildings and other heritage sites of Montenegro was particularly serious, with over 1600 cultural monuments being affected as well 33,000 of works of art and valuable collections. The old towns of Ulcinj, Bar, Budva, Kotor, and Herceg-Novi were so badly damaged that their entire artistic contents had to be rescued and stored elsewhere while the old towns of Budva, Ulcinj and most of Kotor were entirely evacuated as they were in a highly dangerous condition.

The cost of the earthquake according to the Yugoslav government's final estimate was 4 billion USD including 275 million USD indirect losses (7.5% of Yugoslavia's GDP in 1979).

The National Strategy of Emergency Situations (2006) evaluates the seismic risk throughout the country in the following way:

Table 43. Seismic risk, area and potentially affected population in Montenegro²³⁴⁰

Region	Maximum intensity	area		Population	
		Km ²	%	people	%
Coastal region	IX	1,900	13.8	151,000	24.4
Podgorica-Danilovgrad region	VIII	3,030	21.9	205,000	33.1
Central region of Montenegro	VII	7,600	55	229,000	36.9
Seismogenic zone of Berane	VIII	340	2.5	20,000	3.2
Northern region	VI	940	6.8	15,000	2.4

More recently, the seismic activities are concentrated along the seacoast and the Southeastern part of the country. According to the IHMS, last three years the strongest earthquake has been on November 3 2012, with 3.0 Richter magnitudes in the area of Radanovića.

²³³⁹ Damage was also significant in coastal areas of southern Croatia (particularly in the old city of Dubrovnik) and in Southwestern districts of Bosnia-Herzegovina.

²³⁴⁰ Source: National Strategy of Emergency Situations (2006).

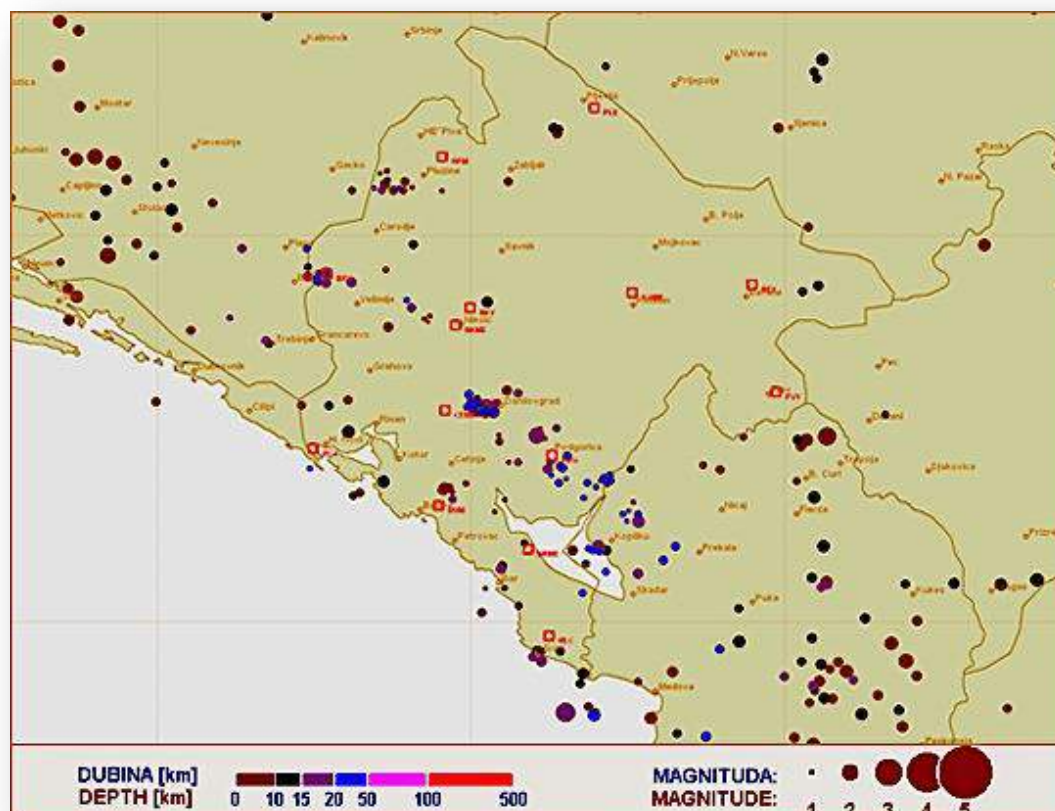

Figure 67. Seismic activities in Montenegro in 2012.²³⁴¹

Heavy rains that cause floods and erosion, including river flooding

Floods are the most frequent natural hazard (there have been six destructive floods in the last 20 years). Pazickopolje and the Lim River valley are most prone to flooding. The biggest floods have been recorded in the upper flow of the Tara and the Lim rivers in 1963, 1979, 1999 and 2000.

The best and most fertile land in Montenegro is regularly flooded. The Pazicko polje is vulnerable to flooding, and flood events were reported there in 1980 and 2001. The valley of River Lim at the estuary of the River Moraca and the Zeta plain are also susceptible to flood. Flooding occurs irregularly in other areas due to the karstic structure.

With average flowing off, which is 40 litres/s/km², and in cubic capacity it is about 19,5 km³/year, Montenegro is a part of 4% of the world territory with the biggest average flowing off. Water is the country's biggest natural resources as 95,3% of watercourses are formed within the country (both source and drainage basin). (UNDP, 2011)

The December 2010 floods had unprecedented water levels, the extent of flooded areas and damage occurred in 12 out of 21 municipalities in Montenegro. Transport routes, electricity supply and communication lines between the northern region and the rest of the country were obstructed for some time and 1.5% of the population had to be evacuated. The "Post-Disaster Needs Assessment following the November – December 2010 Flood Disaster" in Montenegro, estimated the total damages and losses at approximately EUR 44 million, or 1.49% of the 2009 GDP. (ECIS, 2012)

²³⁴¹ Seismicity Maps for Montenegro, available at <http://www.seismo.co.me/maps/jan2010.htm>.

Extreme heat and droughts

According to the available data, i.e. in a series of measurements since 1949, and at some stations and since 1958 until the present day, it is evident that since 1998 extreme heat has started appearing more often, and especially during August. In the Northeastern regions of Montenegro (confluence of the Tara and the Lim), maximum annual precipitation in mm/day has been on the rise since the 80's. However, there is no systematic increase and it has been strictly localised. Strong droughts and increased summer temperatures were recorded in the periods 1981–1990 and 2000–2011.

Cold weather

In January 2012, the country faced a cold freeze, with heavy snowfall blocking access to lifeline services and communications for many communities in the mountainous areas. The Government had to declare a state of emergency and national and international resources had to be mobilised to provide humanitarian relief to the stranded areas.

Technical and technological disasters

The Rulebook on the Methodology for the Development of Threat Assessment Studies of Natural, Technical-technological and Other Disasters considers as “technical and technological disasters: great fires, demolitions or impounding reservoir overflows, expansions and explosions of gases and hazardous substances, radioactive and other types of pollution of air, water, land and foodstuff of herbal and animal origin, great disasters in road, rail and air traffic, nuclear/radiological, chemical and biological disasters, mining disasters, ground settlements due to minerals exploitation, and other similar phenomena that can endanger the health and life of a large number of people and cause great material damage.”²³⁴²

Major technogenic hazards include oil storages along the seacoast, mines in the mountains, steel factories and several small chemical plants, transport and railroad infrastructure (including bridges and tunnels) and the electric grid.

In terms of its preparation for EU membership, “Montenegro has indicated that the so-called Seveso II Directive, i.e. Directive 96/82/EC on the control of the major-accident hazards involving dangerous substances as amended by Directive 2003/105/EC, is at a very early stage of transposition. Full alignment to the Seveso II Directive is planned for 2015 by the adoption of a new Law on Environment in 2014, and a number of secondary legislative acts in 2015. The practical implementation of the Seveso II Directive has yet not started” (as of 2013).²³⁴³ The European Commission 2015 report on Montenegro progress concludes, “Preparations in this area are still at an early stage.”²³⁴⁴

Biological disasters

The Rulebook on the Methodology for the Development of Threat Assessment Studies of Natural, Technical-technological and Other Disasters considers as “biological disasters: epidemics, epizootics and infectious diseases of people, plants and animals.”²³⁴⁵

²³⁴² Rulebook on the Methodology for the Development of Threat Assessment Studies of Natural, Technical-technological and Other Disasters, Article 8.

²³⁴³ Screening report Montenegro, Chapter 27 – Environment and climate change, March 2013. Available at http://ec.europa.eu/enlargement/pdf/montenegro/screening_reports/screening_report_montenegro_ch27.pdf (6 December 2015).

²³⁴⁵ Rulebook on the Methodology for the Development of Threat Assessment Studies of Natural, Technical-technological and Other Disasters, Article 8.

1.2 Policy and Governance

Montenegro has completed important initial steps towards building and upgrading its emergency management system. The National Security Strategy (2006) is the overall conceptual document, the Law on Protection and Rescue (2007) is the basic legal act for crisis management and disaster response and the National Strategy for Emergency Situations (2013) is the statement on the civil protection policy. Twelve national plans on protection from fires, floods, extreme weather, earthquakes, accidents, etc., organise the operational work on risk prevention and civil protection. These documents define the responsibilities, rights and obligation of citizens, legal entities, local self-governments, and state administration and establish a set of competent national and local authorities regarded crisis management and disaster response. The Ministry of Interior (MoI) is mandated for risk management, preparedness and response since 2004. The Directorate for Emergency Situations (DES), subordinate to the MoI, has been established in 2004 and a number of subordinated local units are operational.

The accession of Montenegro to the EU Civil Protection Mechanism (the agreement has been signed in 2014) will bring the country more in line with the EU civil protection *acquis* and disaster management policies. The Spatial Plan of Montenegro (2006) and National Strategy of Sustainable Development (2007) are other instruments for risk mitigation management.²³⁴⁶

Currently, civil protection is an evolving function under gradual transition from a civil defence and local based protection and rescue, towards a disaster risk reduction, prevention and management. However, Montenegro has acknowledged that the organisation for crisis management and disaster response is facing a lack of financial resources and insufficient administrative capacity.

1.2.1 Strategy scope and focus

The overwhelming national security document – the National Security Strategy of Montenegro, determines that the country should be ready to respond to variety of threats against national and international security by undertaking three missions:

- *“Prevention and management of vital threats.* All instruments of security policy contribute to the prevention and management of vital threats. That means in particular: helping to relieve natural and man-made disasters in Montenegro and abroad; protecting people, critical national infrastructure and vital facilities; and combating organized crime and terrorism.”²³⁴⁷
- *“Crisis management for the purpose of promoting peace.* Montenegro benefits directly from a stable strategic development and therefore it has every reason to contribute to crisis management and promotion of peace.”²³⁴⁸
- *“Defence.* Montenegro maintains its capability to protect and defend its sovereignty, borders, territory, air and sea space, and its population against the threat and use of force of strategic magnitude.”²³⁴⁹

The Strategy of National Security rules out that, “helping to relieve natural and man-made disasters in Montenegro and abroad; protecting people, critical national infrastructure and vital facilities” in emergency situations caused by natural disasters, ecological, technical-technological (manmade),

²³⁴⁶ UNDP, Montenegro, available at <http://www.me.undp.org/content/montenegro/en/home.html>.

²³⁴⁷ Strategy of National Security of Montenegro.

²³⁴⁸ Ibid.

²³⁴⁹ Ibid.

chemical, biological, nuclear and radiological disasters, epiDESics, as well as consequences of terrorism and other hazards is between the core national security missions. The scope of disaster management strategy and policy of Montenegro include natural and man-made disasters at national, local, business and private levels. As the capacities of municipalities are relatively limited, the focal point of all preparations is at the Government and the governmental agencies.

At the documental level (National Security Strategy, National Strategy for Emergency Situations and Law on Protection and Rescue), Montenegro applies an integrated approach to disaster management that includes preventive and operational plans and operations.

In 2014, Montenegro launched a National Platform for Disaster Risk Reduction, which is seen as a key step towards implementing the Hyogo Framework for Action. According to UNISDR, “The National Platform will allow for a coordinated approach in building resilience to disasters and focus on multi-hazard risk assessments and the development of a disaster risk management strategy. It will address ongoing vulnerabilities faced by the country, such as earthquakes, floods and forest fires.”²³⁵⁰

1.2.2 Monitoring and analytical support to policy making; R&D

Disaster data is poorly integrated in Montenegro. Because of relatively short history as an independent sovereign state, much data are still merged with data from Serbia and former Yugoslavia. Institutionally, a DES division – Department for Risk Assessment, is responsible for the repository and management of the national database on risks.

The National Strategy for Emergency Situations determines the following set of monitoring and evaluation requirements:

- “Creation of new and improvement of existing technical capacity for reliable continuous monitoring of all natural phenomena and technological processes, as well as biological hazards, which can result in disasters such as seismological, hydrological and meteorological phenomena, as well as radiological, environmental and health conditions and parameters;
- Equip existing laboratories and establishment of new laboratories necessary for an efficient detection technology and radiological accidents, in order to effectively prevent and reduce accidents,
- Develop modern integrated information systems (GIS) for automated monitoring of all important processes as the basis for system management in emergency situations;
- Periodically re-evaluate all types of important hazards in Montenegro, in order to provide valid data for reliable preventive action and emergency management;
- Provision of the institutions engaged in monitoring natural phenomena and technological accidents with relevant equipment and training.”²³⁵¹

The Rulebook on the Methodology for the Development of Threat Assessment Studies of Natural, Technical-technological and Other Disasters stipulates that threat assessments should constantly stay up-to-date. Therefore, hazards are subject to compulsory analysis at least once a year.²³⁵² To enable

²³⁵⁰ Montenegro launches National Platform for DRR, The United Nations Office for Disaster Risk Management, available at <http://www.unisdr.org/archive/41405>.

²³⁵¹ Exert from National Strategy for Emergency Situations, translated from “V.3. MONITORING I EVALUACIJA HAZARDA.”

²³⁵² Rulebook on the Methodology for the Development of Threat Assessment Studies of Natural, Technical-technological and Other Disasters Article 16.

the harmonisation of contents between different levels, the Ministry of Interior submits their reports to municipalities, and municipalities – to concrete business entities. The assessments are stored in printed and electronic versions by the Ministry of Interior, self-governing administrations and legal subjects.²³⁵³

However, it seems that the Rulebook's methodology is not widely acknowledged or practiced, particularly at municipal level, notably because of limited capacities. According to an international study (EU-UNDP, 2011), the Montenegro Red Cross, for example, does not use the existing risk identification methodology either, and receives risk information only in emergency cases rather than on a regular basis.

The hydrological, meteorological, oceanographic, air and water quality data, collected by the Institute of Hydro-meteorology and Seismology of Montenegro through its networks, is stored in the digital Oracle database.²³⁵⁴ The IHMS maintains two types of databases – meteorological and environmental. There is a linkage established by the IHMS with those systems and sensors that measure various radiological, weather, seismologic, air and water quality parameters. The IHMS does not collect or keep any separate hazards statistics, but statistics for high wind, heavy precipitation and extreme temperatures can be produced for each synoptic observation station.

Local community units collect data on the impact of hazards on the population: police units report on the impact of landslides and rockslides on transport.

An international study (EU-UNDP, 2011) concludes that, “[d]ata is scattered amongst various players and no formal mechanism has been developed to store or access it. There is no central depository of hazard-related data, no data storage bank to facilitate data collection and dissemination. Although DRR-related data can be accessed informally on DESand, many stakeholders are unaware of its mere existence because of its unsystematic collection and updating. Beyond hazard-related data, vulnerability and capacity maps are not existent. Information sharing needs to be improved and systematised.”²³⁵⁵

A UNDP Disaster Risk Reduction Capacity Assessment Report For Montenegro (UNDP, 2011) concludes, “The Ministry of Environment conducts risk monitoring but issues limited early warning messages. The ministry has developed predictive hydrological models and is considering the development of similar models for other risks. Existing risks are reflected in the ministry's development plans through policy documents – however, it is not clear how this information is used in the development of programmes of other governmental institutions. In case of forest fires, there is no monitoring and prevention mechanism in place, even in protected areas.”²³⁵⁶

Seismological Observatory in Montenegro is responsible for the monitoring of seismic hazards – probably the best-monitored hazard in the country. Other hazards are monitored to a lesser extend or not at all.

The Institute of Hydro-meteorology and Seismology of Montenegro (IHMS), by using its network of monitoring stations (10 automatic stations, 20 climatological stations, 60 precipitation stations and 51 hydrological stations, out of which 23 are automatic) provides data on a regular basis to the DES and other government organisations. According to an UNDP study (UNDP, 2011), the institute does

²³⁵⁶ UNDP, *Disaster Risk Reduction Capacity Assessment Report For Montenegro*, p. 16.

not have a specific methodology for risk identification when monitoring floods, droughts and fires. The IHMS has counted on the support of the World Meteorological Organisation (WMO) for risk assessment and monitoring. The study also concludes that, “...lack of funding and human capacity is a concern for the smooth functioning of the institute.”²³⁵⁷

Montenegro has joined the ARGOS consortium²³⁵⁸ to enable better identification and monitoring of chemical, biological, radiological and nuclear threats.

1.2.3 Policy for Prevention

Prevention has been considered and addressed by the Montenegrin authorities only since 2010. Montenegro is slowly getting aware of the possibilities existing regarding this issue, for instance through earthquake-resistant design, spatial-city planning and preparation against earthquakes to alleviate seismic risk.

The National Strategy for Emergency Situations prescribes the following set of prevention priorities:

- “To build facilities and installations in accordance with the local risk of emergencies and with respect to technical norms;
- To certify the microbiological laboratories and establish a permanent supervision of their work;
- To intensively implement monitoring of transportation of dangerous goods;
- To strengthen the regimes of arms, military equipment and dual-use goods control;
- To develop appropriate plans for protection against all hazards; the plans shall be concrete and focus on prevention the occurrence of harmful effects from emergencies as well as on rehabilitation in case they happened;
- To conduct of a periodical (at least once a year) review of the readiness of the responsible personnel and mobile teams for all types of assumed disaster;
- To establish reserves of necessary materials for all anticipated disasters;
- To establish preventive measures to protect sources and supply installations of drinking water to the large urban areas;
- To develop national contingency plans in case of emergencies;
- To coordinate interventions in cases of accidents between institutions and with the local authorities.”²³⁵⁹

At the community level, municipalities have the responsibility to build their own capacities. Thus, their development processes are mostly ad hoc and depend on their respective budgets.²³⁶⁰ In flood-prone areas like Berane, Ulcinj or Rozalje, local municipalities are building embankments as preventive measures, but processes like these vary according to municipalities.

²³⁵⁷ Ibid, p.15.

²³⁵⁸ ARGOS is a Decision Support System for crisis and emergency management for incidents with chemical, biological, radiological, and nuclear releases. The current member countries of the ARGOS Consortium are (November 2014): Australia, Brazil, Bosnia-Herzegovina, Canada, Denmark, Estonia, Ireland, Lithuania, Macedonia, Montenegro, Norway, Poland, Serbia, and Sweden: <http://argosconsortium.org/members.html>.

²³⁵⁹ Unofficial translation from Chapter “V.4. PREVENTIVNE MJERE,” p. 149.

²³⁶⁰ Law on Protection and Rescue, Article 41.

Risk mitigation measures are integrated to a good extent into the spatial development plan, even though vulnerability due to different hazards has not been worked out.²³⁶¹ The Vienna Declaration (2004) has recognised the construction of illegal settlements in the countries of South Eastern Europe as an evident problem.²³⁶² As a signatory state, Montenegro is now committed to undertake measures necessary for defining causes of illegal construction and initiating and implementing reforms in the field of sustainable urban development and housing policy through appropriate inspection and supervision. Illegal construction in some local self-governments has been significantly reduced, e.g. in the capital Podgorica. However, lack of professional personnel for execution of the works related to inspection supervision²³⁶³ and disrespect of regulations by legal entities and natural persons hamper the state's efforts to suppress illegal construction and to improve existing legislation in the area of spatial planning.²³⁶⁴ As one of the measures to reduce seismic risk, the municipalities have to define procedures for seismic risk to be assessed and considered when elaborating local planning documents and urban development.

Environmental assessments, taking into account seismic risk and climate change, are compulsory for the construction of critical infrastructures such as bridges, schools and hospitals. However, whether the responsibility of approving construction lies at the municipal or central level is not always clear. (EU-UNDP, 2011)

1.2.4 Policy for Preparedness

The National Strategy for Emergency Situations (2005) provides a basis to respond quickly to technological and natural disasters. The policy for preparedness envisages a whole-of-government approach to emergency assistance and rescue through engagement of experienced representatives from all institutions, which by their function are involved in the process of monitoring, reporting, prevention, rescue and relief, into the national coordinating body of Montenegro. Along this, experts and trained workers in all the relevant institutions for disaster management, as well as trained volunteers, must have a certain schedule to organise their activities and ensure their efficient activating and engaging in disaster response operations.²³⁶⁵

The Rulebook on Methodology for the Development of Protection and Rescue Plans²³⁶⁶ delivers a more systematic guidance on the policy for preparedness. The Rulebook establishes how contingency plans for a) prevention, b) crisis management and c) early recovery should be developed at the national level, a local level and within specific business entities. To comprehensively address the three disaster management phases, the following aspects should be reflected by the policy and planning for preparedness: spatial planning, regulation of river flows, protection from fire, building of local early warning systems, preparation of water sanitation and potable water sources, and implementation of a variety health measures.

²³⁶¹ Source: <http://drace-project.org/index.php/map/montenegro>.

²³⁶⁴ Spatial Planning Support Project Revised Work Plan September 2010 – August 2011.

²³⁶⁵ Unofficial translation from Chapter "V. 6. PRUŽANJE POMOĆI I SPAŠAVANJE," p. 150.

²³⁶⁶ Official Gazette of Montenegro 13/07, Rulebook on methodology for the development of protection and rescue plans, <http://www.questionnaire.gov.me/Annexes/Annex082.pdf>.

Plans should also define which body is accountable for taking decisions, transmitting information to the 112 Centre, executing and managing mobilisation, making reports, and where funding and personal and material resources are to be found.

It requires also a layered map to be created at the national level (1:200 000), identifying population density, threatened zones, and border crossings where international aid and rescuers could potentially arrive. At the local level, 1: 25 000 maps should help locate temporary settlement areas, access roads for intervention, evacuation routes, zones where to place refugees, medical facilities. The similar map should be created for companies (places for the administration of first aid, shelters).

1.2.5 Policy for Response

The Law on Protection and Rescue (Art. 11) regulates the policy for response in the following way:

Activities and practices that are mandatory conducted in the time of risk, are especially:

- 1) *Activation of protection and rescue units;*
- 2) *Implementation of evacuation and care and support for the population and material goods;*
- 3) *Preventing the spread of risk and risk consequences and*
- 4) *Coordinating the activities of participants in protection and rescue.*²³⁶⁷

At the national level, the Emergency Operations Centre situated within the Emergency Management Coordination Team (EMCT) operates the standby troops. At the local level, Municipal Teams for the Management of Emergency Situations include members of the Montenegro Red Cross (MRC), who are volunteers, and a representative of the DES (professional rescuers), and are lead by the mayors.²³⁶⁸

Protection and rescue operations are conducted by civil protection units of the government, fire fighting units, local government units, specialised protection units, business organisations, airborne (helicopter) and terrestrial fire units, trained volunteers, and employees of Ministry of Interior, which have passed the state licence exam for working on protection and rescue affairs. More than 4000 people, not including the Army and Police units, can be counted on to respond to any emergency.²³⁶⁹ From the 10,000 Red Cross volunteers, 1,000 are operational on a daily basis.

The DES can additionally activate its local branches, local MRC units, as well as the local Police Units and its operational helicopter unit. When needed, the MoD can deploy steady Civil Protection Units to empower the resources and capacities of the DES and municipalities.

The quality of protection services greatly depends on the municipalities' financial capacity. A UNDP study cites the response of the municipality of Berane to the 2010 flash floods: 700 persons could be accommodated in sport halls and provided „with food, mattresses, blankets, cooking sets, hygiene items, potable water, baby formula and diapers“. However, according to the report, this has been greatly due to external funding provided by the UNHCR, Caritas Luxemburg and UNDP (the MRC also provided some donations), and the funds were not sufficient to cover urgent repair of houses.²³⁷⁰

²³⁶⁷ Law on Protection and Rescue, Article 11. Available at www.ifrc.org/docs/IDRL/Laws/Montenegro_Law%20on%20Protection%20and%20Rescue.pdf.

²³⁶⁸ Law on Protection and Rescue Official Gazette of Montenegro 13/07, 2007.

²³⁶⁹ The numbers are provided by the Directorate for Emergency Situations.

²³⁷⁰ UNDP, 2010, Montenegro flash floods early recovery support for riverside Berane.

1.2.6 Policy for Relief and Recovery

The terms “relief” and “recovery” have not been used in the relevant legislation and documentation of Montenegro. However, the Law on Protection and Rescue (Art. 12) prescribes the policy of “elimination of risk consequences” in the following format:

The activities and practices that mandatory conducted for the elimination of risk consequences are, especially:

- 1) Assessment of the damage and consequences;*
- 2) Remediation of risk affected areas;*
- 3) Ensuring and providing necessary assistance to vulnerable and affected population;*
- 4) Implementation of health and hygienic and epiDESiological measures;*
- 5) Implementation of appropriate protection of animals and plants and animal and plant products and*
- 6) Organising supply with resources for assistance and provision of utility services for a fast normalisation of life.²³⁷¹*

There is no available information on the mechanism of post-disaster assessment and delivery of compensations at the national level. It seems that the Government decides on case-by-case basis all consequence management issues.

According to the Law on Protection and Rescue (Art. 41), “The municipality shall, in exercising rights and obligations in the protection and rescue field: ... decide on the amount of budgetary funds for damages caused by risk.” Based on this regulation, the local committees conduct damage assessments at the municipality level. A special budget for disaster response is allocated to municipalities and managed by the mayors. However, citizens are not compensated in full. The municipality authorities decide the amount to be compensated, but usually it does not go beyond 50 per cent of the total cost of the damage (regarding construction, this practice covers both legal and illegal construction). As a result, richer municipalities may apply higher standards for damage and loss compensation. In case the available budget in the municipality is not sufficient to compensate the citizens, the central level provides a mechanism to access funds for this purpose. According to Art. 76 of the Law on Protection and Rescue, “Cost of accommodation of evacuated population shall be provided in the budget of Montenegro.”

EU-UN sponsored study concludes that early recovery issues in Montenegro “... are only addressed as much as the budget allows it, which is very superficially, and not specifically incorporated into any strategies, legal acts, plans or institutional arrangements. Financial means are by far not sufficient to effectively allow communities to quickly recover in times of emergencies.” (EU-UNDP, 2011)

1.3 Financing

According to the Law on Protection and Rescue, there are the following sources of disaster management funding:

Protection and rescue shall be funded from:

²³⁷¹ Law on Protection and Rescue, Article 12. Available at www.ifrc.org/docs/IDRL/Laws/Montenegro_Law%20on%20Protection%20and%20Rescue.pdf.

- *The budget of Montenegro;*
- *Municipal budget;*
- *Voluntary contributions;*
- *International assistance;*
- *Funds of business organisations, other legal persons and entrepreneurs;*
- *Other sources.*²³⁷²

According to the Government report (MoI, 2014), the Budget of the Ministry of Interior for 2013, for the purposes of the Directorate of Emergency Situations is at the amount of 2,552,337 euros. The structure of the funds spent by positions is:

- "Gross wages and employer contributions -1,474,081 euros;
- Other personal payments - 280,567 euros;
- Expenses for materials – 117,045 euros;
- Expenses for services – 29,473 euros;
- Expenses for maintenance - 376,623.83 euros;
- Annuity – 90,000 euros;
- For other tasks – 184,545 euros."²³⁷³

The structure of the budget clearly illustrates that funding is limited to salaries mostly. For further development of the most important components of the protection and rescue system such as education and training of the operational units, the purchase of new equipment and machines, etc., no sufficient funds are committed.

1.3.1 Investing in preparedness

Neither that Law on Protection and Rescue, nor any other document prescribes how the budget should be dedicated to risk reduction and crisis response. However, despite that the DES has been working on DRR since 2010, at central level there is no budget to develop disaster risk reduction activities, as the existing budget is allocated to covering salaries. Furthermore, within other ministries, annual planning needs do not include specific programs oriented towards risk reduction so budgets cannot be allocated for them.

At the municipal level, spending on developing or implementing DRR measures is on *ad hoc* basis.

The IHMS is severely under-financed for essential parts, concerning DRR, and it does not have resources to operate a 24/7 analysing and forecasting system.

According to the World Meteorological Organisation study (WMO, 2011), it can be expected that, if ministries prepare adequate DRR programmes or projects, there could be possibility of funding from EC funds. UNDP has also channelled activities through the Bureau of Crisis Prevention and Recovery, which could be directed at capacity development and improving risk assessment practices.

²³⁷² Ibid, Article 16.

²³⁷³ The Government of Montenegro, *Izveštaj o Stanju Sistema Zaštite i Spašavanja U crnoj gori u 2013 Godini*, p.30. Available at www.gov.me/ResourceManager/FileDownload.aspx?rId=164029&rType=2.

1.3.2 Investing in consequence management

Montenegro does not regulate the maximum amount of emergency assistance aid per person or legal entity in the case of large disasters. However, the emergency assistance typically covers only a small fraction of the total damages, as the overall amount of aid is mainly limited to government budget reserves for emergencies. The relief aid, provided by the Government of Montenegro, is up to 10 per cent of physical damages (e.g. in Slovenia, the compensation is 40-60 per cent).

Municipalities in Montenegro dedicate to disaster management between one and three per cent of their budgets. Mayors manage this funds according recommendations from established committees. Presumption is that, if the disaster is significant and damages are above the local budgets capacity, than the Government shall provide additional funding for reconstruction and compensation of people.

Concerned the specific requirements for pricing, reserving or reporting disaster risks underwritten by local insurers, Montenegro companies are allowed to form equalisation or other reserves, but only after a formal approval by the Insurance Regulator.

In terms of personal and family insurance culture, most of the population do not have (or are not aware of the need for) insurance against natural disasters – it barely exists in Montenegro. It is the responsibility of the citizens to activate the insurance, but since it is not mandatory by law, the population and companies don't see the need for it. In practice, citizens expect the State to somehow compensate them. Furthermore, it is not clear if the insurance system in the country is capable of issuing insurance products covering natural disasters, as there is no proper risk assessment that could be used by the insurance companies for costing their products.

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

The Law on Protection and Rescue requires the Government to “...submit a report to the Parliament of Montenegro and the President of Montenegro on the type, cause and scope of the resulting state of emergency, the measures and activities taken to protect and rescue and estimates regarding the possible future developments.” (Art. 36)

However, the policy on civil protection, obviously, is a part of the Ministry of Interior's internal planning, implementation and accountability process. There are not any publicly available plans or annual reports neither from the Ministry of Interior nor the Directorate for Emergency Situations.

A collection of data and assessment has not been established yet in a formal manner that makes post-disaster policy review unavailable.

Recently, the post-disaster recovery is not introduced into disaster preparedness planning.

UNDP-Montenegro has organised 'Post-Disaster Needs Assessment following the November – December 2010 Flood Disaster in Montenegro' observing damages to households and livelihoods in Berane.

1.4.2 Departmental Lessons Learned systems

No data was found on departmental lessons learned systems.

1.4.3 Centralised (national) Lessons Learned system

The Department for Risk Assessment within the DES is responsible for managing a national risk database,²³⁷⁴ but no formal mechanism for the collection, storage and accession of information exists at national level. There is little retrospective country-specific disaster data available and data collection is generally undergone ad hoc at different levels, mostly by local committees, and by organisations pertaining to hazards, which impacted them. There is an extensive belief expressed by the stakeholders that a standardised methodology for impact assessment is needed.

The DES has an inventory of information about some past floods (local commissions made damage assessment reports in the aftermath of the 2009/2010 floods, some information is available concerning the 2000 droughts), but the data is neither organised nor harmonised. The same holds true for data from the Ministry of Agriculture, which prepares surveys on damages caused by floods at municipal level when farmers claim for indemnities. The only comprehensive post-disaster assessment was developed for building stocks after the 1979 earthquakes in order to serve as a basis for a study assessing the vulnerability to seismic hazards. (EU-UNDP, 2011) However, it is difficult this achievement to be qualified as a lessons learning system.

1.4.4 International exchange for Lessons Learned

Obviously, the authorities in Montenegro are aware with the fact that the country has not sufficient resources and capabilities to protect, rescue and relief in a case of major natural or technological disasters. The National Strategy for Emergency Situations reflects this understanding, requiring to establish communication with relevant international institutions, which in the case of a major disaster could render appropriate assistance, such as the International Red Cross, WHO, FAO, UNEP, UNCOPS, UNIDO, IAEA, and others. The Strategy stipulates the importance of regional crisis management cooperation in SEE in order to gain new experiences and improving response capabilities.

1.4.5 Regular policy reviews

The Law on Protection and Rescue requires the Government to “... submit an annual activity report to the competent working body of the Parliament of Montenegro.” (Art. 36)

1.5 Resilience

The Montenegrin authorities do not implement the concept of resilience. There are neither legal, nor policy regulations on the use of sustainability standards by public institution or private business in disaster management and civil protection context.

²³⁷⁴ The Structure, Role and Mandate of Civil Protection in DRR for SEE, 2008.

1.6 Information sharing and data protection

Information collection and sharing are seen as one of the most poorly defined elements in the Montenegro protection and rescue system. The UNDP conclusion (UNDP, 2011) that “... it is still to be decided who has the responsibility to treat data and process information and to make risk assessments”²³⁷⁵ is also shared by other observers. The EU sponsored study emphasises that,

*... [t]here is currently no evidence of DRR information management methodology. Data is scattered amongst various players and no formal mechanism has been developed to store or access it. There is no central depository of hazard-related data, no data storage bank to facilitate data collection and dissemination. Although DRR-related data can be accessed informally on DESand, many stakeholders are unaware of its mere existence because of its unsystematic collection and updating. Beyond hazard-related data, vulnerability and capacity maps are not existent. Information sharing needs to be improved and systematized.*²³⁷⁶

²³⁷⁵ UNDP, *Disaster Risk Reduction Capacity Assessment Report For Montenegro*, p.17.

²³⁷⁶ EU, *IPA Beneficiary Country Needs Assessment Montenegro*, p.17.

2 Legislation

Following the dissolution of the Socialist Federal Republic of Yugoslavia (SFRY) in 1992, Montenegro federated with Serbia, first within the Federal Republic of Yugoslavia and subsequently, after 2003, in a union of Serbia and Montenegro. Since 2003, and following the declaration of its independence on 3 June 2006, the Parliament of Montenegro approved a number of laws and regulations with the aim of modernising the old jurisdiction of the SFRY, as well as introducing new state' competences. In result, the disaster management and civil protection legislation in force is still based on a large number of laws, regulations and decrees approved and implemented by the former Parliament of SFRY. However, protection and rescue are a critical issue for the country, since historically Montenegro has suffered the dramatic effects of natural and technological disasters that have caused huge damage and suffering.

2.1 Crisis (emergency, disaster) management concept

The National Strategy for Emergency Situations is one of the strategic documents concerning national security with. Its goal is to secure that the state has established and maintains a relevant to the country's natural and technological hazards and threats. The strategy has originated from the increased awareness of the needs of the citizens of Montenegro for a comprehensive and efficient treatment of all forms of emergency in the country.

The strategy determines the policy of prevention, mitigation and preparedness at national, local, business and individual levels. The document has a serious volume (pages 165) as it analyses all hazards, risks and expected consequences, frames the civil protection system and explains the integrated procedures for protection and rescue. A National Action Plan is developed to implement the strategy.

The National Strategy for Emergency Situations can be summarised in the following priority commitments:

- Normative regulation of salvage and preventive action in order to protect against natural disasters, technical and technological accidents and biological hazards;
- Establishment of national system of disaster management through the Directorate for Emergency Situations and Civil Security as an organisational unit of the Ministry of Internal Affairs of Montenegro, which will functionally integrate all relevant institutions involved in the process of monitoring of natural and technological hazards, protection and rescue;
- Initiate social processes to long-term development of scientific research in the field of phenomenology of natural disasters and their impact on society;
- Strengthen the overall preparedness of the community and awareness of the importance and need for organised and effective social action in the prevention and treatment of adverse effects and emergencies at regional and local level;
- Improve the system of continuous monitoring of all significant natural, technological and biological hazards, in order to provide reliable and efficient detection and notification;

- Provide relevant and sufficient equipment and training of specialised institutions and individuals for protection and rescue in emergency;
- Take all necessary measures to prevent the occurrence and reduce harmful effects of disasters;
- Create a formal basis and establish international cooperation with other organisations for protection and rescue in the region in order to create conditions for regional rescue and relief in cases of large-scale emergencies.²³⁷⁷
-

2.2 General crisis (emergency, disaster) management law

Specific laws relevant to civil protection have been approved as follows:

- The Law on Protection and Rescue (2007);
- The Law on Hydro-meteorological Services (2010);
- The Law on Hydrographic Services (2010).
- Act on Flammable Liquids and Gases (2010);
- Law on Transport of Dangerous Goods (2014);
- The Law on Explosive Substances (2008).

Among other laws with references to disaster management and civil protection (usually indirect) are the following:

- The Environment Law (1996);
- The Law on Waters of the Republic of Montenegro (2007);
- The Law on Protection of Air against Pollution (1980).

The Law on Protection and Rescue provides the legal background for response to all disasters caused by natural and man-made hazards. In order to protect effectively the population and the material heritage against possible disasters and preventing the spreading of risk, the Law prescribes to conduct activities related to collection and processing of data on potential risks, establish information and early warning systems.

The Law mandates that these preventive activities include assessment of vulnerabilities²³⁷⁸ as well as the development of plans for protection and rescue, spatial development and building buildings, the establishment of a protection and rescue system and provision of material resources, personnel and other resources necessary to carry out the planned activities. The Law enables the overall adequate functioning and gives to municipalities' competencies to act in cases of disasters.

The Law stipulates that the Directorate for Emergency Situations coordinates the development of National Plans of Protection and Rescue. The National Plan for Protection of Extreme Meteorological Occurrences and the National Plan for Flood Protection derive from the National Plan.

²³⁷⁷ Unofficial translation of V. STRATEGIJA ZAŠTITE OD KATASTROFA, p.145.

²³⁷⁸ Defined as "a qualitative and quantitative analysis of data on the possible hazards of the occurrence of natural disasters" "with predictions of their possible future course and consequences, the proposal of the level of protection against risk and proposal of preventive and other measures for protection and rescue."

2.3 Emergency rule

The Law on Protection and Rescue introduces the emergency rule as “state of emergency.” It is stipulated, that the Parliament of Montenegro, based on Government proposal, shall proclaim state of emergency. Such a proposal should be made at the occurrence of a hazardous event, or after it occurred, if the hazard could not have been foreseen. The emergency rule might be proclaimed for the territory of Montenegro if there is an imminent hazard that would affect or has already affected at least two municipalities.

State of emergency shall be introduced for a municipality if there is an imminent hazard that would affect or has already affected part or the entire municipality. In a case of introduction of an emergency rule, the key role is of the Ministry of Interior. It is responsible to:

- Deliver the official communications about the hazard;
- Inform about the introduction of state of emergency and its scope, activities and measures to protect and rescue to be taken;
- Coordinate and command the task forces, implementation of mobilisation, timely notification and control of implementation of required measures and activities to protect and rescue, with the exception of search and rescue at sea;
- Keep records of task forces, resources and measures taken to protect and rescue in states of emergency.

However, the Law on Protection and Rescue and the other normative acts do not regulate what human rights and civil freedoms could be limited or dismantled by introducing “state of emergency” and for how long. Obviously, the presumption is that the parliament will be responsible enough to introduce only the necessary restrictions, on a concrete territory for as shorter as possible period.

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

Directorate for Emergency Situations on Threat Assessment

Pursuant to Article 34 of the Law on Protection and Rescue, the Ministry of Interior has adopted two documents: the Rulebook on the Methodology for the Development of Threat Assessment Studies of Natural, Technical-technological and Other Disasters and the Rulebook on Methodology for the Development of Protection and Rescue Plans.

The Rulebook on the Methodology for the Development of Threat Assessment Studies of Natural, Technical-technological and Other Disasters delegates responsibility:

- To the Directorate for Emergency Situations and other ministries for risk assessment on the territory of Montenegro;
- To the local governments in coordination with the Directorate for Emergency Situations for the vulnerability assessment of municipalities and
- To companies with more than ten employees, again in coordination with the Directorate for the vulnerability assessment of companies activities and infrastructure.

According to the rulebook, the threat assessment shall include:

- “An assessment of hazards or causes that may lead to the occurrence of disasters and the consequences that may arise for people, material and cultural goods and the environment;
- Determining the appropriate organisation of protection and rescue in order to prevent the occurrence of disasters or for purposes of rescue of people; and
- An assessment of needs and possibilities in the provision of human and material potentials necessary for achieving the estimated protection and rescue organisation.”²³⁷⁹

The military

There is no legal basis on the role of the army in disaster management and disaster response. There are, however, a National Security Strategy and a National Defence Strategy. There are no by-laws and standard operational procedures (SOPs) on the role of the army on disaster management. The Ministry of Defence (MoD) has not been involved in the development of any of the legal documents related to disasters. This, however, does not exclude the cooperation between the MoD and the DES, which have been working together during the floods in December 2010. The MoD is considering the development of internal SOPs for disaster response.

Construction

The Law on Construction establishes construction practice and construction codes. However, in reality new codes and practices are better applied to new constructions and to a lesser extent to older and illegal constructions. Although this particular law has a provision for disaster situations, most of the sectorial legislative documents do not mention DRR.

Water

The Law on Water defines the obligation of preparation of a General Plan for Protection from the Harmful Effects of Water (The current plan covers the period 2010-2016). It especially contains works and measures, which are undertaken preventively and in the period of high waters for protection from floods and erosion; a method of institutional organisation of defence; duties and responsibilities of the manager for protection; a method for monitoring and recording data; a method for early warning.²³⁸⁰

The law foresees the preparation of an annual Operational Plan for the Protection from the Harmful Effects of Floods. At national level, it should be prepared by the Water Department and the Ministry of Rural development and Agriculture (MoRA), while at the local level it should be prepared by competent local authority, with the approval of the MoRA's Water Department. The Operational Plans determine the names of managers of protection against the harmful effects of water, headquarters, bodies and names of companies and other entities that conduct legal protection against the harmful effects of water and means for operational implementation of protection.

Hydro-meteorological service

The laws on “hydrometeorological services” and on “hydrographical services” (2010) define the tasks of the Institute of Hydrometeorological and Seismology of Montenegro (IHMS). It states that the IHMS has duty to:

²³⁷⁹ Rulebook on the Methodology for the Development of Threat Assessment Studies of Natural, Technical-technological and Other Disasters, Article 3.

²³⁸⁰ The Government of Montenegro, *Општи План Заштите од Штетног Дејства Вода, за Воде од Значаја за Црну Гору, за Период од 2010. до 2016. Године*. Available at <http://faolex.fao.org/docs/pdf/mne139429.pdf>.

- “Produce non-scheduled meteorological and hydrological information and warnings in situation before atmospheric and hydrosphere emergency situation;
- Organise emergency observation and measurement of the hydrological stations profiles
- Submit emergency information;
- Monitor weather and waters;
- Collect and analyse data;
- Prepare forecast;
- Inform and alert responsible agencies.”²³⁸¹

Air

There is also a Law on Environment and Air Quality. In 2007, the Government has adopted the National Strategy of Sustainable Development, which recognises climate changes and protection of ozone layer as a priority.

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

The Law on Local Self-Government states that the local authorities are the first line of responding to protect and rescue the population from natural and manmade disaster. In the event of a disaster, an emergency management team led by the mayor (which includes a representative of the DES in a deputy position) is created, and it comprises all relevant authorities and stakeholders (including the Red Cross).

The protection services are managed locally and their equipment and training is provided with municipal funds. International studies report that few richer municipalities have an adequate mechanism to respond to emergencies, while most of them have very scarce means.

In case the municipality does not have enough means to respond to the disaster, it can request the Ministry of Interior for support. The DES, based in the Ministry of Interior, has local branches, however its capacities at the local level are modest.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

The Law on Protection and Rescue determines that “Civil protection shall be part of a single protection and rescue system in states of emergency. Civil protection shall consist of civil protection units, protective and rescue equipment, buildings and devices.” (Art. 56)

Citizens that reached 18 years of age shall be entities under obligation to participate in Civil Protection until 63 years of age (men) or 55 years (women). At the same time, all men and women

²³⁸¹ WMO, “Chapter Six: Meteorological, Hydrological and Climate Services to Support Disaster Risk Reduction and Early Warning Systems in Montenegro” in *Strengthening Multi-Hazard Early Warning Systems and Risk Assessment in the Western Balkans and Turkey: Assessment of Capacities, Gaps and Needs*, p. 141. Available at www.wmo.int/pages/prog/drr/projects/SEE/documents/SEEPPhase%20I%20-%20MontenegroReport.pdf.

older than 15 years may voluntarily participate in civil protection, with rights and duties of civil protection members. (Art. 59)

Under these circumstances, the citizens who voluntarily perform protection and rescue activities shall be organised in “specialised units.” They have to be registered, certified and managed (during emergencies) by the Ministry of Interior. In case of engagement of crisis response operations, the volunteers have to be compensated by the Ministry.

The Law determines that the Red Cross of Montenegro, as a volunteer organisation, shall especially do the following:

- “Perform search service tasks in view of collection and recording of data on evacuated persons, refugees, displaced and missing persons;
- Participate in giving shelter and accommodation of evacuated population, refugees and displaced persons, provision of assistance in the implementation of other measures that may contribute to the care and support for afflicted and vulnerable population, refugees and displaced persons;
- Run, organise, conduct or participate in solidarity actions for assisting vulnerable persons;
- Organise and train teams for activities in the field of social security, hygienic and epidemiological protection, care of the wounded and sick, rescuing on water and mountains and psychosocial support to the population and
- Advertise and organise voluntary blood donation actions, in cooperation with medical institutions for blood transfusion, keep records of voluntary blood donors, establish conditions for granting awards to voluntary blood donors and grant awards.”²³⁸²

The Law also provide opportunity for business organisations, entrepreneurs, and other legal and physical persons to organise voluntary units. (Art. 67) These units shall be completely provided with resources and training by the establishment bodies, which are also obliged to submit annual and monthly activity reports to the Ministry of Interior and the mayor of the municipality.

2.7 Legal regulations for international engagements of first responders and crisis managers

The Directorate for Emergency Situations has signed on behalf of the country a number of bilateral partnership agreements, mostly related to cooperation in emergency response, with countries such as Bosnia and Herzegovina, Slovenia, Croatia, Macedonia, Greece, Serbia and the Russian Federation. Montenegro also participates in regional and international frameworks in the area of disaster management such as Disaster Preparedness and Prevention Initiative, Programme for the Prevention Preparedness and Response to Natural and Man-Made Disasters (PPRD South), Civil-Military Emergency Preparedness, and the Organisation for the Prohibition of Chemical Weapons, among others.

However, the Law on Protection and Rescue does not provide any special regulations concerned the engagement of foreign first responders in emergencies on the Montenegrin territory and for sending Montenegro rescuers abroad. It only states that the Ministry of Interior shall

²³⁸² Law on Protection and Rescue, Article 66.

“...cooperate with the competent authorities of other countries and with international organisations and institutions.”²³⁸³

²³⁸³ Ibid, Article 37.

3 Organisation

3.1 Organisational chart

In 2004, the Government of Montenegro has adopted changes and amendments to the regulations on the state administration. Under the terms of the new regulation, the Ministry of Interior and Public Administration has been made responsible for managing risks, managing civil protection and rescuing in emergency situations and managing to relieve of consequences in the extraordinary situations (earthquakes, fires and other natural and technical/technological catastrophes).

The regulation also has established a Directorate for Emergency Situations and Civil Security as a unique body to coordinate Civil Protection in Montenegro. The Directorate has changed the name in 2013 to Directorate for Emergency Situations (DES) and the ministry has been titled Ministry of Interior (Moi).

Ministries and state agencies, engaged in disaster management with different responsibilities and resources, include the Ministry of Interior (namely the DES), Ministry of Defence, Ministry of Health, Ministry of Foreign Affairs and European Integration, Ministry of Transport and Maritime Affairs, MoRA, Ministry of Sustainable Development and Tourism, Army of Montenegro, Police Directorate, Agency for Environment Protection, Institute for Hydrometeorology and Seismology, Centre for Ecotoxicological Researches, Medical Emergency Service, Montenegro red Cross, other.

Within the current legal and organisational framework, there are three levels of disaster protection and rescue: political, administrative and local (municipalities).

A) Political level

The key political leadership, guidance, coordination and control are provided by:

- Emergency Management Coordination Team (The Prime Minister heads the team and all ministers are members);
- The Ministry of Interior (Directorate for Emergency Situations) is the core national administrative authority on protection and rescue from natural and other disasters);
- The Ministry of Sustainable Development and Tourism (Institute of Hydrometeorology and Seismology Service of Montenegro controls the waters, air, sea, and seismic activities).
- Administrative level

The Directorate for Emergency Situations (DES) is the leading national agency responsible for issues related to disaster management, which is well established and recognised by other national and international organisations. According to the National Strategy for Emergency Situations, DES is responsible for:

- Development of strategies, projects, programs and monitoring their implementation;
- Implementation of the process of harmonisation of legislation on civil protection with the EU legal system;

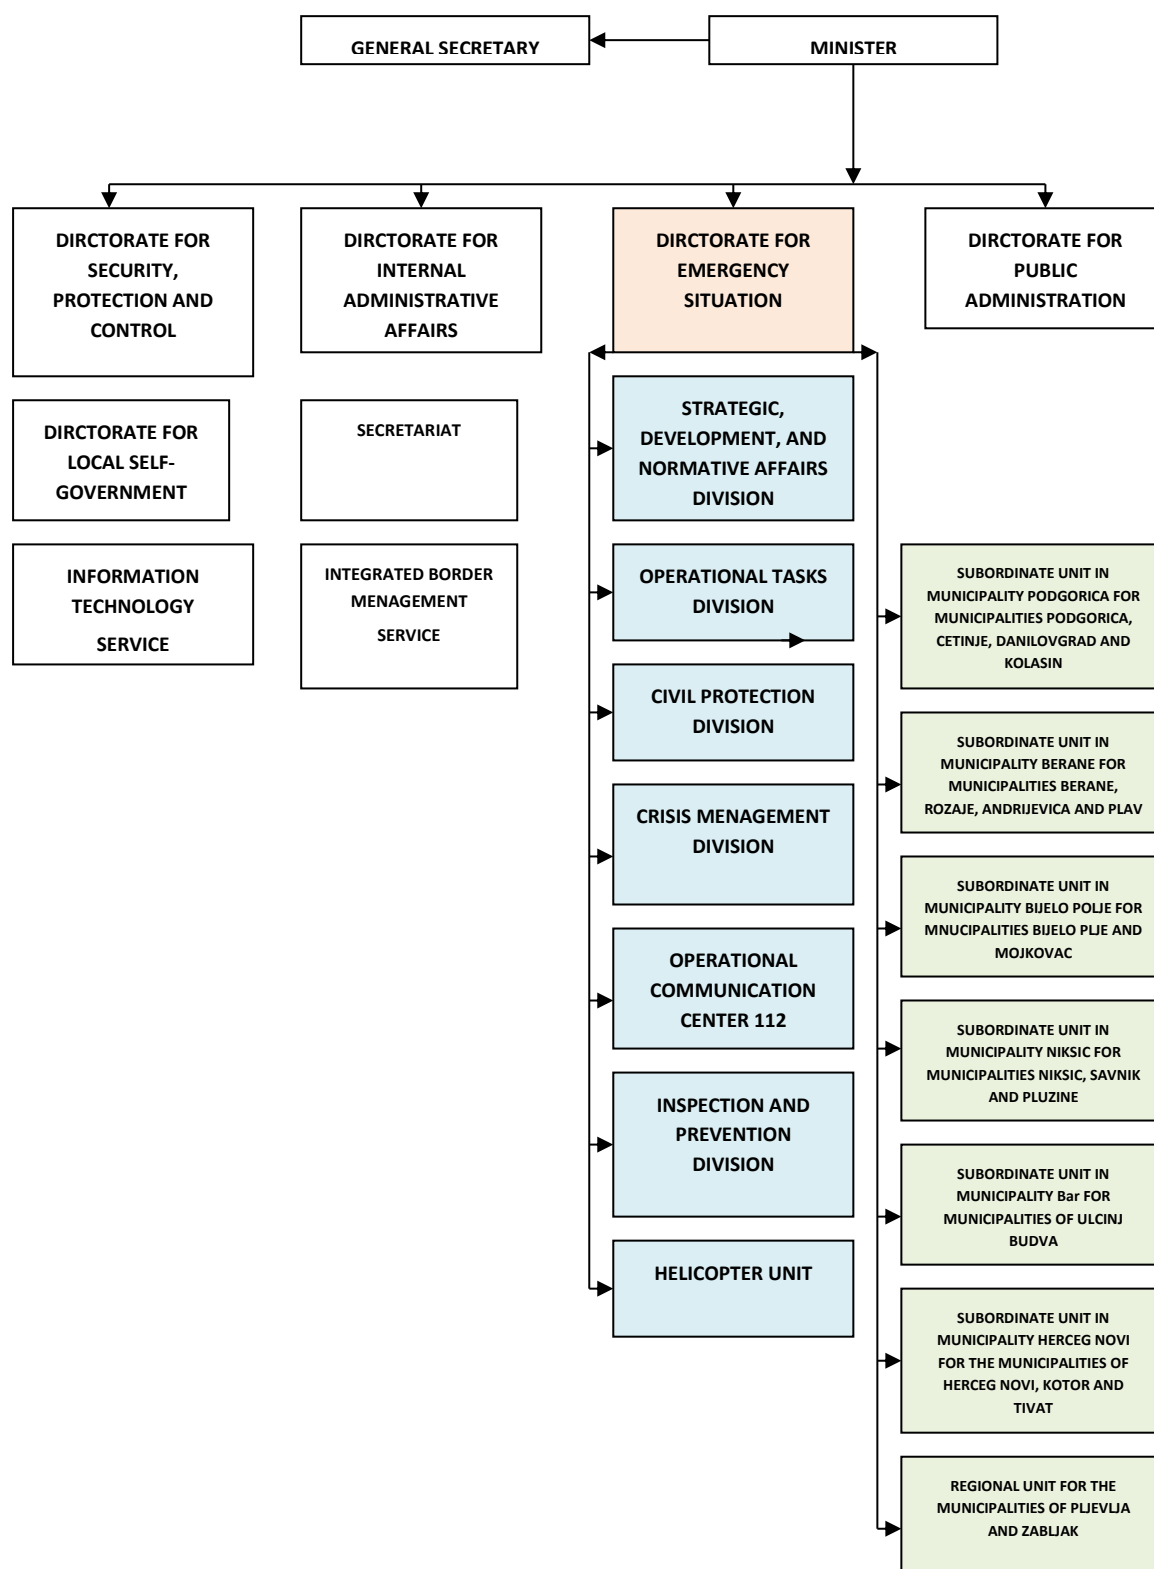

Figure 68. Organisation of the Directorate for Emergency Situations within the Ministry of Interior.²³⁸⁴

²³⁸⁴ The Structure, Role and Mandate of Civil Protection in Disaster Risk Reduction for South Eastern Europe. South Eastern Europe Disaster Risk Mitigation and Adaptation Programme, World Bank and the United Nations International Strategy for Disaster Reduction Secretariat (UNISDR), available at http://www.unisdr.org/files/9346_Europe.pdf.

- Drafting of laws and regulations;
- Analysis and monitoring of the situation in the area of protection and rescue;
- Establishing programmes to equip and develop the system of protection and rescue;
- Preparing draft decisions on the provision of material reserves for the protection and rescue;
- Giving directions for the management of the protection and rescue and proposing measures to protect participants and rescue;
- Collecting data on threats, causes and consequences of emergency situations;
- Assisting in eliminating the consequences of emergencies;
- Applying control on the preparedness of emergency operational units;
- Preparing and monitoring the execution of the contract on the use and operation of specialised units;
- Prescribing technical standards of protection and rescue system in accordance with international standards;
- Planning and development of civil protection and alignment of its activities with the operational units of protection and rescue;
- Preparing proposals for decisions on sending overseas operating units for training exercises and humanitarian activities;
- Seeking and accepting help from other countries in the event of emergencies;
- Receive calls and information in emergency situations through a single Operational Communications Centre 112.

DES also has to provide inspection and control work in the areas of:²³⁸⁵

- Protection and rescue, transportation of dangerous goods, manufacturing, transportation, procurement, storage and use of explosive materials, storage, possession, transport, handling and use of flammable liquids and gases;
- Review of technical documentation;
- Transport and transit of arms, military equipment and dual-use goods;
- Technical protection of people, space and facilities;
- Preparation, organisation and implementation of programmes for professional development and training of the operational units members;
- Organising and implementing preventive, operational and remedial measures for the protection and rescue; carrying out rescue activities in the event of emergencies;
- Preparing and informing citizens in the event of emergencies;
- Elimination of unexploded explosive devices;
- Organisation and operation of the unit for extinguishing fires from the air;
- Search and rescue operations from the air;

²³⁸⁵ Unofficial translation from *Nacionalna Strategija za Vanredne Situacije*, p. 112. Available at http://www.mup.gov.me/biblioteka/direktorat_VS/strategije.

- Pilot training, pilot simulator and mandatory technical rehearsal; implementation of the program of cooperation with international and regional organisations, institutions and other entities involved in the protection and rescue;
- Preparation and monitoring of the implementation of international agreements in the field of protection and rescue.

The Directorate²³⁸⁶ for Emergency Situations is divided into five divisions (indicated below from 1 to five), four departments (indicated as 2.1, 2.2, 3.1 and 3.2) and seven territorial units (listed in point 6):

1. Division for Civil Protection and Humanitarian Aid.
2. Division for Prevention:
 - 2.1. Department for Risk Management;
 - 2.2. Section for Management of Hazardous Substances.
3. Crisis Management Division:
 - 3.1. Department for Training and Operations;
 - 3.2. Operational communication centre 112;
4. Helicopter Unit.
5. Inspections and Prevention Division.
6. Regional Emergency Units:
 - 6.1. Podgorica Regional Unit for the Capital City of Podgorica, capital of Cetinje, and Funtana and municipality of Kolasin
 - 6.2. Regional Unit for the municipalities of Niksic Niksic, Šavnik and Plužine
 - 6.3. Branch Office Bijelo Polje for the municipalities of Bijelo Polje and Mojkovac
 - 6.4. Regional Unit for the municipalities of Berane Berane, Rožaje, Andrejevica and blue
 - 6.5. Regional Unit for the municipalities of Pljevlja and Zabljak
 - 6.6. Branch Office Bar in the municipalities of Bar and Ulcinj Budva
 - 6.7. Regional Unit Herceg Novi for the municipalities of Herceg Novi, Kotor and Tivat

Division for Civil Protection and Humanitarian Aid. Its main duties include “development of strategies, projects and programmes in the civil protection domain and monitoring their implementation; providing risk assessment and drafting national plans for protection and rescue; developing and maintaining of civil protection units; providing training and exercises to the members of the civil protection units; monitoring the situation and tendency in the field of civil protection; planning, organising and mobilising units and teams of civil protection; managing, coordinating and equipping units and teams of civil protection; implementing of measures for protection and rescue; monitoring and enforcement of laws and other regulations in the field of protection and rescue; drafting of laws and regulations proposals; participating in the development of standard operating procedures; harmonisation of legislation in the jurisdiction of this Directorate with the EU legal system; cooperation with international and regional organizations, institutions and other entities; providing

²³⁸⁶ For the purposes of this study the rank of Montenegro’s administrative units is presented within the hierarchy of “Directorate” that consists of several “divisions”, each of which includes several “departments”, while they are organised in sectors or sections.

and seeking international assistance; making and monitoring the implementation of the programme of development assistance (IPA, etc.).”²³⁸⁷

The *Division for Prevention*. Its main duties include “managing the operations and other activities for protection and rescue; implementing the measures for protection and rescue; creating a database of all risks; monitoring and enforcement of laws and other regulations in the field of protection and rescue; participating in the drafting of laws and regulations; making risk assessment and plans for protection against chemical, biological and radiation accident; performing administrative tasks within the jurisdiction and powers established by law in the field of protection and rescue, transport of dangerous goods, manufacturing, transportation, supply, storage and use of explosives, storage, possession, transport, handling and use of flammable liquids and gases; controlling the transport and transit of arms, military equipment and dual-use goods; proposing the system of measures for implementation of established policy and predicting the consequences of legislation.”²³⁸⁸ The division is divided into two departments:

- Department for Risk Management: “It is responsible for the management of the national database of the risks as reported by the National Strategy for Emergency Situations. The duties of the Department encompass the drafting and development of strategic documents and plans at national or inter-municipal levels, cooperation with scientific bodies (universities), laboratories and other research institutions.”²³⁸⁹
- Section for Management of Hazardous Substances (HAZMAT): It has jurisdiction over the activities defined by the Law on Protection and Rescue and other regulations related to this area, including the construction of new buildings, the surveillance of warehouses containing dangerous substances, the transport of dangerous goods and military equipment, and the management of weapons.²³⁹⁰

The *Crisis Management Division*. Its main duties include “implementation of measures for protection and rescue; organising, implementing and monitoring of members of operational units training, as well as organising the exercise of these units; providing the equipment of operational units; developing of programs for professional training of members of operational units; managing and coordinating operational units; coordination of all institutions, companies and institutions in case of a disaster; data collecting and analysis; reporting and informing citizens, legal entities, the Government, emergency responders and authorities, businesses and other stakeholders to protect and rescue using standard operating procedures and coordinating action on call; proposing the system of measures for implementation of established policy and predicting the consequences of legislation.”²³⁹¹ The division is also divided into two departments:

- Department for Training and Operations. “It is in charge of the coordination of all organisations, companies, and State or local authority institutions in emergencies. The department

provides municipal departments for protection and rescue and Civil Protection units with the equipment and training needed to cope with all types of risk.”²³⁹²

- Operational communication Centre-112. “The Centre uses the European emergency number 112 and is designed to be a unique communication hub for all types of emergency. Once operational, it will process all the data and information relevant to emergencies, including protection and rescue activities and measures. The Centre will be responsible for broadcasting the information to the public, state institutions, legal entities, rescue units and other competent bodies and subjects for protection and rescue (including the ERCC).”²³⁹³

Helicopter Unit (with the rank of division). “The unit operates four helicopters - „Abell-412“, „Abell-212“, „Abell-206“ and „Gazella“, two planes type „Dromader“ and two aircraft for fire extinguishing type „AT-802A Fire Boss“. It is also responsible for search and rescue operations in Montenegro. The helicopters are also used for tactical transport of equipment and personnel in case of emergencies.”²³⁹⁴

Inspections and Prevention Division. This Division controls functions and operations for protection and rescue; transportation of dangerous goods; manufacturing, transportation, procurement, storage and use of explosives; storage, possession, transport, handling and use of flammable liquids and gases; transport and transit of weapons, military equipment and dual-use goods. For facilities, in which are stored or used in technological process hazardous substances, the Division determines the zone of danger, security systems and other measures to increase security and reduce the risk of various fire-accidents, accidents, incidents, etc.”²³⁹⁵

Regional emergency units. They perform the following tasks, “monitoring and enforcement of laws and other regulations for protection and rescue; assess the risk and protection and rescue plans; implementation of measures for the protection and rescue; formation and organisation units and teams of civil protection; coordinating the actions of participants in protection and rescue units of local self-government; training and exercises members of civil protection units; raising public awareness for emergency response; implementation of the mobilisation of civil protection; collection, information processing and information; rescue activities in the formation of emergencies; proposing a system of measures for the implementation of established policy and forecasting consequences of legal decisions; perform other duties within the scope of the regional unit.”²³⁹⁶

Protection and Rescue Task Forces perform all measures and operations for disaster management and include the following formations:²³⁹⁷

- Civil protection units;
- Units for protection and rescue of municipalities (firefighting units, units for providing assistance to vulnerable and affected population and other protection and rescue units), organised as municipal protection and rescue services;
- Specialised protection and rescue units;
- Volunteers protection and rescue units;

²³⁹⁷ Law on Protection and Rescue, Art. 14.

- Units for protection and rescue of business organisations and other legal subjects and entrepreneurs; and
- Airborne firefighting unit.

According to a UNDP report as of 2011,

“... the majority of municipalities do not have enough capacity to prepare and protect themselves from existing risks and hazards. The level of capacity is much lower compared to the central level. At the same time, it is the responsibility of the municipalities to fund the municipal protection service (local rescuers). However, in most of the cases, funding is limited to salaries only. Some municipalities, however, have established reserve funds for first immediate response and some have mid- and long-term development plans (as in the municipality of Bar). Nevertheless, plans do not, in most cases, include the existing risks and hazards. Information flow from institutions such as the Hydrometeorological Institute of Montenegro to municipal level is not regular and is not clearly framed. Municipalities are also not mandated to have cross-border cooperation with municipalities from neighbouring countries.” (UNDP, 2011)

The Institute for Hydrometeorological and Seismological Service of Montenegro (IHMS) is another organisation with an important role in disaster risk reduction, mitigation and protection. The institute is under the Ministry of Sustainable Development and Tourism. The IHMS tasks are explained in chapter 2.4. The institute has 112 staff members, of which 59 are based in Podgorica. The table below provides details on its organisation.²³⁹⁸

The Department of Seismology in IHMS is in practice the Seismological Observatory of Montenegro. It exists since 1979 and is currently being transferred to the Ministry of Sustainable Development and Tourism and IHMS. “The Observatory operates the seismic observation network, prepares regional and micro-local maps, and conducts research on earthquake effects on building structures, ground, water courses, and many more.”²³⁹⁹ The Observatory is organised in two departments within IHMS:

- “Department for instrumental and engineering seismology responsible for recording of seismic data for earthquakes in Montenegro and its surroundings, technical maintenance of seismic and GPS instruments on all stations in seismological network, calibrating of seismographs and accelerographs, upgrading of equipment for acquisition of

Seismology	Instrumental and engineering seismology; Seismic data analysis and processing	
	Hydrometeorological Information systems	
	Administration and finance	
	PR and international cooperation	

seismic data, processing and maintenance of database of digital accelerograms, processing of macro-seismic data for strong and catastrophic earthquakes, determination of seismic hazard elements, etc.”²⁴⁰⁰

- “Department for seismic data analysis and processing in charge for couple levels of automatic acquisition of seismic signals generated by earthquakes and explosions, modern numerical and graphical analysis and processing of seismic and GPS data, quantification of parameters for actual and historical seismicity in Montenegro, seismo-tectonic interpretation of seismic data, focal mechanism solutions for stronger earthquakes in region, seismological database maintenance, modernisation of methods and computer programs for seismic and geodynamic analysis, publishing and exchange of seismic data, etc.”²⁴⁰¹

The Ministry of Defence (MoD) controls the Security Forces of Montenegro. The National Security Strategy determines as one of the internal tasks of the Montenegro Security Forces: “Providing support to state institutions and authorities in cases of environmental, natural or man-made disasters of greater scale, as well as in cases of human or animal epiDESics, where human life, environment and material goods are under considerable threat ...”²⁴⁰² However, according to an international study (UNDP, 2011), the role of the MoD in disasters is not clear and has not been identified at the national level or indeed within the ministry itself. In practice, during the floods of December 2010, the MoD’s Operations Centre reported to the operations centre of the DES and based on an informal and personal level the cooperation worked well.

C) Local level

²⁴⁰⁰ Hydrometeorological and Seismological Service of Montenegro’s website at www.seismo.co.me/Staff.htm.

²⁴⁰¹ Ibid.

²⁴⁰² National Security Strategy, Art. 5.

At the local level, municipal teams are only responsible for the management of emergencies. These teams are led by the president/governor of each municipality. A deputy of SEM is present in each municipality to coordinate sectoral activities and serve as the link between the government body and municipalities. The fire-fighting service, with its Municipal Rescue and Protection Units, plays an important role. Currently, 450 people are attached to these units. (EU-UNDP, 2011)

3.2 Organisational cooperation

Within the current legal and institutional framework, the organisational cooperation is mostly operational. The way the system works in the most dangerous situations of seismic and flooding emergencies is presented in Table 5.

Table 45. Functional scheme of Montenegro disaster (floods and seismic) response system

Function	Lead body	Sources; forces
Early warning	IHMS	Other entities International sources Citizen
Notification and alerting	DES: Operational Communications Centre 112	Local authorities; Enterprises Specialised NGO organisations
Coordination 1 (Operational)	DES	Inter-institutional and central-local coordination at administrative level
Coordination 2 (Political)	Emergency Management Coordination Team	Government level coordination (in cases of serious emergencies)
Operations	Task force(s)	Civil protection units; Units for protection and rescue of municipalities (firefighting units, units for providing assistance to vulnerable and affected population and other protection and rescue units), organised as municipal protection and rescue services; Specialised protection and rescue units; Voluntary protection and rescue units; Units for protection and rescue of business organisations and other legal subjects and entrepreneurs; and Airborne firefighting unit.
		International support

Considering the size of the country and its geological setting, trans-boundary initiatives play a crucial role in disaster mitigation and preparedness.²⁴⁰³

DES has signed bilateral partnership agreements with Albania, Bosnia and Herzegovina, Slovenia, Croatia, Macedonia, Greece, Serbia and the Russian Federation, which define a common protocol for cross-border cooperation in the event of natural disasters. The latest flood emergencies have proved

²⁴⁰³ Source: <http://drace-project.org/index.php/map/montenegro>.

that these agreements are efficient, especially regarding the provision of support, custom lifting and fast entry for rescue teams.

According to the EU study (EU, 2011), Montenegro participates in the following regional activities:

- “The Disaster Preparedness and Prevention Initiative for South Eastern Europe and the EU-funded PPRD South Programme, to implement HFA objectives and priorities;
- The Civil Military Emergency Planning for South Eastern Europe, in cooperation with the U.S. Army Engineering Corps, to improve the civil-military coordination of disaster preparedness and response;
- The Drought Monitoring Centre for South East Europe, the European Centre for Medium-Range Weather Forecasts and the Accident Reporting Guidance Operational System (ARGOS) to upgrade its hydro-meteorological services, weather forecasting products and early warning system;
- The Project SHARE (Seismic Hazard Harmonisation in Europe, 2009–2012), within the Seventh Framework Program of the European Commission, to provide an updated, living seismic hazard model for the Euro-Mediterranean region²⁴⁰⁴ and NATO’s Science for Peace project „Harmonisation of Seismic Hazard Maps for the Western Balkan Countries“, whose end product will be an integrated database organised in GIS applications for the whole region with a regional earthquake catalogue and seismic hazard maps.”²⁴⁰⁵

Specific memorandums of understanding in the field of education, technical training, preparedness and prevention are being considered with Turkey and Italy.²⁴⁰⁶

While a number of regional agreements are signed at the central level, municipalities do not have the mandate to replicate this process at local level. Regarding the capacity of Montenegro’s crisis response institutions to benefit from regional coordination and cooperation, leveraging expertise, capacities, resources and information across the region among SEE countries and with various regional centres in Europe the assessment of the EU – UNDP from 2011 is that the effectiveness of international cooperation is quite low, “...partially because of lack of experts and acaDESic staff with good skills in European languages, especially English. This aspect is often under considered, but it dramatically hampers the participation of personnel to international workshops or training.”²⁴⁰⁷ (EU-UNDP, 2011)

²⁴⁰⁴ Source: <http://www.share-eu.org/>.

²⁴⁰⁵ EU, *IPA Beneficiary Country Needs Assessment Montenegro*, p. 26.

²⁴⁰⁶ The Structure, Role and Mandate of Civil Protection in DRR for SEE, 2008.

²⁴⁰⁷ International organisations also contribute to the strengthening of DRR through the UN’s Regional Disaster Risk Reduction Overview Course, UNDP projects such as the Spatial Planning Support Project, or the German Gesellschaft für Technische Zusammenarbeit and World Bank Land Administration and Management Project.

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

Recently, there are no by-laws and standard operational procedures (SOPs) for civil protection operations in Montenegro that to be relevant to all stakeholders. Sops have been established for some components as the Operational Communication Centre “112.”

However, in 2013, the Department for Emergency Management has sent for coordination the final version of the Standard Operating Procedures (SOP) for crossing the border in the event of natural disasters involving the Ministry of Internal Affairs of Montenegro and the Ministry of Internal Affairs of the Republic of Serbia.²⁴⁰⁸

According to the UNDP study as of 2011, the MoD is considering the development of internal SOPs for army participation in disaster response operations.

4.2 Operations planning

The normative ground for operational planning is the Rulebook on Methodology for the Development of Protection and Rescue Plans.²⁴⁰⁹

The overall national-level planning document on disaster management is the National Plan for Rescue and Protection. The plan is based on the vulnerability assessments for all major hazards, as the National Strategy has outlined them for Emergency Situations. The set of hazard-based national plans includes:²⁴¹⁰

- National Plan for Protection from Earthquakes;
- National Plan for Fire Protection;
- National Plan for Protection Against Chemical Accidents;
- National Plan for Protection Against Biological Accidents;
- National Plan for Protection Against Radiation Accidents;
- National Plan for Search and Rescue in Civil Aviation Incidents and Accidents;
- National Plan for Protection Against Floods;
- National Plan for Protection Against Landslides and Avalanches;
- National Plan for Protection from Extreme Weather Phenomena;
- National Plan for Protection from Traffic Accidents on Road and Rail;
- National Plan for Protection from Technical and Technological Hazards;

²⁴⁰⁸ Izveštaj o stanju sistema zaštite i spašavanja u Crnoj Gori u 2013 godini.

²⁴⁰⁹ The Ministry of Interior, *Rulebook on Methodology for the Development of Protection and Rescue Plans*. Available at <http://www.sluzbenilist.me/PrevPropPreuzimanje.aspx?tag=%7B4C4F661B-C938-4F93-9C8B-23ABC5D1FC6F%7D>.

²⁴¹⁰ Cross-referenced from Disaster Risk Reduction Capacity Assessment Report For Montenegro, (UNDP: April 2011) and the United Nations Office for Coordination of Humanitarian Affairs (UNOCHA) mission report to Montenegro in November 2010.

- National Plan for Protection from Destruction of Power Plants.

As the floods are the current most serious source of risk, the authorities in Montenegro pay special attention to prevention, rescue and relief measures in cases of heavy rains and flooding. According to a 2015 Montenegro report on the transposition of Directive 2007/60/EC of the European Parliament and of the Council of 23 October 2007 on the assessment and management of flood risks,

*Preventive measures regarding protection from floods are prepared and implemented by the Ministry of Agriculture and Rural Development and Water Directorate, on the grounds of the Law on Water and General Plan for protection from adverse effects of water for water areas which are important for Montenegro, along with Operational Plans for protection from adverse effects of water. Preventive measures include: regulation of watercourse, building protection structures (dams), cleaning and deepening of watercourses, maintenance and repair of damaged parts of protection structures, observation and reconnaissance of the state of watercourses and high dams etc.*²⁴¹¹

4.3 Logistics support in crises

The Law on Protection and Rescue prescribes that, in the case of imminent threat or in time of emergency on the territory of municipality, the president of municipality have the right and obligation to mobilise all human and material resources from the territory of that municipality, in accordance with the municipal plan. Mobilised persons and material resources shall be entitled to reimbursement of expenses from the municipal budget, in accordance with the regulation of the municipality.

Concerned the citizen, the Law (Art. 61) stipulates that they have to make available to civil protection units the use of vehicles, machines, equipment and other material resources, land, facilities, devices and energy sources, necessary for protection and rescue in case of introduction of “state of emergency”.

Material obligation is also considered to be the placing of instruments and devices for observing, notifying and informing on commercial and other buildings, and as an exception, on residential buildings as well, if the instruments and devices can not be placed on other buildings. The material obligation may be ordered to legal persons and entrepreneurs as well.

Military logistic support has been and could be provide based on decision of the Emergency Management Coordination Team.

²⁴¹¹ Directive 2007/60/EC of the European Parliament and of the Council of 23 October 2007 on the assessment and management of flood risks, available at <http://www.eu.me/en/library/category/217-water-quality?download=1163:floods-directive>.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

The Emergency Management Coordination Team (EMCT) is tasked with management of the national early warning system.²⁴¹²

The early warning system (EWS) is currently in the process of being developed. The system is located with the DES, and each relevant ministry and institution has place within it.

According to the internal regulations of the Ministry of Interior, the “Section 112” of DES – “Operations and Communications Centre 112” performs the activities related to the coordination and management of search and rescue operations. The centre is collecting information and data, reporting and informing citizens, legal entities, government, emergency responders and authorities, businesses and other stakeholders in accordance with standard operating procedures.

The unit is also calling operational units in the event of mobilisation; preparing and sending requests to seek international assistance in case of emergencies; preparing the notification of threats and disasters that may threaten the neighbouring countries; establishing communication with the state’s crisis centre, and centres for search and rescue of countries in the region.

The centre is administrating and maintaining security database and geographic information system, keeping proper records, and performs other tasks within the scope of the DES.²⁴¹³

However, according to an official report, problems of a technical nature prevent completion of the project. The system is still not fully operational because the missing optical cables connections between ECC 112 in Podgorica, Bijelo Polje and Bar, and the hub at the Ministry of Interior and radio communications between all locations of EEC 112. (MoI, 2014)

As the system of 112 is still in the development phase and the television and radio is not always reliable in diffusing priority information, the current dissemination mechanism of warnings and advisories is not very efficient, especially to those situated in threatened areas. The warnings given directly to the public via the IHMS web pages are a very passive dissemination channel and do not actively meet people, authorities and public when needed.

While the DES issues warnings and coordinates action with municipal representatives, the Parliament alone has the power to declare a national state of emergency. A major problem is the lack of clear guidelines as to how this decision is reached and how national emergencies should be announced to the public. Additional procedures concerning support of national and local authorities should be established, as well as a classification of emergencies and alerts. (EU-UNDP, 2011)

²⁴¹² Improving the System is one of Montenegro’s development priorities; however no fixed budget is allocated and progress is highly dependent on external funding. A major stride was the implementation of the large-scale fire detection system FIREWATCH by the DES in collaboration with German partners. Considerable progress towards establishing real-time data exchange for hydro-meteorological, seismic and fire hazards at national and cross-border level was made with help of WMO following catastrophes such as the earthquakes and floods at the end of the last decade. Currently, the DES is working to expand early warning systems and data exchange to a broader range of natural hazards (EU-UNDP, 2011).

²⁴¹³ Pravilnik o Unutrašnjim Organizaciji i Sistematizaciji Ministarstva Unutrašnjih Poslova, Art. 3.3.2.

5 Capabilities

Human and material resources are considered as a very important component of the system of protection and rescue. It is essential that all subjects of protection and rescue operations at the state and municipal levels are provided with resources to promptly undertake all planned and extraordinary measures for prevention of hazards and protection and rescue in case of disasters.

5.1 Human resources

According to the Government annual report (Mol, 2014), in 2013 the Directorate of Emergency Situations has employed 106 employees: 55 officers with higher education (of whom seven masters of science), 3 positions with a college degree and 48 officers with a high school diploma. From a total of 106 employees of civil servants and employees, 32 of them or 30.19% are women, and 74 or 69.81% are men.

In all municipalities in Montenegro organisations (units) for protection and rescue services have been formed. 582 members, of which 530 members have been permanently employed, and 52 - hired on contract have served in these units.

Pursuant to Article 65 of the Law on Protection and Rescue, Ministry of Internal Affairs has concluded a contract with rescue specialists (organised also in units). At the end of 2013 a contract was signed with Mountain Rescue Courier Service. It has been established full cooperation of the Mol with the Red Cross of Montenegro and numerous joint activities on improving the system of protection and rescue have been planned and undertaken.

As part of the protection and rescue system, the volunteer fire departments that operate with a long tradition in the municipalities of Tivat and Kotor are of particular importance. In addition, procedures have been initiated for the establishment of volunteer fire companies in the capital Podgorica and in Banjani (the municipality of Niksic).

Entrepreneurial units, as a kind of operating units, are considered as very important because of the willingness to provide an adequate first response to certain types of hazards (fire), which may happen in a company, other legal entity or an entrepreneur. Entrepreneurial units are organised in White Shipyard, airports Tivat and Podgorica, Bar Harbor, KAP, Tjeljezara Niksic, Pljevlja thermal power plants and at "Monteput" Podgorica.

Units for extinguishing fires from the air (i.e. the helicopter unit of the DES) is organised as a directorate within the Directorate for Emergency Situations. The total number of officers is 17, of whom 14 have been employed on full-time while three have been engaged under a contract of work. In addition to the above, in the course of fire season, contractors engage the additional four executors.

5.2 Materiel (non-financial) resources

Ensuring equipment, instruments and materials is a precondition for the establishment of a system of protection and rescue services. Units have to be able to act immediately and as long as it is necessary to respond to disasters.

Facilities, accommodating service protection and rescue units in Podgorica, Bar, Budva and Niksic, Bijelo Polje, Mojkovac, Herceg Novi, Zabljak, Ulcinj, Rožaje, Berane and Cetinje, meet the accommodation requirements of professional members of the protection and rescue services. In Savnik, the unit shall move into a new facility, expected in the second quarter of 2014. In the municipality Andrijevci, by a donation from the US Embassy in Podgorica, an object in the former barracks of the Army of Montenegro has been reconstructed, thereby creating conditions for normal operation and functioning of these units.

5.3 Training

Training of protection and rescue services

Training on floods and fire response have been organised in cooperation with the US Embassy, the Ministry of Defence, the Ministry of Interior, the Red Cross and NGOs. However, these training are not coordinated and do not always benefit of adequate facilities. Done on an ad hoc basis, they do not facilitate the understanding of the specific roles and responsibilities of the various actors, including the role of technical agencies such as the IHMS. More in-depth training on understanding disasters and their impacts are needed to complement experience with technical knowledge.

Despite its limited number of forecasters, meteorological and hydrological experts, the IHMS participates in UNISDR courses and is currently involved in the development of an international strategy for risk reduction, which consists of 22 workshops that brings international expertise.

Training of the protection, search and rescue teams at the local level is provided and funded by the municipalities. However, it is not always offered in a systematic way nor does it always reach out to all the municipal staff, since the size of the budget for preparedness and response activities is left to the appreciation of the municipalities.

Police and NGOs have their own training programs. The MRC has been training its preparedness and response teams in first aid at local, national and regional level. Some elements of the regional disaster response teams have been trained for international deployment. (EU-UNDP, 2011)

Source: Ministry of Interior Annual Report 2014

Training centres

Training activities are mostly geared towards various rescue and recovery specialists. The DES has currently one training centre within the Police AcaDESy in Danilovgrad for the training and education of rescue units. However, it is very much oriented towards theory. There are plans to open three training centres across the country that will deal with the special training needs of rescue units in a more practical way. DRR training programmes in relation to specific hazards are delivered regularly by the DES for personnel involved in civil protection activities such as central and municipal rescue teams, fire-fighters, operational units, but also decision-makers at central level and the public. Worthy of note is a training course for seismic hazards, organised with the support of the French Sécurité Civile.

Hazards and disasters awareness rising

There are limited resources for capacity development and no formal process of awareness rising is in place. Moreover, legislation does not specify which governmental body is responsible for implementing DRR awareness raising projects, and authorities still lack DRR knowledge in order to design campaigns, especially as the DES only addresses DRR since 2010. According to the government, awareness-raising activities are especially limited at the local level. This greatly increases the population's vulnerability. "To name just one example, no awareness raising activity was done in the highly earthquake-prone region of Berane."²⁴¹⁴

The Bureau of Public Relations, the Government of Montenegro and the DES coordinate media plans oriented towards public awareness of hazards and prevention, but the involvement of the media Directorate to advocate DRR needs to be developed. Among the population and the media, awareness of disaster-related issues or preparedness and response is often limited, which can lead to inaccurate or inadequate information broadcasts.

Although the Montenegro Red Cross did not conduct any awareness raising activities until now, it plans to do so in the future by joining the Red Cross DRR regional programme and further cooperating with DES. Actions have already been targeted at schools and the MRC plans to organise a DRR campaign together with governmental and non-governmental organisations. Ad hoc awareness raising events have been undergone by „Green Home” and the United States Agency for International Development, although the public service campaign did not specifically focus on DRR. The Fire Union of Montenegro has been educating the population about fire protection.²⁴¹⁵

Apart from occasional events, like classes visiting fire brigade units, DRR is not yet integrated into school curricula. This is likely to change when the primary education system reforms of 2010 are implemented. One of the reform plans for 40 optional modules, out of which one should include DRR content. Also, weekly lessons focusing on protection and rescue, what action to take in emergency situations and containing an introduction to natural hazards on the territory of Montenegro should be offered by head teachers. On the other hand, the reform cut the budget allocated to teacher training, including the training targeting disaster response. Educating children will be a difficult task for teachers, if they do not have the knowledge themselves.

A EUR 40,000 awareness project, which is part of the EU-funded Programme on Prevention, Preparedness and Response to Natural and Man-made Disasters (PPRD South), is targeted at 5,000 6th grade students (aged 12) in 62 pilot primary schools in Montenegro. The project will inform

²⁴¹⁴ EU, *IPA Beneficiary Country Needs Assessment Montenegro*, p. 21.

²⁴¹⁵ Report of Montenegro Ministry of Internal Affairs, Report of Montenegro to the United Nations' World Conference on Disasters Reduction (WCDR, Kobe-Hyogo, Japan, 2005).

children about actions they and their family should take before and after earthquakes. If the subject „Protection and Rescue from Natural Disasters and other Man-made Accidents” is effectively re-introduced in the curricula of 7-9 grade students, this first awareness project would constitute an ideal introduction to disasters.²⁴¹⁶

No university program focuses on DRR only, but civil engineering, architectonic planning are taught at the Civil Engineering Faculty in Podgorica.²⁴¹⁷

5.4 Procurement

5.4.1 Procurement regulation

The basic Montenegro legislation on procurement is the Law on Public Procurement (Official Gazette of MNE, no. 42/11). However, concerned the disaster management, the Law stipulate that its provisions do not apply to: “Procurement aimed at protection and recovery from catastrophes and major disasters – state of emergency.” (Art.3)²⁴¹⁸

The Public Procurement Directorate, Ministry of Finance as a line ministry, and the Commission for Control of Public Procurement Procedure have competencies and are responsible for the control of public procurement procedures. The Ministry of Finance supervises the legality and effectiveness of administration operations. Judicial control over the legality of the public procurement procedures is ensured by the administrative dispute before the Administrative Court of Montenegro.

The Public Procurement Administration, in accordance with Article 19 of the Public Procurement Law and its scope of work established by Article 42 of the Decree on Organisation and Manner of Work of the State Administration, shall be entitled to perform the following tasks:

1. *“To monitor implementation of the public procurement system;*
2. *To monitor the compliance of the legislation regulating the public procurement system with EU legislation, to prepare technical basis, to initiate and participate in preparation of the public procurement regulations;*
3. *To give approval to contracting authorities on fulfilment of conditions for conducting certain public procurement procedure in the cases envisaged by this Law;*
4. *To provide advisory assistance upon contracting authority’s request;*
5. *To organise and conduct professional development and advanced training of the human resources in charge of performing public procurement tasks;*
6. *To organise professional exam for performing tasks in the area of public procurement;*
7. *To establish and maintain the Public Procurement Portal for the purpose of ensuring transparency of public procurement;*
8. *To publish public procurement plans, contract notices, decisions on candidates’ qualifications, decisions on selection of the most favourable bid, decisions on*

suspension of public procurement procedure, decisions on annulment of public procurement procedure, public procurement contracts, changes or amendments of public procurement plans, contract notices, decisions and contracts, as well as of other acts in accordance with this Law;

9. *To prepare and publish a List of contracting authorities on the Public Procurement Portal;*
10. *To encourage the conducting of public procurement in electronic form;*
11. *To pursue cooperation with international organisations, institutions and specialists in the field of public procurement;*
12. *To prepare and submit to the Government annual reports on the public procurement, carried out in the previous year;*
13. *To prepare and publish a list of bidders on the basis of decisions on selection of the most favourable bid;*
14. *To prepare and publish a common public procurement vocabulary on the Public Procurement Portal;*
15. *To perform inspection control;*
16. *To issue publications and other technical literature;*
17. *To perform other tasks, in accordance with the Law.”²⁴¹⁹*

Montenegro has adopted the following EU directives, relevant to procurement:

- Directive 2004/18/EC of the European Parliament and of the Council of 31 March 2004 on the coordination of procedures for the award of public works contracts, public supply contracts and public service contracts;
- Directive 2014/24/EU of the European Parliament and of the Council of 26 February 2014;
- Directive 2014/25/EU of the European Parliament and of the Council of 26 February 2014.

5.4.2 Procurement procedures

Types of Procedures

According to the Law on Public Procurement (Art. 20), “*public procurement procedures for goods, services or works are as follows:*

- *Open procedure;*
- *Restricted procedure;*
- *Negotiated procedure with prior publication of a contract notice;*
- *Negotiated procedure without prior publication of a contract notice*
- *Framework agreement;*
- *Consulting services;*
- *Contest;*
- *Shopping method;*
- *Direct agreement.”*

Value scales

²⁴¹⁹ From the web site of the Public Procurement Administration of Montenegro
<http://www.ujn.gov.me/en/nadleznosti/>.

The public procurement procedure shall be determined according to the estimated value of the public procurement, which is classified into the following value scales:

- I Value scale – in cases when the estimated value of the public procurement is up to EUR 5,000, the contracting authority shall perform the direct agreement;
- II Value scale – in cases when the estimated value of the public procurement exceeds EUR 5,000 up to EUR 25,000 for procurement of goods or services, or when the estimated contract value exceeds EUR 5,000 up to EUR 50,000 for procurement of works, the contracting authority shall perform the shopping method;
- III Value scale – in cases when the estimated value of the public procurement exceeds EUR 25,000 for procurement of goods or services, or when the estimated contract value exceeds EUR 50,000 for procurement of works, the contracting authority shall perform some of the procedures listed in Article 20 items 1 to 7 of this Law.

Electronic Licence Registry

According to the Public Procurement Administration of Montenegro, “the Registry is available at the Internet address www.licenca.me and includes 540 licenses, permits and approvals for performing the economic activities issued by 36 institutions. The Chamber of Commerce is responsible for maintenance of the Registry, in cooperation with the Ministry of Finance.”²⁴²⁰

5.5 Niche capabilities

Montenegro suffers from insufficient disaster response capabilities due to limited funding and other resources. However, country’s plans are focussed on building capacities for mostly for response to floods and heavy snows in the mountains emergencies.

However, as the EU monitoring mechanism has stated, Montenegro is satisfactorily aligned with the EU civil protection acquis. Nevertheless, the country will need to further improve its administrative capacity in order to align the system with standards and good practices of the Member States. Technical and material resources need to be enhanced, in particular by further equipping and training civil protection and other concerned staff to reach a sound basis for adequate support for risk prevention and preparedness as well as necessary response in case of emergencies. Given the frequency of disasters in the country, disaster risk reduction and disaster management should be treated as a matter of priority at national and local level (EU, 2013).

Driving Innovation in Crisis Management for **E**uropean **R**esilience

NORWAY

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: MSB (Kristen Arnell, Marie Norrby)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by CSDM and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

Norway consists of 19 counties (fylker, singular - fylke): Akershus, Aust-Agder, Buskerud, Finnmark, Hedmark, Hordaland, More og Romsdal, Nordland, Nord-Trøndelag, Oppland, Oslo, Østfold, Rogaland, Sogn og Fjordane, Sør-Trøndelag, Telemark, Troms, Vest-Agder and Vestfold.

Each county is administered by a county council (elected by the people) responsible for local affairs, and a county governor, who is the King and Government's representative in the county to implement the Parliament's and Government's decisions. The county governor is appointed by the King in Council, and is responsible for the administration of national (central) affairs at the county level. There are, however, only 18 county governors, as two regions (Oslo and Akershus) are organised with a common governor. At the local level, there are 430 municipalities. The capital, Oslo, is both a county and a municipality. The municipalities are led by a popularly elected municipal board, with tax raising powers and a broad range of political responsibilities in providing local services to the population.

In the area of national preparedness, the Norwegian Directorate for Civil Protection and Emergency Planning (DSB) is to support the Ministry of Justice and the Police in its coordinating role, develop and maintain national emergency preparedness and response plans and give advice and report to the Ministry and the Government in connection with national crisis management. The Directorate was established in 2003, and its objective is to maintain a full overview of the risk and vulnerability in society, promote measures which prevent accidents, crises and other undesirable incidents, and ensure sufficient emergency planning and efficient management of accidents and crises.

The DSB provides information and advice and carries out supervision of ministries, county governors and municipalities. Research, studies and documentation related to the development of national vulnerability and the changing threat scenario make up an important part of the Directorate's work, as a basis for planning emergency preparedness, response and priorities. The Directorate plans and conducts exercises in crisis management and crisis communication for strategic management at the national, regional and local levels.

Furthermore, the DSB is the national public authority for municipal and inter-municipal fire services, the local electrical safety inspection authorities and the county governors' emergency preparedness and response work. The DSB is also responsible for the professional and administrative follow-up of the Norwegian Civil Defence, the Emergency Planning College, the Norwegian Fire Academy and the Civil Defence's three regional schools.

The Civil Defence Organisation is an operative part of the DSB. The DSB is responsible for the education and training of Civil Defence Forces. Its activities are organised around the head office in Tønsberg and Oslo, 20 civil defence districts, five civil defence camps, five schools and five regional inspectorates for inspection and control of electrical safety.

Typical risks include weather related hazards, critical infrastructure e.g. power supplies and some geo related hazards such as landslides.²⁴²¹

1 Policy

1.1 Risk Assessment

Risk assessments are done by all levels in the public sectors.

Local level: 434 municipalities

Regional level: 19 County Boards, 5 Hospital Regions, 27 Regional Police authorities

National level: All governmental agencies

Risk assessments are also done by the private sector that can affect the population and environment like Seveso plants and Energy sector.

1.2 Policy and Governance²⁴²²

Norway is a constitutional monarchy. The executive power rests formally with the King, but in practice with the government, and the legislative power rests with the unicameral parliament. The King, with the parliament's approval, appoints the government, and both the prime minister and each cabinet minister are judicially directly responsible to the parliament. Each minister is normally in charge of a ministry, which is responsible for carrying out public administration in his or her field. The regional level consists of 19 counties, the county governor being the highest representative of the central government. There are however, only 18 county governors as two regions (Oslo and Akershus) are organised with a common

Governor. At the local level there are 430 municipalities. The capital, Oslo, is both a county and a municipality. The municipalities are led by a popularly elected municipal board, with tax raising powers, and a broad range of political responsibilities in providing local services to the population.

1.2.1 Structure of civil emergency planning

The concept of Total Defence is still a guiding doctrine in Norwegian crisis emergency planning (CEP). However, the focus of the concept has changed, from mobilization of all national resources in support of an all-out military struggle, to a focus on societal security. Total Defence is now broader and a two-way street, where civilian resources can provide support in the time of military crises, and the military is operationally prepared to assist civilian society in times of need, regardless of whether this is due to man-made or natural disasters. Societal security is defined as safeguarding the population and key societal functions and infrastructure against attack or damage where the existence of the country is not threatened. The work on safety and security in society is furthermore based upon the principles of liability, decentralisation and conformity. Together these principles are

²⁴²² <https://www.msb.se/RibData/Filer/pdf/24677.pdf>

the foundation for establishing efficient crisis prevention and crisis management.²⁴²³ Crisis in regard to nuclear accidents are handled by a specific organisation called “atomberedskapsorganisajonen” (nuclear readiness organisation)²⁴²⁴

- The principle of liability states corresponding responsibility either when dealing with a normal everyday situation or an extraordinary situation. This principle applies to all public and private activities. In addition, each citizen is responsible for his or her own safety. Responsibility for the functions of normal, everyday activities, will presumably improve the ability to handle critical situations. Thus, each ministry is responsible for emergency planning within its own sector. However, the Ministry of Justice and the Police has been given a more distinct responsibility for coordinating the administration of work on safety, security and emergency planning within the civil sector in general.
- The principle of decentralisation states that the responsibility for crisis management should be handled at the lowest possible level. The principle of conformity states that society must be able to operate in accordance with normal standards no matter what challenges it is exposed to, and that the structures of responsibility are maintained in extraordinary situations.
- Holistic and coordinated crisis management centrally, regionally and locally.

1.2.2 Strategy scope and focus

The politically defined objectives for the work on safety and security of Norwegian society are based on the notion that emergencies should be prevented, and that emergencies that arise should be tackled in the best way possible. Basically, society must be able to meet any threat and handle any situation that may occur. The central objective is ensuring that interruptions to important societal functions and large accidents will not entail large societal losses, to initiate measures preparing society to meet any challenge and securing emergency planning in general. The government has been working on strengthening the following:

- Preventive activities, including health, environment and security work.
- Ensuring that agencies with emergency responsibilities are able to tackle major incidents, including acts of terrorism and/or mass destruction.
- Coordinated and purposeful work with regard to ensuring critical infrastructure protection.
- Increased cooperation, including plans and exercises, between civil and military authorities.
- The ability of intelligence and security services to analyse, warn and prevent different forms of terrorism in Norway.

Crisis emergency planning organisational structure

The executive authorities must at all times be prepared to manage any crisis that may occur. A basis for crisis management is the corresponding responsibility when dealing with a normal everyday

²⁴²³https://www.regjeringen.no/globalassets/departementene/fd/dokumenter/rapporter-og-regelverk/fd_stotte-samarbeid_web_april.pdf

²⁴²⁴https://www.regjeringen.no/globalassets/departementene/fd/dokumenter/rapporter-og-regelverk/fd_stotte-samarbeid_web_april.pdf

situation or a crisis situation or war. This is in accordance with the principles of liability and decentralisation previously mentioned. However, in 2006 the government decided to strengthen the central crisis management by introducing 3 strategic elements. First, a ministerial level council to improve crisis coordination was created in what has been named the Government Crisis Council. Secondly, a clarification of overall responsibility for crisis management at the central level was established through the concept of a Lead Ministry. And thirdly, a support and assist function for the Lead Ministry and the Government Crisis Council is the task of the Crisis Support Unit.

The Government Crisis Council is chaired by the Secretary General in the lead ministry and is the top-level strategic coordinating body during crises in which there is a need for extensive coordination among several ministries. The Government Crisis Council handles coordination of affected ministries and furnishes coordinated information and necessary documentation to the government. All ministries must be prepared to accept the role of the lead ministry. The selection of the lead ministry is based on the principle of “most affected ministry” given the nature of the crisis, and the ministry that has best access to information and policy instruments for managing the crisis. The appointment of the lead ministry does not change constitutional responsibilities. The lead ministry is responsible for the regular coordination of crisis management at the ministerial level. In a crisis situation, the lead ministry shall:

- draw up coordinated situation reports.
- identify and assess the need for measures at the national level.
- handle necessary coordination with other ministries.
- ensure that coordinated information is given to the media and the population.

If there is uncertainty about which ministry is to coordinate crisis management, the prime minister in consultation with the relevant ministers will appoint the lead ministry in accordance with a recommendation from the Government Crisis Council. In such situations, the Ministry of Justice and the Police shall take the necessary initiative until something else is decided. With assistance from the Crisis Support Unit, the lead ministry will assume the secretariat function for the Government Crisis Council.

Ministry of Justice and the Police

The Ministry of Justice and the Police has a particular responsibility for coordinating the administration of work on safety, security and emergency planning in the civil sector in general. This includes responsibility for developing new national guidelines, making principal decisions regarding the Norwegian civil preparedness system, as well as administrative responsibility for the search and rescue service (SAR). However, each ministry is responsible for planning within its own sector. In most cases where central crisis management is necessary, the Ministry of Justice and the Police will be appointed lead ministry.

Directorate for Civil Protection and Emergency Planning (DSB)

In 2003, the government established the Directorate for Civil Protection and Emergency Planning consisting of the former Directorate for Civil Defence and Emergency Planning and the former Directorate for Fire and Electrical safety. The purpose was to create a basis for a wider range of expertise within the field of safety and security, and a common structure of authority from national to local level for the administration of fire, rescue and emergency planning. The directorate is the

executive body of the Ministry of Justice and Police with regard to civil emergency preparedness, and its formation is intended to result in more efficient use of resources and give the Ministry of Justice and the Police a more distinct role concerning the collective emergency and rescue services. The directorate's objective is to maintain a full overview of risk and vulnerability in society, promote measures that prevent accidents, crises and other emergencies, and ensure sufficient emergency planning and efficient management of accidents and crises.

Civil defence

The Civil Defence Organisation is an operative part of the DSB, and divided into 20 regional districts. 50,000 individuals serve in the Civil Defence Organisation, and about one third of these forces are ready to be utilised for peacetime emergencies. The DSB is responsible for the education and training of civil defence forces, which in peacetime are an important supplementary resource to the police and other emergency and rescue services, and regional and local authorities.

County governors

The county governors coordinate and supervise crisis emergency planning in their regions. The regional administration promotes emergency planning at the local level and participates in the planning of support of the military forces, as well as being responsible for environmental issues, agriculture and the inspection of municipal administrations. In a major crisis the county governor may also be responsible for crisis management coordination, and this authority increases greatly in times of war.

Municipalities

The municipalities are responsible for key societal services, and ensuring the continuation of these services during emergencies. This applies to local infrastructure, health services, care for the elderly and information to the public. The municipalities have primary responsibility for dealing with any peacetime emergency. Important tools in this respect are risk and vulnerability assessments and establishing local crisis management plans. All municipalities are required to have a fire service, and this is the municipality's primary resource for handling both fires and/or other types of emergency. Additionally, the municipalities are required by law to undertake civil emergency preparations for the health sector.

The police

The police are tasked with securing people, property, order, and public safety. It is the responsibility of the police to deal with accidents and incidents where life and health are at risk, and to ensure measures to avert danger and limit consequences. Crime prevention and investigation are also an important part of the societal safety and security work. Police reserve units may be used during major emergencies and disasters. Furthermore, the Police Directorate has an operative staff that may be established during major emergencies or acts of terrorism.

The rescue service

The Norwegian Search and Rescue (SAR) service maintains an integrated coordination structure, which means that each joint rescue coordination centre is prepared to handle land, sea or air

operations, rescue operations on offshore oil or gas installations, as well as operations requiring international cooperation. The collective SAR management at the two rescue coordination centres located in Bodø and Stavanger, and the rescue sub-centres lead and coordinate search and rescue operations within their respective areas. These centres consist of representatives from a number of government agencies who (together with the local chief of police who is in overall command) lead and coordinate search and rescue operations within their respective areas.

Military defence

The armed forces have the task, enshrined in the relevant laws and regulations and within the limits of their

competence and available resources, of providing support to society and the civil authorities in the event of major accidents, rescue operations, natural disasters and other situations posing a threat to life or health, or involving the risk of material damage. The armed forces must be capable of helping to prevent and counter possible assaults and attacks on the country's inhabitants, infrastructure and management functions. For instance, the armed forces conduct border guard activities along the Norwegian-Russian border in Finnmark. Armed forces units take part in search and rescue operations, and the Norwegian Coast Guard conducts maritime surveillance and control of Norwegian territorial waters and in the exclusive economic zone.

Voluntary organisations

Voluntary organisations provide important contributions during accidents at a local level, as well as emergency aid to other countries. Norway have nine voluntary rescue organisations on a national level, they are organised in "Frivillige Organisasjoners Redningsfaglige Forum" (FORF) (Voluntary organisations Rescue For a)

Den norska räddningstjänsten är lokalt förankrad och bygger till stor del på frivillighetsorganisationer. Norge har nio frivilliga räddningsorganisationer på nationell nivå som finns samlade i Frivillige Organisasjoners Redningsfaglige Forum (FORF).

These organisations are:

- Norges Røde Kors Hjelpekorps (Red Cross)
- Norsk Folkehjelp Sanitet (Medical assistance)
- Norske Redningshunder (Rescue dogs)
- Sjøredningskorpse til Redningsselskapet (Sea rescue)
- Rovernes Beredskapsstyrke (Home guard)
- Norske Alpine Redningsgrupper (Alpine rescue=
- Norsk Radio Ræle Liga (Radio support)
- Norsk Aeroklubb (Aeronautical support)
- Norsk Grotteforbund (Cave rescue)

In total these organisations has some 10 000 volunteers and in total some 500 local operative units. The majorities of the Norwegian municipalities (approx 350) host one or several of these organisations.

The local connection makes it possible for these organisations to function effectively in case of disruptions in the infrastructure such as road network and communications. The voluntary

organisations has some niche capabilities when come to operating in open terrain with good sustainability. This capability is often used when it comes to save life's.

Intelligence, counter-intelligence and security services

These services have responsibilities both in preparations against threats to important societal values and in relation to crisis management. Focus is on prevention against a broad spectrum of societal threats, and they consist of the Defence Intelligence Service, the Police Security Service and the National Security Agency.

The National Security Agency reports both to the Ministry of Defence, as its superior authority, in cases concerning military matters and to the Ministry of Justice and the Police, as its superior authority, in cases concerning the civil matters.

1.2.3 Civil military cooperation

Civil military cooperation in Norway is based on the Total Defence concept, which states that there will be a “total mobilisation of all possible civil and military resources to maintain the will to defend oneself, to offer the greatest possible resistance to aggression, to protect life and health, to maintain an organised society and to prevent damage caused by peacetime crises and/or war”. Greater emphasis is now being placed on armed forces support to civil communities. In crisis situations in peacetime, this support will normally take the form of supplementary assistance to the civil authorities when the crisis is of such a nature that the particular authority responsible for that sector is unable to manage the crisis on its own. The concept implies interdependence and close cooperation between civil preparedness and military defence. Civil preparedness measures may be used during peacetime in efforts to avoid or limit serious incidents when sufficient aid cannot be obtained from the ordinary aid organisations. In addition, civilian defence provides assistance to the police, fire brigades, health services and other public bodies and non-governmental organisations. Furthermore, in the case of a full military mobilisation the army will need substantial resources from civilian society, and it is therefore of vital importance that civilian society functions well in order to both supply the military and keep everything else running.

1.2.4 Monitoring and analytical support to policy making; R&D

DSB provides studies', auditing and guidelines along with the county boards. There is also for example FFI, Norwegian defence research institute.

1.3 Financing

1.3.1 Investing in preparedness

No aggregated sums have been identified since it is various authorities at local level that fund different sectors of preparedness. Some statistics at national level can be found at www.ssb.no

1.3.2 Investing in consequence management

For the private sector most have companies have insurance.

For the public sector the state pays when there has been a major rescue operation. All other sectors have to pay their own costs. The “polluter pays” is the fundamental rule.

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

Individuals get help from the municipality. POSOM groups (group that consists of representatives from various municipality sectors and other societal functions such as church) and other personal help are organised so that if need you get a temporary shelter. Voluntary organisations, like the Red Cross are also assisting.

1.4.2 Departmental Lessons Learned systems

The municipalities and county boards have a common organisation to share different experience.

1.4.3 Centralised (national) Lessons Learned system

There is no single centralised system. Every sector and agency has their own responsibility. SSB, Statistics Norway, is the national agency that collects statistics from a variety of sectors. Some sectors like Dangerous Goods have several agencies and actors that collect statistics and experiences. Below are some examples.

In the spectra of social and health care there is a national lessons learned system, both for the municipalities and Hospital areas.

To investigate major accidents DSB provides reports and recommendation to improve and provide opportunities for lessons learnt.

1.4.4 International exchange for Lessons Learned

Some examples:

DSB, together with other governmental agencies, arrange observation studies when they identify incidents of interest to learn from.

The Nordic countries have also ongoing cooperation in different areas. Nordred Agreement (www.nordred.org), HAGA declaration (named after castle) and Nordhels (www.nordhels.org) are some of them.

CTIF is an international organisation that has national sub-organisation. The purpose is to learn from each other and incidents that has append, from fire to hazardous materials. <http://ctif.org/>

1.4.5 Regular policy reviews

After every election there is a review of the Risk and vulnerability analysis. The level of ability is then reviewed and the new policies are set at the local level.

1.5 Resilience

Responsible for working with the protection of vital services and critical infrastructure rests in accordance with the principle of responsibility of each sector, as well as the owners and proprietors of businesses.

At the national level a national strategy and action plan for the protection of vital infrastructure as well as guidelines has been produced.

To ensure a structured approach to resilience implementation Norway has adopted standard NS-ISO 22301.

1.6 Information sharing and data protection

Personal information Law (PUL) and Inspire directive are implemented.

Each municipality has responsibility to ensure the safety of its citizens. The Social office, in the municipality is always involved when evacuation needs to be done.

Each sector is responsible to comply within the law, and secure that necessary information can be shared.

Each citizen has the right to know what kind of threats that normally exist within the municipality, like the risks for flooding or Seveso plants.

There is no national register of voluntary personnel. Every Voluntary organisation in itself has its own register of members.

One example is FORF, Non-Profit Organisations' Rescue Forum, which organizes several voluntary organisations.

Kriseinfo.no is a web site that gathers information on regular bases from different sites, regarding different warnings and information to the public about how to be prepared and find information.

2 Legislation

2.1 Crisis (emergency, disaster) management concept

The foundation of CM manifested in the Norwegian law.

The responsibility principle

The person or organisation that is responsible for an activity under normal conditions is also responsible for such operations in an emergency situation.

The equality principle

Operations should, as far as possible, be organized in the same way during emergency situations as under normal conditions.

The proximity principle

Emergencies should be handled at the lowest possible level in society. On a central level the Government is the body responsible for this area, on the regional level it is the County Administrative Board and on the local level it is the municipalities.

In the different legislation rolling at all levels and sectors, the method to cope with a major incident is based on cooperation.

2.2 General crisis (emergency, disaster) management law²⁴²⁵

Legislation concerning Norwegian civil emergency planning may be divided into two pillars consisting of acts, prepared delegations of powers for law-making, regulations and directives. The first concerns the protection of the population in times of hostile acts and war, and the second relates to peacetime emergencies. The following acts provide the main framework for administrative operations in times of crisis/war:

- The War Act of 15 December 1950
- The Supplies Act of 14 December 1956, made valid for a peacetime crisis in 1974
- The Act on Civilian Defence of 17 July 1953. This act applies both in war and during peacetime, and is currently under revision.
- The Security Act of 20 March 1998
- The Act of Social and Health Preparedness of 23 June 2000

There is no overall legislation concerning civil protection in peacetime. Many government agencies and private organisations do however have civil protection tasks and are responsible for civil emergency planning, and every part of the administration must ensure that the necessary detailed emergency plans are put into effect. This is mainly regulated through laws and regulations concerning specific sectors.

The following legislation is important in this regard:

²⁴²⁵ http://ec.europa.eu/echo/files/civil_protection/vademecum/no/2-no-1.html#over

- Police Act of 4 August 1995,
- Fire Protection Act of 8 December 2000, implemented on 1 January 2001.
- The Fire and Explosion Prevention Act of 14 June 2002
- The Planning of Buildings Act of 14 June 1985, amended 24 November 2000
- Protection Against Pollution Act of 13 March 1981
- Regulation of 4 July 1980 on the main principles for the organisation of the Search and Rescue Services
- A new Act proposed on Municipal Responsibility for Sectorial Risk, Vulnerability Assessment and Emergency Plan, that was implemented 1 January 2010
-

2.3 Emergency rule

Municipalities' Rescue Services always have to have an incident commander. The incident commander has far reaching powers to engage people and resources that he/she need to handle the incident, but not without paying for it.

The Hospital area's representative in the health care authorities during a pandemic or for specified dangerous diseases also have far reaching powers, for example to isolate people.

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

DSB is a national coordinator to help the municipalities and other actors to facilitate the management of the incident. Regarding legal arrangements and regulations see 2.2.

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

None

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

There is no specific legislation regarding NGO's involvement, but is on voluntary base, the "Frivillige Organisasjoners Redningsfaglige" Forum, forming a cooperation with nine major organisations.

2.7 Legal regulations for international co-operations

There is a number of different agreements that regulates the international co-operation, especially in the Nordic area. Norway also works actively within UN, NATO and EU. DSB is the focal point that co-

ordinates international co-operation. Within EU Norway is a partner of the European Union Civil Protection Mechanism.²⁴²⁶

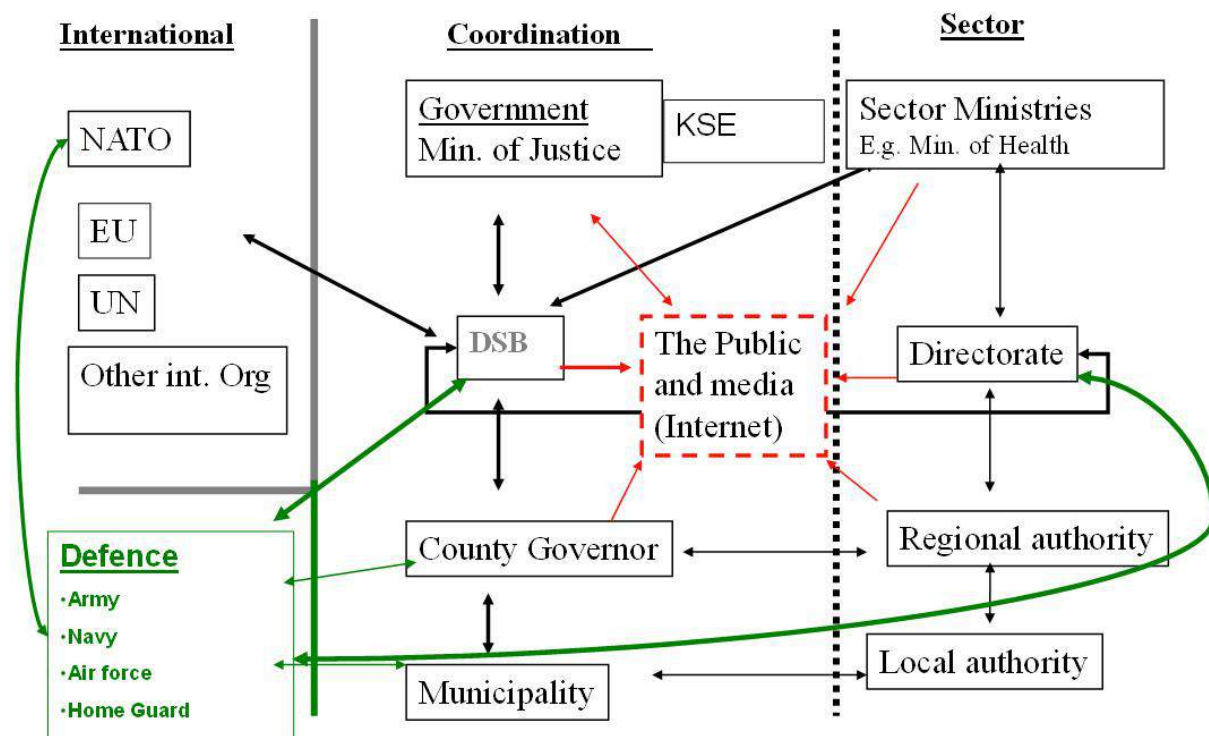

Figure 69: Principle lay out of Norway's international co-operation within crisis management

2.7.1 Nordred agreement

This is a framework for co-operation regarding rescue operations between the Nordic countries. It is meant to prevent accidents and reduce injuries to people, property and the environment. Participating countries are Denmark, Finland, Iceland, Sweden and Norway. The agreement's article 6 regulates the states obligations:

- Inform on new legislations and organisation within the rescue area
- Contribute to development and co-operation regarding rescue capabilities
- Ensure active contacts with necessary agencies and arrange meeting when necessary.

2.7.2 NORDEFCO-Nordic Defence Co-operation

The NORDEFCO-agreement is aiming at strengthen the countries defence capabilities, identify synergy effects in the defence area and to foster efficient solutions. Members are Sweden, Finland, Denmark, Iceland and Norway.

2.7.3 Haga declaration

Haga Declaration of 2009 aims to enhance the Nordic cooperation to prevent, reduce and manage the consequences of major accidents and disasters. The declaration covers the following areas:

- Rescue services
- Training and education

²⁴²⁶https://www.regjeringen.no/globalassets/departementene/fd/dokumenter/rapporter-og-regelverk/fd_stotte-samarbeid_web_april.pdf

- CBRN-Develop the capability to handle major accidents in this area
- Crisis communication to the general public
- Exchange experiences regarding volunteer organisations use in crisis management
- Research and development

2.7.4 Haga declaration II – a robust nordic region

This agreement from 2013 aims at even further developing the Nordic countries ability to prepare for and handle societal disruptions.

2.7.5 Nordic Medical agreement

This agreement aims at reinforce the ability to assist each other with medical assistance when the country's own resources is not enough.

3 Organisation

3.1 Organisational chart

A schematic skis of how a major rescue operation can be organised

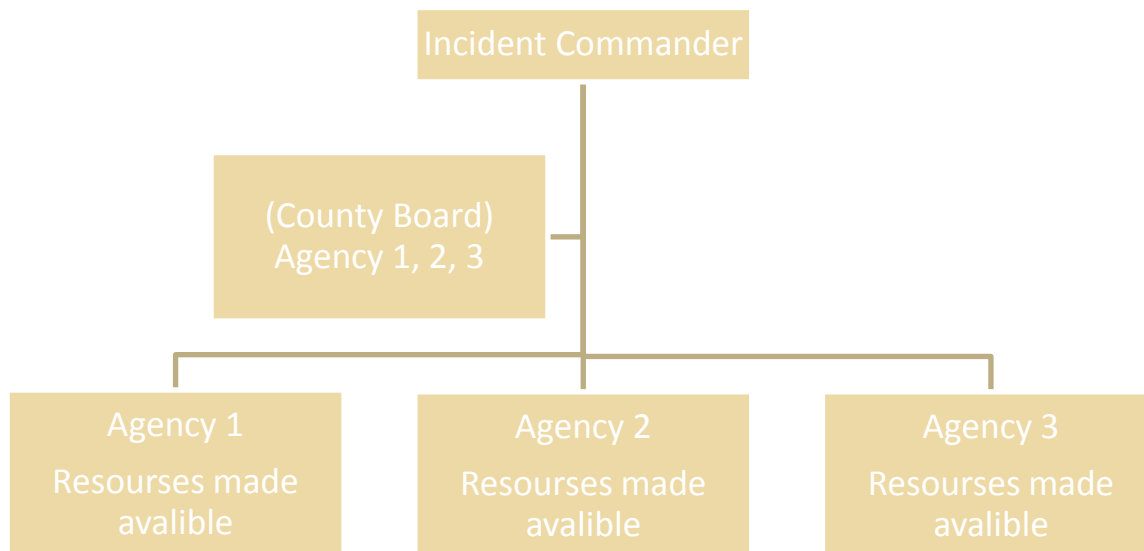

Figure 70: Organisation of a major rescue operation.

- National/ IO authority for emergency and disaster management; chain of command and high-level decision-making:
The incident commander is the commander during a rescue operation. The Commander can request more recourses and help. All tactical and operational decisions rest at the local level even when there is a crisis. The politicians may need to make funding available to handle the incident.
- Interdepartmental (inter-ministerial) emergency and disaster management authority:
The ministries have a group to keep them informed. DSB and other affected agencies inform the government on regular base during a major incident. They can make more resources available, if necessary.
- National permanent emergency and disaster management unit(s)/ formations; first responders:
There are no national First responders, except for:
Special police forces, mountain rescue, sea rescue, nuclear accident and maritime environment rescue operation.
- Planned/ anticipated use of specialised military assets:
Civil agencies and rescue service can ask for the recourses the military have. The local first responder's organisations may also have pre planned cooperation, and then the military, if they agree to help, is under the command of the incident commander.
- Departmental emergency and disaster management arrangements:

Each department need to have their own disaster management arrangement, including pre planned cooperation with others. It is each organisations own responsibility.

- Other national civil service organisations:

DSB is appointed to coordinate and encourage cooperation between national civil service organisations: special police forces, mountain rescue, sea rescue, nuclear accident and maritime environment rescue operation.

- Provincial (regional) authorities and arrangements for emergency and disaster management: County Boards, Hospital Areas and municipalities are obliging to plan. Local (municipal, town) authorities have arrangements for emergency and disaster management

- Volunteers and volunteer organisations; specialised NGOs:

Frivillige Organisasjoners Redningsfaglige” Forum organises voluntary organisations that have capacity to be engaged in search and rescue operations both on land at sea. They also have flying capacities to conduct visual reconnaissance.

- Private businesses:

Private businesses are obliged to protect themselves and their property. They are also obliged to prevent further damages, if possible.

In some sectors there are more regulations, transport of dangerous goods, Seveso plants, energy sector etc.

Below is a scheme showing key players and their relationships. The support is going towards the incident commander at the local level. The levels are not chain of command or a hierarchy; it is a way of describing local, regional and national agencies and their respective responsibilities.

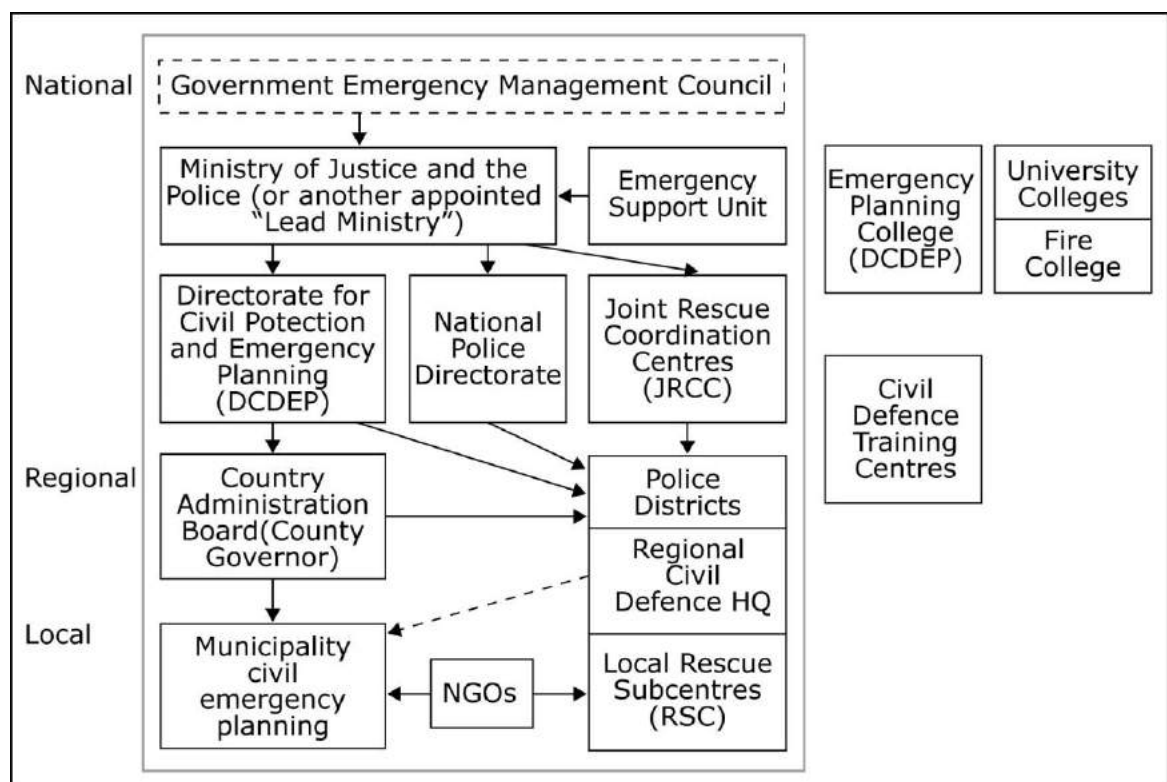

Figure 71: General lay out of how Norway organise its Crisis Management.

3.2 Organisational cooperation

- Operational cooperation (e.g., coordinated CM operations planning and response at national level, cross-border operational cooperation, operational cooperation within the EU)
 - *How priorities are assigned in the case of simultaneous occurrence of events?*
The municipalities prioritise, together with the incident commander, the resources. The County Board can support with prioritization of national and international recourses.
 - *How cross-border collaboration is organized?*
Under the Nordred agreement, municipalities on both sides of the border have local agreements. They have been authorised by the Nordic countries governments to sign agreements on cooperation in the aim of assisting each other, both in crises and during smaller incidents, like fires and traffic accidents.
- Cooperation and coordination in CM capability development (coordinated departmental CM capability planning, nationally centralized CM capability planning, multi-nation/ EU-level coordination of capability planning and capability development)

Cooperation is vital to handle all incidents. The incident commander is responsible to organise the cooperation and all parties are responsible to cooperate and make resources available for the incident commander. Every sector is responsible to handle their part of the incident.

Cooperation is a vital part of the legislation in the Nordic countries legislation. The Nordred agreement and Haga declaration means that there exists several on going cooperation, both at local, regional and national level. CM is a challenge due to the decentralised CM system. There is an ongoing exchange of experience and sharing of knowledge.

On EU-level DSB is represented in the Module group discussing mainly HNS, Host Nation Support, and the EU Civil Protection Mechanisms Voluntary Pool.

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

Depending on the risk and responsibility each organisation has SOPs or not. There are guidelines and handbooks that DSB produce for the municipalities rescue service to use. Other sectors have their governmental agencies that produce handbooks and guidelines.

4.2 Operations planning

Depending on the risk and responsibility each organisation has its own operations planning. The auditing that the County Boards and DSB do of the plans for operation, highlight the organisations that do not meet a minimum level of safety that the public can expect.

4.3 Logistics support in crises

Depending on the outcome of the risk assessment and the organisations responsibility each organisation has to plan for their own needs of logistics support.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

There are national procedures how to alert municipalities, county boards and central alarm system. Kriseinfo.no is a web site that gathers information on regular bases from different sites, regarding different warnings and information to the public about how to be prepared and find information.

5 Capabilities

5.1 Human resources

https://www.politi.no/nord_trondelag/redningstjeneste/Tema_920.xhtml

Civil defence has 8 000 men and women that are educated and exercised divided in to 20 districts.

5.2 Materiel (non-financial) resources

- What specific non-financial resources (dedicated equipment etc.) have been allocated to crisis management (central, regional, local preparedness and response)?
 - All sectors and levels have their own pre planning to handle an emergency.
 - DSB has helicopters that can be used in forest fires.
 - The energy sector has their recourses, like personnel on call.
- Permanent reserve stocks (fuel, food, medicines, tents, blankets, etc.)
 - Stock of medicines (Nationally funded)
 - Municipalities and County Council may have their own.
- Planned /anticipated/ involvement of specific military assets (e.g. reconnaissance assets, search and rescue helicopters, fire-fighting planes/helicopters, CBRN, etc.)
 - These assets exist among civil agencies like the Norwegian Coast Gard, Police, and Rescue Services.
- Incident commander during a rescue operation, can if deemed necessary mobilise or commandeer private assets during crises.

5.3 Training

- National, local and departmental exercises
 - DSB organises a table top crises management exercise every third year for national agencies.
 - Every County Board organise on regularly base table top exercise in their respective region.
 - Every municipality organise on regularly base table top exercise in their respective region.

<http://www.sivilforsvaret.no/Distrikter/Nord-Trondelag/Samvirke/LRS-aktiviteter/Ovingsutvalg-i-lokal-redningssentral-LRS/>
- Centralised specialist training
 - DSB organise training for UN, EU, Norwegian national, regional and local agencies.
- Training of volunteers and NGO personnel
 - FORF among other voluntary organisations organises training, with funding from DSB
- Cross-border and multinational training activities

-Barents Rescue is a major exercise between Sweden, Norway, Finland and Russia every third year. But there are many other exercises done every year.

- Is there a certification system? What standards are used to define specialists' training requirements?
 - Norway does not have a certification system for specialists training requirement. The employer may implement ISO standards if they find it appropriate.

Are there specialised training programmes for high-level decision makers?

- Courses are offered in crisis management and crisis information.
- Strategic Crisis Management, 5 meaning
- Civil Protection, Emergency Planning, and Civil and Military Cooperation, 5 ECTS

National training centres

National Emergency Planning College

The college is organised under DSB

Norway's fire academy <http://nbsk.no>

5.4 Procurement

5.4.1 Procurement regulation

- What needs to be procured? E.g. goods or services, including trainings?

Procurement regulation in the public sector is strict. Best value for many is the basic rule. Cooperation between the different agencies in the public sector is however encouraged
- Which EU directive on procurement is applicable on procurement of CM tools and related?

Are all articles of the directive applicable or are some articles not implemented?

-All articles are implemented and needs to be followed. If it is a sudden unexpected crisis you are allowed to buy what you need to handle the situation.

5.4.2 Procurement procedures

The public sector at all levels has their own procurement organisation that deals with procurements. A common web site www.anskaffelser.no is available for national an agency.

5.5 Niche capabilities

JRCC has flying capacities for sea rescue operations.

www.hovedredningssentralen.no/english/

Civil defence has resources, organised in to 20 districts.

The Norwegian Coast Guard

TURKEY

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: ECORYS (Laura Birkman, Rachel Beerman and Linette de Swart)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by MSB and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

Turkey is prone to a range of complex emergencies – including both natural and manmade (industrial) disasters, due to its tectonic, seismic topographical and climactic structure. Turkey is subject to floods, landslides, avalanches, forest fires and, most importantly, earthquakes. In Turkey, the policy framework concerning natural disasters was conceived in the aftermath of the Erzincan Earthquake of 1939 with the "Measures and Assistances to Be Put into Effect Regarding Natural Disasters Affecting the Life of the General Public" no.7269 of 1959. The disaster management structure of Turkey underwent an important shift in 2009 with the establishment of the Disaster and Emergency Management Presidency (AFAD), the national level competent authority concerning disasters and emergencies. The AFAD Presidency undertakes the coordination function at the centre, while the responsibility for implementing the policies and operations lies with the provincial organisations – the Provincial Disaster and Emergency Directorates. AFAD is responsible for coordinating nearly all phases of disaster management including disaster risk reduction (DRR) at the national level, and installs rules, regulations, and guidelines for preparation of DRR plans at sub-national levels. The operating administrative level becomes higher as the extent and severity of disaster grows in scale and scope. While the reforms introduced in 2009 transferred significant responsibility for DRR and disaster response to the provincial and municipal levels, both of which now come under the responsibility of the province and district, this has not been implemented in practice. The system may therefore be termed both central and decentralized but is coordinated from central bodies and functions through AFAD. The state has no legal responsibility to fund the costs for national investments in preparedness, whereas investments in consequence management come directly from the AFAD budget (response and relief) and the national compulsory earthquake insurance scheme. Niche crisis management capabilities include campsite construction and canine-assisted search and rescue for earthquakes and avalanches.

WMO	World Meteorological Organization

1 Policy

The Crisis Management and related²⁴²⁷ Policy is designed to effectively coordinate the use of national and community, public and private resources, as well as those provided through international co-operation, to protect life and property before, during and immediately following a major crisis triggered by natural disasters or man-made catastrophes. It is placed into operation whenever an emergency affecting the country, regions or locals cannot be controlled through routine, daily and normal channels and procedures.

1.1 Risk Assessment

1.1.1 Key Risk Areas

Turkey is prone to a range of complex emergencies – including both natural and manmade (industrial) disasters, in particular, floods, landslides, avalanches, forest fires and, most importantly, earthquakes, due to its tectonic, seismic topographical and climactic structure. Table 47 summarises the record of natural disasters, including their human and economic impact in Turkey during the last 30 years. Table 1 shows the percentage breakdown of these natural disasters.

Table 47. Summary of Natural Disaster, human impact and economic damage.

Type of disaster	No. Events	No. Killed	Total affected (4)	Damage (000 USD)
Earthquake (seismic activity)	35	19841 (566.9)	4387715	\$24,509,800
Epidemic (1)	3	35	380	-
Extreme Temperature (2)	7	100	8450	\$1000 (5)
Flood	29	508	1715320	\$2,180,500
Mass movement dry	1	261	1069	-
Mass movement wet (3)	9	332	13487	\$26,000
Storm	7	70	1639	-
Wildfire	5	15	1150	-
(1) Include Bacterial and Viral Infections diseases (2) Includes cold waves, heat waves and extreme winter conditions (3) Includes avalanches and landslides (4) Refers to Sum of injured, homeless, and affected (People requiring immediate assistance during a period of emergency; it can also include displaced or evacuated people). (5) Amount includes only heat waves.

²⁴²⁷ E.g. in Germany the responsibility for crises of different types is defined by the “Grundgesetz” (German Constitution).

Figure 72: Distribution of natural disasters in Turkey, 1985-2014²⁴²⁸

Earthquakes have, by far, the greatest impact to the population and infrastructure of Turkey. Turkey ranks third in terms of human losses resulting from earthquakes, and eighth in terms of the number of individuals impacted by earthquakes (AFAD Earthquake Department Database).

On average, Turkey experiences at least one earthquake each year with a magnitude between 5 and 6. The majority of the population (70%) lives in seismically active, earthquake-prone areas, where major economic investments and significant vital infrastructure (75% of the country's industrial plants) and related construction take place (AFAD, 2013). Economic losses caused by natural disasters, either directly or indirectly, underscore the necessity of effective disaster management in Turkey.

Turkey is also prone to floods, which are the most frequent and costly natural disasters in Turkey in terms of human impact and economic loss. According to the historical flood database, 4,067 flood occurrences in Turkey have been recorded between 1955 and 2009, causing 1,400 deaths and serious damage to 30,800 dwelling units. Landslides, rock-falls and avalanches have also caused significant human and economic loss during the last 50 years. From 1955 to 2009, landslides affected 5,472 settlements and killed 200 people. In this period 68,300 dwelling units were relocated to safer places. Landslides frequently affect inner and eastern Anatolia, and particularly the Black Sea regions in Turkey. According to AFAD data in 2013, 25% of the country is exposed to landslide hazards, with 11% of the population located in landslide areas. Finally, extreme winter conditions, cold waves and heat waves have affected thousands of people and killed several hundred during the years. The direct economic losses of such weather conditions (heat waves) are not taken into account in the EM-dat database (WMO, 2012; AFAD website).

²⁴²⁸ EM-DAT: The OFDA/CRED International Disaster Database, www.emdat.be - Université catholique de Louvain - Brussels - Belgium

1.1.2 Risk assessment mechanism and procedures

The Disaster and Emergency Management Presidency (AFAD), the national level competent authority concerning disasters and emergencies, is responsible for preparing multi-hazard assessments, including maps and micro-zoning mapping studies, which are then developed at the regional level and in particular for urban areas. The government has invested significant resources in a number of projects aimed at determining the natural and man-made risks that threaten the country and on how to manage them. An important step in this regard occurred with the establishment of the Turkish Disaster Data Bank in 2014. The Turkish Disaster Data Bank project, conducted by the Middle East Technical University (METU) Disaster Management Centre and AFAD, aggregates data on historical risks to demonstrate the nation's vulnerabilities in order to identify strategic priorities for future risk mitigation. A second important project, the Disaster Risk Modelling project, was launched in early 2014. This project will use mathematical models to perform predictions of probable disasters.²⁴²⁹ AFAD uses the data collected to determine the country-level strategy for disaster and emergency situations.

Numerous risk assessments exist, however they focus primarily on geophysical hazards - and generally limited to earthquakes - and on the Marmara region. Flood hazard maps have only been prepared for West Black Sea Region based on the floods of 2010. These maps were produced by Turkish State Hydraulics Works (DSI). A major limitation is therefore the fact that no national level multi-hazard risk assessments have been developed to date with a common methodology available to inform planning and development. According to current legislation and strategic planning, AFAD has commenced efforts towards the development of the definition of risk assessment standards for the full spectrum of disasters. AFAD is tasked with developing risk assessment guidelines for local governments and providing technical support to local authorities to carry out risk assessments in their jurisdiction. These local risk assessments are then provided to AFAD by the local governments that have launched risk assessment studies at the local level. AFAD has acquired technical capacities in GIS and databases development and management (Department of Data Processing) (WMO, 2012)

The following hazard maps and risk scenarios were available as of 2011:

- The National Seismic Zoning Map of Turkey (Earthquake Research Department).
- Earthquake Prediction Models (Laboratory Division of the Earthquake Research Department, developed with the support of Germany).
- GIS for assessing the potential extent of floods and the scope of earthquake related damage based on fully digitalised nationwide geological maps (General Directorate for Mineral Research and Exploration).
- Hydrometeorological hazard risk maps, which are not systematically produced over the entire country but developed by the Turkish State Meteorological Services (DMI) and Turkish State Hydraulics Works (DSI) when requested by a community.
- Forest fire susceptibility maps at the national level (General Directorate of Forestry).

²⁴²⁹ Statement by H.E. Ambassador Mehmet Ferden Cariki, Permanent Representative of the Republic of Turkey to the UN Office at Geneva and Other International Organisations in Switzerland (2014). First Preparatory Committee of the 3rd World Conference on Disaster Risk Reduction, 14-15 July 2014, Geneva.

- Maps showing the distribution of landslides, rock falls and snow avalanches affecting residential areas at the national level (UNDP/WMO, 2011).

Risk assessments with higher resolution are limited to the Greater Municipality owing to the high seismic risk in Istanbul (i.e., the disaster risk reduction (DRR) plan of the Istanbul Metropolitan Municipality (IMM)).

The following databases are available, which are important for characterizing the earthquake risk. They contain geological, geotechnical and structural engineering data provided by GIS systems and are used in order to carry out a detailed mitigation study:

- **Earthquake Source Database:** Identifies the seismic sources, characterized by their geometry, maximum magnitude, recurrence relationship, and attenuation from source to site, that define the earthquake threat for the region (e.g. Istanbul). Data may include probability of rupture on a fault segment conditional based on the timing of previous ruptures thus providing time-dependent hazard estimates.
- **Geotechnical Hazard Database:** Comprises a soil classification scheme and site characteristics, including the potential for liquefaction, landslide, and fault rupture in the study region.
- **Vulnerability Database:** Defines the engineering principles that relate ground motion characteristics and damage ratio for different types of structures in the study region. (UNDP/WMO, 2011)

AFAD has access to two different databases for flood-related hazards.

- **Turkey National Disaster Archive Project (TUAA):** Developed by the former General Directorate of Disaster Affairs, TUAA is the National Disaster Inventory System. This database includes (i) date and place of the event, (ii) affected area, (iii) affected buildings, and (iv) affected people (number of dead, number of injured people).
- An archive of the data collected in collaboration with the DSI since 2009.²⁴³⁰ Since 2011, AFAD and DSI have been working together to develop a systematic approach to flood data collection and hazard mapping. AFAD uses this data to determine the country-level strategy for disaster and emergency situations.

1.2 Policy and Governance

On 16 December 2009, the new department called “Disaster and Emergency Management Presidency” (AFAD) was established under the Prime Ministry by Law No. 5902. to take necessary measures for an effective emergency management and civil protection issues Turkish nationwide. AFAD is authorized to act in all disasters and emergencies situations in the country. It has the mandate to produce and implement policies on: (i) pre-incident: preparation, mitigation and risk

²⁴³⁰ For more information on hazard analysis and mapping for hydrometeorological risk assessment, see WMO (2012), “Meteorological, Hydrological and Climate Services to Support Disaster Risk Reduction and Early Warning Systems in Turkey.” In *Strengthening Multi-Hazard Early Warning Systems and Risk Assessment in the Western Balkans and Turkey: Assessment of Capacities, Gaps and Needs*, 211-212.

management before the occurrence of events, (ii) during incident: response during the event, (iii) post-incident: recovery and reconstruction after the event, and (iv) and for the effective implementation of these activities across the country.

1.2.1 Strategy scope and focus

Since the early 1960's, Turkey had in place a range of regulations and implementation arrangements concerning disaster and crisis management which referred to all phases of the disaster and crisis management cycle, however disaster and emergency management policies have been more reactionary in nature, resulting in a strategy focused on the response and the recovery and rehabilitation phases, rather than prevention and reduction of disaster risks. The experience of the 1999 Marmara Earthquakes made clear the insufficiency of existing arrangements. Since then, the focus has begun to shift to risk mitigation and prevention.

The **AFAD Strategic Plan 2013-2017**, adopted in 2013, introduced a new disaster management model in Turkey, shifting the priority from “Crisis Management” to “Risk Management”. The new model, today called the “Integrated Disaster Management System”,

*provides for identification of hazards and risks in advance to mitigate the losses caused by disasters and emergencies, taking measures to prevent or minimize possible losses before the disaster takes place, ensuring effective response and coordination, and carrying out post-disaster recovery works in an integrated manner.*²⁴³¹

The integrated disaster management system consists of 4 axes: **Mitigation, Preparedness, Response, and Recovery**. The activities and outputs for each of the axes are presented in table 2

²⁴³¹ AFAD website, accessed 25 September 2014.

Table 48. Integrated Disaster Management Cycle: Actualizing the integrated disaster management system

Mitigation axis...	Preparedness axis...
<p>Covers activities oriented to reduce or eliminate the likelihood of loss or lessen its intensity through risk evaluations. Under this axis raising public awareness on disaster risk, developing organizational structures and legislation implemented before and after disasters, and developing research and development policies and strategies in line with needs and priorities are actions covered. In this framework, the following outputs constitute the basis of mitigation activities:</p> <ul style="list-style-type: none"> • Risk management and mitigation plans based on disaster and emergency studies implemented at country level, • National Disaster Management Strategy and Action Plan, • Determination of possible disaster and emergency regions and announcement of preventive measures, • Plans, projects and zoning principles for areas likely to suffer damages, • Information and evaluation reports on disasters and emergencies taking place in the country and abroad, • Principles of in-kind, in-cash and humanitarian aid, • International exchange of information, • Arrangements oriented to inform, educate and raise awareness of the public on disasters and emergencies, and • Standards of disaster and emergency services 	<p>Implicates the preparation and training activities for intervention in disasters through coordination of people and institutions. In this phase AFAD's purpose is to ensure full scale preparedness against disasters. In this framework, the following outputs constitute the basis of disaster preparedness activities:</p> <ul style="list-style-type: none"> • Arrangements oriented to inform, educate and raise awareness of the public on disasters and emergencies, • Emergency aid and logistic service plans, • Disaster and emergency plans for miscellaneous groups, • Information, communication, forecasting and early warning systems, • Resource management system, • Risk maps, • Research and development activities, • Training of response teams, • Exercises concerning disasters, • International cooperation, • Generalizing insurance services, • Ensuring conformity of NGOs to disaster-related service standards, and • Ensuring conformity to standards of disaster and emergency management centres' common communication and information systems
Response	Recovery
<p>Covers the activities to determine and meet all necessities that may arise as a result of disasters and emergencies, as fast as possible. In this framework, the following services are crucial in ensuring coordination and effective job distribution by AFAD for quick delivery:</p> <ul style="list-style-type: none"> • Communication • Transportation, • Protection from fire and hazardous substances, • Search and rescue, • Safety and traffic, • Health and sanitation, • Damage assessment, • Infrastructure reparation, • Safety of food, agriculture and animal, • Emergency shelter, • Nutrition, • Interment, • Debris removal, • Social support, • Logistics and maintenance, • Information management, and • Emergency aid funding 	<p>Covers activities to normalize and, if possible, further improvement of all life systems that have been disrupted due to disaster or emergency, in the fastest and most accurate way. In this framework, the following outputs and services are essential in ensuring return to normal social life and increasing disaster resilience:</p> <ul style="list-style-type: none"> • Measures to normalize life after disaster and emergency, • Safe site selection, • Disaster housing, • Credit to those building their homes, • Zoning, planning and project arrangements for disaster prone locations • Post-disaster safe re-building

Source: AFAD Strategic Plan 2013-2017

In addition to the AFAD Strategic Plan, the Presidency has developed and begun implementation of three additional national strategic and action plans (all of which are inter-related with the AFAD Strategic Plan). These plans are:

- National Earthquake Strategy and Action Plan (2013-2023)

- National Climate Change Strategy / National Climate Change Action Plan (2011-2023)
- Turkey Disaster Response Plan

Mechanism For DRR in TURKEY

Figure 73: Mechanisms for DRR in Turkey²⁴³²

Together, these plans build Turkey's road map until 2023.²⁴³³ AFAD's Recovery department has drafted a National Recovery Plan that is waiting to be confirmed as of *National Progress Report on the implementation of the Hyogo Framework for Action (HFA) (2011-2013)* (see AFAD, 2013b). The plans are described in greater detail in 4.2.

1.2.2 Monitoring and analytical support to policy making; R&D

The AFAD Strategic Plan 2013-2017 identifies monitoring of disaster losses and hazards, and related R&D as critical to its approach to disaster risk reduction. The provincial directorates can develop project plans and submit them to the Ministry of Development for Projects, but the Presidency is the main responsible body for the development of Projects. According to the Plan, AFAD fulfils its duties in this regard by:

- Collecting necessary basic data on disaster risks and developing the necessary planning tools in order to monitor the relationship between the development policy and disaster risk,

²⁴³² AFAD (2014) Presentation at the 5th International Disaster and Risk Conference IDRC 2014, 24-28 August 2014, Davos, Switzerland.

²⁴³³ Statement by the Ambassador M.F. Cariki to the UN, July 2014.

- Collecting and disseminating data required for making timely and effective development plans and policies to reduce disaster risk,
- Re-orienting disaster risk reduction sectors, mobilizing and warning the public.

At the national level, Turkey has in place a number of systems for systematically reporting, monitoring and analysing disaster losses and hazards: the National Earthquake Observation Network, operated by AFAD, produces data that is stored within the National Earthquake Data Center's database and shared with the public; The Flash Flood Early Warning Project, which covers 6 countries (Turkey, Azerbaijan, Armenia, Georgia, Bulgaria and Syria) in the Black Sea and the Middle East is being conducted in cooperation with the World Meteorology Organization (WMO) and the American Hydrology Research Centre (HRC). The output is the Flash Flood Early Warning System test products; Finally, fires are monitored by the Fire Operations Centre.

In 2012, Turkey initiated a National Earthquake Investigation Programme (UDAP). With this programme, AFAD will fund earthquake investigation projects of universities and governmental institutions between 2012 and 2023.²⁴³⁴ The Annual budget for 2012 was set at 1.000.000 USD, and will increase annually. The budgets for 2013 and 2014 were 1.076.000, 1.654.000, respectively; and the budget for 2015 is set at 1.815.000 USD. In addition to this, international financial resources have been provided by World Bank, EU, JICA and Islamic Development Bank, etc. to be used in the DRR projects.

A number of universities, particularly Karadeniz Technical University, were involved in more than thirty research projects and studies between 2011 and 2013 on reducing the disaster risks. One such project is the Disaster Emergency Management Information System (AFAYBIS) project that is being carried out by YTU. The AFAYBIS project aims to support both disaster management and e-Government studies in Turkey. During the analysis stage of the project, approximately 50 institutions related to disaster management are under examination (AFAD, 2013b).

At the local level, research studies have been carried out in, e.g. Istanbul which provide estimated risk parameters to the population, buildings, transportation systems, and lifelines. Parameters have also been developed to estimate the potential impact of risks on essential facilities, services and emergency response. Inventory data on urban elements at risk have been obtained from a range of sources, including from relevant state/public institutions, private companies, specific studies and from satellite imagery, and are used in the following projects and studies:

- Disaster Prevention / Mitigation Basic Plan in Istanbul including Seismic Microzonation in the Republic of Turkey – (JICA – IMM).
- Earthquake Risk Assessment for Istanbul Metropolitan Area – Bogazici University (supported by the American Red Cross) (BU – ARC).
- Earthquake Risk Assessment for Industrial Facilities in Istanbul – Bogazici University (supported by Munich-Re Group)

²⁴³⁴ Regarding the UDAP program, 6 projects (implemented by academics) had already been launched by the end of 2012.

- Turkish Improvement of Natural Hazard Insurance and Disaster Funding Strategy (TEFER) Project – Turkish Treasury (supported by the World Bank and conducted by Cordis-Willis with the assistance of CAR and Bogazici University). (AFAD, 2013b)

1.2.3 Policy for Prevention

Specific policies distinguished by prevention, preparedness, response, relief and recovery could not be identified in the framework of this study.

Notwithstanding the lack of clarity on the policy for prevention, several relevant players can be identified.

- The Earthquake Engineering Division established within AFAD is responsible for the development of building codes and standards for construction in disaster prone areas, aimed at increased resistance to earthquakes.
- The Ministry of Public Works and Settlement (MPWS) is another key actor in this phase, responsible for the monitoring of the aforementioned building codes (together with the municipalities). The MPWS is also responsible for retrofitting of large scale bridges.
- Implementation of the building code policies is done by the local, district and provincial governments.
- Local governments are tasked with enforcing building codes and related urban development and planning standards within their jurisdiction. Outside the municipal boundaries, however, enforcement and implementation of building codes and standards is left to provincial and district governments.
- The MEF, through the DSI and DMI, is tasked with the protection of surface and underground water, sea and land environments and the prevention of pollution. (UNDP/WMO, 2011)

1.2.4 Policy for Preparedness

Specific policies distinguished by prevention, preparedness, response, relief and recovery could not be identified in the framework of this study.

At the central level, the Department of Planning and Mitigation at AFAD is responsible for all coordination aspects of preparedness; In the event of an earthquake, Department of Earthquakes is also involved. The main tasks/responsibilities of the department of Planning and Mitigation include:

- To prepare disaster and emergency response, risk management and hazard reduction plans, which will be applied nation wide.
- To determine possible disaster and emergency areas and to pronounce preventive measures.
- To determine reconstruction, plan and project rudiments of disaster prone areas.
- To determine cash, goods and humanitarian aid rules.
- To work for informing and raising awareness of public about disasters and emergencies.
- To collect and evaluate information about disasters and emergencies occurred inside and abroad.
- To determine standards of common communication and data systems in Disaster and Emergency Management Centres and inspect them.

- To carry out the routine works of Disaster and Emergency Training Centre related to Disaster and Emergencies.
- To execute other tasks given by Director General.
- To determine administrative strategies.
- To establish and operate all kinds of communication, early warning, data and prediction centres.
- To suggest to related agencies about public investments and personnel requirements.
- To ensure improvements and generalize insurance services.
- To determine and supervise service and accreditation standards. [AFAD website]

The most important organisational bodies involved in the development and implementation of disaster preparedness in Turkey are the provincial and district governments.

Two other organisations play a role in disaster preparedness. These are the Turkish Red Crescent Society (TRCS) and the Turkish armed forces. The former formulates Disaster Preparedness and Intervention Plans at the national, provincial and local levels, while the latter develop their own Military Emergency Assistance Plans in coordination with the provincial and local governments. The plans reviewed and revised annually and approved by the Land Forces Command (Ganapati, 2008).

1.2.5 Policy for Response

Specific policies distinguished by prevention, preparedness, response, relief and recovery could not be identified in the framework of this study.

Tasks, mandates and responsibilities concerning response are ascribed to AFAD under Law N. 5902 and specified according to Law N.7269 Article 4. At the central level, AFAD's Department of Response is the responsible entity for the coordination of all disaster response activities. In the event of an earthquake, the Department of Earthquakes is also involved. The main responsibilities ascribed to the Department of Response of AFAD include:

- During the disaster and emergency situations: to carry out works to resolve the effects of disaster and emergency situations by evaluating the any source belong to public, private and NGO, foreigners and organizations;
 - To manage Prime Ministry Disaster and Emergency Situations Centre;
 - To ensure the establishment and management of emergency management centres at governmental agencies and in provinces;
 - To define the standards of Fire Brigade and SAR Teams and to cooperate with the agencies and institutions providing these services;
 - To plan and conduct protective and rescuer activities;
 - To conduct missions given by the agreements related to disaster and emergency situations;
 - To co-operate with the International Agencies and Foreign Governments in its own field.
- [AFAD website]

At the provincial level, the provincial directorate is the lead organisation responsible for response operations. The directorate is tied to the Governorate and has the right to ask for the participation of all other public institutions in the province. The key organisational units involved in response operations are the provincial and district (municipal) governments through the implementation of the disaster response plans by the Provincial and District Rescue and Aid Committees (RAC) (described in section 3.1.2).

Municipalities are also involved at the level of implementation; municipal bodies are not involved in the policy development, but rather through the provision of equipment and staff in the event of a crisis. In practice, a high level secretary of the deputy mayorship is invited to the provincial directorate and may contribute to coordination of the municipal team. (Ganapati, 2008).

In addition to the central and local governments, the Turkish Red Crescent Society is involved in response and rescue activities (see section 5.2).

1.2.6 Policy for Relief and Recovery

Specific policies distinguished by prevention, preparedness, response, relief and recovery could not be identified in the framework of this study.

Tasks, mandates and responsibilities concerning rehabilitation and reconstruction are ascribed to AFAD under Law N. 5902 and specified according to Law N.7269 Article 4. The Recovery approach in Turkey focuses not only on reconstruction of damaged buildings, but also it engages in an integrated approach that covers the disaster area as a whole, including infrastructure, schools, hospitals, road, parks and physical and social environments. The recovery activities incorporate risk reduction measures for a resilient recovery and aim to reduce necessary recovery activities in the future through strengthening infrastructure and retrofitting (UNDP/WMO, 2011).

At the central level, AFAD's Department of Recovery is the lead entity responsible for the coordination of relief and recovery operations. The main tasks/responsibilities ascribed to the Department of Recovery include:

- To take necessary measures for normalising life after disaster and emergency situations;
- To assure temporary settlement at disaster and emergency areas and to provide psychological support, social aid, food and medical treatment to effected people;
- To ensure coordination with other governmental authorities on the legal process of reconstruction, planning and projection work at disaster effected areas and to supervise the activities performed;
- To accept and provide international humanitarian aid;
- To prepare reconstruction and recruitment plans for post-disaster period in cooperation with Governmental Agencies, Local Authorities, Universities and Non-Governmental Organisations and to propound this plan to Supreme Committee of Disaster and Emergency Situations and to coordinate the application of approved plans, preparation of Expansion Reports related to application. [AFAD website]

The Earthquake Engineering Division at AFAD is responsible for developing the basic principles for the rehabilitation of structures damaged by earthquakes. The Ministry for Public Works and Settlement (MPWS) is also a key player during relief and recovery operations. The MPWS is responsible for damage assessment and reconstruction and rehabilitation of damaged buildings. The Ministry of Education is responsible for damages to schools. The provincial level is also heavily involved in relief and recovery in their jurisdiction (AFAD website).

1.3 Financing

1.3.1 Investing in preparedness

Concrete figures could not be obtained, as budget documents are not available in English. However, according to the official *IPA Beneficiary Needs Assessment – Turkey* report (UNDP/WMO, 2011) one percent of the national budget is allocated for studies, in-service training, education and awareness-raising amongst public authorities, volunteers and the population related to disaster risk reduction in Turkey. The budget of the Province Governorships is directly transferred from the AFAD Presidency. The governorship is then similarly required to transfer a minimum of one percent of their budget to the Provincial Disaster and Emergency Directorates. On top of the budget allocated by AFAD to the Provincial Disaster and Emergency Directorates, additional funding sources are available in case of any need or implementation of capacity building projects. However, although the State has a legal obligation (Law No. 7269) to fund the costs of reconstructing buildings after an earthquake, the State has no similar legal responsibility concerning DRR. There also appears to be a dearth of information regarding the exact budgeting for such resources.

International donations are the other principal funds contributing to the disaster related budget in Turkey. Over the last decade the World Bank provided over USD 1 billion for the improvement of infrastructure, emergency management and risk reduction activities and capabilities of the country; the Japanese International Cooperation Agency (JICA), the United Nations Development Programme (UNDP)²⁴³⁵ and the Swiss Agency for Development and Cooperation provided USD 870,000 to support of the UNDP Local Capacity Building for Disaster Prevention Programme, while the European Commission Humanitarian Aid Office has also contributed towards DRR in Turkey (UNDP/WMO, 2011).²⁴³⁶

²⁴³⁵ Contribution from the Target for Resource Assignment (core of USD 368,900) to support the National Programme for Disaster Prevention, aimed at improving public awareness, training, upgrading capacities in technological preparedness and impact mitigation.

²⁴³⁶ Ibid. Funding provided for 32 emergency and humanitarian relief projects through a contribution of 380,000 Euros for a UNDP programme to strengthen the capacities to cope with earthquakes and a further 20 million Euros for the Marmara Earthquake Recovery Project. IPA Needs Assessment#2, p. 12.

1.3.2 Investing in consequence management

Funding for relief in the aftermath of disasters comes directly from the central government. AFAD is authorized to allocate the disaster response and recovery budget to the related institutions and the local government in the scope of their needs. This comes, for instance, in the form of tents, the construction of temporary residences, and rubble clean up for the residents of damaged homes, as well as in the form of compensation funds during the rehabilitation phase. Following the earthquake in the Marmara Region, temporary residences were constructed by the MPWS. Supplying temporary residences required funding to cover the rental fee of land, the cost of infrastructure provision, and actual construction costs.

The Ministry of Finance has a Disaster Reserve Fund, which can be used for the disasters during the period of recovery (AFAD, 2013b).

Finally, since 1999, in the aftermath of the two major earthquakes that caused widespread destruction of the country's building stock, the Government of Turkey enforces compulsory earthquake insurance for residential buildings on a nationwide basis (Decree 587). With this decree law, it is compulsory to take out insurance for all residential buildings that fall within municipality boundaries, effectively abolishing the obligation of the government to extend credit to the victims of an earthquake (previously a requirement under the Disaster Law). The purpose was to privatize the risk in two steps: (1) by offering insurance through the Turkish Catastrophic Insurance Pool (TCIP, or DASK in Turkish – Do-al Afet Sigortalari Kurumu)²⁴³⁷, (2) then by exporting large parts of the risk to the world's reinsurance and capital markets. To serve this purpose, the World Bank funded the creation of the Compulsory Earthquake Insurance Authority as a separate state owned entity to carry out the National Catastrophic Insurance Programme (NCIP). This program became part of a larger initiative known as the Turkish Emergency Flood and Earthquake Recovery Program (TEFER – Türkiye Acil Sel ve Deprem İyileştirme Programı) (Gülkan et al, 2012).

The various mechanisms for financing disaster management in Turkey are shown schematically in the figure below.

²⁴³⁷ TCIP is a legal public entity managed by the TCIP Management Board, which consists of representatives of the Prime Ministry, the Treasury, the MPWS, the Capital Markets Board, the Association of Insurers, an operational manager, and an earthquake scientist. See: Turkish Catastrophe Insurance Pool, <http://www.dask.gov.tr>.

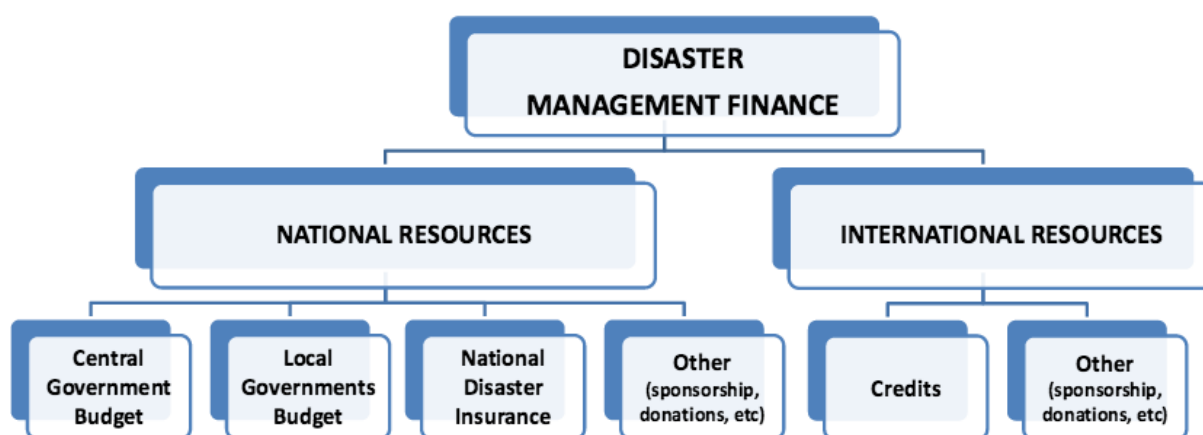

Figure 74: Current financial structure of disaster management in Turkey²⁴³⁸

Limitations of the programme:

Among the limitations to the current set up is that the compulsory scheme covers only residential buildings that fall within municipality boundaries, while dwellings in small villages are excluded; it does not coverage retrofitting nor promote renewal policies, and; the penalty for non-insurance is not sufficiently high. All of these drawbacks have been cited in reference to preventing the further productivity of the policy. In addition, as TCIP is a privately funded entity, its funding has been primarily dependent upon premium contributions made by homeowners under the insurance scheme (ibid).

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

AFAD is formally charged with overseeing post-disaster assessments however there is no formal mechanism for assessing the experience of individual emergencies – either at the national or provincial / municipal level.

At the central level, the Presidency keeps records of events and prepares reports on particular emergencies or disasters where significant actions have been taken. For instance, the Presidency prepared a report (which included Lessons Learned) following the experience of the Van Province Earthquakes in 2011. The reports were then sent to all provincial directorates. These reports are also shared with other stakeholders to share experience and information with all relevant and involved stakeholders.

At the provincial level, following a response operation, the relevant authorities meet to discuss the adequateness and efficiency of the legislations and capacity. On this basis, new regulations and planning is introduced. However these discussions take place informally.

²⁴³⁸ AFAD (2013c). “Prime Minister Disaster and Emergency Management Agency.” Presentation on 13 December 2013, accessed http://www.oecd.org/gov/risk/HLRF_2013_Plenary_3_Tetik.pdf

1.4.2 Departmental Lessons Learned systems

There are no formalised Lessons Learned systems. Lessons learned practices are incorporated informally into post-disaster assessments, in particular where significant actions have been taken.

1.4.3 Centralised (national) Lessons Learned system

There are no formalised Lessons Learned systems. Lessons learned practices are incorporated informally into post-disaster assessments, in particular where significant actions have been taken.

1.4.4 International exchange for Lessons Learned

Turkey is engaged in international activities at the multilateral, regional and bilateral levels and currently profits from know-how and technological transfer coming from the UNDP and the World Bank. In addition to these activities, AFAD signed a Plan of Action with UN-OCHA in March 2013 to strengthen the partnership between the two entities. The plan foresees greater cooperation in information management, strategic and operational coordination, advocacy and capacity-building. The two are also working with Turkish NGOs to promote better collaboration with the international humanitarian response system.²⁴³⁹

AFAD shares information with EU Commission bodies (DG ECHO, ODDG, etc.) and attends meetings of the Commission in which it shares information regarding its risk and damage mitigation experience. However there is no integrated system connecting AFAD with the EU.

1.4.5 Regular policy reviews

AFAD conducts regular policy reviews through the high council meetings/boards where AFAD functions as the secretary (see section 3.1). Specific information on the scope and content of such policy reviews could not be obtained in the framework of this study due to lack of English translations.

1.5 Resilience

Turkey's approach to the concept of resilience is based on increasing disaster awareness through education (educational campaigns in 2013) with the aim to build a more resilient society. This is considered to be an important component of Turkey's overall approach to DRR. AFAD is responsible for education, training, and awareness-raising activities in the field of disaster risk reduction.

²⁴³⁹ UN-OCHA website, Turkey. Available <http://www.unocha.org/romena/about-us/about-ocha-regional/turkey>. Accessed 25 September 2014.

No specific international standard is pursued; rather, standardisation is sought through the application of the relevant regulations and circulars. AFAD undertakes the role of accrediting the NGOs and organises awareness raising meetings with the private sector representatives. However, they do not have a regulatory or auditing power on the standards for different stakeholders.

Equipment that has been standardised includes: uniforms/service dressed were standardised, provincial duties, representation in protocols, indispensable equipment at the provincial directorates were standardized.

1.6 Information sharing and data protection

Turkey does not have an updated database in use. While in the past there were obligations for civil defence that included registers, with the establishment of AFAD, civil defence records halted and it was turned into volunteering; They have the roster of NGOs but not the individual volunteers. So they do not share such volunteer information. Relevant regulation (for certification or standardisation) has not yet been prepared by AFAD. Studies on this issue are ongoing (expert interview).

No such policy is in place regarding the sharing of classified information and the current regulations do not foresee sharing of classified information. The regulation is developed based on local experience (ibid).

The use of social media is not common practice for the purpose of crisis management in Turkey. No such plans are in the making (ibid).

2 Legislation

2.1 Crisis (emergency, disaster) management concept

Law no 7269 on Precaution and Aid Against Disasters Effecting Common Life, dated 15 May 1959, introduced the concepts of disasters such as earthquake, flood, landslide, rock fall, avalanche, fire and storm, and possible disasters, and covers the measures to be taken for the protection of lives and property before a disaster in settlement areas that are prone to disasters.

Beyond this indication, however, a dedicated crisis management concept, other than the structures and documents described in this report, could not be obtained nor identified in the frame of this study.

2.2 General crisis (emergency, disaster) management law

The current disaster legislation framework consists of a range of laws, decree laws, regulations, directives and circulars which date back to the late 1920's and 1930's since the Republic of Turkey was established in 1923. The most important laws in the field of emergency and disaster management are as follows:

Law No. 7126 (1958) on Civil Defence established the General Directorate of Civil Defence under the Ministry of Home Affairs. With this, the directorate and its local branches were tasked with disaster response and preparedness.

Law No. 7269 (1959) on "Measures and Assistances to Be Put into Effect Regarding Natural Disasters Affecting the Life of the General Public" represented a critical codification of the legal regulations in terms of disaster management in Turkey. The law attempted to fill the legal gaps in this area and established the legal basis for different phases on disaster management and the establishment of relevant state organisations. The law has been amended several times, though it is still the main legislative document on disasters in Turkey.

Law No 3194 (1985), the Development Law, outlines the principles of preparation and implementation of plans for settlements, building construction and building permits by local and provincial governments, as well as the role of central government Ministries.

Law No. 5902 (2009) on the "Organization and Functions of the Disaster and Emergency Management Presidency" established the new department called "Disaster and Emergency Management Presidency" (AFAD) (*Afet ve Acil Durum Yonetimi Başkanlığı*) under the Prime Ministry. AFAD was established to take necessary measures for an effective emergency management and civil protection issues Turkish nationwide. The new law combines under one roof the actors responsible

for Disaster Management. The law describes the necessary administrative structure, its activities, responsibilities, relations with other units and running of tasks related to disaster and emergency management of natural technological and human originated hazards. The law aims: (1) To take necessary precautions and measurements on disaster and civil protection related services at country level; (2) to maintain coordination amongst the organisations that have a role in pre- and post-disaster activities; (3) to policy making and implementation on disaster management. (Ganapati, 2008; AFAD, 2012a)

Additional disaster-related laws, regulations, decrees and related measures can be found in the Table 49 below.

Table 49. Relevant legislation, Laws

Name of Law	Year	Law, Decree, etc. Number	Details
Civil Defence Law	1958	Law No. 7126	Establishes the General Directorate of Civil Defence under the Ministry and describes the responsibilities of the directorate and its local branches in relation to disaster response and preparedness; Addresses issues of training on civil defence
Measures and assistances to be put into effect regarding disasters affecting the life of the general public	1959	Law No. 7269	Confers extraordinary powers to provincial governors and district heads and details responsibilities of these and other key players in disaster scenarios; includes statements on relocation of settlements.
Decree on Basic Principles Related to Disasters Affecting the Life of the General Public	1968	Official Gazette No. 13007	Outlines the basic criteria to be used in declaring disasters
Extraordinary Situation Law	1983	Law No. 2935	Provides the legal basis for action to the respective bodies in a state of emergency (together with the 1984 Decree on State of Emergency Council (No. 84/7778))
Development Law	1985	Law No. 3194	Outlines principles for preparation and implementation of plans for settlements, building construction, and building permits by local and provincial governments; outlines role of MPWS concerning settlement plans, and that of State Planning Organization concerning regional plans.
Execution of services related to damage and disruption caused by natural disasters	1995	Law No. 4123	Outlines procedures of distribution of financial aid to areas affected by disasters
Regulations on Disaster Mitigation	1999	Decree No. 582	Provides information concerning debris removal following a disaster. According to the Decree, the Prime Ministry, and the Local Government support an Emergency Fund Program that provides resources from the Ministry of Finance in disaster response(Ural)
Regulation on Civil Defence and	1999 and	Decree Law No. 586 and	Enhances response capacity of the Ministry of the Interior (where the government's search and rescue teams are located) with the

Name of Law	Year	Law, Decree, etc. Number	Details
Municipality Law	2000	596	establishment of provincial directorates of civil defence in 11 provinces. These are equipped with necessary vehicles and devices recruiting 2500 personnel and 300 on a contractual basis, to prepare detailed local plans for their training and exercises; the SAR teams are to be created within hours.
Decree Law on Mandatory Earthquake Insurance	1999	Decree No. 587	Establishes the responsibilities of the Natural Disasters Insurance Administration and details how it is governed; provides information on the earthquake insurance regulation for residential buildings located in urban areas; Public buildings and buildings in rural areas fall outside the scope of the decree.
Law on Building Inspection	2001	Law No. 4708	Establishes responsibilities of Building Inspection Firms (BIFs) and inspection Committees regarding construction inspection.
Decree on Working Procedures and Principles of Natural Disasters Insurance Administrations	2001	Official Gazette No. 24600	Outlines the responsibilities, procedures and working principles of the Natural Disasters Insurance Administration
Law on Municipalities	2004	Law No. 5272	Establishes the responsibilities and describes the organisational structure of municipalities; provides details on their budget arrangements. It is the main legislation that gives additional power and responsibilities to Municipalities, previously limited to mitigating disasters
Disaster Insurance Law	2006	Law No. 6305	Determines the procedures and principles for the compulsory earthquake insurance to cover the financial losses which may arise in buildings due to earthquakes and for the insurance and reinsurance coverage to be presented in order to cover the material and physical damages which may arise as a result of various disasters and risks which cannot be covered by insurance companies, or which bring about challenges with regards to offering coverage.
Organization and Functions of the Disaster and Emergency Management Presidency	2009	Law No. 5902	Lays down the provisions to be implemented where there is a need for a declaration of a state of emergency in cases of serious disturbances of public order by epidemics, serious economic recessions, and comprehensive terrorist acts in order to distort the democratic order established by the Constitution and to eliminate fundamental rights and freedoms.
Restructuring [Transformation] of areas under risk of disasters	2012	Law No. 6306	Responsible for determining the procedures and principles regarding recovery, resettlement, renewal to provide healthy and safe living environments in the areas under the risk of disaster and in the other areas and fields where risky constructions exist.

Sources: AFAD, 2012a; Ganapati, 2008; Ural 2005

2.3 Emergency rule

The conditions for extraordinary situations resulting in a state of emergency are described in Art. 4 of the Law No. 7269. Expert interviews reveal that the conditions vis-à-vis the concept of urgency as laid out in Law no 7269, however, are vague and not clearly defined.

The 1983 Law on State of Emergency (No. 2935) and the 1984 Decree on State of Emergency Council (No. 84/7778) provide the legal basis for action to the respective bodies in a state of emergency. Under the law, a state of emergency can be announced by the Prime Minister only. If a state of emergency is declared by the Council, Governors and district heads are mandated to implement it.

Under Law No. 2935, personal rights may be restricted with the decision of the Cabinet and Council of Ministers.

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

Under the new Law No. 5902 (2009), AFAD is responsible for coordinating nearly all phases of disaster management including disaster risk reduction (DRR) at the national level, and installs rules, regulations, and guidelines for preparation of DRR plans at sub-national levels. It also has a coordination role between the various institutions and organisations that are responsible for different types of disasters. This includes the Forestry and Hydraulics Ministry for floods, the Environment and Urbanization Ministry for climate change, and the Food, Agriculture and Livestock Ministry for droughts.

However, according to Law No. 7269 of 1959, which is the main legislative document and relates to all disaster-related activities and responsibilities at country level, MPWS is the coordinating governmental body. Both legislative acts are in operation, which means the coordination itself has not been identified very clearly by related legislation. Moreover there are still “conflicts between laws governing sectorial responsibilities and the Disaster Law as well as what type of planning processes are necessary for DRR which need clarification.” (UNDP/WMO, 2011: 9). For example, MPWS is the main body responsible for the coordination of disaster response activities (Law No. 7269), whereas AFAD is responsible for coordinating nearly all phases of disaster management, including DRR at the national level, and for instigating the rules, regulations and guidelines for the preparation of DRR plans at the sub-national level (Law No. 5902).

Although the Law No. 5902 greatly improved the efficiency of the different phases of the disaster management cycle, official documents report that the coordination mechanisms between AFAD, MPWS, PMCMC and the ministries on the one hand, and between public authorities and other actors on the other, remain insufficient (ibid).

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

Law No. 5902 transferred significant levels of responsibility to local authorities. While the central government is responsible for reconstruction and rehabilitation, responsibility for mitigation, preparedness and response activities, such as the implementation of earthquake-resistant building codes for construction within their jurisdiction, come under the authority of the province (Governor) and District (Qaimaqam). Response to a disaster is under the responsibility of the Governor at the Provincial level and Qaimaqam at district level.

The latest legal arrangements regarding local government in Turkey are the Special Provincial Administration Law (No. 5302), the Municipality Law (No. 5393) and the Metropolitan Municipality Law (No. 5216). The Municipality Law No. 5393 is the main legislation that gives additional power and responsibilities to municipalities.²⁴⁴⁰ According to this law, local governments are now responsible for making disaster and state of emergency plans, as well as public awareness programmes.

The law states:

Bearing in mind the characteristics of the town, the municipality shall draw up the necessary disaster and emergency plans to protect the town from fire, industrial accidents, earthquakes and other natural disasters and reduce the damage caused by such disasters, and prepare the necessary teams and equipment for the purpose.

In the preparation of emergency plans, coordination shall be ensured with other provincial-scale emergency plans if any, and the opinions of relevant ministries, public organizations, professional organizations, universities and other local governments shall be consulted.

Necessary measures shall be taken to educate the public in accordance with the plans, and joint programs may be drawn up with the authorities, entities cited in the second paragraph. In the event of a fire or natural disaster outside the municipal boundaries, the municipality may provide the necessary assistance and support to the regions concerned. (Art. 53)

Expert interviews further indicate that the provincial directorate has no real autonomy and capabilities to take initiative at all levels are limited. The provincial directorates do not have financial capacity to intervene on their own; rather, additional financing must be requested from the Presidency, and then it may be allocated to the province.

²⁴⁴⁰ A municipal administration can be established in localities of more than 5,000 inhabitants with a referendum. As to provinces and districts, municipal administration has to be instituted irrespective of their population. Metropolitan municipalities are defined as "Cities which comprise more than one district within their own boundaries". This concept was introduced by the Act of Metropolitan Municipalities (No. 5216). See Ural (2005a) for more information.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

Prior to 1999, NGOs other than the TRCS did not have a legal role to play in disaster preparedness. Laws and regulations have since been introduced to formalise their participation. For example, under the Directive on Conditions of Participation of Volunteers in Civil Defence Service, volunteer search and rescue teams can participate in training and drills undertaken by the General Directorate of Civil Defence. The Regulation on Voluntary Participation in Services of Special Provincial Administrations and Municipalities states that “Special provincial administrations or municipalities may, depending on their purview, employ volunteers” for the purpose of “Inspection and emergency services such as traffic, fire fighting, search and rescue”(Official Gazette Issue: 25961, Art 5).

Specific provisions for the involvement of the NGOs however are mainly foreseen in the provincial plans prepared by the provincial directorates. No specific rules or policies on liability or insurance regarding their involvement are in place. It is anticipated that this issue will be handled together with the regulation of volunteer participation.

2.7 Legal regulations for international engagements of first responders and crisis managers

The Presidency is authorised to establish connections for international engagement; In kind and in cash assistance or other technical support provided by the international organizations are coordinated through the Presidency. Law no. 7126 on Civil Defence (1959) regulates the rescue and first aid actions that are to be carried out during disasters. The provincial directorate are not capable to establish connections with the international organizations.

3 Organisation

The new Law No 5902 defines the central and provincial level structure of crisis management in Turkey, which involves all concerned governmental bodies and is replicated almost identically at the central (Prime minister), provincial (Governor) and local (Sub-governor/Qaimaqam/District Governor) levels.²⁴⁴¹

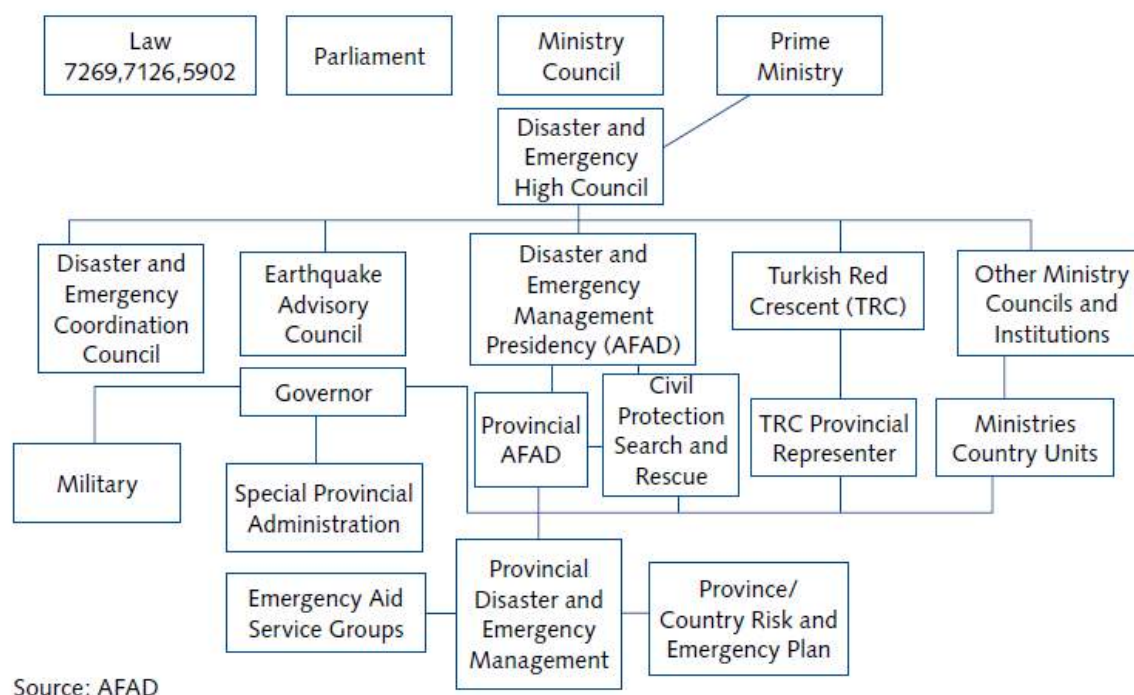

Figure 75: Organisational Management of Disaster and Emergency Management in Turkey²⁴⁴²

3.1 Organisational chart

The following organisations have a crucial role in the Turkish disaster and crisis management:

- AFAD (central and provincial)
- Government ministries, in particular
 - Prime Ministry Office
 - Ministry of Public Works and Settlement (MPWS)
 - Ministry of the Interior
 - Ministry of Environment and Forests (MEF)
 - Ministry of Health

²⁴⁴¹ Local authorities in Turkey are of three types: Municipalities, Special Provincial Administrations, and Village Administrations.

²⁴⁴² Gülkan et al, 2012, "Disaster Risk Management in Turkey." In *Improving the Assessment of Disaster Risks to Strengthen Financial Resilience. A Special Joint G20 publication by the Government of Mexico and the World Bank*.

- Public security bodies (e.g. police HQ, gendarmerie, fire services)
- Provincial units and municipalities
- TRCS, NGOs
- Turkish Armed Forces

The range of actors that may be involved in a disaster or crisis situation in Turkey are many and wide-ranging and may include institutions not dedicated to crisis management services, e.g. Housing Development Associations or DSI. See, for instance, the range of possible actors in Figure 76 below.

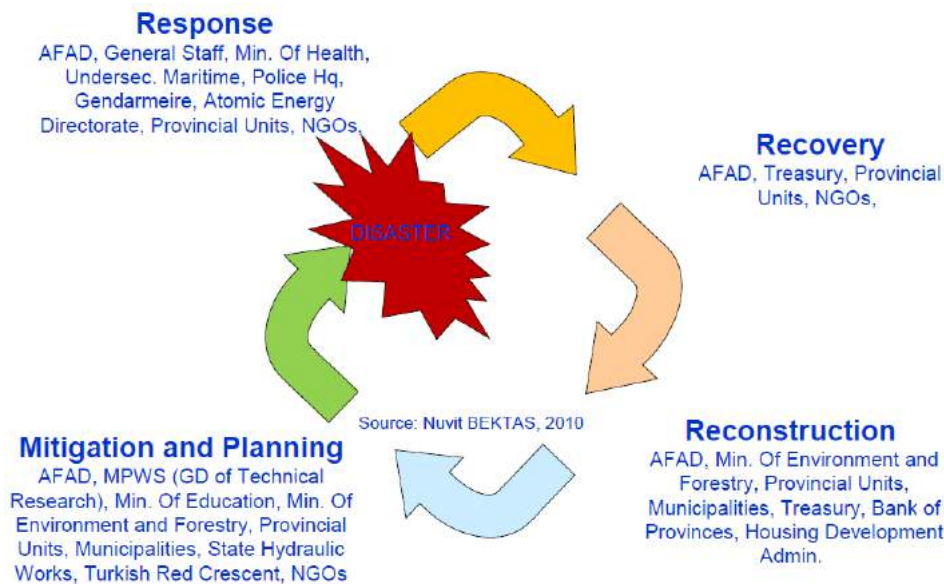

Figure 76: Crisis Management Cycle²⁴⁴³

The AFAD Presidency undertakes the coordination function at the centre, while the responsibility for developing and implementing disaster preparedness plans and operations in Turkey lies with the provincial organisations – the Provincial Disaster and Emergency Directorates.

3.1.1 National level authorities and organisations

Disaster and Emergency Management Presidency (AFAD)

AFAD was established by the Law No. 5902 (2009) to take necessary measures for the provision of effective emergency management and civil protection issues nationwide and for the coordination of other institutions at every phase of disaster management. AFAD functions like an umbrella organization; depending on the nature (type of disaster ranging from floods to extreme weather to earthquakes), the incidence level (local, provincial, national) and magnitude of the disaster or emergency, AFAD collaborates with the Turkish General Staff, the Ministry of Foreign Affairs, the Ministry of Health, the Ministry of Forests and Hydraulic Works and other relevant ministries as well

²⁴⁴³ AFAD, 2010, "A New Disaster Management Structure in Turkey." Presentation at the 1st Meeting of the European Forum for Disaster Risk Reduction (EFDRR), Stenungsund, Gothenburg, Sweden, 6-8 October 2010.

as non-governmental organizations. In a disaster and emergency situation, AFAD is the only responsible organisation at the national level.

AFAD has the responsibility for coordinating nearly all phases of disaster and crisis management including disaster risk reduction (DRR) at the national level, and installs rules, regulations, and guidelines for preparation of DRR plans at the provincial (sub-national) levels. It also has a coordination role between institutions and organizations. AFAD is authorized to act in all disasters and emergencies situations in the country. It has the mandate to produce and implement policies on: (i) pre-incident: preparation, mitigation and risk management before the occurrence of events, (ii) during incident: response during the event, (iii) post-incident: recovery and reconstruction after the event, and (iv) and for the effective implementation of these activities across the country.

AFAD further has the mandate to:

- define the needs of in kind, in cash and humanitarian assistance;
- determine management strategies;
- establish and operate all kinds of information, communication, forecasting and early warning systems;
- make proposals to the relevant authorities with the need of public investment and personnel;
- implement training activities and exercises;
- take the recovery measures to ensure return to normal life after the disaster;
- provide temporary settlement in disaster areas.

The law also established eight central level departments within the new unit. These are:

- Department of Planning and Mitigation
- Department of Response
- Department of Recovery
- Department of Civil Protection
- Department of Earthquakes
- Department of Administrative Affairs/Services
- Department of Information Technologies and Communication [Added 24 October 2011]
- Department of Strategy Development [Added 24 October 2011]
- Department of Legal Consultancy [Added 24 October 2011]²⁴⁴⁴

Figure 77 illustrates the organisational chart of the Presidency. The duties and responsibilities of the departments are outlined in Chapter 1.

²⁴⁴⁴ AFAD, 2009, "A new change in the disaster management structure of Turkey," Prime Ministry, 17 December 2009, accessed 25 September 2014, <http://preventionweb.net/go/12840>.

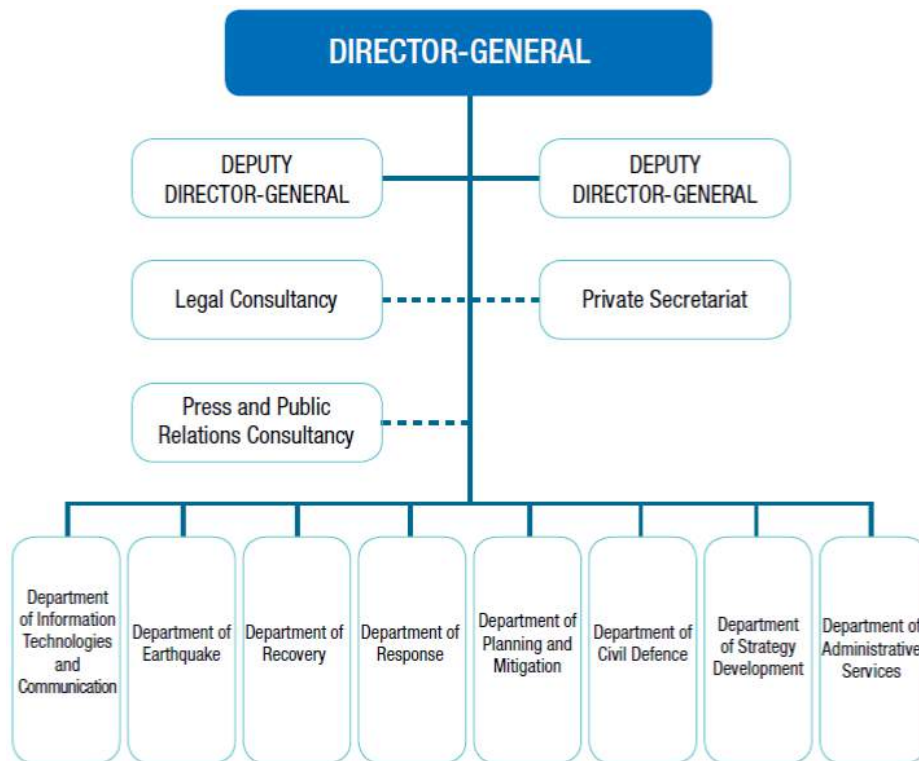

Figure 77: Organisational Chart of the Disaster and Emergency Management Presidency (AFAD)²⁴⁴⁵

Under the eight departments, several working groups have been established to cover different topics as shown in Figure 78 below.

²⁴⁴⁵ AFAD (2012a) "AFAD Strategic Plan 2013 – 2017." Ankara, Turkey: Republic of Turkey, Prime Ministry Disaster and Emergency Management Presidency.

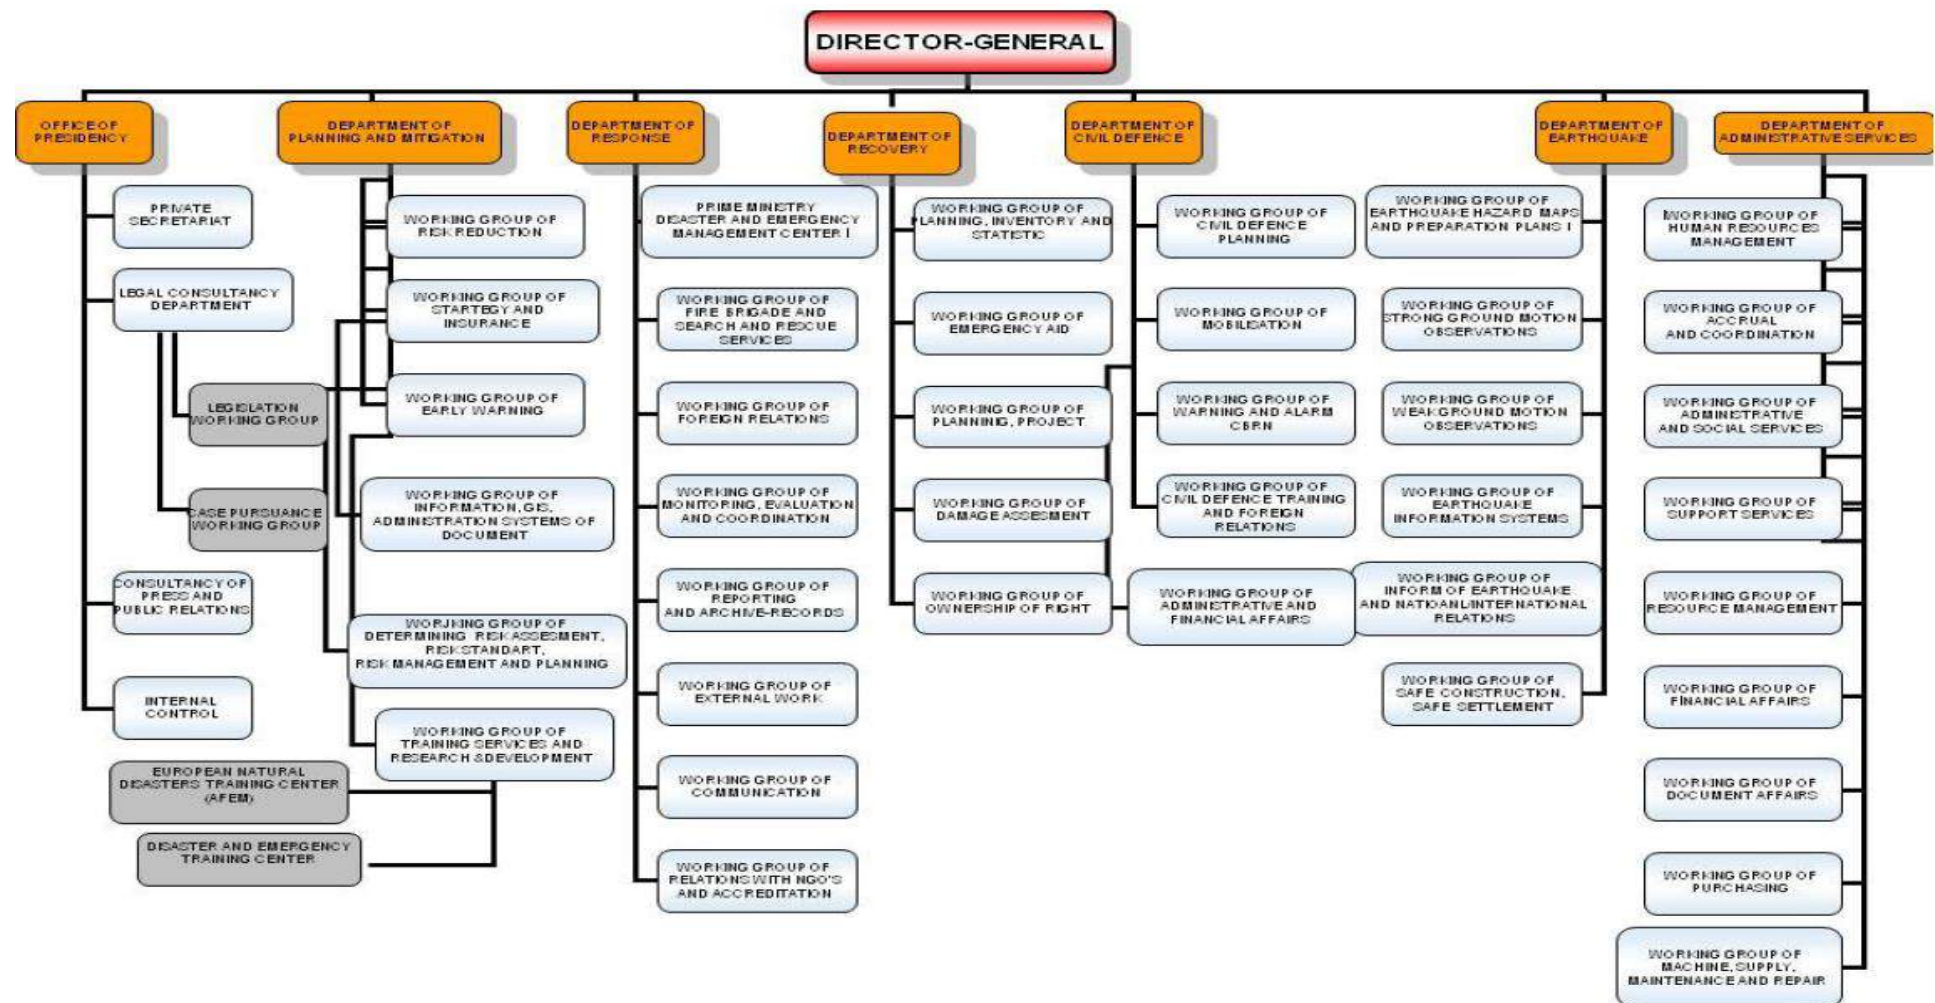

Figure 78: Working Groups under the Central Level Departments of the CM authority ²⁴⁴⁶

²⁴⁴⁶ AFAD, Strategic Plan 2013 – 2017

In addition to these departments the plan outlines three high levels boards/committees. The composition of these committees/boards is presented in Figure 79.

- **The Disaster and Emergency Management Higher Committee/Supreme Board**, consists of appointed ministers under the chair of the Prime Minister or his/her appointed Deputy Prime Minister. The board is tasked with the duty of approving the plans, programmes and reports related to disasters and emergencies. The Board convenes twice yearly, and may be summoned for an extraordinary meeting at the request of the chair. The Secretariat of the Board is conducted by the Presidency (AFAD).
- **The Disaster and Emergency Management Co-ordination Committee/Board**, is composed of the relevant undersecretaries and organization executives under the chair of Undersecretary of the Prime Ministry (i.e. Undersecretaries of National Defence, Interior, Foreign Affairs, Finance, National Education, Health, Transportation, Energy and Natural Sources, Environment and Forest and Public Works and Settlement Ministries; Undersecretary of State Planning Organisation, Director General of Disaster and Emergency Management Presidency, Head of Turkish Red Crescent).

The Board is responsible for evaluating information in cases of disasters and emergencies, determining measures to be taken, ensuring and inspecting their implementation, and ensuring coordination with agencies, organizations and NGOs. The Board convenes at least four times a year, and may be summoned for an extraordinary meeting at the request of the chair when needed.

- **The Earthquake Advisory Board (EAB)** is comprised of the relevant representatives under the chair of AFAD and is responsible for presenting alternative policies for mitigating damages caused by earthquakes and setting priorities and policies for earthquake-related research. The EAB is a multi-stakeholder consultancy mechanism. The EAB provided support to the Earthquake Department in the Presidency in the preparation the National Earthquake Strategy and Action Plan that was launched in 2011. The secretariat of the Board is conducted by the Earthquake Department of the Presidency.

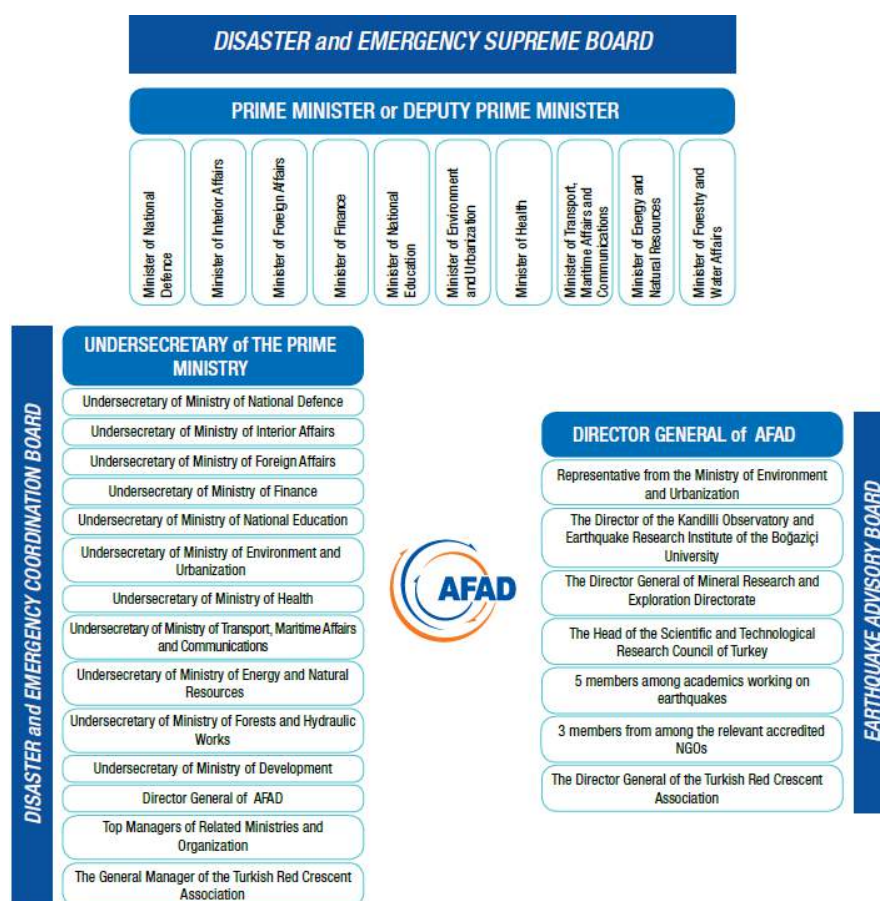

Figure 79: AFAD Disaster and Emergency High level boards/committees²⁴⁴⁷

Other Government Ministries involved in crisis management/risk reduction and Inter-ministerial arrangements

The institutions involved may vary depending on type and severity of disaster/risk. In addition to AFAD, the relevant institutions include:

Ministry of Public Works and Settlement (MPWS), acts as the main body responsible for the coordination of disaster response activities (according to Law No. 7269) and develops the standards for seismic microzonation to guide safe construction within the regulations concerning “Specification for Structures To Be Built in Disaster Areas.” The MPWS is responsible for implementing and monitoring the regulations at the central level, while it is the responsibility of the municipalities to administer and enforce these regulations in practice (UNDP/WMO, 2011).

Ministry of Environment and Forestry (MEF) comprises the bodies responsible for the national hydrological (i.e. **General Directorate of State Hydraulic Works - DSI**) and meteorological services (i.e. **General Directorate of State Meteorological Services - DMI**) in Turkey:

- The **DSI** operates the National Hydrological Observation Network through its 23 regional offices and is responsible for monitoring the whole country, excluding the large urban areas where responsibility is held by the Municipalities, and for hazard assessment of flood and hydraulic drought. DSI is responsible for the monitoring the whole country excluding the

²⁴⁴⁷ AFAD, Strategic Plan 2013-2017.

large urban areas where responsibility is held by the Municipalities With 25 regional directors, DSI coordinates the preparation of the strategic and action plans for the water sector. Specific tasks include: managing the national hydrological database; producing annual and monthly reports, and; the provision of hydrological services to the agriculture, energy, environment and services sectors.

- The **DMI** operates and maintains the National Meteorological Observation Network and is responsible for monitoring and hazard assessment of meteorological hazards. Specific tasks include: producing meteorological analyses, weather forecasts and disseminating hazard warnings (and related information) to authorities and the public. The main objective of the DMI is to: make observations, provide forecasts; provide climatological data, archive data and other information; communication of these to the public; provide meteorological needs for army and civil aviation.

Both the DMI and DSI play a role in policy making on DRR planning through the Ministry of Environment and Forestry (MEF) as sources of basic hydro-meteorological information, though they do not have a role as integrated partners in policy making and strategy planning of the national DRR (WMO, 2012).

Ministry of Agriculture & Rural Affairs, through the *General Directorate of Agricultural Production and Development (TUGEM)*, is responsible for the Agricultural drought management and coordinator of the Turkey Agricultural Drought Action Plan, specifically for the Monitoring and Early Warning Committee and the Risk Assessment Committee. The *General Directorate of Agricultural Research (TAGEM)* (also falling in the same Ministry) provides services and information to TUGEM and collaborates with DMI to develop R&D projects on agrometeorological early warning and crop simulation modelling.

Ministry of Energy and Natural Resources, through the *General Directorate of Electrical Power Resources Survey and Development Administration (EIE)*, carries out engineering services for the production of electrical energy and is an investor public organisation. It was established under Law No. 2819 and has the status of a juridical person, governed by private law and administered in accordance with commercial methods. (WMO, 2012; UNDP/WMO, 2011)

Turkish Red Crescent Society

The Turkish Red Crescent Society (TRCS) is the main non-governmental organisation operating in the field of disaster management in Turkey. TRCS is supported by the International Federation of the Red Cross (IFRC) and the Red Crescent societies and forms an independent national organisation with strong legislative links to the Government and funding. It has national, provincial and district level committees that are heavily involved in disaster preparedness through the conduct of public awareness and training activities. TRCS also actively operates in disaster areas through its search and rescue (SAR) activities. (UNDP/WMO, 2011). Other NGOs active in the field in Turkey are presented in Chapter 5.1.

Turkish Armed Forces

The Turkish Armed Forces are a part of central local disaster management in Turkey (though they do not play a role in DRR). During emergencies, authorities coordinate response activities with the Turkish Armed Forces. In the aftermath of the August 1999 earthquake, the Turkish Armed Forces made the decision to form a battalion size search and rescue Unit subordinate to Special Forces Command with intent to better cope with large-scale natural disasters. The special group is called “Natural Disasters Search and Rescue Battalion” (DAK) (UNDP/WMO, 2011).

3.1.2 Provincial level organisations

The dual organization of local administration in Turkey that was mentioned in the introduction to this chapter, comprised of appointed governors on the one hand and elected municipal officials on the other, establishes the basis for distinguishing their different roles in disaster management. The *IPA Beneficiary Needs Assessment* report states that,

*Provincial governors are agents of the central authority; therefore they perform in-line functions when managing emergency situations province-wide. This is achieved through powers provided in the ‘Disasters Law’ (7269). Accordingly, the governor assumes authority to act in extraordinary situations. The mayor and municipal bodies fall under the authority of the governor in these circumstances.*²⁴⁴⁸

The organizational structure of crisis management and disaster risk reduction at the provincial level is under the authorization of the governor. The governor does not have an operational role but coordinates and mobilizes others. The governor may also demand assistance from other provinces, which have not been affected by a disaster. Figure 80 shows an example organisational chart of the provincial level for the Bursa province.

Organisational procedures

At the provincial level, the Law on Municipalities No. 5272 (2004) mandates the provincial and district governments to prepare Emergency Assistance Plans. The provincial directorate of AFAD prepares the provincial plans, which are then submitted to the governorate for approval. There are 26 service group plans below it. Depending on the type of crisis/disaster situation, the relevant public agency is to take responsibility in line with its provincial plan and in compliance with the plan of the provincial directorate of AFAD. Out of those 26 service groups, 8 group plans are prepared by the provincial directorate of AFAD. The other 18 is prepared by the provincial directorates of other central institutions/ministries.

Provincial directorates

AFAD undertakes its responsibilities at the provincial level through the **Provincial Disaster and Emergency Management Directorates**, which are legally required in each city / province, and are directly attached to the city governor, and the **Provincial Civil Defence Search and Rescue Team Directorates**, which have been established in 11 provinces. Each governorship also has its own

²⁴⁴⁸ UNDP/WMO, 2011, “IPA Beneficiary Country Needs Assessment – Turkey,” p. 9

Provincial Rescue and Aid Committee (RACs), responsible only for response and recovery activities. The 11 provincial civil defence search and rescue directorates were established to reinforce the provincial rescue and aid committees and local relief forces with more professional and alert reserves at strategically stationed regional centres.

The Provincial Directors for Disaster and Emergency are the authorities responsible for the coordination and mobilisation of human, material and monetary resources inside and outside of the province (Law No. 7269). They are responsible for:

- Determining hazards and risks at the provincial level;
- preparing provincial emergency aid and response plans for the province with the help of the Provincial Search and Aid Groups and in cooperation with the Provincial Red Crescent Units (Law No. 5902);
- implementing and monitoring emergency and response plans in times of disasters;
- managing the logistic services at the time of disaster and emergency;
- undertaking loss and damage assessments of the province;
- accrediting civil society organisations involved in disasters (e.g., search and rescue teams);
- managing the Provincial Disaster and Emergency Management Center; and,
- educating the public. (UNDP/WMO, 2011).

According to the *IPA Beneficiary Needs Assessment - Turkey* report, “A common problem is that provincial officials in charge of disaster management are in most cases unfamiliar with the reality on the ground, especially as the turnover of government officials can be high in certain provinces.” (2011).

Provincial Civil Defence Search and Rescue Team Directorate

The 11 provincial civil defence search and rescue directorates were established by Decree Law No. 586 and Decree 596 (2000). These are: Adana, Afyon, Ankara, Bursa, Diyarbakir, Erzurum, Istanbul, Izmir, Sakarya, Samsun, and Van. Each one is equipped with necessary vehicles and devices recruiting 2500 personnel and 300 on a contractual basis, to prepare detailed local plans for their training and exercises.

Provincial Rescue and Aid Committees (RACs)

Under each RAC, there are 9 service groups. The 9 service groups are responsible only for response and recovery activities. These include: communications, accessibility/transportation, search and debris removal, first aid and medical services, damage assessment and temporary shelter, security, purchase-rental distribution, agricultural services, and electricity-water sewer (Ganapati, 2008; WMO, 2012). Both the provincial and district levels are mandated by law to have rescue and aid committees (RACs).

Turkish Red Crescent

In every province and district, TRCS has its own branches for community participation; at the Provincial level, it is involved with the provincial RACs that serve to foster community participation through volunteers and community leaders in each province and also has branches in most of the

major cities. TRCS provides blood transfusion services, first aid trainings and disaster preparedness training to support preparedness efforts (TRCS website). See also Chapter 4.3 and 5.1.

Military:

Although the military plays an important role in Turkey, the role of the Turkish Armed Forces in disaster management is limited to the coordination of response activities and the provision of support through provincial garrisons that are in direct contact with the governors (UNDP/WMO, 2011).

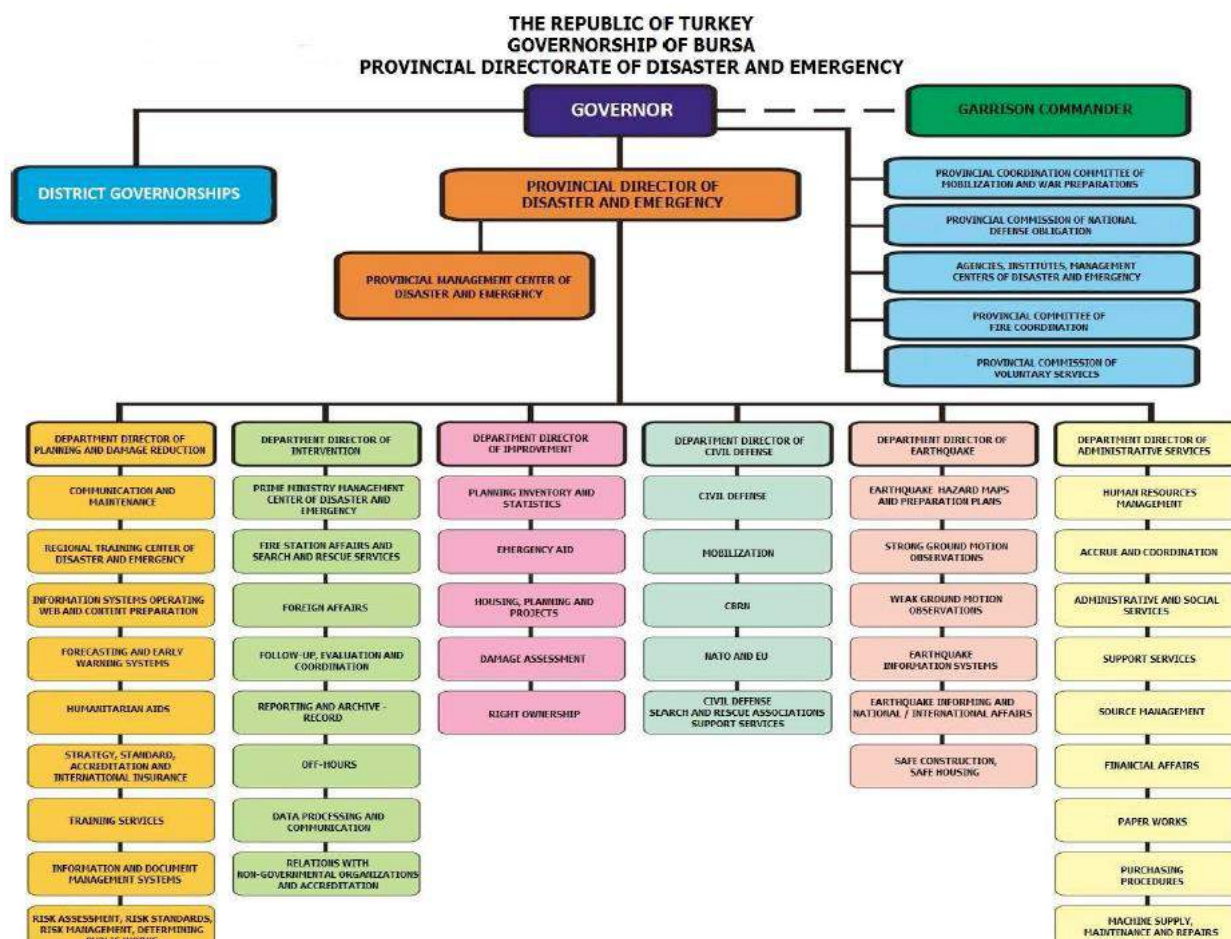

Figure 80: Example Organisational Chart of Provincial Directorate for Disaster and Emergency Management of Bursa Province²⁴⁴⁹

3.1.3 Municipal level authority and organisations

The municipality, via the governors, are responsible for preparing and implementing disaster and emergency plans for their jurisdiction, and organising mitigation, preparedness and response measures. The governor of the municipality must ensure the feasibility of local disaster and state of emergency management plans as well as their compatibility with the provincial and national level plans.

²⁴⁴⁹ UNDP/WMO, 2011, "IPA Needs Assessment".

The Law on Municipalities (No. 5272/5393, 2004), states “The Municipality shall make plans according to the characteristics of the territory in order to prevent fire, industrial accidents, earthquakes and other natural disasters and to minimise the risks of such events and prepare the teams and equipment for action” (Art. 53). These laws are discussed in more detail in Section 2.5.

At the district and municipal level, officials:

- organise disaster preparedness activities,
- control fire departments,
- implement and monitor regulations on MPWS building standards for seismic micro-zones, land use decisions, and
- make preparations for the development strategies (under the provisions of the 1985 Development Law).

One issue that has been noted in official reports is that the mayors and municipal bodies are not held liable for DRR activities and come under the authority of the governors in extraordinary situations. It is the provinces that bear all responsibility. This constitutes a problem because the provinces are not involved in local DRR activities.²⁴⁵⁰

TRCS has its own branches for community participation at the district/local level, similar to the province level. See 3.1.3 above.

3.2 Organisational cooperation

As described in section 3.1, AFAD has the primary responsibility for coordinating emergency organisations in Turkey.

Interviews with key stakeholders indicate that in the case of simultaneous occurrences of events, there are bilateral MoUs signed and in place, where parties take action accordingly. Teams are mobilised immediately according to the e-mail or fax that comes from their stakeholders. Principal areas of international organisational cooperation are coordination in response and risk sharing.

In terms of regional cooperation,

Since 2008 Turkey has been represented at the regional level by the [AFAD] through the Disaster Preparedness and Prevention Initiative (DPPI) for South Eastern Europe and hosted the regional DPPI meeting in 2009. [...] Another form of regional cooperation concerning disaster management is Turkey's engagement within the Civil-Military Emergency Planning Council of South Eastern Europe, which encourages civilian control of military resources during disasters whilst building a multi-national “network of networks” that favours cooperation between neighbouring countries. Turkey and Greece signed the Protocol on the Formation of a Joint Hellenic-Turkish Standby Disaster Response Unit to improve cooperation and joint response

²⁴⁵⁰ “The IMM is a special case due to the fact that the Istanbul Metropolitan Municipality Disaster Coordination Centre (AKOM) was established to act as the responsible head of the fire brigades, health, transportation, enterprises and civil defence departments when an emergency situation arises.” The issue of liability has been noted in WMO (2012), UNDP/WMO (2011), and UNDP(2013).

*mechanisms. A joint exercise was successfully conducted in Ankara in December 2006. The Black Sea Economic Cooperation Agreement signed by Turkey includes a clause for emergency assistance and emergency response to natural and manmade disasters. Hazard and risk assessments are developed jointly by the Mediterranean countries. A real-time flood forecasting and early warning system for the Maritsa and Tundzha rivers was developed jointly by Turkey and Bulgaria with French and Dutch support as a constituent of the European PHARE Project: Capacity Improvement for Flood Forecasting in the Bulgarian-Turkish Cross-border Cooperation Region. A Data Exchange Tool for the DSI, the MEF and decision makers was created along with a dynamic website that is accessible to the general public.*²⁴⁵¹

In addition to these activities, AFAD signed a Plan of Action with UN-OCHA in March 2013 to strengthen the partnerships between the two entities. The two are also working with Turkish NGOs to promote better collaboration with the international humanitarian response system.²⁴⁵² Other partners include FEMA, with which Turkey has initiated important hazard reduction related agreements (e.g., Cooperative Hazard Impact-reduction Effort via Education (ACHIEVE)).

Turkey is an active member of the Capacity for Disaster Reduction Initiative (CADRI) and is eligible for support coming from the Euro-Atlantic Disaster Response Coordination Centre as a NATO member. As a candidate country for EU accession, Turkey receives significant support from the European Union and participates in a range of projects and activities. The Ministry of Interior has participated in meetings of the EU General Directorate since 2000 and is eligible to participate in the EU Civil Protection Mechanism for Facilitating Cooperation in the event of Major Emergencies. (UNDP/WMO, 2011).

In terms of regional cooperation, AFAD actively participates in the activities and projects of DPPI SEE, BSEC, ECO, NEAMTIC and EUROMED PPRD which are mostly based of disaster preparedness and prevention.²⁴⁵³

²⁴⁵¹ UNDP/WMO, 2011, "IPA Needs Assessment", p. 23-24.

²⁴⁵² UN-OCHA, "Turkey."

²⁴⁵³ Statement by H.E. Ambassador Mehmet Ferden Cariki, Preparatory Committee of the 3rd World Conference on Disaster Risk Reduction, 14-15 July 2014, Geneva.

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

No SOPs at the central level could be identified in the context of this study, while provincial level stakeholders in the country indicate that at the provincial level, response plans include such procedures. The unit which is responsible to manage the disaster response is defined as “solution partner” in the response plan. That institution also prepares its own provincial plan, and collects necessary capacity information from other relevant public offices in the province.

The SOPs include the following:

- Where the institutions will gather in the event of emergency or crisis
- How the aforementioned institutions will reach the disaster regions – plan is developed
- Service units plan how to locate their service groups in the region.

However the stakeholders indicate that the SOPs are not fully understood by all institutions, though they aim to assist the provincial institutions through meetings and trainings. The provincial plans include a section for regular tests and drills to be held, however this has not yet been implemented. A national CBRN (chemical, biological, radiological and nuclear) drill is planned in the coming months in Istanbul. Relevant staff from all 81 provinces will attend the drill.

4.2 Operations planning

Central government and provincial/district government bodies, the military and NGOs are responsible for drawing up emergency preparedness and response plans (see Figure 73)

At the national level, a **National Disaster Management Strategy and Action Plan** is under preparation (as of the publication of the AFAD Strategic Plan 2013-2017) with the purpose of forming an effective and efficient management structure and high-level strategy that will ensure consistency and harmony between national plans. The national plans determine the duties, powers and responsibilities of all stakeholders involved in the national disaster management system. The national plans have been, or are in the process of being prepared. These include:

- National Disaster Response Plan
- National Recovery Plan
- National Disaster Mitigation Plan

Turkey Disaster Response Plan (completed): Finalized in 2013, the National Disaster Response Plan (UAMP) covers all the response activities necessary in case of any disaster or emergency and defines the processes, roles and duties of the service groups, coordination units and other central and local bodies that will take part in the response operations, including also communication ways and logistics in the event of a disaster/crisis. For instance, the Ministry of Health will be responsible for the psycho-social support to be provided for the surviving victims. The Plan identifies the basic

principles of response planning before, during and after disasters. UAMP has been prepared by AFAD with the support from all relevant actors that have a role in response phase. The response plan will take effect in 2015.

According to the *HFA Monitor Report* (2013),

The plan links completely the central and local management and the supporting actors. Geographical Information System based implementations that come into force for better management of the disasters and emergencies. Logistical needs are identified and steps taken for the creation of logistical centres. Special tents were designed which are proper for the Turkish families and for four seasons and stocked 65000 unit. Istanbul Civil Defence Search and Rescue Brigade is certified as a heavy class brigade by UN INSARAG and it is targeted that all the brigades will be certified in a few years. Together with the countries in the region, search and rescue exercises are performed in a planned way especially with NATO and European Union. For more effective coordination of civil and military assets, Turkey, Qatar and Dominican Republic initiated HOPEFOR initiative in 2010 and the Second International HOPEFOR Conference took place in Antalya in 2012 and an exercise took place in the scope of the conference which shows the effective coordination of civil and military assets. It is planned that Land Forces Command Natural Disasters Search and Rescue Troop will give trainings on natural disasters to Kyrgyzstan and Albania delegates. To reduce the loss of life and property in multi dwelling places like the institutions, the schools, the teacher guest houses, the club houses, the Ministry of Education issued a circular letter for performing 'Personnel Evacuation Exercise' to the central and local organization, the schools and the institutions during the Week of Earthquake between 01-07 March.²⁴⁵⁴

National Recovery Plan (Planned / Waiting to be confirmed as of the HFA National Progress Report 2011-2013 report): To be prepared by end of 2014, the National Recovery Plan will ensure that life returns to normal as soon as possible after a disaster. The plan aims to increase the speed of recovery by addressing several factors, such as social, economic, physical and environmental factors and IC technologies.

National Disaster Mitigation Plan (in development/planned): To be prepared by end of 2015, the National Disaster Mitigation Plan constitutes an important step in the transition from crisis management to risk management. The plan aims to increase the public's capacity to cope with disasters by defining the activities carried out for the purpose of identifying disaster hazards and risks as well as for preventing or minimizing their impacts (AFAD, 2012a; AFAD, 2013b)

Procedures related to the development of operational plans

At the provincial level, the provincial directorate of AFAD prepares the provincial Emergency Assistance Plans for their provincial district governments, which are then submitted to the governorate for approval. There are 26 service group plans below it. Depending on the type of crisis/disaster situation, the relevant public agency is to take responsibility in line with its provincial plan and in compliance with the plan of the provincial directorate of AFAD. Out of those 26 service groups, 8 group plans are prepared by the provincial directorate of AFAD. The other 18 are prepared

²⁴⁵⁴ AFAD, 2013b, "HFA Monitor Report - Turkey," 30.

by the provincial directorates of other central institutions/ministries. The plans of the provincial directorate of AFAD are:

- (i) service logistics,
- (ii) sheltering services,
- (iii) CBRN service,
- (iv) search and rescue,
- (v) budget and accounting,
- (vi) procurement,
- (vii) resource management,
- (viii) information management.

These plans are directly linked with the national level plans. The same plans are also prepared at the national level by the relevant central organizations/ministries (AFAD, 2013b).

According to the *IPA Needs Assessment* report (2011), these provincial level Disaster Emergency Relief Plans currently exist irregularly, depending on the type and magnitude of the disaster in the event of an earthquake. Moreover, the preparation of regional contingency plans remains optional. As a result,

*certain areas present a low level of preparedness, while areas of fast growing and illegal urbanisation lack emergency relief plans altogether. Plans prepared at different scales differ in their scope and strategy and create overlaps and contradicts. This is particularly the case in metropolitan areas, where government has charged different institutions with establishing local relief plans according to their realm of expertise.*²⁴⁵⁵

The Turkish Red Crescent Society (TRCS) and the Turkish armed forces also play a role in operations planning and disaster preparedness. See Section 1.2.4 for a description of their role.

No international standardisation approach is used or adopted. Standardisation in the operation planning process is limited with the exception of the provincial response plans. Provincial level stakeholders indicate that a higher level of detail and standardisation was foreseen at the beginning of the process; however this has not been pursued in practice.

Military support is anticipated in all provincial plans for all emergency situations, as foreseen in the relevant regulations. See Chapter 3 for discussion of TAF involvement in Turkish disaster management.

²⁴⁵⁵ UNDP/WMO, "IPA Needs", p. 19-20. It should be noted that the Disaster and Emergency Response Plan for Istanbul represents an extremely high level of preparedness within the IMM. For more information, see Istanbul DED, "Istanbul ADMIP: Disaster and Emergency Prevention, Response and Recovery Plan," June 2014. Available <http://www.guvenliyasam.org/Contents/rehber-kitaplar/en/ADMIP-EN.pdf>.

4.3 Logistics support in crises

Private logistics providers are involved in crises situations. For example, private sector facilities such as cool silos and other special facilities are anticipated for use in the event of an emergency. Other private sector providers of logistics support include the Istanbul Bus Company (İETT) and Istanbul Sea Buses Company (İDO). The companies have made preparations for evacuating people from disaster areas to safe places (UNDP/WMO, 2011).

Military logistics support is also anticipated. The Turkish Armed Forces, for example, maintain logistic support coordination centres to ensure timely response in the event of emergencies. During the Van Earthquakes (2011) the use of military planes was made available for delivering SAR forces and other rescue workers, equipment and aid (e.g., blankets, tents, etc.).

Logistics support is also provided through non-governmental providers, such as TRCS, which has a disaster response and assistance unit consisting of 5 branches: Disaster Preparedness and Planning Unit, International Disaster Response Unit, Operational Unit, Logistics Unit, Psycho-Social Support Unit. These units maintain several logistic depository facilities with stocks of tents, food and blankets in each province, airport and harbour that support its emergency operations. These include a tent production facility and storage facilities distributed around the country to provide logistics support in the event of a disaster (one central storage in Ankara and satellite storages in seven other provinces) (Ganapati, 2008).

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

The monitoring, notification and warning systems are comprised of several networks, notification centres and early warning. A national coordination body has been established and early warning and communications systems that are in place for immediate threat of disaster are well developed. Figure 81 shows the intelligence and dissemination system as defined in the AFAD Strategic Plan 2013-2017.

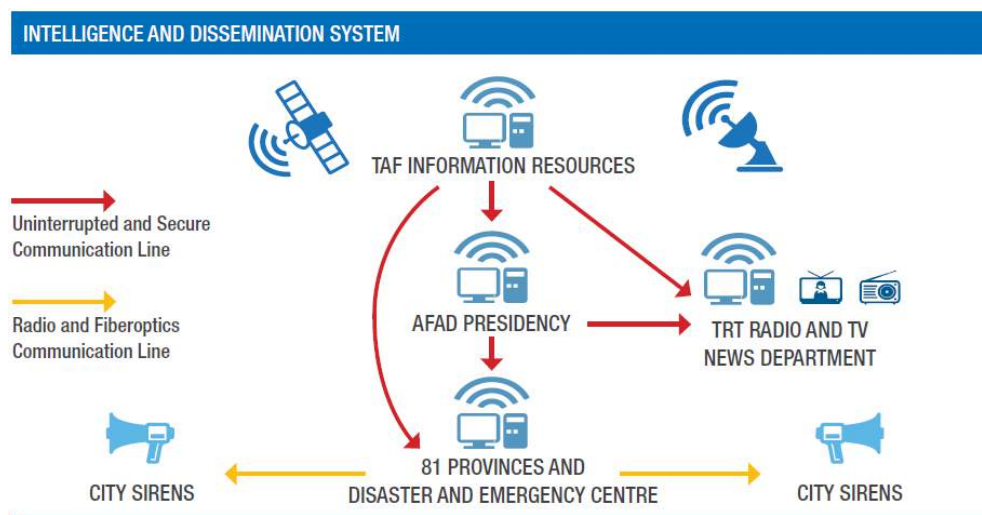

Figure 81: Intelligence and Dissemination System ²⁴⁵⁶

Regarding crisis communication to the public,

Warnings for the public are issued for a variety of parameters, all of which cause damage to life, property and infrastructure – examples of these are strong precipitation, hail, storms, cold and heat waves, coastal and sea area warnings, sand and dust storms, and forest fires. The messages outline possible risks such as flash flood, landslides, lightning and hail for a strong precipitation event. ²⁴⁵⁷

Networks and forecasting

Two main networks exist to record land deformations to forecast seismic risks. These are the **National Telemetric Earthquake Observation Network (TURKNET)** and the **National Earthquake Monitoring Network**. TURKNET is monitored by the Seismology Division housed in AFAD and consists of 24 stations dispersed across the country. ²⁴⁵⁸ The National Earthquake Monitoring Network is operated by KOERI and consists of 116 broadband and 22 short period seismometers and a satellite system, all of which support real-time communication. Additional data from 72 stations is provided through agreements with neighbouring countries. ²⁴⁵⁹ DMI and DSI (see 3.1.1) operate early warning systems in Turkey for all hydro-meteorological risks.

The DMI Observation Network prepares short and longer term weather predictions and is extremely dense, encompassing:

- 257 hydro-meteorological stations,
- 132 synoptic stations,

²⁴⁵⁶ AFAD, 2012a, Strategic Plan 2013-2017

²⁴⁵⁸ For more information, SEBA Hydrometric, Turkey Emergency Flood and Earthquake Recovery Project, < <http://www.seba-hydrometrie.de/en/reference-projects/tefer-turkey.html>>.

- nearly 500 automatically transmitting radio sonde stations,
- 118 lake observation systems,
- 150 snow stations,
- 330 meteorological stations; and,
- 1,000 water quality and sedimentation measurement stations

The DSI network comprises:

- 710 precipitation stations,
- of which 357 are currently operational and
- 1,176 discharge measurement stations.

The equipment used by DMI and DSI for data communication and dissemination of warnings is described in Figure 82 below.

5 Capabilities

5.1 Human resources

The number of personnel cadres assigned to the Presidency is 515. As of the writing of the AFAD Strategic Plan document 2013-2017, the total number of personnel employed in the Presidency is 447. Of this, 322 are permanent employees while the remaining 125 are temporary.

Figure 83: General Personnel Status of the Presidency²⁴⁶¹

Figure 84: Distribution of Permanent Personnel as per Service Classes²⁴⁶²

The personnel composition structure of the Presidency is mainly comprised of disaster management experts, engineers from related disciplines, instructors, technical staff and administrative staff (AFAD 2014). At the provincial level, staff is predominately comprised of search and rescue professionals and a smaller number of technical staff.²⁴⁶³ Stakeholders in the country indicate, however, that the capacity to mobilize is dependent upon the situation.

²⁴⁶¹ AFAD, Strategic Plan 2013-2017

²⁴⁶² Ibid.

²⁴⁶³ For example, in Ankara, the provincial directorate staff is made up of 100 search and rescue professionals and 20 technical staff (e.g., engineers, mechanics, health and administrative staff).

In addition to the Presidency's staff, "[a] stand-by operative network" comprised of well trained staff from the General Directorate of Civil Defence, the natural disasters search and rescue battalions, regional disaster commands and natural disaster assistance troops subordinate to the Turkish Armed Forces, as well as a network of volunteers from the TRCS and other NGOs is ready to intervene in the event of a disaster (UNDP/WMO, 2011). The armed forces are involved mainly through the implementation of their Emergency Assistance Plans (See 1.2.4). In addition, they carry out search and rescue activities and provide services related to security, health, shelters, transportation, communication, and service to basic needs of victims (Ganapati 2008).

NGOs are mainly involved in search and rescue operations. Among the major NGOs involved in the field of disaster and crisis management in Turkey are the search and rescue association AKUT, the Neighbourhood Disaster Support Group (MAG), the Disaster Preparedness and Earthquake Training Association and, most importantly, Turkish Red Crescent Society (TRCS).

- **AKUT** is the first volunteer search and rescue organisation. AKUT has 9 regional offices and is increasingly supported through volunteer participation and fund-raising activities.
- **The Disaster Preparedness and Earthquake Training Association** is the only organisation with a central focus on disaster prevention and mitigation rather than on protection and rescue. The association aims to increase community awareness through training activities that cover disaster awareness, environment and water awareness, fire prevention as well as first-aid and search and rescue training aimed at children, families and municipalities. The trainings are certified by the Ministry of Health.
- **TRCS** is an NGO with a special status and strong legislative links to the Government and funding due to its role at the national, provincial and local levels. It has national, provincial and district level committees that are heavily involved in disaster preparedness through the conduct of public awareness and training activities. In October and November 2011, the TRCS successfully mobilized and deployed 986 of its staff for the response operation. (UNDP/WMO, 2011).

These NGOs are also members of the National Platform established in March 2011 (See also Section 3.1). The GEA Search and Rescue Group²⁴⁶⁴ is also members of the Platform.

Foundations, which are under the oversight of the General Directorate of Foundations, support the Government with research efforts, training and education, and public awareness activities. The Environment Foundation of Turkey²⁴⁶⁵ is particularly active in the field as a member of the National Platform, as well as through its dissemination of materials on public training and awareness and the organisation of national and international conferences.

Professional organisations which are active in disaster and crisis management include the Chamber of Geological Engineers, the Chamber of Geophysical Engineers, the Chamber of Civil Engineers and the Psychiatric Association of Turkey as well as the Chamber of Architects, the Chamber of Commerce and the Chamber of Medical Doctors. The first four are also members of the National Platform (UNDP/WMO, 2011).

²⁴⁶⁴ GEA Search and Rescue Group, <http://www.gea.org.tr/?lang=en>.

²⁴⁶⁵ Environment Foundation of Turkey, <http://www.cevre.org.tr/>.

From the private sector, the following are represented in the National Platform: the Turkish Industrialists' and Businessmen's Association, the Union of Chambers and Commodity Exchanges of Turkey, the Turkish Contractors Association as well as the General Directorate for Press and Information, the Turkish Association of Journalists and Turkish Radio and Television Cooperation. Commercial enterprises are increasingly investing in business continuity services designed to assess and then mitigate physical and or operational risks. The importance of public-private partnerships for disaster management has been stimulated by the combination of building codes and reinsurance rates. (ibid).

5.2 Materiel (non-financial) resources

AFAD has warehouses and equipment available from the moment an earthquake hits. At the provincial level, a number of provinces have established large warehouses for the storage of necessary stock and equipment, such as containers, tents, blankets, kitchen utensils, clothing, etc. In Istanbul, for example, a year's supply of medicine and equipment is ready on stand-by and replenished annually; portable toilets procured, and; tent areas identified and water and sewage infrastructure completed. The Istanbul Emergency Aid and Lifesaver Directorate put together 2,500 emergency aid kits to use in the early stage of response. IMM's Emergency Aid and Lifesaver Directorate also has 20 emergency response stations and 29 ambulances available to it. Ankara does not yet have such a warehouse as described above, but plans are ongoing. The exact levels (numbers) of provincial stocks are not publicly available.

Provision is made in administrative law for the mobilisation or commandeering of private assets during a crisis. Certain provisions are made for governments to mobilise or commandeer private assets during crises, as in Law no. 7269. Assets can be mobilized in a number of ways, such as through hiring and appropriating.

Regarding the involvement of military assets, in Ankara, for example, the provincial level has access to the aerial capacities of the law enforcement agencies in Ankara through the governorate. The planned use of other military assets, either at the national, provincial or municipal levels, is not clear. At the central level, AFAD has been developing projects with the National Police for the visual local identification and damage assessment.

The TRCS provides first aid and health services, distributes tents, foods and blankets to victims on the basis of its preparedness and intervention plans (information on the TRCS logistics support, including its tent production facilities is provided in section 4.3) (Ganapati, 2008).

A bread distribution organization plan has been developed for use during an earthquake. The plan is based on the results of studies on production, storage and distribution of 5 million loaves of bread "with high calories and good nutrition" (UNDP/WMO, 2011: 29). Istanbul Public Bread factories are able to make production with LPG.

5.3 Training

AFAD is responsible for education, training, and awareness-raising activities in the field of disaster risk reduction with the aim to target all relevant stakeholder groups at all levels, including decision makers, national and local officials from directors-general to experts working on disaster and emergency management, NGOs and the general public.

Within the framework of regular training for national level officials, provincial and district governors, an official report states

the General Training Department of the Ministry of Interior [...] has initiated seminars on disaster management for government officials. Officials are also trained through the [AFAD] Disaster and Emergency Training Centre. An agreement was signed between Istanbul Technical University and the Ministry of Interior of Turkey in 2001 for four projects: (i) Training on Emergency Management, (ii) Development of Turkish Fire Brigades, (iii) Development of an Emergency Management System and (iv) GIS Standards Based on Emergency Management. Moreover, the University has cooperated with the Ministry of Interior's Strategic Research Unit to develop training that is targeted at provincial and district governors. The Turkish Emergency Management General Directorate (now integrated into the [AFAD]) carried out three International Disaster Management Courses aimed at managers in government ministries, the police, the military, emergency services, non-governmental institutions and industry in partnership with Bournemouth University. Many new projects are currently in the start-up phase, two of them being the National Exercise Simulation Centre at the DEMP headquarters and the Centre of Excellence for the Training of Fire Brigades.²⁴⁶⁶

Certification is provided for relevant public officials and public employees, especially in the fields of search and rescue. This certification is also sought for public institutions to take part in drills and tests. No international standards are pursued; national rules and regulations are applied.

Provincial level directorates conduct and participate in provincial and departmental training exercises and provide regular trainings on search and rescue and civil defence for relevant public officials, as well as earthquake simulation exercises for professionals and the wider public. More specific information on this subject could not be identified within the context of this study.

The training of volunteers at the local and provincial level is held in SAR, non-structural mitigation and first-aid. For example, the Neighbourhood Disaster Volunteer (NDV) Programme was implemented by the Neighbourhood Disaster Volunteer Association with support from the government. As of 2011, more than 3,472 Neighbourhood Disaster Volunteers from 85 neighbourhoods located within the provinces of Kocaeli, Istanbul, Yalova and Izmir had completed the standard basic training programme and signed cooperation protocols with Civil Defence.²⁴⁶⁷

²⁴⁶⁶ UNDP/WMO, 2011, "IPA Needs", 17-18.

²⁴⁶⁷ www.mag.org.tr/eng/proje2.html

The “Safe Life Volunteers Campaign”, implemented within the framework of the Istanbul Seismic Risk Mitigation and Emergency Preparedness Project, offered 15 different training modules on disaster preparedness, including one child-friendly programme. More than 26,000 people have been reached since 2008 and all of the training material is made available to the public.²⁴⁶⁸

Since 2012, AFADEM offers a training for ‘Basic Disaster Awareness Trainers’ aimed at presenting a very systematic approach on top of previous efforts. The personnel of AFAD local organizations, Provincial Directorates of the Ministry of Youth and Sports and the municipalities have been trained under this programme. As of the HFA Monitor 2011-2013, trainings are planned for social services, the Turkish Red Crescent and the Union of Psychosocial Services in Disasters workers in order to reach vulnerable areas after disasters and to inspect disturbed psychosocial structure. (AFAD, 2013b).

5.4 Procurement

5.4.1 Procurement regulation

Background

Within the European legislation three different procurement directives apply, which are mutually exclusive, meaning that only one of the directives apply to public procurement. Two of the three directives are topic specific, the first relating to the procurement of energy, water, transport and postal goods and services and the second one relating to the procurement in the defence and security industry. If none of the specific directives apply the general public procurement directive will apply. It is vital to know which of the three directives apply to the procurement of CM tools and services as the three directives have different procedures and thresholds.

Not all goods and services need to be publicly procured. First of all, contracts with values below the specified thresholds do not have to be procured. The thresholds differ between the directives as well as between goods and services (including trainings). Also some of the articles are not compulsory and Member States can choose not to implement these articles. On the other hand the directives provide minimum rules and Member States can opt to maintain stricter rules as long as the stricter rules are non-discriminatory. Therefore quite some differences might exist between the procurement schemes within Member States and this can influence the adaptation of CM tools and services in the different MS.

This project revolves around the procurement related to crisis management. This is for example the procurement of ambulances, emergency packs or training. In Turkey there is a procurement law which applies to the procurement of goods and services. This section will explain the scope of the procurement law, the award procures and the evaluation of tenders.

Scope

²⁴⁶⁸ www.guvenliyasam.org ; www.beyazgemi.com.tr; All of these projects have been conducted by Beyaz Gemi Training and Consulting. See UNDP/WMO, 2011.

The Turkish public procurement law applies to the procurement of goods, services or works of which the costs are paid from resources of the public administrations included in the general budget, state economic enterprises and social security establishments etc. that are assigned with public duties (article 2). This is only the case if the estimated value of the project is above the threshold value. The threshold values are:

- Three hundred billion Turkish Liras for procurement of goods and services, operating under the general or the annexed budget;
- Five hundred billion Turkish Liras for procurement of goods and services by other contracting authorities within the scope of the PPL;
- Eleven trillion Turkish Liras for the works by any of the contracting authority covered by the procurement law.

Furthermore, the procurement law does not apply to all goods, services and works of these public organisations. Article 3 makes an exception for several types of procurement, for example: procurement related to defence, security or intelligence that need to be treated confidentially; procurement which is pursuant to international agreements and have foreign financing and the institutions covered by law; procurement necessary for research and development projects, executed or supported by national research and development institutions; drafting emergency response plans and procurement of services etc., which are urgently needed to decontaminate the sea environment. Furthermore the procurement law does not apply when there is an urgent need that will come up in cases such as defence, security and humanitarian aid issues.

Award procedures

The contracting authorities are liable for ensuring transparency competition, equal treatment, reliability, confidentiality, public supervision, and fulfilment of needs appropriately, promptly, and efficient use of resources. The contracting authorities can divide the procurement into lots, but this can't be done with the purpose of avoiding threshold values (article 5).

In the procurement of goods, the contracting authority can apply the open procedure, the restricted procedure or the negotiated procure.

In the open procedure, all tenderers may submit their tender (article 19). In the restricted procedure, only tenderers that are invited, following a pre-qualification by the contracting authority, can submit their tenders (article 20). This procedure can be used when the open procedure is not applicable, since the nature of the subject necessitates speciality and/or technology and in procurement works where estimated costs exceed half the threshold value. The pre-qualification shall be carried out in accordance with the qualification criteria.

The negotiated procedure may be applied when it is inevitable to conduct the tender procedures immediately, due to unexpected and unforeseen events or due to occurrence of specific events relating to defence and security. More over the procedure can be used when the procurement is requiring a research and development process; the procurement has specific and complex characteristics or procurements with an estimated costs up to fifty billion Turkish Liras (article 21). In this procedure, the tenderers who are accepted as qualified may submit their initial proposals. This

does not include prices on aspects such as technical details and realization methods. The contracting authority shall then interview each tenderer on the best methods and solutions. After this interview, the tenderers will submit their proposal, including a price offer.

In several cases, the contracting authority can use direct procurement, for example when the goods and services can only be supplied by one natural or legal person; when the procurement has a low value or when the procurement is related to medicine (article 22).

Evaluation

The tenderers whose tenders are not in compliance with the requirements of article 36 shall be excluded from the evaluation proceedings (article 37). If the information is not crucial for the tender, the contracting authority may request the tenderer to complete the information. The tenderer shall be examined for their conformity with the qualification criteria, determining the capacity of the tenderer to perform the contract as well as the conditions set forth in the tender document. Tenders that are abnormally low shall be evaluated on economic nature of the manufacturing process and the methods of work; selected technical solutions and advantageous conditions utilized by the tenderer and the originality of the works proposed (article 38).

The tender shall be awarded to the tenderer with the economically most advantageous tender. This is determined solely on the basis of the price or together with the price by taking into account the non-price factors. When the price is the only determination factor and two or more tenderers have the same price, the evaluation will also take the non-price factors into account. If non-price factors play a role in the evaluation process, these factors must be expressed in monetary values (article 40).

5.4.2 Procurement procedures

Background

The European directives provide the legal boundaries for procurement, but they do not fully regulate the procedures followed. Other projects done show that the actual procedures can differ between Member States. It is important to understand whether the procurement activities are carried out by a civilian or military organisation. Also insight in their public procurement procedures (which are often defined at a national level) provides a good overview of the different practises.

Crisis management will not be limited to EU-28 countries and neighbouring countries might also be affected. Procurement in these countries is not covered by the EU directives and therefore it is important to have some insights in the procurement practices in these neighbouring countries.

5.5 Niche capabilities

Niche capabilities of Turkey's AFAD include: Campsite construction and canine-assisted search and rescue for earthquakes and avalanches.
