WP	Work Package

Project Description

DRIVER evaluates emerging solutions in three key areas: civil society resilience, responder coordination as well as training and learning.

These solutions are evaluated using the DRIVER test-bed. Besides cost-effectiveness, DRIVER also considers societal impact and related regulatory frameworks and procedures. Evaluation results will be summarised in a roadmap for innovation in crisis management and societal resilience.

Finally, looking forward beyond the lifetime of the project, the benefits of DRIVER will materialize in enhanced crisis management practices, efficiency and through the DRIVER-promoted connection of existing networks.

DRIVER Step #1: Evaluation Framework

- Developing test-bed infrastructure and methodology to test and evaluate novel solutions, during the project and beyond. It provides guidelines on how to plan and perform experiments, as well as a framework for evaluation.
- Analysing regulatory frameworks and procedures relevant for the implementation of DRIVER-tested solutions including standardisation.
- Developing methodology for fostering societal values and avoiding negative side-effects to society as a whole from crisis management and societal resilience solutions.

DRIVER Step #2: Compiling and evaluating solutions

- Strengthening crisis communication and facilitating community engagement and self-organisation.
- Evaluating emerging solutions for professional responders with a focus on improving the coordination of the response effort.
- Benefiting professionals across borders by sharing learning solutions, lessons learned and competencies.

DRIVER Step #3: Large scale experiments and demonstration

- Execution of large-scale experiments to integrate and evaluate crisis management solutions.
- Demonstrating improvements in enhanced crisis management practices and resilience through the DRIVER experiments.

DRIVER is a 54 month duration project co-funded by the European Commission Seventh Framework Programme (FP7/2007-2013) under grant agreement no. 607798.

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report				Page:	8 of 1872	
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status:	Final

Executive Summary

New solutions, technical and non-technical, provide strong opportunities to improve crisis management (CM), while successful operationalization of new solutions essentially depends on their compatibility with framework conditions such as organisational, legal, and political aspects in the respective area.[1] The knowledge about those framework conditions is thus essential to optimize the innovation potential of emerging CM solutions.

The document at hand presents a report on CM Organisations, capabilities, policy and legislation. Formerly in the original DOW it appeared as D82.11 and D83.11.

It provides a unique collection of “Supporting information on CM systems” of EU Member States (MS), EU-level, and UN-level as well as of those countries concerned by the DRIVER scenarios. It serves as non-technological performance conditions and criteria for the DRIVER solutions, as well as a support to the test-bed design (SP2) and to the design of the experimental campaigns (incl. the development of the scenarios) in SP6. Next to the objective of receiving most realistic scenarios for the testing of new CM solutions, at a later stage in DRIVER the analysis of framework conditions aims at developing experience-based recommendations for different types of stakeholders such as incident commanders and policy makers of the EU and its MS.

Since there is an inextricable link between the activities of the DRIVER WP82 and WP83, a combined template covering the high level-analysis required in both task 82.1 (“Crisis Management Processes & Organisations”) and task 83.1 (“Policy & Governance”) has been developed (see also D81.1 SP8 Work Plan [2]). Thus, the conducted studies of EU MS, EU- and UN-level as well as of selected additional countries include information on CM Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC). Taking into account the general DRIVER perspective, special attention was given to (a) the national level, (b) cross-border and bi- or multilateral cooperation and (c) decision-maker related data. In addition, CM related Civil-Military cooperation in the different countries has been examined. In total 36 individual studies have been created, to be found in Annex 3.

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report					Page:	9 of 1872

1 Introduction

Natural and man-made hazards, their variances and broad range of possible impacts on society, critical infrastructures, environment or economy, perpetually induce new challenges for crisis management. These challenges must be met by constant improvements and adaptations of the crisis management process, to ideally be able to cope with complex disasters in the best possible way at any time. New technical and non-technical solutions play a crucial role in this regard, providing strong opportunities for improving crisis management capabilities and thus societal resilience.

Whether new solutions are implemented in crisis management, if they actually strengthen resilience, as opposed to rather triggering negative secondary impacts or providing no real added-value, strongly depends on conditions such as relevant organisational, legal, and political framework conditions.[1]

As part of the old Subproject 8 “Supporting information”, this survey is intended to provide high-level information on CM procedural, organisational and institutional structures (related to task 82.1) as well as on policy and legislation aspects (related to task 83.1) in all EU MS, EU-level, and UN-level as well as of those countries concerned by the DRIVER scenarios. Furthermore, information on procurement processes have been gathered to, in a later stage, support the exploitation of the Portfolio of emerging solutions (PoES) and of the DRIVER Test-bed (related to T82.1). In addition, a separate study on civil-military cooperation in CM has been conducted (related to T83.1).

Crises addressed within the scope of DRIVER are major disasters (natural or man-made) that require coordination between or assistance from other MS, i.e. exceeding the crisis management capacity of one nation or affecting more than one MS. The information gathered during this high-level analysis therefore focuses primarily on this type of crisis. This excludes other types of crises, like “financial crises” or war-like crises.

Objectives:

The survey describes and analyses the high-level CM Policy, Legislation, Organisation, Procedures & Capabilities of EU MS, EU-level, and UN-level as well as of those countries likely to be affected by the DRIVER scenarios. The gathered information is intended

1. to support the experimentation by serving as non-technological performance conditions and thus, **support the test-bed design in SP2** and consequently, **the development of the DRIVER Portfolio of Emerging Solutions (PoES)**
2. to later **support the development of the scenarios and the execution of Joint Experiments (JEs) and the Final Demo (FD)** in SP6
3. to support the **preparation of recommendations for the EU and MS** on how to benefit from the DRIVER-results to strengthen CM structures and improve common preparation and operations and thus, European resilience.

The compatibility of a CM solution to CM context factors can be optimized from both sides. While on the one hand, the information contained in the report at hand supports the later development of

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report					Page:	10 of 1872
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status:	Final

recommendations to different stakeholders in the EU and its MS, it also serves the solution providers in DRIVER as valuable information on how to optimize their products and services.

To fulfil the above mentioned objectives, the country/international organisation (IO) studies needed to (a) provide information with specific use for the solutions tested in the thematic areas of DRIVER (SP3 Civil Society Resilience, SP4 Strengthened Responders, SP5 Training and learning) and (b) be structured in a way that allows a comparison of certain aspects among the different studies.

While studies on some CM systems already exist, like the results from the FP7 project ANVIL – Analysis of Civil Security Systems in Europe¹, they could not meet the before-mentioned needs as in general they have a different focus. For instance, ANVIL covers only 17 of the 28 MS, Mediterranean countries relevant for the DRIVER scenarios are missing as well as the EU- and UN-level. Nevertheless, these studies already provided some valuable input and have been used as resources for some of the studies.

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report				Page:	11 of 1872
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status: Final

2 Methodology and limitations

Methodology

Comparing the work plan and objectives of WP82 (“CM Institutions & Capabilities”) and WP83 (“Governance”), it was obvious that both WPs should cooperate and perform their work in parallel where reasonable, to optimize the results and to avoid any duplication. Both WPs conduct high-level analyses on national as well as on EU- and UN level: WP82 concentrating on CM procedural, organisational, and institutional structures, WP83 concentrating on CM policy and legislation. These issues are closely related, and it made most sense to gather the respective information together.²

Moreover, it has been decided that each country / international organisation analysed in this survey should be covered by only one partner for all subtasks. The main purpose has been to avoid that DRIVER relevant stakeholders are contacted by different partners within DRIVER in a short time frame. In addition, this decision aimed to avoid duplication of work, too much coordination needs between partners, and to perform work more efficiently.

In order to provide the supporting information laid down in the objectives of this survey in a most useful way, the responsible DRIVER partners of the receiving SPs have been consulted. This consultation of SP2-5 in month (M) 3 of DRIVER with regard to their information needs, to be considered in the high-level analysis, was done by a functional requirements analysis (see also D81.1 SP8 Work Plan Annex 1 [2]). It became evident that for many of the contacted WPs, it was too early in the project period to define clear information needs from WP82 and WP83.

To better meet the objectives and requirements of SP8 to provide supporting information, it has been therefore decided to expand the efforts in the updated tasks in M25-29 (task 82.2 and task 83.2), mainly planned to update information with regard to the information needs in the scenario design of the Joint Experiments and of the Final Demo in SP6 (SP6 started in M11), and to reduce the original scope of task 82.1 and task 83.1.

As a result, the high level analysis in the first phase (tasks 82.1 & 83.1) provides the recipients of the deliverables with a general overview on CM PLOPC – in short for the information to be gathered in WP82 and WP83, including amongst other Procurement aspects and Civil-Military aspects, covering the EU MS, selected additional countries and international organisations (EU and UN).

In contrast, the update phase (M25-M35) will be able to focus on more pertinent CM PLOPC issues identified by the receiving SPs, including the support of the development of the scenarios in SP6 as well as of the development of experience-based recommendations for different groups of CM stakeholders of the EU and its MS. Consequently, in the beginning of these update tasks 82.2 and

² As a result, the two work packages have been merged during the restructuring process of DRIVER at the end of 2015 into the WP88 “CM policy context and recommendations” of the new SP8 “Assessment & Innovation”.

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report					Page:	12 of 1872
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status:	Final

83.2³ in M25, a second round of the functional requirements analysis will be conducted consulting the receiving SPs and WPs.

Based on the above mentioned scope of the high-level analysis and by the review of the results of the first consultation of the partners in SP2-5, a common template for the reports D82.11 has been developed (see Annex 2) and has been used as a guideline for the country studies as well as EU- and UN-level. The template, including guiding notes for the partners, ensured the comparability of the gathered information on “Policy, Legislation, Organisation, Procedures & Capabilities” (PLOPC) in all relevant tasks of WP82 and WP83, and defined the structure of each country report (see chapter 3 Structure of the studies).

As a result, receiving partners are able to compare specific information from various countries very easily by evaluating the same chapters of the different studies.

Information on CM related Civil-Military cooperation in the respective countries has been gathered in a separate study, developed and conducted by CSDM.

The work has mainly been done by desk top research, based on publicly available information. In addition, information gaps have been filled by conducting interviews with relevant stakeholders where possible.

As already stated, the studies cover issues on

Policy (e.g. risk assessment, strategy scope and focus, monitoring, analytical support and R&D, financing, policy review cycle, approaches to resilience, information sharing and data protection)

Legislation (e.g. CM concept, general crisis/ emergency/ disaster management law, emergency rule, department/agency-level and specific regional and local legal arrangements, regulations on the involvement of volunteers and specialised NGOs, as well as for international engagements of first responders)

Organisation (e.g. chain of command, cross-border operational cooperation),

Procedures (e.g. Standing Operating Procedures, national crisis management plans), and

Capabilities (e.g. human resources, materiel resources).

They further provide data on CM organisations’ **procurement processes** to support the exploitation of DRIVER solutions and the DRIVER test-bed.

For the respective country / IO studies, see the Annex 3.

³ Now T88.2 Update of supporting information on CM systems

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report					Page:	13 of 1872
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status:	Final

Scope and limitations of the survey

Taking into account the available budget and time for the analysis while considering the objectives of the survey that mainly tend to support further work within in the DRIVER project, “high-level” has been defined as followed:

- national level
- cross-border, bi- or multilateral
- decision maker related

Budget and time constraints also need to be considered when assessing the scope and completeness of the respective studies, also due to varying extent of available online information or missing translations of e.g. policy and legal documents. Moreover, not always has it been possible to schedule expert interviews in the given time. This sometimes resulted in level headings that have been left blank. Next to the limited time and missing translations, this was in very few cases due to information that is not available to the public in general, so even the experts weren't allowed to give this information.

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report				Page:	14 of 1872

3 Structure of the studies - Overview

Country / International Organisation: Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Overview

1 Policy

- 1.1 Risk Assessment
- 1.2 Policy and Governance
 - 1.2.1 Strategy scope and focus
 - 1.2.2 Monitoring and analytical support to policy making; R&D
 - 1.2.3 Policy for Prevention
 - 1.2.4 Policy for Preparedness
 - 1.2.5 Policy for Response
 - 1.2.6 Policy for Relief and Recovery
- 1.3 Financing
 - 1.3.1 Investing in preparedness
 - 1.3.2 Investing in consequence management
- 1.4 Policy review, Evaluation & Organisational Learning
 - 1.4.1 Post-Disaster Assessment
 - 1.4.2 Departmental Lessons Learned systems
 - 1.4.3 Centralised (national) Lessons Learned system
 - 1.4.4 International exchange for Lessons Learned
 - 1.4.5 Regular policy reviews
- 1.5 Resilience
- 1.6 Information sharing and data protection

2 Legislation

- 2.1 Crisis (emergency, disaster) management concept
- 2.2 General crisis (emergency, disaster) management law
- 2.3 Emergency rule
- 2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management
- 2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management
- 2.6 Legal regulations on the involvement of volunteers and specialised NGOs

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report				Page:	15 of 1872
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status: Final

2.7 Legal regulations for international engagements of first responders and crisis managers

3 Organisation

3.1 Organisational chart

3.2 Organisational cooperation

4 Procedures

4.1 Standing Operating Procedures and Guidelines

4.2 Operations planning

4.3 Logistics support in crises

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

5 Capabilities

5.1 Human resources

5.2 Materiel (non-financial) resources

5.3 Training

5.4 Procurement

5.4.1 Procurement regulation

5.4.2 Procurement procedures

5.5 Niche capabilities

Resources

For the **detailed structure including guiding notes** about the specific information requested under each heading, please see the template in the **Annex 2** that has been used by the authors as a guideline.

These guiding notes are a result of the functional requirements analysis of the SP2-5 (see also D81.1 SP8 Work plan Annex 1 [2]) and serve the objective to gather data relevant for a later implementation of DRIVER/CM solutions.

In addition, this template serves the other DRIVER partners to easily figure out, where valuable information can be found in the different studies.

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report				Page:	16 of 1872
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status: Final

4 Exemplary analysis of collected data

This and the following chapter on “outlook” give an example of the use of the collected data in the country/IO organisation studies and have been taken from the publication in context with the Future Security 2015 [1].

The “high-level” studies, conducted for EU Member States, selected third countries, and on EU- and UN-level, cover topics on Organisation (e.g. chains of command, cross-border operational cooperation), Procedures (e.g. Standing Operating Procedures, national crisis management plans), and Capabilities (e.g. human/ materiel resources). They further cover Policy (e.g. risk assessments, analytical support and R&D, financing, policy review cycle, approaches to resilience, information sharing and data protection) and Legislation (e.g. general crisis/ emergency/ disaster law, emergency rule, specific regional and local legal arrangements, regulations on the involvement of volunteers, international engagements of first responders). They also provide data on CM organisations’ procurement processes to support the exploitation of DRIVER emerging solutions and the DRIVER test-bed. Besides general information, also first specific information needs for DRIVER solutions have been considered in the analysis.

As already stated, innovation processes in Crisis Management, i.e. a successful operationalisation of new Crisis Management solutions, strongly depend on the ability to be integrated in the respective framework conditions.

Those conditions can considerably differ between different nations, as shown in some examples below.

4.1 Policy and Strategy focus

Comprehensive crisis management includes measures for prevention and risk reduction, preparedness and protection of critical assets, maintaining capabilities and readiness to react to emerging crises quickly and manage their consequences, as well as measures to enhance resilience.

The surveyed countries recognise the need to comprehensively address crisis management requirements. For example, the aspiring EU member Albania recently introduced a comprehensive approach towards disaster risk reduction and management, including prevention, preparedness, response and recovery [3].

Some of the surveyed countries clearly emphasise the importance of one or another phase of crisis management. Countries like Albania, Belgium and Croatia emphasise response tasks and capabilities [3][4][5]. The strategy focus in Finland, on the other hand, is on preparedness and prevention rather than on response and recovery as a result of its low risk profile in terms of natural and man-made-disasters [6]. The policy of Austria puts a premium on preparedness issues like education and training of key response personnel, the promotion of new response technologies like decision support systems, simulation tools and also on an improved organizational framework for cooperation and coordination in the response phase [7].

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report					Page:	17 of 1872
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status:	Final

While in some countries the concept of resilience is virtually unknown (and the term does not even translate easily in the respective language, e.g. Albania, Bulgaria), other countries strongly emphasise the importance of increased resilience of communities and societies. Such examples are provided by the Czech Republic, the United Kingdom, and other among the surveyed countries [3][8][9][10].

4.2 Centralised vs distributed crisis management

Practically all European countries implement distributed systems for crisis management. In practice, however, there are significant differences in views – and respective policies and budget allocation – on the role of the state versus the role of the local preparedness and response. Bulgaria, for example, still heavily relies on the centralised development of capabilities and financing from the state budget. The crisis management approach of Denmark, taken as an example to the contrary, assumes the local level to be better placed to tackle local crisis situations, than the national level, and relies heavily on the contribution of private organisations, volunteers and NGOs in Danish crisis management [8][11].

4.3 Volunteer involvement

The involvement of volunteers in crisis management strongly differs in various EU Member States, which has already been shown in previous studies [12][13]: In general, volunteering is strongly influenced by the history, politics and culture of a community and a country. There are countries with longstanding traditions and well developed voluntary sectors (e.g. Ireland, the Netherlands, UK) as well as countries with less developed voluntary sectors (e.g. Bulgaria, Greece, Romania). Also, volunteering has different weights on the political agenda (e.g. high in Austria, Germany; rather low in Bulgaria, Czech Republic), which lead to differences also in the level of volunteering. Moreover the general treatment, organisation and support of affiliated volunteers and voluntary agencies differ from country to country.

The studies at hand e.g. confirm (referring to [14]) that the “German civil security system officially and strongly relies on non-profit relief organisations and their volunteer staff. [...] While most management tasks and everyday emergency services are carried out by professional staff, volunteers remain essential for more exceptional crisis management situations.” [14][15]. Also the country study Austria confirms that “One characteristic of the Austrian Crisis and Disaster Management is the strong involvement of voluntary organizations which enable an easy access to a huge amount of human resources. Due to the fact, that there is no single organisation in Austria, which will be mainly responsible for the response to disasters, related duties will be organized by voluntary organisations” [7]. In contrast, in Bulgaria “the legal provisions for the use of volunteers and volunteer formations are fairly recent. In the short period of about three years in which they are in force, 162 formations were created, and FSCP (Fire Safety and Civil Protection) provides public access to the respective registry” [8].

4.4 Post-disaster assessment and Lessons Learned systems

First evaluations of the country surveys let assume that nearly every organization involved in Crisis Management reports and analyses the measures that have been taken during a disaster as well as during exercises and trainings, in many cases including international/ cross border experiences.

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report				Page:	18 of 1872
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status: Final

Nevertheless, only few additional centralized (national) or inter-organisational Lessons Learned systems including central data bases of respective information and/or a central organization exist like in Ireland [16] or Finland, where investigation reports of all major accidents, regardless their nature, are prepared and include recommendations for improving systems, policies and processes [17][6]. A major problem of these review processes is in many cases the lack of implementation of its findings. As a result, findings of review processes could often rather be seen as lessons identified than lessons learned, which hampers the innovation process.

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report					Page:	19 of 1872
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status:	Final

5 Outlook: work in progress

The next (update) phase will focus on pertinent issues regarding the applicability of DRIVER solutions. In a two-way process, information with the teams designing, conducting, and analysing the results of DRIVER experiments will be exchanged. This exchange is planned to be organised along questions, such as:

1. How each proposed and demonstrated solution adds value to the European capacity to manage crises? Potential contributions may range from filling in an identified capability gap, to a more robust crisis management (i.e. increases of effectiveness), to increasing the efficiency of preparedness and response.
2. To what extent the solution could be adapted to framework conditions (i.e. legislation, procedures, organization, existing capabilities, and policy), that differ from the ones in which the experiment took place?
3. What are requirements in the framework conditions (which might differ among countries) that are necessary in order to implement the solution?
4. What additional contextual information is needed to better tailor the solution and design future experiments?

The expectation is that such rigorous and structured exchange, complemented by additional surveys and analysis, will provide a sound foundation for evidence-based recommendations to policy-makers and legislators, as well as to incident commanders, and other decision makers at the operational and tactical levels of crisis management.

From current status, three groups of recommendations are anticipated, addressing respectively the capacity for professional response; strengthening the involvement of societal actors and resilience, and enhancing the capacity to innovate and adapt crisis management policies to evolving risks and societal expectations, with each group covering four thematic issues.

5.1 Professional response

The professional response to crisis management will benefit significantly by enhanced situational awareness, efficient coordination, command and control, streamlined information management, and enhanced logistics.

In terms of awareness, DRIVER solutions will facilitate situational assessment and sense-making, with focus on damage and needs assessment, prediction of crisis evolution and raising alerts, and continuous risk mapping. Further, situation assessment will be complemented by information from airborne sensors, with the requisite mission planning for remotely piloted aerial systems (RPAS) and modelling and optimization in traffic management.

Recommendations on Coordination, Command and Control will focus on multinational/ cross-border, multiagency and, in particular, civil-military coordination. The supporting analysis, including analysis of results of experiments, will cover the issues of resource allocation and tasking, information exchange and interoperability.

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report				Page:	20 of 1872
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status: Final

The focus in the examination of information management is on reporting lines for and exchange of operational situational information, elaboration of a common operational picture (COP), interoperability, crowd sourcing and sending information to the public.

In terms of logistics, the main interest is on modelling logistics processes in crisis management, optimization of transportation means, and cooperation with civil society logistics' stakeholders.

5.2 Resilience

Society can turn into an effective actor in crisis management and disaster response through advanced volunteer management, enhanced societal and community resilience, effective crisis communication, and timely and professional psycho-social support.

Recommendations in regard to volunteer management will focus on volunteer registration databases, ad hoc management of spontaneous volunteers in the field, and crowd tasking.

Societal and community resilience will be addressed by measuring community resilience and raising awareness on local levels, assessment of the resilience of local government and definition of respective action plans, organisation and mobilization of individuals and communities.

The analysis of crisis communication will focus on crisis resilience communication, measuring the impact of messages to the public and the elaboration of key messages to the public.

The focus in providing psycho-social support will be on training, in particular basic training for psychosocial first aid.

5.3 Innovation capacity

The capacity to innovate and adapt to changing circumstances is contingent on the rigour and professionalism of education and training, the capacity to identify and incorporate good practice, and the agility of crisis management organisations.

Recommendations related to education will focus on continuous learning, multinational and multiagency education, as well as the shared understanding of required crisis management competences.

Advances in training will emphasise multi-national and multi-agency training, serious gaming, and training of volunteers, as well as context and dilemma training and the development of educational packages for trainers.

The identification of good practice requires rigorous evaluation and drawing lessons from field experience, exercises, experiments, and demonstrations. Focus is on a lessons learned framework for cooperation, coordination and collaboration across borders, sectors and organisations.

The EU-wide capacity for innovation depends on organizational agility and adaptiveness that include, inter alia, continuous mapping of requirements to available capabilities and maintaining a European crisis management architecture.

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report					Page:	21 of 1872
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status:	Final

6 Conclusion

36 intensive surveys of the European Member States, the United Nations and the European Union and additional countries likely to be affected by the DRIVER scenarios have been completed. In a next step (Update of supporting information on CM systems (M25-M35, new task 88.1), more pertinent organisational, legal, and political framework conditions regarding the applicability of DRIVER solutions will be focused upon.

The results of this document:

- serve as non-technological performance conditions and criteria for the DRIVER solutions and will as such support the Design of the Test-bed in DRIVER
- support the scenario design of the Joint Experiments and the Final Demo
- serve as background information for solution providers to enhance the innovation potential of their products and services
- serve together with the results of the DRIVER experimentation activities as a basis for the development of recommendations in WP88 with regard to potential implications for adjustments of structures and processes on UN-level, EU-level and MS-level to policy-makers, legislators, incident commanders and other decision-makers (e.g. in CM organisations of MS)

Annex 1: List of created studies

Information on Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response of a country or international organization has been gathered and elaborated in 36 individual studies.

The respective author/s of the studies is/are responsible for its content and quality.

List of conducted studies and author organisations:

International organisations / studies

- European Union (EOS)
- United Nations (ECORYS)
- Civil-Military Cooperation in CM (CSDM) – separate structure

EU Member States

- Austria (AIT)
- Belgium (ECORYS)
- Bulgaria (CSDM)
- Croatia (AIT)
- Cyprus (ATOS)
- Czech Republic (AIT)
- Denmark (ECORYS)
- Estonia (CSDM)
- Finland (FhG-INT)
- France (EPLFM)
- Germany (FhG-INT)
- Greece (ATOS)
- Hungary (CSDM)
- Ireland (Q4PR)
- Italy (EOS)
- Latvia (CSDM)
- Lithuania (CSDM)
- Luxembourg (ECORYS)
- Malta (ECORYS)
- Netherlands (ECORYS)
- Poland (CSDM)
- Portugal (ATOS)
- Romania (CSDM)

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report				Page:	25 of 1872
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status: Final

- Slovakia (AIT)
- Slovenia (CSDM)
- Spain (ATOS)
- Sweden (MSB)
- United Kingdom (CIES)

Selected additional countries, likely to be concerned by the DRIVER scenarios

- Albania (CSDM) (Tsunami – Scenario Final Demo)
- Israel (FhG-INT) (Tsunami – Scenario Final Demo)
- Montenegro (CSDM) (Tsunami– Scenario Final Demo)
- Norway (MSB) (Nordic Ice storm⁴ – Scenario Joint Experiment 2)
- Turkey (ECORYS) (Tsunami – Scenario Final Demo)

⁴ After producing this study, the Ice Storm scenario for Joint Experiment 2 was replaced by a Heat Wave. The study on Norway is kept given that its legislation was already analysed.

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report				Page:	26 of 1872
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status: Final

Annex 2: Template of the studies that has been used as a guideline by the partners/ authors

Note that the guiding notes, which describe the requested content of each chapter, have been deleted in the final studies. Additional guiding notes on formatting etc. have already been excluded here, since they were not relevant for clarifying the content in the different chapters. Nevertheless, they can be found in D81.1 SP8 work Plan Annex B [2].

Country / International Organisation: XXX

Overview

(short summary, up to a page – should give an insight of the characteristic aspects of the country – information might include:)

- National crisis management & disaster response concept
- Key stakeholders: Public governance (government, governors, mayors, parliamentary committees); State sector (police, paramilitary forces, fire brigades, ambulances, doctors), legal (Justice department, lawyers), military, nuclear power plants; Private sector (energy, incl. private nuclear power plants, cyber and telecommunications, drinking water, food, healthcare, finance (banks and others), water management, transportation, chemical industry, defence (ammunitions) industry, others; Volunteer organisations; Specialised NGOs
- Government structure: Authorities and responsibilities at national, regional and local levels
- National organisations responsible for international co-operation (incl. humanitarian aid) and engagement for disaster response and relief
- Financing as a percentage of GDP; ways of financing preparedness and response
- Niche crisis management capabilities ⁵ of interest to the EU and other MSs

Driver definition of a 'Crisis':

⁵ These are capabilities in which a MS or an associated country specialises and it is ready to provide them to other countries in case of a crisis/ disaster, while other countries recognise their quality and are or may be willing to use them. Examples are air assets for fighting massive fires, field hospitals, etc.

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report				Page:	27 of 1872
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status: Final

A crisis within the context of DRIVER is a major disaster (natural or man-made) that requires coordination between or assistance from other MS, i.e. that exceeds the crisis management capacity of one nation or affects more than one MS. This excludes e.g. “financial crisis” or war-like crises.

The information to be gathered during this high-level analysis should therefore primarily be relevant for this type of crisis.

See “Objectives of the survey”: *Definition of “high-level”: national, cross-border, decision-makers-level*

1 Policy

(Working definition: The Crisis Management and related⁶ Policy is designed to effectively coordinate the use of national and community, public and private resources, as well as those provided through international co-operation, to protect life and property before, during and immediately following a major crisis triggered by natural disasters or man-made catastrophes. It is placed into operation whenever an emergency affecting the country, regions or locals cannot be controlled through routine, daily and normal channels and procedures.)

1.1 Risk Assessment

Describe the risk assessment mechanism/procedure and summarise key risks and areas of concern (e.g. earthquakes, nuclear power stations, floods, ...)

1.2 Policy and Governance

Describe the key features of the crisis management framework (e.g. single authority or distributed management; emphasising central or local preparedness and response, state/public or societal, e.g. community, volunteer organizations, individuals)

1.2.1 Strategy scope and focus

Does the strategic approach to crisis management really cover all necessary activities for Prevention (incl. Resilience Actions) – Preparedness – Response (incl. Mitigation) - Recovery? Or the focus is on few of them? (please specify). Are there other national actions that contribute to one of the phases, but are not actually mentioned in the strategic approach to CM?

⁶ E.g. in Germany the responsibility for crises of different types is defined by the “Grundgesetz” (German Constitution).

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report				Page:	28 of 1872
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status: Final

1.2.2 Monitoring and analytical support to policy making; R&D

Is there any scientific support or specific R&D programme that contributes to risk assessment supporting policy making (e.g. national research programmes, support through academia)? Is there scientific support in other CM policy areas?

1.2.3 Policy for Prevention

(here and for the following three sub-titles: who has the lead responsibilities, who else contributes, please give a brief characterisation of responsibilities, etc., ...)

1.2.4 Policy for Preparedness

1.2.5 Policy for Response

1.2.6 Policy for Relief and Recovery

1.3 Financing

1.3.1 Investing in preparedness

(Status and Expectations: Public – Private; Local – National – Regional – coordination at EU level /Pooling & Sharing -like/ – Centralized EU funding)

Financing disaster preparedness and response (total at all levels, as percentage of GDP)

1.3.2 Investing in consequence management

(Who is expected to cover, or actually covers, the costs of recovery: EU level – National – Local (municipal) – Insurers – the Individual entity)

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

Is there a framework or system for assessing the experience of individual emergencies and disasters?

1.4.2 Departmental Lessons Learned systems

Are there Lessons Learned systems in individual organisations as listed above?

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report				Page:	29 of 1872
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status: Final

1.4.3 Centralised (national) Lessons Learned system

Is there a centralised (national) Lessons Learned system (state/federal level)? If so, which is the responsible agency? How do stakeholders exchange information about problems and successes in previous events? How is the system connected or planned to be connected to efforts at EU-level (i.e. DG ECHO lessons learned system)?

(If available, please provide examples of the impact of lessons learned)

1.4.4 International exchange for Lessons Learned

Does the country participate in international activities to evaluate the experience and learn from it? If so, please provide examples. (bi- / multilateral information exchange)

1.4.5 Regular policy reviews

Is there a process of conducting regular policy reviews and effective incorporation of its findings in the policy process? If so, do the parliament, regional bodies and local communities contribute to the review?

(If available, please provide examples of the impact of lessons learned)

1.5 Resilience

- Does the country/IO implement the concept of resilience?
- If yes, please describe how it fits into the crisis management ecosystem
- Do CM organization, local community and private business apply related standards, e.g. ISO 22301 "Business Continuity Management - Requirements" or any other (formal or industrial) standards? Please specify.

1.6 Information sharing and data protection

1.6.1 Please describe whether the country/ IO has adopted specific policies, measures or derogations from EU law with regard to data protection to enable:

- the sharing of personal data during crises [in 'extreme cases'] or for crisis management purposes, e.g. data on people with particular disabilities
- the sharing of classified information (internally and with third states/ organisations), e.g. data about specific vulnerabilities or about terrorist threats

1.6.2 Does the country/IO have registers/databases of volunteers? If yes, under what circumstances can data be used/ shared? E.g. particular capabilities, level of readiness/ availability, contact information

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report				Page:	30 of 1872
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status: Final

1.6.3 Does the country have or plan to use data gathered from social media during crises? If so how? (e.g. “crowd sourcing” and “crowd tasking”, "citizen as a sensor")

2 Legislation

2.1 Crisis (emergency, disaster) management concept

(Is there a written conceptual document? If so, please specify. What is its status? What is the scope?)

(Scope, status)

2.2 General crisis (emergency, disaster) management law

Are crisis management arrangements set out in legislation? If yes please describe key statutes (scope, status, etc.)

2.3 Emergency rule

(Does the law envision introduction of emergency rule? Under what conditions? What are the emergency powers? Limitations on individual rights and liberties?)

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

(What is allowed on local level, e.g. are cities allowed to act autonomously?)

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

Does crisis management legislation make specific provision for the involvement of NGOs and volunteers? Are there any specific rules or policies on liability or insurance?

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report					Page:	31 of 1872
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status:	Final

2.7 Legal regulations for international engagements of first responders and crisis managers

(UN, EU regulations, other?); rules of engagement, insurance regulations

3 Organisation

3.1 Organisational chart

- National/ IO authority for emergency and disaster management; chain of command and high-level decision-making
- Interdepartmental (inter-ministerial) emergency and disaster management authority
- National permanent emergency and disaster management unit(s)/ formations; first responders
- Planned/ anticipated use of specialised military assets
- Departmental emergency and disaster management arrangements
- Other national civil service organisations
- Provincial (regional) authorities and arrangements for emergency and disaster management (e.g. crisis HQ)
- Local (municipal, town) authorities and arrangements for emergency and disaster management
- Volunteers and volunteer organisations; specialised NGOs
- Private businesses

3.2 Organisational cooperation

- Operational cooperation (e.g., coordinated CM operations planning and response at national level, cross-border operational cooperation, operational cooperation within the EU)
 - How priorities are assigned in the case of simultaneous occurrence of events?
 - How cross-border collaboration is organized? Please identify procedures used by stakeholders for cross-border cooperation (e.g., how is it initiated)
- Cooperation and coordination in CM capability development (coordinated departmental CM capability planning, nationally centralized CM capability planning, multi-nation/ EU-level coordination of capability planning and capability development)

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report					Page:	32 of 1872
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status:	Final

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

(is about established (or not) procedures of information exchange, coordination, requests, etc., and their actual incorporation by participating organizations)

- Is there a written/ published document(s)?
- What is the scope of the SOP document(s)
- Are SOPs understood and accepted by all parties, and implemented in practice?
- Are the SOPs regularly tested both by activation and by exercise?

4.2 Operations planning

(is about plans - national, agency-level, municipal, etc.)

- Is there a national crisis/ emergency, disaster/ plan?
- Are there departmental crisis/ emergency, disaster/ plans? Please enumerate.
- Are there local crisis/ emergency, disaster/ plans?
- Is the operation planning process standardised? Please identify the standards used (e.g. ISO 22320 "Societal security -- Emergency management -- Requirements for incident response", other formal or industrial standards)

4.3 Logistics support in crises

- Planned/ anticipated use of private logistics providers (e.g. DHL)
- Planned/ anticipated use of military logistics support
- Others?

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

- Who is responsible for crisis communication? Who coordinates crisis communication within and among MSs? How is the inter-organisational coordination of information exchange about crisis communication to the general public organised and managed?
- How long does it take for the general public to become informed about pending hazards?
- Which technical infrastructure is used to achieve situational awareness at local/ national/ European/ international level?

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report				Page:	33 of 1872
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status: Final

5 Capabilities

5.1 Human resources

- Permanent emergency and disaster management personnel
- Capacity to mobilise personnel
- Involvement of volunteers, volunteer organisations, and specialised NGO personnel
- Involvement of private businesses
- National educational programme(s)

5.2 Materiel (non-financial) resources

- What specific non-financial resources (dedicated equipment etc.) have been allocated to crisis management (central, regional, local preparedness and response)?
- Permanent reserve stocks (fuel, food, medicines, tents, blankets, etc.)
- Planned /anticipated/ involvement of specific military assets (e.g. reconnaissance assets, search and rescue helicopters, fire-fighting planes/helicopters, CBRN, etc.)
- Is provision made for governments to mobilise or commandeer private assets during crises?

5.3 Training

- National, local and departmental exercises
- Centralised specialist training
- Training of volunteers and NGO personnel
- Cross-border and multinational training activities
- Is there a certification system? What standards are used to define specialists' training requirements?
- Are there specialised training programmes for high-level decision makers?
- Training centres

5.4 Procurement

5.4.1 Procurement regulation

Background

Within the European legislation three different procurement directives apply, which are mutually exclusive, meaning that only one of the directives apply to public procurement. Two of the three

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report					Page:	34 of 1872
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status:	Final

directives are topic specific, the first relating to the procurement of energy, water, transport and postal goods and services and the second one relating to the procurement in the defence and security industry. If none of the specific directives apply the general public procurement directive will apply. It is vital to know which of the three directives apply to the procurement of CM solutions and services as the three directives have different procedures and thresholds.

Not all goods and services need to be publicly procured. First of all, contracts with values below the specified thresholds do not have to be procured. The thresholds differ between the directives as well as between goods and services (including trainings). Also some of the articles are not compulsory and Member States can choose not to implement these articles. On the other hand the directives provide minimum rules and Member States can opt to maintain stricter rules as long as the stricter rules are non-discriminatory. Therefore quite some differences might exist between the procurement schemes within Member States and this can influence the adaptation of CM solutions and services in the different MS.

Questions:

- What needs to be procured? E.g. goods or services, including trainings?
- Which EU directive on procurement is applicable on procurement of CM solutions and related? Are all articles of the directive applicable or are some articles not implemented?
- Are additional national regulations applicable and/or are there additional requirements?

Since February 2014 the general procurement directive and the directive for energy, water, transport and postal goods and services have been revised. Most parts of the newly adopted directives need to be implemented in February 2016. One of the new aims of the directives is to facilitate cross-border procurement involving different public institutions. This might be relevant for DRIVER, as Member States are enabled to jointly procure CM solutions. To see if this topic is relevant the following questions could help:

Questions:

- How often is there a need to jointly procure CM solutions or services? And how often does cross-border procurement occur? Are there any considerations for future joint procurement? If yes, in what area and what are potential partner nations?
- Is there a need for additional legislation with regard to cross-border procurement?
- How important is interoperability and do issues arise around the interoperability?

5.4.2 Procurement procedures

Background

The European directives provide the legal boundaries for procurement, but they do not fully regulate the procedures followed. Other projects done show that the actual procedures can differ between Member States. It is important to understand whether the procurement activities are carried out by

Document name:	D82.11 – CM Organisations Report including Procurement Regulations & D83.11 – Policy and Legislation Report					Page:	35 of 1872
Reference:	D82.11	Dissemination:	PU	Version:	2.0	Status:	Final

a civilian or military organisation. Also insight in their public procurement procedures (which are often defined at a national level) provides a good overview of the different practises.

Crisis management will not be limited to EU-28 countries and neighbouring countries might also be affected. Procurement in these countries is not covered by the EU directives and therefore it is important to have some insights in the procurement practices in these neighbouring countries.

Questions:

- Which organisations are involved in the procurement of CM solutions? And how do they organise their procurement process?
- How is the procurement process in the non-EU countries organised? Are coordinating activities of any kind in place or are they planned?

5.5 Niche capabilities

- Which niche capabilities⁷ of the country/IO are (potentially) of interest to the EU CM and disaster response?

Driving Innovation in Crisis Management for **E**uropean **R**esilience

EUROPEAN UNION ORGANISATION

Policy, Legislation, Organisation,
Procedures & Capabilities (PLOPC) in
crisis management and disaster response

Responsible Partner: EOS - Klaudia Tani, Nicola Iarossi

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by ECORYS and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

Crisis management in the European Union (EU) is a multidimensional field, insofar as it concerns different policy fields, both within and outside the EU. Competences of crisis management vary across various EU Institutions in addition to most of the responsibilities remaining with Member States (MS). The Treaty of Lisbon, which entered into force in 2010, foresees several major developments in the discipline, which will have implications for Crisis Management operators in the MS.

Three main bodies are responsible for crisis management within the EU institutional context: DG-ECHO mostly involved with internal EU dimension and the coordination of MS; The European External Action Service (EEAS), involved with the external dimension and the EU Council representing the individual MS. A certain number of specific bodies and emergency's centres have been also developed in order to standardise situational awareness, coordinate the joined MS interventions as well as activate European policies and management of financial support allocated from the European budget via the enactment of different projects in the work programme.

European bodies coordinate with European ongoing intervention on the field implemented by MS first responders; support with European funds Humanitarians Aids activities, Crisis Management response (in a limited extent) and the actuations of European prevention, preparedness policies into MS. The overall approach, including the European Civil Protection Mechanism is being addressed in this study of EU institutions in Crisis Management (CM). For this reason, no peculiar field-assets are owned and operated directly by the European Bodies but Emergency Centres, like the ERCC (Emergency Response Coordination Centre in DG ECHO) and Crisis Rooms (in EEAS and The EU Council) with relevant IT Tools for supporting the European Union mission in the Crisis Management and Civil Protection area.

1 Policy

1.1 Risk Assessment

The European Commission developed an alerting system which feeds information to the EU Civil Protection Mechanism participating states real-time in order to improve their analytical capacity in terms of disaster monitoring and early warning mechanisms⁸.

In addition, a European Flood Awareness system (EFAS) was established with the aim to collect information on floods, and inform the the National/Regional Hydrological Services as well as the Emergency Response and Coordination Centre (ERCC) up to ten days before a severe incident. The EFAS was established by the Institute for Environment and Sustainability (IES) and is currently operated by four separate consortia:

- **EFAS Computational** centre;
- **EFAS Dissemination** centre;
- **EFAS Hydrological data collection** centre and
- **EFAS Meteorological data collection** centre⁹.

The European Forest Fire Information System (EFFIS) was also established by the IES, but is currently operated under the Joint Research Center (JRC) of the European Commission (EC). The picture below shows the functions of the application, with availability to search by country, narrow the hot spots as well as fire severity and fire perimeters. Thus, a possible fire erupting in South of France would be more easily prevented, as their civil protection agency would be aware of the high risk of fire eruption in the next few hours.

⁹ European Flood Awareness system, <https://www.efas.eu/>

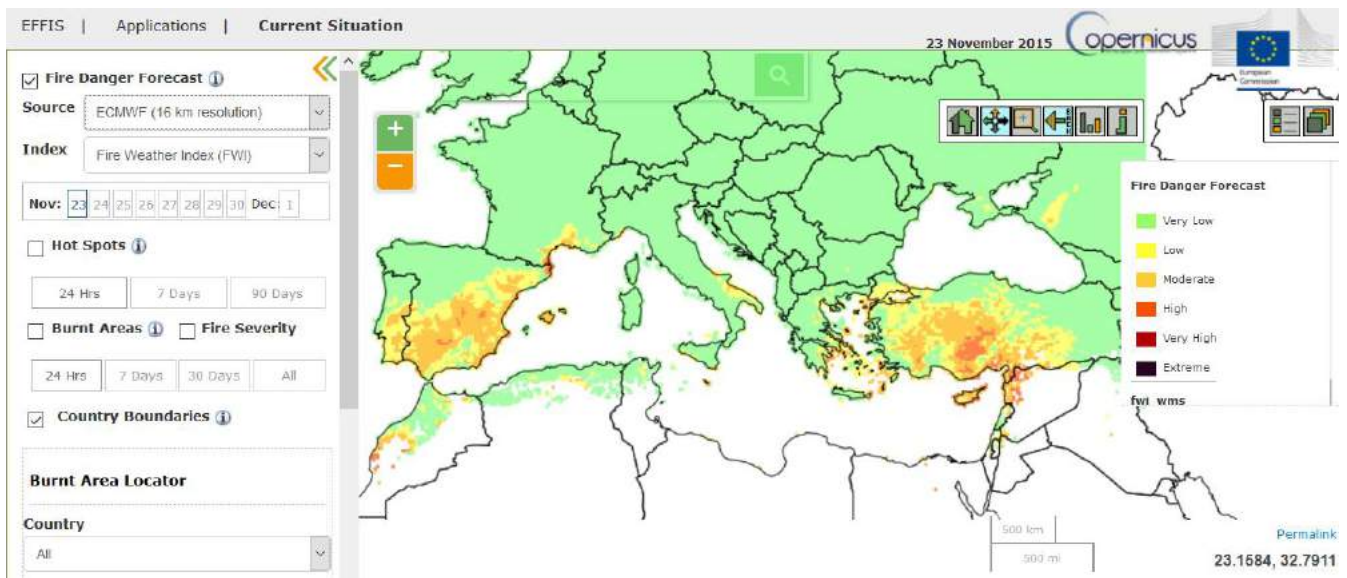

Figure 1: EFFIS application

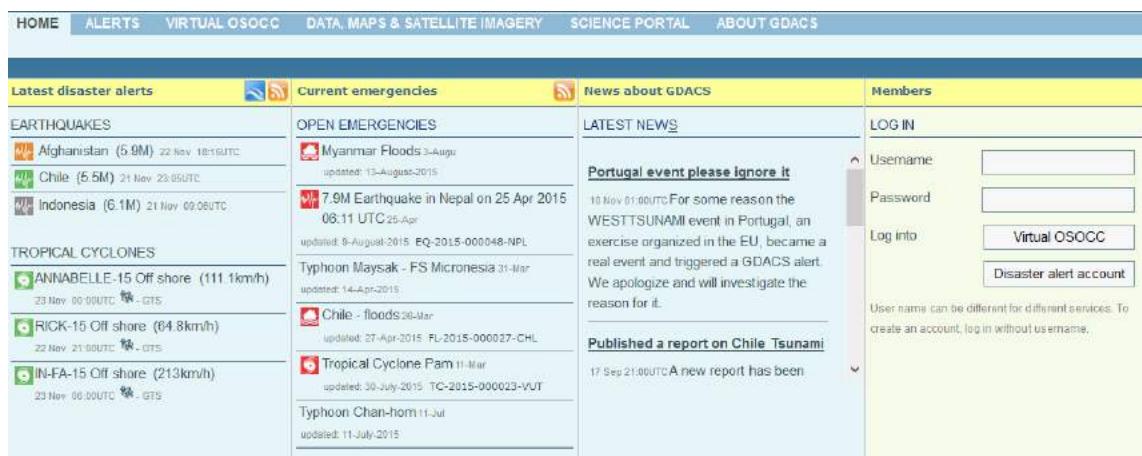

Figure 2: GDACS news and alerts

In addition, the Global Disaster Alerts and Coordination System (GDACS) was developed by the Joint Research Centre and used by the EU and UN. It is a fully automated real time alerting system which gathers data about all types of natural events. As also shown below, the latest disasters alerts are portrayed in a wall per disaster and there are also latest news and reports posted regularly.

“GDACS is a collaboration platform for organisations providing information on humanitarian disasters. From a technical point of view, GDACS links information of all participating organisations using a variety of systems to have a harmonized list of data sources. In 2011, the GDACS platform was completely revised to collect, store and distribute resources explicitly by events. The system matches information from all organisations (by translating unique identifiers), and make these resources available for GDACS users and developers in the form of GDACS Platform Services”¹⁰.

¹⁰ GDACS, Event-based data and information, <http://portal.gdacs.org/data>

[illegible]

This satellite imagery, can assist to any type of intervention during a crisis and ensure that CM professionals are informed of what to expect within this camp.

¹¹ UNITAR, http://www.unitar.org/unosat/node/44/2322?utm_source=unosat-unitar&utm_medium=rss&utm_campaign=maps

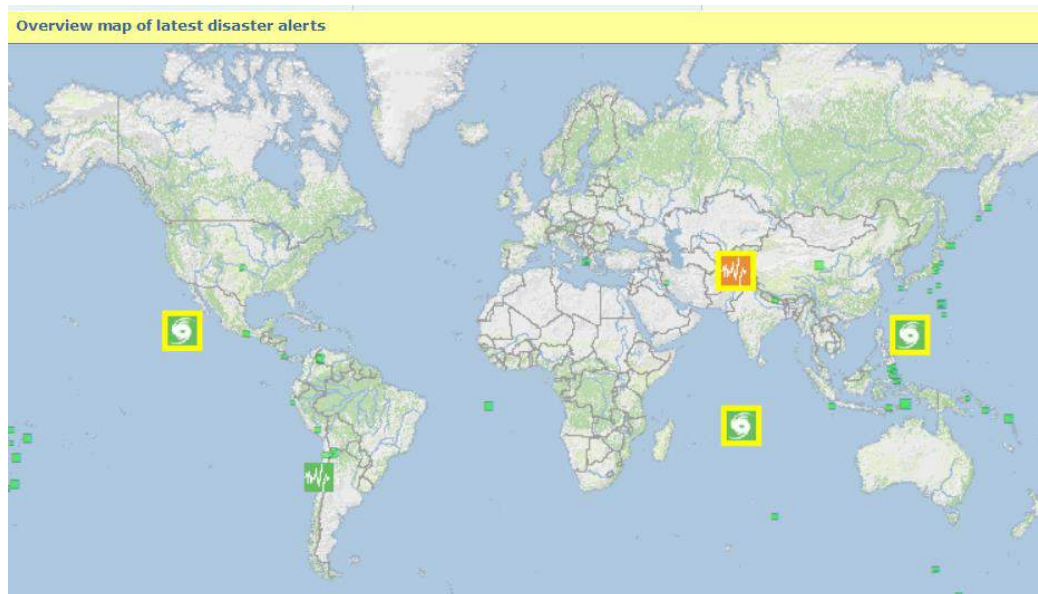

Figure 4: GDACS situational map

Further monitoring mechanisms include the European Mediterranean Seismological Centre (EMSC) which allows for earthquake detection in the Mediterranean area to be considerably quicker and accurate, by adding also sensors in Tunisia.

The European Commission also cooperates with the Intergovernmental Oceanographic Commission (IOC-UNESCO) on the establishment of a tsunami warning system for the North Atlantic and Mediterranean region similar to the one implemented in the Indian Ocean region.

It further

“promotes international cooperation and coordinates programmes in marine research, services, observation systems, hazard mitigation, and capacity development in order to understand and effectively manage the resources of the ocean and coastal areas. By applying this knowledge, the Commission aims to improve the governance, management, institutional capacity, and decision-making processes of its Member States with respect to marine resources and climate variability and to foster sustainable development of the marine environment, in particular in developing countries”¹².

IOC observes and monitors the oceans with the Global Ocean Observing System (GOOS) and it “aims to develop a unified network providing information and data exchange on the physical, chemical, and

¹² Intergovernmental Oceanographic Commission (IOC), About us, <http://www.unesco.org/new/en/natural-sciences/ioc-oceans/about-us/>, accessed December 23rd

biological aspects of the ocean”¹³. Relying to this information, other stakeholders may act on the ocean.

In addition, the Indian Ocean Tsunami Warning System (IOTWS) is coordinated by a “network of country systems in which each country has the responsibility of identifying the hazard, assessing the risk and issuing the warning to its population”¹⁴.

Finally, early warning and monitoring systems are developed and financed by the Civil Protection Financial Instrument. Systems focus on the EU MS' territory and mechanisms within as well as mechanisms shared with third countries through EEAS.

1.2 Policy and Governance

The EU has a broad set of instruments and structures to respond to crises and disaster internal and external to the EU. These instruments and structures are found within the EC as well as the EEAS. Today the EU's MSs also cooperate frequently in order to prevent and respond to natural or manmade disasters both inside and outside the EU. In addition to bilateral and multilateral arrangements, the basis for the EU-level cooperation of the MSs is placed within the European Commission and in order to increase EU's ability regarding aftermath over the last decade various structures and features have been introduced.

The main instruments/ structures for EU aftermath CM are under the EU Commission:

- Civil Protection (Commission, DG ECHO);
- Humanitarian Aid (Commission, DG ECHO);
- Consular Protection (Commission);
- EU Solidarity Fund (Commission).

Under the EEAS:

- Aftermath CM actions under the Instrument of Stability (EEAS);
- CSDP (EEAS), where tasks as humanitarian assistance and rescue support can be included;
- the new function of “Managing Director for crisis response and operational coordination (EEAS). This function is supposed to promote coordination within the EU, and more specifically between the Commission and the EEAS in relation to disasters outside the EU.

Under the Council of the European Union:

- The Crisis Coordination Arrangements (CCA). The purpose of CCA is to promote coordination at a high political level in the EU in relation to crises having an impact on several MSs or being of

¹³ Intergovernmental Oceanographic Commission (IOC), About us, <http://www.unesco.org/new/en/natural-sciences/ioc-oceans/about-us/>, accessed December 23rd

¹⁴ S.S.L.Hettiarachchi et al. Risk Assessment and Mitigation within a Tsunami Forecasting and Early Warning Framework: Case Study - Port City of Galle, http://www.ioc-tsunami.org/index.php?option=com_oa&task=viewDocumentRecord&docID=16002

‘political significance’ for the EU. For an overview of the EU’s instruments and structures for aftermath CM, see the figure below.^[3]

1.2.1 Strategy scope and focus

The EU’s role is limited to the coordination and promotion of cooperation between national, regional, and local disaster response capacities (art. 6 of the Treaty on the Functioning of the European Union), especially for preparedness and response phases as defined in the Treaty of Lisbon (art. 196 TFEU). This process was introduced only a decade ago and the EU does not, thus far, have any highly sophisticated in-house competence in the various domains pertaining to crisis management.

Coordination concerns, as already indicated (see Table 1), civil protection assistance inside and outside the EU, humanitarian assistance as well as military and civil operations outside the EU. Regarding the latter, such action falls under the so-called Common Security and Defence Policy (CSDP), which is part of EU’s external tools, with specific decision-making procedures and actors involved.

Table 1: Response Resources by types.

Other reported types of response resources	
First aid / medical care related resources	First aid and emergency care (including psychological and psychosocial support)
	Emergency mobile hospital
Logistics / transport related response resources	Transport, logistics and storage
Maritime response related resources	Marine Pollution team
	Marine SAR team
	Technical Diving Team
	Diving rescue team
	EMSA capacities (see description below)
Search and rescue related resources	Canine search and rescue team

	Detection and handling of explosive material
Sampling and detection related resources	Decontamination in case of a biological and or chemical attack
	Sample collection teams with equipment (Chemical)
	Decontamination in case of a radiological or nuclear attack
	Detection teams with equipment (Radioactivity)
	Ecological laboratory with mobile unit
Fire fighting related resources	Fleet of medium to high capacity aircraft used in 2007 by the Member States includes 24 for France, 16 for Italy, 18 for Portugal, 27 for Spain and 21 for Greece
Assistance / support related resources	Expert pool
	Coordination/assessment experts
	Water purification
	Container kitchens / Emergency food supplies
	Emergency shelter

The Union has been able, as we will show, to play an active role in coordinating and supporting crisis management operations, as well as in establishing platforms for information sharing and early warning. In the words of one Commission official, the EU strives in its disaster response, to be first in and last out. In this sense, the EU and its Member States seek to act comprehensively when disaster strikes – from immediate protection and humanitarian relief, to longer term development and risk mitigation and preparedness. Indeed, the EU’s ability to work following a “comprehensive approach”, as described above, and cover coordination of all aspects of a crisis, include prevention, with wide range of tools at its disposal, has bettered disaster response worldwide.

1.2.2 Monitoring and analytical support to policy making (R&D)

The European Commission's DG ECHO is committed to develop every year a strategic plan in order to co-ordinate and to programme its activities efficiently and in an appropriate manner adopting a holistic approach based on MS needs. To ensure maximum transparency, ECHO's annual strategies are available to the public.

In order to be consistent in the allocation of resources to different countries according to their respective needs, regardless of pressure, and to guarantee the credibility and transparency of Community humanitarian aid - the European Commission has developed a set of rigorous need assessment tools.

DG ECHO, in fact, has developed a two-phase framework for assessing and analysing needs in specific countries and crises. The framework provides an evidence base for prioritisation of needs, funding allocation, and development of humanitarian implementation plans (HIPs).

The first phase is based on the Global Vulnerability and Crisis Assessment (GVCA) tools. The GVCA is a tool based on national indicators and composite data that allow for a comparative analysis of countries to identify the level of vulnerability/ crisis. The first component identifies the most vulnerable countries, where humanitarian needs are likely to be greater in the event of a disaster, using a vulnerability index. The second component identifies countries that are in a humanitarian crisis situation corresponding to the ECHO intervention criteria, by means of a crisis index. Taken together, the two indices define the priorities for intervention.

The indicators could vary from health risks to numbers of refugees and IDPs. This data produces a final table which looks like the following

2014 - v.2 (September) - Global Vulnerability and Crisis Assessment				
Indicator list		Sub-indicator level		
GVCA Final Index		1		
ISO3	Country	GVCA Vulnerability Index	GVCA Crisis Index	GVCA Final Index
ATG	Antigua and Barbuda	1	0	0.5

Figure 5: GVCA Global Vulnerability and Crisis Assessment, September 2014

To note here that this “application is a prototype tool for DG ECHO and the EU Member States. The purpose is to provide access, in an interactive way, to the composite indicators, as well as their source data, that are used in ECHO's humanitarian needs strategy”¹⁵.

As compendium to the GVCA another tool is used: the Forgotten Crisis Assessment (FCA). The FCA is a methodology which identifies serious humanitarian crisis situations where the affected populations are not receiving enough international aid or even none at all. The second phase of the framework focuses on the sub-crisis context and response analysis, carried out jointly by ECHO experts in both the field and in the Brussels headquarters. The main difference between GVCA and FCA, is that FCA takes into account more historical components that could eventually prevent an escalation of a probable crisis.

1.2.3 Policy for Prevention

There are both formal and informal principles that guide EU-cooperation in the aftermath of CM. The principles on subsidiarity, no duplications, collective responsibility and solidarity pave the way for the aftermath of CM actions in the EU.

The third principle is referred to as the principle of collective responsibility that implies that the MSs collectively are responsible for the prevention of and the preparedness for a crisis in the EU.

¹⁵ CVCA/FCA, <http://echo-global-vulnerability-and-crisis.jrc.ec.europa.eu/PublicVisualization.aspx>

The MSs have the responsibility to carry out preventive and preparatory measures at the national level. When measures are taken at the national level considerations must be taken of the fact that if national crisis prevention and preparedness are not undertaken, this may cause damage to the EU as a whole since crises today tend to be transnational.^[3]

The adoption of these principles do not allow for identification of who is responsible and what Unit needs to be informed when. In policy when the political mandate is given to the relevant Commissioner and the service structure (Director General, Director of the specific Directorate, Heads of Unit) of the relevant EC's Departments it needs to be clear and straight forward in order for CM professional to be able to identify quickly the decision making route.

1.2.4 Policy for Preparedness

In terms of preparedness, the EC has adopted a Strategy Paper for the period 2014-2020 and Multi-Annual Indicative Programme 2014-2017 for the Instrument

“contributing to Stability and Peace identifying five priorities for actions in the areas of conflict prevention, peace-building and crisis preparedness as provided for in Article 4 of the Regulation (EU) No 230/2014: a) Promoting early warning and conflict-sensitive risk analysis in policy making and implementation; b) Facilitating and building capacity in confidence-building, mediation, dialogue and reconciliation, with particular regard to emerging inter-community tensions; c) Strengthening capacities for participation and deployment in civilian stabilization missions; d) Improving post conflict recovery, as well as post disaster recovery with imminent threats to the political and security situation; e) Assistance to curb use of natural resources to finance conflicts and to support compliance by stakeholders with initiatives, such as the Kimberley Process Certification Scheme, especially as regards implementation of efficient domestic controls on the production of, and trade in, natural resources”¹⁶.

The aim of this instrument also includes, as part “a” states early warning and conflict-sensitive risk analysis in policy making and implementation, which is key for promoting preparedness. The EU thus is trying to close the gap of warning-response.

The EU also has preparedness strategies for health risks developed since 2011. “A generic emergency management plan comprises a range of activities to protect communities, property and the environment, and is usually based on a ‘comprehensive’ approach, an ‘all hazards’ approach, a ‘multi-sectoral and inter-sectoral’ (or ‘all agencies’ or ‘integrated’) approach that encompasses all elements that are relevant in ensuring that Member States have a ‘prepared

¹⁶ European Commission, COMMISSION IMPLEMENTING DECISION of 27.5.2015 on the Annual Action Programme 2015 for the Instrument contributing to Stability and Peace - Conflict prevention, peace-building and crisis preparedness component to be financed from the general budget of the European Union, http://ec.europa.eu/dgs/fpi/documents/20150601_2015_aap_icsp_article_4_en.pdf

community”¹⁷. Giving the opportunity to EU MS to support their national plans and rely on their regional and European partners.

Finally, any preparedness approach deriving from the EU, has a 7 step planning:

1. Information Management;
2. Communication;
3. Scientific/evidence based advise;
4. Health crisis management structures;
5. Intersectoral collaboration;
6. Health sector preparedness;
7. Management of plans¹⁸.

1.2.5 Policy for Response

It is still improbable, due to legal and political constraints, that the EU will be able to create its own civilian protection corps as suggested in 2005 by the Barnier Report¹⁹. The EU is instead planning, as indicated in the Commission’s Communication on crisis response, to create a “European Emergency Response Capacity”²⁰, which would consist of a pool of pre-identified national assets voluntarily be made available, for immediate deployment in EU-led disaster response operations. These assets could be deployed, as advocated by the European Parliament under the designation of an EU Civil Protection Force to increase the visibility of EU action. The following principles stated in the Communication should be recalled since they will guide the work on the development of the EU disaster response capacity in the near future:

- Geographic coverage: internal and external to the EU

The EU should be able to respond more effectively to disasters both inside the EU and outside the EU.

A fully coherent approach for disasters outside the EU will need to bring together the different instruments that could possibly be deployed depending on the nature of the crisis. The objective should be to identify and deploy the most appropriate resources to respond to any given disaster.

- Nature of disaster: all types

The EU disaster response capacity should address all types of disasters (other than armed conflicts) that overwhelm national response capacities and result in a need for EU assistance.

- Central role of the UN for humanitarian assistance

¹⁷ European Commission, Strategy for Generic Preparedness Planning Technical guidance on generic preparedness planning for public health emergencies
http://ec.europa.eu/health/preparedness_response/docs/gpp_technical_guidance_document_april2011_en.pdf

¹⁸ European Commission, Generic Preparedness planning,
http://ec.europa.eu/health/preparedness_response/generic_preparedness/planning/index_en.htm

¹⁹ Michel Barniers, For a European civil protection force: Europe aid,
http://www.europarl.europa.eu/meetdocs/2004_2009/documents/dv/031006barnier_/031006barnier_en.pdf

²⁰ DG ECHO, ECHO Factsheet,
http://ec.europa.eu/echo/files/aid/countries/factsheets/thematic/emergency_response_capacity_en.pdf

EU assistance should act in accordance with internationally agreed humanitarian principles when responding to humanitarian needs caused by disasters outside the EU. Improved EU coordination will help strengthening the central coordinating role of the UN.

- Balance response, prevention, preparedness

An approach that balances response with disaster prevention and preparedness will be the cornerstone of the EU strategy on disaster management.

- Cost-effectiveness

Improving cost effectiveness will lead to more efficient ways of delivering assistance, such as pooling of assets to reduce costs and avoid duplication of efforts.

The setting-up of the EU Emergency Response Capacity responding to the above guiding principles requires progress to be made in the near future, especially in terms of planning, assets, deployment and coordination.

The adoption of these principles doesn't allow to identify exact "responsibilities" in the policy actuation, out of the political mandate given to the relevant Commissioner and the service structure (Director General, Director of the specific Directorate, Heads of Unit) of the relevant EU Commissions Departments called also Directorates-General (DG-ECHO and the External Action Service).

There are often great expectations that the Lisbon Treaty will solve EU's challenges regarding coordination between the Union's different institutions and CM structures. But the fact is that responsibility within the EU for the aftermath of an incident is divided between the EEAS and the EC.

Consequently, new forms of cooperation need to be developed. Regarding EU-assistance the modalities for coordination between the institutions will be set in a decision adopted by the Council on a joint proposal by the Commission and HR/VP. The COSI (Standing Committee on Operational Cooperation on Internal Security) sets within the Council for ensuring that operational cooperation on internal security is promoted and strengthened within the Union and the Political and Security Committee (the PSC) shall assist the Council in this respect. The importance of further EU-coordination between different EU-instruments is highlighted through the Solidarity Clause (article 222) which reads as follows:

"The Union and its MSs shall act jointly in a spirit of solidarity if a MS is the object of a terrorist attack or a victim of a natural or man-made disaster. The Union shall mobilise all instruments at its disposal, including the military instruments of the MSs, to:

- *prevent the terrorist threat in the territory of the MSs;*
- *protect the democratic institutions and the civilian population from any terrorist attack;*
- *assist a MS in its territory, at the request of its political authorities in the event of a terrorist attack;*

- *assist a MS in its territory, at the request of its political authorities, in the event of a natural or a man-made disaster*²¹.

Furthermore, it is stipulated that if a MS is the object of a terrorist attack or victim of a natural or a man-made disaster, the other MSs shall offer assistance at the request of the political authorities of the stricken MS. The MSs shall too, to that end, coordinate their measures within the European Council.

Furthermore, the Lisbon Treaty has introduced a new function, the High Representative of the Union for Foreign Affairs and Security Policy and Vice president for the Commission (HR/VP). The role of the HR/VP is three-fold: to represent the Council in foreign affairs and security policy, to be the Commissioner for external relations as well as to be one of the Vice-Presidents of the Commission.

A European External Action Service (EEAS) is comprised of officials from relevant departments of the General Secretariat of the Council and of the Commission as well as staff seconded from national diplomatic services of the MSs that in turn will work in close cooperation with the diplomatic services of the MSs. The EEAS will assist the HR/VP.

In 2010 a new function for crisis response and operational coordination was established within the EEAS. The purpose of this function is to provide for coordination between the EEAS and the Commission instruments, especially the Monitoring and Information Centre (MIC) recently replaced and updated by the new Emergency Response Coordination Centre (ERCC), when a disaster is ongoing.

The Managing Director (further on referred to as “the Director”) has got the task of promoting coordination within the EU, and more specifically between the Commission and the EEAS in relation to disasters outside the EU. The Director is a member of the Corporate Board of the EEAS, thus, working under the direct authority of the HR/VP. The Director shall support HR/VP in ensuring coherence and coordination of the EU’s external actions, notably as regards crisis response and management. For example the Director shall support HR/VP to develop appropriate coordination mechanisms with the EC, not only DG ECHO, but also assist EU MSs in crisis response outside of Europe and regarding the liaison with UN agencies as well as international and civil society organisations. Furthermore, the Director is responsible for ensuring effective and coherent cooperation within the EEAS, more specifically between the CM and Planning Directorate (CMPD), the Civilian Planning and Conduct Capability (CPCC), the EUMS and the EU Intelligence Analysis Centre (EU SITCEN). In relations to disasters outside the EU, the Director shall “[...] define strategic lines to be followed in bilateral and multilateral contacts and coordinate of the relevant headquarter services and EU-delegations.” Finally HR/VP may delegate specific tasks and missions to the Director related to crisis response.

²¹ European Union, Consolidated Version of the Treaty on the Functioning of the European Union, Solidarity Clause, <http://eur-lex.europa.eu/legal-content/EN/TXT/PDF/?uri=CELEX:12012E/TXT&from=EN>

The EU-delegations have got an enhanced mandate to coordinate the EU's actions in third countries. The EU-delegations will take over the political coordination between the MSs and obtain a strengthened role in relation to the EU's civilian and military operations. The purpose is to achieve more coordinated and coherent EU action.

The Lisbon Treaty also gives the EC power to initiate legislation in the area of consular protection, for example directives to enhance cooperation and coordination. The European Council in turn may also as a consequence of the Lisbon Treaty adopt acts by qualified majority (as in the area of Civil Protection). Moreover, the Lisbon Treaty underlines an increased need for a "European dimension to consular protection"²².

Since 2007 the Civil Protection Mechanism can be utilised to support consular assistance to the EU citizens in major emergencies in third countries. Like the declaration of a state of emergency of Bosnia and Herzegovina, after major flooding in its western part in 2014. Moreover, during crises for example in Libya and Egypt in 2011 and in Haiti in 2010, information sharing and coordination of assistance among EU consular authorities was made possible through an EU secure website "Consular On-Line" provided by the SITCEN. In March 2011, the EC presented a Communication on the state of play and the way forward to further develop the cooperation.^[3]

1.2.6 Policy for Relief and Recovery

One of the main EU activities impacting the relief policy is Humanitarian Aids.

Based on international humanitarian principles and as set out in the European Consensus on humanitarian aid²³, the EU provides needs-based humanitarian assistance with particular attention to the most vulnerable people or communities²⁴. Aid is channelled impartially to the affected populations, regardless of their race, ethnic group, religion, gender, age, nationality or political affiliation.

The EU provides remedy to all major crises zones around the world including Syria, South Sudan, and the Central African Republic, as well as countries facing post-conflict instability, such as Côte d'Ivoire. The EU also plays a crucial role in assisting and raising awareness of "forgotten crises" – often protracted crises which escaped the media and international community's attention.

EU humanitarian aid covers areas such as: food and nutrition, shelter, healthcare, water and sanitation among others. Aid, funded by the EU, is carried out in partnerships with international organisations and humanitarian NGOs.

²² Communication From the Commission to the European Parliament and the Council Consular protection for EU citizens in third countries: State of play and way forward, <http://eur-lex.europa.eu/legal-content/EN/TXT/PDF/?uri=CELEX:52011DC0149&from=en>

²³ European Council, European Consensus on humanitarian aid, <http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:C:2008:025:0001:0012:EN:PDF>

²⁴ European Commission, Humanitarian Aid and Civil Protection, Helping victims of disasters and conflicts, and protecting those at risk, http://europa.eu/pol/pdf/flipbook/en/humanitarian-aid_en.pdf

In order to support the recovery of stricken areas within the EU territory, the EU set up a specific fund (the Solidarity Fund). This specific fund has helped MS and third countries in distress, to recover after a major disaster. For example 16.2 mil EUR were given to Greece and Bulgaria this July, after major flooding. Recovery operations are financed through this specific fund²⁵.

The Solidarity Fund was established in 2002 after a Council decision, and was amended in 2014. It is a complementary instrument to the efforts put by the state and it is based on the subsidiary principle, where the assistance is critically needed to avoid major repercussions to society. This instrument has to be deployed immediately and in a swift manner, without surpassing the responsibility of the State.

*"It may be desirable for the beneficiary State, in conformity with its specific constitutional, institutional, legal or financial context, to associate the regional or local authorities with the conclusion and the application of the implementation arrangements, the beneficiary State remaining in all cases responsible for the implementation of the assistance and for the management and control of the operations supported by Community financing"*²⁶.

1.3 Financing

1.3.1 Investing in preparedness

In the field of civil protection, the EU plays an "enabling role" to support, coordinate or supplement the actions of Member States in the prevention of, preparedness for, and response to disasters. The primary responsibility for the protection of people as well as the environment and property, including cultural heritage, remains with MSs.

Consequently, it is MSs who bear the financial costs of most civil protection actions, leaving the EU civil protection budget relatively small, compared to that for humanitarian aid. Whereas, the EU civil protection budget can only offer limited incentives, Structural Funds (SF) can support with more substantial funding. "The budget for the implementation of the **EU Civil Protection Mechanism** for 2014-2020 is €368.4 million of which €223.7 million shall be used for prevention, preparedness and response actions inside the EU and €144.6 million for actions outside the EU. These amounts are complemented by contributions from non-EU countries that participate in the EU Civil Protection Mechanism"²⁷.

²⁵ European Commission, Commission allocates €16.2 million from the EU Solidarity Fund to Greece and Bulgaria in the wake of natural disasters, http://ec.europa.eu/regional_policy/en/newsroom/news/2015/07/commission-allocates-eur16-2-million-from-the-eu-solidarity-fund-to-greece-and-bulgaria-in-the-wake-of-natural-disasters

²⁷ European Commission, Financing Civil Protection, http://ec.europa.eu/echo/funding-evaluations/financing-civil-protection_en

1.3.2 Investing in consequence management

The EU Solidarity Fund (EUSF) was established in November 2002. The purpose was to enhance the EU's ability to respond to major disasters, to show and articulate solidarity with disaster struck regions within the EU and to support the recovery of stricken areas. The total amount of EUSF is set to a total of 1 billion Euros per year²⁸. Previously there had been no funding or programmes available in the area of Civil Protection at the EU level, since funding was exclusively under the competence of MSs. In order to be granted from the EUSF there are three categories which need to be fulfilled: (1) The total costs of the damages amount to over three billion Euros (in 2002 prices) or more than 0,6 % of a country's Gross National Income (GNI). (2) A neighbouring country or accession country is seriously affected by the same crisis, but does not suffer damages that meet the criterion set up for the first category and regions are seriously affected by disasters. (3) The total annual assistance to regions can amount to a maximum of 7,5 % of the total budget for the EUSF. ^[3]

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

For Civil Protection, specific requirements for interim and ex-post evaluation are provided in the Decision on a Union Civil Protection Mechanism (Art. 34).^[1] This regulation, COM (2011) 9344, has been recently adopted in 2013; thus, the process to acquire and manage Lesson Learned is relatively new. This evaluation process is comprised of the achievements indicated from lesson learned for all the operation conducted by using the European CM mechanism.

1.4.2 Departmental Lessons Learned systems

Within the above mentioned program of evaluation and lesson learned, the Emergency Response Coordination Centre (ERCC) adopted its own process for evaluating the lesson learned in each operation where the Centre is involved²⁹. For example one of the lessons learned mentioned in a study funded by the EC, is that "by pooling resources and capacities, the Mechanism provided greater predictability and reliability of assistance as compared to bilateral cooperation mechanisms"³⁰.

²⁸ Proposal for a REGULATION OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL establishing the European Union Solidarity Fund, <http://eur-lex.europa.eu/legal-content/EN/TXT/PDF/?uri=CELEX:52005PC0108&from=EN>

²⁹ Wilkinson C. and Zimmerman S., Evaluation of Civil Protection Mechanism - Case study report - Forest Fires in Europe, http://ec.europa.eu/echo/files/evaluation/2015/CPM_case_study_forest_fires_en.pdf

³⁰ Wilkinson C. and Zimmerman S., Evaluation of Civil Protection Mechanism - Case study report - Forest Fires in Europe, http://ec.europa.eu/echo/files/evaluation/2015/CPM_case_study_forest_fires_en.pdf

1.4.3 Centralised (national) Lessons Learned system

In the EU, the centralised system for lesson learned is the one managed by DG-ECHO as mentioned above.

1.4.4 International exchange for Lessons Learned

The lesson learned procedure is organised in a way that, at the end of each evaluation activity for the specific operation, a meeting with all the stakeholders involved is mandatory. In case of participation or cooperation with international organisations, the relevant operators/representatives are involved and become part of the lesson learned assessment process. As an example of such meeting, we could consider the one held after the operation in the recent Philippine Tsunami in 2013. DG ECHO deployed technical assistance after the tsunami and has provided an assessment in 2013³¹.

“Rapid field needs assessments have been conducted by ECHO staff from the RSO in Bangkok, which was then complemented by information from the EU CP team members that were placed in key coordination positions where information was continuously coming in from different parts of the affected area. In addition, ECHO received various reports from implementing partners including information exchanged with the ASEAN Emergency Response Assessment Team (ERAT). This team was supported by a member of the ASEAN Partnership Group (APG), which receives funding from ECHO. ECHO also received satellite Maps from the Copernicus Emergency Mapping System, which were widely shared”³².

The immediate assessment showed that shelter, food, drinking water and medical care were lacking in the field and should be provided to the State.

1.4.5 Regular policy reviews

Correct implementation of EU-funded operations is ensured by several layers of audits and monitoring, at internal level and by external actors.

Controls performed by the Commission

The main aspects of the control strategy developed by the Commission include supervision and monitoring procedures and ex-ante/ex-post controls.

- “Strict selection and quality control mechanisms for partners under the Framework Partnership Agreement that the Commission signs with NGOs and international

³¹ DG ECHO, ECHO assessment report 2013, http://www.europarl.europa.eu/meetdocs/2009_2014/documents/deve/dv/echo_assessment_report_/echo_assessment_report_en.pdf

³² DG ECHO, ECHO assessment report 2013, http://www.europarl.europa.eu/meetdocs/2009_2014/documents/deve/dv/echo_assessment_report_/echo_assessment_report_en.pdf

organisations as well as defining the requirements for financial credentials and expertise of partners;

- Appraisal of project proposals and on the spot project monitoring through a network of the Commission field experts (technical assistants) worldwide;
- Regular field visits to projects by geographical desks, auditors and the Commission management;
- Obligation for partners to produce reports after the end of each operation to justify their expenses. A thorough analysis of these reports and checks on eligible expenditure are carried out by operational and financial desk officers at the Commission;
- Regular evaluations are undertaken, focusing on major country operations, partners and thematic issues. The results of these are posted on the Commission's website;
- EU- funded humanitarian aid activities implemented by external parties (partners and contractors) are subject to financial and systems audit;
- All Commission services have an internal audit capacity. This provides an independent and objective opinion on the quality of the internal control systems and assists the Director General and management in controlling risks and monitoring compliance"³³.

The monitoring mechanisms listed above should not be seen in isolation. Each contributes to providing reasonable assurance on the legality of transactions and their general compliance with relevant rules.

1.5 Resilience

As a follow up to the Communication "The EU approach to resilience: learning from food security crises"³⁴, Council Conclusions were adopted in May 2013 and the Resilience Action Plan issued in June 2013. The Action Plan provides the framework for continuing and scaling up EU efforts for resilience at different levels (from policy and advocacy to tools and methods) and with concrete country/region strategies and specific cases. In 2014, the Commission will contribute to implementing the resilience agenda and will, in particular, integrate resilience as a driver for quality and aid effectiveness of its humanitarian response and development assistance. Closer co-operation within Commission services and with the EEAS will be pursued. Resilience will be systematically included as an element in the Humanitarian Implementation Plans (HIP). Better coordination between development and humanitarian objectives and interventions will be pursued, based on a common analysis of risks and vulnerabilities. In October 2013, a joint instruction letter on the implementation of the Commission's approach to resilience was sent to Ambassadors of the EU Member States, heads of EU Delegations and heads of ECHO field offices. The letter sets out the expectation that resilience will "be streamlined and integrated as a priority in our programming

³³ Delivery, Coordination and Control on the use of EU funds, *Monitoring of use of funds*, pg. 25

³⁴ Communication from the Commission to the European Parliament and the Council The EU Approach to Resilience: Learning From Food Security Crises,
http://ec.europa.eu/echo/files/policies/resilience/com_2012_586_resilience_en.pdf

(humanitarian/development, EU/Member States) in order to allow the EU's external assistance to make a difference to the most vulnerable”³⁵.

The EU approach to resilience acknowledges national governments' responsibility to build resilience. Building resilience is a long-term process that needs to be context-appropriate and embedded in national policies and planning for development. In order to contribute effectively to this agenda, the Commission will engage in a more structured way with governments at local and regional level as well as central level. A central objective of resilience is to address underlying, and linked, causes of people's vulnerability. This requires that multi-faceted actions be supported by humanitarian and development assistance partners over the short, medium and long term.

The resilience approach must bring sustainable benefits to the most vulnerable populations and households, taking into account the diversity of needs of women, children, men and the elderly, who may suffer from multiple factors of vulnerability including those coming from the climate change. Action is required at various levels and dimensions. In line with its experience and added value, the Commission will in particular contribute to action at community level.

In this context, the Commission will increasingly be involved in joint planning processes with the Member States that have the potential to play a key role in supporting the resilience agenda. The Commission will work in close partnership with other donors, multilateral agencies and Civil Society Organisations in support of National and Regional resilience strategies. The Intra-ACP resilience building programmes as well as the AGIR initiative in the Sahel and the SHARE initiative in the Horn of Africa provide a framework for co-ordination. Elsewhere, the Commission will seek to develop strategic and operational partnerships, at all levels, to optimise different expertise and added value behind resilience objectives.

1.6 Information sharing and data protection

1.6.1 Describe whether the country/ IO has adopted specific policies, measures or derogations from EU law with regard to data protection

Various mechanisms are in place to ensure coordination and exchange of information crisis response and humanitarian aid activities in general, including:

- Member States and the Commission meet regularly in the Council Working Group on Humanitarian Aid and Food Aid (COHAFA). Exchange of information on overall strategies and on responses to specific crisis situations features regularly in the agendas of COHAFA;
- Crisis reports are shared with Member States. They contribute to the development of shared assessment and understanding on the situation on the ground and thus contribute to the overall coordination of the EU response;

³⁵ European Commission SWD(2013) 503 Final, Commission Staff Working Document Annual Strategy for Humanitarian Aid in 2014: General Guidelines on Operational Priorities, http://ec.europa.eu/echo/files/policies/strategy/strategy_2014_en.pdf

- Exchanges with partners both at headquarters and at the field take place regularly;
- The European Disaster Response Information System (EDRIS) collects data on Commission and Member States' humanitarian aid activities;
- At international level, the Commission continues to participate in well-established fora such as the Good Humanitarian Donorship and the ICRC Donor Support Groups. It will chair the OCHA Donor Support Group in 2014;
- Regular exchanges of views on the EU's response to crisis take place in the European Parliament (DEVE Committee);
- DG ECHO organises ad hoc crisis coordination meetings of the EU services (including ARGUS meetings) and participates in broader inter-service meetings aimed at exchanging information (such as e.g. Crisis Platform meetings organised by the EEAS).

The EU is supposed to not derogate from its own laws, thus EU laws concerning data privacy protection compliancy is fully adopted by the EU institutions, also in the scope of crisis management activities.

1.6.2 Does the country/IO have registers/databases of volunteers?

Regulation No 375/2014 of the European Parliament and the Council on establishing the European Voluntary Humanitarian Aid Corps ('EU Aid Volunteers initiative') dated 03/04/2014 established a database for the registered volunteer organisations as at the article 13:

Database of EU Aid Volunteers:

1. *Candidate volunteers who have successfully passed the assessment referred to in Article 12(5) shall be considered to be EU Aid Volunteers and shall be eligible for deployment. They shall be included as such in the database of EU Aid Volunteers.*
2. *The Commission shall establish, maintain and update the database of EU Aid Volunteers, including as regards the availability and eligibility of EU Aid Volunteers for deployment, and shall regulate access to and the use of it. The processing of personal data collected in or for this database shall be carried out, where relevant, in accordance with Directive 95/46/EC and Regulation (EC) No 45/2001³⁶.*

1.6.3 Does the country have or plan to use data gathered from social media during crises? If so how? (e.g. "crowd sourcing" and "crowd tasking", "citizen as a sensor")

³⁶ REGULATION (EU) No 375/2014 OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL establishing the European Voluntary Humanitarian Aid Corps ('EU Aid Volunteers initiative'), <http://eur-lex.europa.eu/legal-content/EN/TXT/PDF/?uri=CELEX:32014R0375&from=EN>

No specific plan results for using data gathered from social media, although the EU is co-funding different R&D project in this specific area and a specific software module gathering information from the social media is already implemented in one of the situation awareness system in the Emergency Response Coordination Centre (ERCC).

2 Legislation

2.1 Crisis (emergency, disaster) management concept

There are both formal and informal principles that guide EU-cooperation in aftermath CM. The principles on subsidiarity, no duplications, collective responsibility and solidarity pave the way for aftermath CM actions in the EU³⁷.

The principle of subsidiarity is central in the aftermath of CM. A crisis or a disaster shall be managed at the lowest possible level, such as the national or the local level. Preventing and responding to disasters is first of all a national responsibility. When national capabilities are overwhelmed, EU MSs can, however, request assistance through the Civil Protection Mechanism (see below) or through other bilateral or regional agreements. The importance of the principle of subsidiarity in the EU in general is, inter alia, underlined through a new provision in the Treaty of Lisbon which paves the way for a greater possibility for the national parliaments exerting influence on the EU policy process to see to that subsidiarity is being considered.

Closely interlinked to the principle of subsidiarity is the second principle to not duplicate capacities and structures that already exist. In other words, capacities that already are present at the national level and at the local level shall not be established at the EU level as well.

The third principle is referred to as the principle of collective responsibility that implies that MSs collectively are responsible for the prevention of and the preparedness for a crisis in the EU. MSs have the responsibility to carry out preventive and preparatory measures at the national level. When measures are taken at the national level considerations must be taken of the fact that if national crisis prevention and preparedness are not undertaken, this may cause damage to the EU as a whole since crises today tend to be transnational.

The last principle is the principle of solidarity that can be described as the very essence of the cooperation within the EU. The principle of solidarity indicates that MSs shall support each other in the event of a major crisis or emergency. The Civil Protection Mechanism and the Crisis Coordination Arrangement (CCA) are two concrete examples of this principle. The importance of solidarity provided in crisis situations amongst EU MS has increased over the years, not least as a consequence of the many terrorist attacks and the natural disasters that have struck Europe during the last decade. This has, inter alia, paved the way for the introduction of a solidarity clause in the Lisbon Treaty.

³⁷ European Commission, Annual Report 2012 On Subsidiarity And Proportionality, <http://eur-lex.europa.eu/legal-content/EN/TXT/PDF/?uri=CELEX:52013DC0566&from=EN>

The ‘General Provisions on the Union’s External Actions’ in the Lisbon Treaty includes two new articles, Article 2 and Article 6, which stipulate that the Union shall define and pursue common policies and actions and work for a high degree of cooperation in all fields of international relations in order to:

- preserve peace, prevent conflicts and strengthen international security;
- assist populations, countries and regions confronting man-made or natural disasters³⁸.

Hence, there is an apparent ambition expressed in the Lisbon Treaty to develop a more coherent EU response to disasters outside the Union³⁹.

2.2 General crisis (emergency, disaster) management law

Cooperation within Civil Protection could be traced to the end of the 1970s in relation to the managing of marine pollution. During the 21st century, the scope of the European cooperation in this area has deepened and broadened and today it covers cooperation to prevent, prepare and respond to disasters. At present, the cooperation in the area is based on two legal acts:

- the Council Decision establishing a Community Civil Protection Mechanism from 2001 (a revised version was adopted in autumn 2007)⁴⁰;
- the Council Decision establishing a Civil Protection Financial Instrument adopted in 2007⁴¹;
- The Emergency Response Coordination Centre (ERCC) was set up in May 2013;
- The Council Decision No 1313/2013/EU of The European Parliament and of The Council of 17 December 2013 on Amending the Union Civil Protection Mechanism.

The Lisbon Treaty provides the area of Civil Protection with a specific article – Article 196 ‘Civil Protection’, and formally establishes Civil Protection as an area of ‘shared competence’ between the Union and the MSs⁴². Shared competence means that the EU is given the competence to carry out actions to support, coordinate and complement actions undertaken by the MSs. However, the measures carried out by the EU shall not replace those of the MSs, nor shall EU legislation comprise the harmonization of national legislation⁴³. Article 196 on Civil Protection stipulates that supportive, coordinating or complementary measures carried out by the Union shall be made with a view to increasing the efficiency of the systems for crisis prevention, preparedness and response to natural and manmade disasters. These measures shall aim to:

³⁸ European Union, Treaty of Lisbon Article 22, <http://www.lisbon-treaty.org/wcm/the-lisbon-treaty/treaty-on-european-union-and-comments/title-5-general-provisions-on-the-unions-external-action-and-specific-provisions/chapter-1-general-provisions-on-the-unions-external-action/100-article-22.html>

³⁹ European Union, Treaty of Lisbon Amending the Treaty on European Union and the Treaty Establishing the European Community, <http://eur-lex.europa.eu/legal-content/EN/TXT/?uri=celex%3A12007L%2FTXT>

⁴⁰ European Parliament and European Commission, Decision No 1313/2013/EU Of The European Parliament And Of The Council of 17 December 2013 on a Union Civil Protection Mechanism, <http://eur-lex.europa.eu/legal-content/EN/TXT/PDF/?uri=CELEX:32013D1313&from=EN>

⁴¹ COUNCIL DECISION establishing a Civil Protection Financial Instrument, <http://eur-lex.europa.eu/legal-content/EN/TXT/PDF/?uri=CELEX:32007D0162&from=EN>

⁴² European Union, Treaty of Lisbon Amending the Treaty on European Union and the Treaty Establishing the European Community, <http://eur-lex.europa.eu/legal-content/EN/TXT/?uri=celex%3A12007L%2FTXT>

⁴³ European Union, Treaty of Lisbon Amending the Treaty on European Union and the Treaty Establishing the European Community, <http://eur-lex.europa.eu/legal-content/EN/TXT/?uri=celex%3A12007L%2FTXT>

- Support, coordinate and complement those measures taken at a national, regional or local level concerning the prevention of risks, the preparedness of the MSs' actors within the area of Civil Protection as well as the response to natural and other disasters within the EU,
- Enable rapid and efficient operational cooperation between Civil Protection capacities of the MSs and to
- Ensure coordination between international actions as regards Civil Protection.

Prior to the Lisbon Treaty, each MS had the opportunity to block a decision. The establishment of measures necessary to achieve the objectives referred to above will from now on be taken in accordance with the ordinary legislative procedure, which involves a strengthened legislative role for the European Parliament and a qualified majority as the ordinary voting procedure in the Council.

2.3 Emergency rule

No specific emergency rule introduction is envisaged in the EU legislation. Even the most recently adopted regulation in this scope doesn't introduce variation on the obligation and responsibilities comprised at MS level or by the other EU regulation in place. For example, the "Decision for the introduction of a New Union Mechanism of Civil Protection" is stating at Chapter 1 / Article 1 the following points:

"5. The Mechanism shall not affect Member States' responsibility to protect people, the environment and property on their territory against disasters and endowing their emergency management systems with sufficient capabilities to enable them to cope adequately with disasters of a magnitude and nature that can reasonably be expected and prepared for.

*6. The Mechanism shall not affect obligations under existing relevant legislation of the Union or the European Atomic Energy Community or under existing international agreements"*⁴⁴.

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

A set of specific legal arrangements has been established by the European Commission, The Council and the European parliament in dedicated areas.

The Treaty of Lisbon underpins the commitment of the EU to provide assistance, relief, and protection to victims of natural or man-made disasters around the world (art. 214), and to support and coordinate the civil protection systems of its Member States (art. 196). It further mandates the European institutions to define the necessary measures for such actions to be carried out.

⁴⁴ European Council, 2007/779/EC, Euratom: Council Decision of 8 November 2007 establishing a Community Civil Protection Mechanism, <http://eur-lex.europa.eu/legal-content/EN/ALL/?uri=CELEX:32007D0779%2801%29>

The following is an overview of the legal framework which has been established to-date:

- Regulation No 375/2014 of the European Parliament and the Council on establishing the European Voluntary Humanitarian Aid Corps ('EU Aid Volunteers initiative') - 03/04/2014
- Decision No 1313/2013/EU of the European Parliament and of the Council on a Union Civil Protection Mechanism - 17/12/2013
- Regulation (EC) No 1257/96 concerning humanitarian aid - 20/06/1996
- Commission Decision 2010/481/EU, Euratom amending Decision 2004/277/EC, Euratom as regards rules for the implementation of Council Decision 2007/779/EC, Euratom establishing a Community civil protection mechanism - 29/07/2010
- Commission Decision 2008/73/EC, Euratom amending Decision 2004/277/EC, Euratom as regards rules for the implementation of the Mechanism - 20/12/2007
- Commission Decision 2007/606/EC, Euratom laying down rules for the implementation of the provisions on transport - 08/08/2007
- Commission Decision 2004/277/EC laying down rules for the implementation of Council Decision 2001/792/EC - 29/12/2003
- Council conclusions on the development of the external dimension of the European Programme for Critical Infrastructure Protection - 09/06/2011
- Council conclusions on Integrated Flood Management within the European Union - 12/05/2011
- Council conclusions on Further Developing Risk Assessment for Disaster Management within the European Union - 11/04/2011
- Council Conclusions on Host Nation Support - 02/12/2010
- Conclusions on Innovative Solutions for Financing Disaster Prevention - 08/11/2010
- Council conclusion on Psychosocial support - 21/05/2010

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

NOT DIRECTLY APPLICABLE FOR THE EU ORGANISATION.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

Regulation No 375/2014 of the European Parliament and the Council on establishing the European Voluntary Humanitarian Aid Corps ('EU Aid Volunteers initiative') dated 03/04/2014 *"establishes a European Voluntary Humanitarian Aid Corps ('the EU Aid Volunteers initiative') as a framework for joint contributions from European volunteers to support and complement humanitarian aid in third countries. This Regulation lays down the rules and procedures for the operation of the EU Aid Volunteers initiative and rules for the provision of financial assistance and applies to:*

1. *selection, training and deployment of EU Aid Volunteers to support and complement humanitarian aid in third countries;*
2. *actions that support, promote and prepare the deployment of EU Aid Volunteers to support and complement humanitarian aid in third countries;*
3. *actions inside and outside the Union aimed at building the hosting organisations' capacity for humanitarian aid in third countries.*"⁴⁵

2.7 Legal regulations for international engagements of first responders and crisis managers

Depending on specific emergencies, a particular "Term of reference" is adopted within the EU bodies operating in such situation. Rules of engagement for the CM operators or first responders involved into international operations follow the UN/OCHA guidelines in such respect.

"The Cluster Approach operates at two levels. At the global level, the aim is to strengthen system-wide preparedness and technical capacity to respond to humanitarian emergencies by designating global Cluster Leads and ensuring that there is predictable leadership and accountability in all the main sectors or areas of activity. At the country level, the aim is to ensure a more coherent and effective response by mobilizing groups of agencies, organizations and NGOs to respond in a strategic manner across all key sectors or areas of activity, each

⁴⁵ European Commission, EU Aid Volunteers initiative: Technical Assistance for sending organisations Capacity Building for humanitarian aid of hosting organisations, Call for proposals, http://eur-lex.europa.eu/legal-content/en/TXT/PDF/?uri=OJ:JOC_2015_017_R_0005

sector having a clearly designated lead, as agreed by the Humanitarian Coordinator and the Humanitarian Country Team”⁴⁶.

3 Organisation

3.1 Organisational chart

Although different EU Commission Directorates are involved in crisis management, the European Union Organisation affecting Civil Protection and Crisis Management Coordination and Support is structured in three “Institution”:

1. The European Commission - Directorate General for Humanitarian Aids and Civil Protection;
2. The European External Action Service and
3. The European Council.

3.1.1 The European Commission – Main Structures for Aftermath Crisis Management

Civil Protection and Humanitarian Aid (DG ECHO)

The main instruments for EU crisis response are found within DG ECHO and consist of the Civil Protection Community Mechanism and the Emergency Response Coordination Centre (ERCC) as well as the EU instruments for humanitarian aid.

The Mechanism constitutes the basis of cooperation within the area of Civil Protection. It is a structure through which participating states voluntarily may pool their Civil Protection capacities to countries inside or outside the EU that have requested help to all types of major emergencies including natural and man-made disasters such as acts of terrorism, technological, radiological and environmental accidents.

DG ECHO finances humanitarian aid outside the EU to e.g. the UN, the International Committee of the Red Cross (ICRC) or other non-governmental organisation (NGOs) that implement the humanitarian aid. DG ECHO has got considerable financial means, around 640 million Euro/ per year but limited operational capacity. Besides the head office in Brussels, ECHO has got field offices around the world. ^[3] The DG-ECHO organisation chart at October 2014 is represented in the following figure:

Figure 6: Organisational Chart of DG-ECHO, Oct. 2014

The Mechanism involves the participation of all EU MSs, Norway, Iceland, Liechtenstein and Croatia. At the EU level, the ERCC serves as the focal point for the participating states' national contact points. It is accessible 24/7. ERCC serves as a forum for the access and the sharing of information between the participating states, it provides early alerts and information on interventions carried out through the Mechanism as well as facilitates coordination of assistance by matching offers of assistance put forward by participating states to the needs of countries requesting help. The ERCC's state-of-the-art crisis situation centre provides monitoring and analytical capacity, and has close links with EU research programmes and research organisations to foster and utilize innovation in crisis response and management. The ERCC and the national contact points communicate through the reliable web-based alert and notification application Common Emergency and Information System (CECIS), mentioned above, as well as the ERCC Portal for wider dissemination of information. Moreover, there is a Civil Protection financial instrument that was adopted in 2007, which enables financial support for activities regarding prevention, preparedness and response to a crisis. Up to 50 % of the total transportation costs, with exceptions for materiel, may also be financed through the instrument. The instrument covers a period from 2007 to 2013 and amounts approximately 190 million EUR. From mainly having been focusing on the handling of a disaster, cooperation in the area of Civil Protection now also includes prevention.

The Emergency Response Coordination Centre (ERCC), operating within the European Commission's Humanitarian Aid and Civil Protection department (ECHO), was set up to support a coordinated and quicker response to disasters both inside and outside Europe using resources from 31 countries participating in the Union Civil Protection Mechanism. The ERCC replaces and upgrades the functions of the previous Monitoring and Information Centre (MIC). With a capacity to deal with several simultaneous emergencies in different time zones, around-the-clock, the ERCC is a coordination hub facilitating a coherent European response during emergencies helping to cut unnecessary and expensive duplication of efforts. It collects and analyses real-time information on disasters, monitors hazards, prepares plans for the deployment of experts, teams and equipment, and works with Member States to map available assets and coordinate the EU's disaster response efforts by matching offers of assistance to the needs of the disaster-stricken country. Better planning and the preparation of a set of typical disaster scenarios will further enhance the ERCC's capacity for rapid response. "The ERCC also supports a wide range of prevention and preparedness activities, from awareness-raising to field exercises simulating emergency response"⁴⁷.

The following Figure, instead, compares the main aspects of instruments, EU Civil Protection and humanitarian aid.

 The European Commission Humanitarian Aid and Civil Protection – two complementary tools		
	Humanitarian Aid	Civil Protection (MIC)
What?	Funding from EC budget (€930 million in 2009). Active donor: programming and policy development in the field of humanitarian aid.	Voluntary contributions of assistance in kind from Member States (experts, specialised teams, equipment, other material assistance). Budget of Civil Protection Financial Instrument = EUR 189 million over seven years.
To whom?	Implementing partners (UN specialised agencies / Red Cross/Crescent movement/ NGOs / international organisations).	Government of affected country
Geographical scope?	The most vulnerable population(s) in third countries, mainly in developing countries.	Inside and outside the European Union.
Type of disaster?	Natural and man-made disasters (wars, conflicts, forgotten crises etc.).	Natural and man-made disasters (complex emergencies rather the exception).
Timescale?	Immediate aftermath of crisis and beyond (presence of humanitarian needs).	Acute stage only (normally max. 2-3 weeks).

Figure 7: European Humanitarian Aid and Civil Protection Concept

⁴⁷ DG ECHO, ERCC, http://ec.europa.eu/echo/what/civil-protection/emergency-response-coordination-centre-ercc_en

Others involved Directorates:

In aftermath CM, the **Secretariat-General of the Commission** has got an important role to ensure coordination between different Directorate General (DGs) and services. The EU CM Unit was established in 2008 in order to improve the Commission's internal CM. The Commission's security office is the operative point of contact for ARGUS staffed 24/7 (24 hours 7 days a week, see below).

Early warning and rapid alert systems for different crises that could have severe consequences for many MSs are found within the Commission. These different systems have developed sector-wise and their establishment is often a result of specific events. There are for example systems for radiological emergencies (ECURIE) within DG Energy and Transport, chemical and biological threats (RAS BICHAT, RAS CHEM), contagious diseases in humans (EWRS), threats to animal health (ADNS), threats to plant health (EUROPHYT), threats in food and feed (RASFF), threats to consumer health and safety (RAPEX) within DG Health and Consumers, threats against critical infrastructures (CIWIN) within DG Home Affairs and Civil Protection incidents (CECIS) and global disaster monitoring (GDACS) within DG ECHO.

For cross-sectorial crises the Commission's Secretariat-General holds a coordinating role by operating a Web-based network (ARGUS). The network enables rapid information exchange between a range of Commissions departments and ensuring high-level political coordination. All DGs have got a designated point of contact for ARGUS, but all DGs are not allowed to feed information into the system. Besides promoting the internal coordination of the Commission, ARGUS also consists of a Web portal where MSs' permanent representations to the EU and the Council Secretariat may take part of non-classified information in case of a crisis.

The Directorate General for Regional Policy (DG-REGIO) is instead in charge of the EU Solidarity Fund management, while the Directorate General for Justice (DG-JUSTICE) is dealing with the Consular protection in case of crisis and the related EU citizens evacuation mechanism.

3.1.2 The European External Action Service – Main Structures for Aftermath CM

The newly formed European External Action Service (EEAS) is the main policy-making organ responsible for political and security-related aspects of crisis management, the so-called Common Foreign and Security Policy (CFSP) and the Common Security and Defence Policy (CSDP), under the responsibility of the High Representative for Foreign Policy.^[2] The High Representative of the Union for Foreign Affairs and Security Policy and Vice president of the European Commission (HR/VP) has the overall responsibility for the policy development regarding the EU's external actions.^[3]

Within the EEAS, a distinction is made between crisis response and CM. The first includes swift and short-term measures, which are the responsibility of the Managing Director for Crisis Response and Operational Coordination (see paragraph 1.2.5).^[3] The EEAS was, originally, not intended to have a disaster response role beyond its political, security and defence remit. However, after the Haiti

earthquake, it was decided that the EEAS should play a wider role in coordinating activities which concern the whole of the Union's external action. The post of "managing director for crisis response and operational coordination" was therefore created. The director's role is to support the High Representative in coordinating and ensuring coherence in the EU's external relations when it comes to crisis management and response; assist in developing mechanisms within the EU institutions, and with third parties for better communication and coordination. However, this position is recent and the clarification of the mandate is under development. The second includes long-term measures including for example stabilization and capability development, which is the responsibility of one of the HR/VP's deputy secretary-general.

The HR/VP office relays to different structures and related Instruments for actuating Civil Protection policies and actions. The structures connected with the Instruments of Stability and the CSDP are exposed hereafter:

DG External Action (DG RELEX) and the Instrument for Stability

The HR/VP also is the Commissioner for External Relations. DG RELEX has established a crisis room that provides support as well as monitoring and information services during a crisis or a regular operation. The crisis room has contacts with the EU-delegations on the ground in an affected country in issues concerning aftermath CM or political crises. Work is on-going on merging SITCEN and DG RELEX crisis rooms. The purpose of the Instrument for Stability (IfS) is to prevent or take care of situations of instability in third countries, for example as a consequence of disasters or in high or low intensity conflicts. Focus is on conflict prevention, CM and peace building. IfS is used within the scope of the development tools within the European Commission, however, when the latter are not able to intervene in time.

Civilian aspects of CSDP and its Support to aftermath CM and recovery

The Union is developing also a Common Security and Defence Policy (CSDP), covering all questions relating to EU's security, including the progressive framing of a common defence, should the Council so decide. The CSDP was given a range of CM functions (known also as the "Petersberg tasks") under the Amsterdam Treaty. They include inter alia humanitarian and rescue operations, peace-keeping, and combat operations in CM, including peace-making. CSDP has two fields of action:

- a civilian crisis management structure, which deploys Police, Justice, and Public Administration experts to conflict areas to substitute locally scarce structures, or help reorganise local security sectors;
- a military, peacemaking and peacekeeping component⁴⁸.

In this area, major changes were introduced with the entry into force of the Lisbon Treaty. First, the military and civilian CSDP components which were previously managed by the Council structures (DGE) have both been transferred into the EEAS and most importantly, integrated into the same

⁴⁸ Report from the Commission to the European Parliament, the Council, the European Economic and Social Committee and the Committee of the Regions 2011 Annual Report on the Instrument for Stability, http://eur-lex.europa.eu/resource.html?uri=cellar:2ec28dd4-ecfd-492e-8e83-24c2f9da87b3.0001.02/DOC_1&format=PDF

department with the objective to better coordinate their work. Civilian-military cooperation has already started developing at the planning stage, at capability level as well as in the field. This is not, as we will see, the case yet between military and civil protection tools deployed under Commission's coordination.

Since the first civilian deployment in 2003, civilian CSDP missions have extended their scope (police, monitoring, justice, security sector reform, border assistance), nature (non-executive e.g. having a mandate only to advise and executive e.g. a mandate to take the enforce decisions), geographic location and size. Civilian experts (seconded and contracted) are deployed in civilian CSDP missions⁴⁹. As a matter of fact, civilian CM has become the most frequently used tool under CSDP.

The CSDP civilian CM structure is composed by different bodies:

- the Civilian Planning and Conduct Capability (CPCC)
- the Committee for Civilian Aspects of CM (CIVCOM)
- the CM and Planning Directorate (CMPD)

The Civilian Planning and Conduct Capability (CPCC) is responsible for an autonomous operational conduct of civilian CSDP missions. Under the political control and strategic direction of the PSC (Political and Security Committee, assisting the Council decision) and the overall authority of the High Representative, the CPCC ensures the effective planning and conduct of civilian CSDP CM missions, as well as the proper implementation of all mission-related tasks.

On civilian issues, the PSC is provided with recommendations and advice by CIVCOM (Committee for Civilian Aspects of CM), a working group at expert level. Main tasks: to assist PSC and other Council bodies by acquiring a comprehensive view of the means available to the EU and MSs to respond to a crisis; to improve EU's CM capability e.g. by developing and implementing lessons learned, common standards and best practices, helping to ensure a higher degree of coherence in EU strategies, helping to improve co-ordination of resources and exchange of related information in the EU.

In addition to the CPCC and CIVOM, the newly established CM and Planning Directorate (CMPD) operates as an integrated structure for strategic planning of CSDP civilian and military missions, and also for supporting the various aspects of CSDP development.

Military aspects of CSDP and its support to disaster response

Whereas the civilian CM provides the EU a tool for supporting post-conflict societies in rebuilding basic functions and institutions of a state, the CSDP military CM capabilities are often described as the military arm of the EU. The key EU bodies relevant and specific to the CSDP military CM are:

- the European Union Military Staff;
- the European Union Military Committee and
- the Joint Situation Centre.⁵⁰

⁴⁹ European Union, CSDP, Civilian CSDP Missions: lessons and best practices, <https://www.consilium.europa.eu/uedocs/cmsUpload/Fact%20Sheet%20-%20Civilian%20CSDP%20missions%20-%202009%20report%20on%20lessons%20and%20best%20practices.pdf>

⁵⁰ European Union, Military Staff of the European Union (EUMS), <http://eur-lex.europa.eu/legal-content/EN/TXT/?uri=uriserv:r00006>

The European Union Military Staff provides in-house military expertise for the High Representative of the Union for Foreign Affairs and Security Policy (HR) and performs early warning, strategic planning, and situation assessment. The EUMS is the only permanent integrated military structure of the European Union. Established on 11 June 2001, the EU Military Staff receives tasking from the EU Military Committee (which represents the Chiefs of Defence of all the MSs). It exhibits a permanent strategic planning capability, i.e. the “analysis of the implications of political objectives, the desired end-state, restraints, constraints, and capabilities needed for a particular operation”. Furthermore the EUMS runs the EU Operational Centre, a skeleton Operational Headquarter (OH) for CSDP missions that can be upgraded to an active OH, if needed and requested by MS.

The European Union Military Committee or (EUMC) is composed of the Chiefs of Defence (CHOD) of the MSs, who are regularly represented by their permanent Military Representatives (MilReps). It has a permanent chairman, selected by the CHOD of the MSs and appointed by the Council. The EUMC is the military counterpart to the CIVCOM.

The Joint Situation Centre (SITCEN) is implemented within the Council General Secretariat and is also run by the EUMS. It provides 24/7 intelligence, analysis and early warning and serves as communications hub for the HR and EUSR⁵¹.

3.1.3 The Council of the European Union – Main Structures for Aftermath CM

The EU’s Crisis Coordination Arrangement – CCA

For emergencies/crises, more specifically crises having a harsh and broad impact on several MSs, are of rapidly spreading nature and/or of political significance that require coordination on political level within the EU, there is the EU emergency and crisis coordination arrangement (CCA). The CCA was formally agreed in 2005. The main purpose of the CCA is to facilitate the ability of the MSs and the commissions to coordinate the information to the public and CM actions. Crises which develop slowly and over time or more “ordinary” crises affecting MSs shall be managed according to the ordinary procedures and structures within the EU.

The Presidency shall in consultation with the affected MSs, with assistance from the Council Secretariat and the Commission, decide whether or not a crisis calls for the triggering of the CCA in Brussels.

The core function of the CCA consists of the CCA Steering Group that is set up in relation to a crisis, thus not being a permanent structure. The group shall prepare and facilitate the decision-making process of COREPER II 40 – COREPER II 40 includes the permanent representatives of all MS on the following four Councils: economic and financial affairs, foreign affairs, general affairs, justice and

⁵¹ FOCUS Project, SitCen,

<http://www.focusproject.eu/documents/14976/0/CBRA+analysis+of+EU+Situation+Centre>

home affairs⁵². The group brings together the Council Presidency (the permanent representative), affected MSs (permanent representatives), and the General Secretariat of the Council. The group works as a preparatory body to decision-making in COREPER II, where decision is taken on planned actions to be undertaken. A decision is then formally taken by the Council.

The Steering Group replaces the normal working procedures in the Council. The Group supports the Presidency in identifying proposals for possible EU responses to the crisis.

To support COREPER and the Steering Group, there is a CCA Support Machinery that gives advice adjusted to the specific crisis. The need of support from the Support Machinery is coordinated by a Support Group that is composed by officials from the Council Secretariat and the Commission, namely: The Director of SITCEN (Joint Situation Centre); the Head of the Councils Press Office; the spokesperson of the HR/VP and of the Commission; Commissions ARGUS- representative as well as other specific expertise needed from for example the Presidency or the MSs’.

A MS or an EU-body that has acknowledged a crisis may activate the CCA through a specific call to the SITCEN. The Director of SITCEN in turn informs the Presidency, the Directors of the Private Office of the Secretary-General and Deputy Secretary-General of the Council and the Commission (ARGUS duty service) about the situation. The Presidency’s EU ambassador confers with the Council Secretariat (Secretary-General) and the Commission (Secretary- General) and the EU ambassadors of the affected MSs whether or not to trigger the CCA and activate the Crisis Steering Group. The formal decision is taken by the Presidency’s EU ambassador in discussion with its government.

Joint Situation Centre (SITCEN)

The EU Situation Centre is implemented within the Council General Secretariat and is run by the European Union Military Staff (EUMS). It provides 24/7 intelligence, analysis and early warning and serves as communications hub for the HR/VP and the European Union Special Representatives (EUSR).

3.2 Organisational cooperation

Three main coordination and cooperation activities could be highlighted from the EU actors in the Crisis Management occurrence:

1. CSDP Coordination with Civil Disaster Response and MSs
2. Coordination and cooperation with UN/OCHA
3. Coordination and cooperation with NATO/EADRCC

⁵² European Council, Coreper II, <http://www.consilium.europa.eu/en/council-eu/preparatory-bodies/coreper-ii/>

3.2.1 CSDP Coordination with Civil Disaster Response and MSs

In case of a major disaster abroad, the European Emergency Response Centre at DG ECHO requests military assets (mostly available transportation capacities) from the EU Movement Planning Cell within the EUMS (EEAS). The request is then preceded to the Multinational Movement Coordination Centres in Eindhoven (air transport) and Athens (transport by sea). From there the national Points of Contacts (typically within the national Ministries of Defence) are contacted and asked for available assets on a case-by-case basis. The gathered information is reported back to the EUMS that in turn coordinates the different possible contributions from MSs and reports back to DG ECHO. In order to allow for fast reactions the PSC is only involved, if bigger assets are requested. As for all CSDP instruments, there is no action foreseen for incidents inside the EU.

Despite political issues for the CSDP bodies to act inside the EU, every year the EUMS is involved in a large scale, though table-top exercise, the Crisis Coordination Arrangement Exercise (CCAEx), that plays through a large scale disaster affecting several MSs (coordinated by SITCEN).

3.2.2 Coordination and cooperation with UN/OCHA

There are no legal provisions for disaster response in an international context beyond customary law. There are, however, non-binding guidelines and agreements that have been developed, for example within the framework of the Inter-Agency Standing Committee (IASC), which are highly accepted among most of the humanitarian organizations. Humanity, neutrality, impartiality and independence are the leading principles for humanitarian assistance. Moreover the so called “humanitarian imperative” prevails, which means that humanitarian needs that occur in a country first shall be managed by the affected country. However, if the state or other institutions in the country are not able to manage the humanitarian situation, other countries and organizations have got a responsibility to provide support in accordance with international law.

When crises and disasters strike outside the EU, the UN (namely the UN Office for the Coordination of Humanitarian Affairs, OCHA), has got the overall responsibility to coordinate all humanitarian assistance to a stricken country. This is a provision that is highly acknowledged within the EU, among the Commission and most of the MSs. When the EU Civil Protection Mechanism was established in 2001 MSs’ humanitarian assistance to an affected country could from that day on not only be given for example bilaterally or through the UN, but also through the EU. Thus there was a need to broaden cooperation between the EU and UN as regards humanitarian assistance from the already existing cooperation in relation to financial aid to cooperation in humanitarian assistance missions as well. A core ambition of the EU today is to enhance cooperation with other international actors, especially the UN.

At present, the humanitarian aid system is undergoing a reform. In 2005 criticism was put forward regarding the lack of coordination in the humanitarian system. The purpose of the reform is to enhance predictability, accountability and partnership. The UN has got two main coordinative functions.

- First, OCHA coordinates the humanitarian actors within the so called “cluster-system”⁵³. This system was also created as a result of the humanitarian reform. There are around 10 clusters which are led by appointed cluster leads (UN bodies), for example: Coordination of camps (UNHCR/IOM), water and sanitation (UNICEF), health (WHO), emergency shelter (UNHCR/IFRC), food and nutrition (UNICEF), IT/telecommunications (OCHA/UNICEF/WFP); logistics (WFP), early recovery (UNDP), education (UNICEF and Save the Children Alliance) and agriculture (FAO).
- Second, OCHA coordinates humanitarian actors within the On-Site Operations Coordination Centre (OSOCC). The purpose of the OSOCC is to assist the local authorities to manage the disaster by for example coordinating international search and rescue teams. Moreover, the OSOCC enables the exchange of information and coordination between involved actors, which include governmental and non-governmental organisations, but also regional organisations like the ERCC.

3.2.3 Coordination and cooperation with NATO/EADRCC

Besides the EU and the UN, states cooperate within NATO/ Euro-Atlantic Partnership Council (EAPC) to coordinate disaster relief assistance in case of an emergency. The Euro- Atlantic Disaster Response Coordination Centre (EADRCC) is the focal point.

CM is one of NATO's fundamental security tasks. It can involve military and non-military measures to respond to a threat, be it in a national or an international situation. NATO began developing Civil Protection mechanisms in the event of a nuclear attack as early as the 1950s. NATO member countries soon realized that these capabilities could be used effectively against the effects of disasters induced by floods, earthquakes or technological incidents, and against humanitarian disasters. An assistance scheme first set up in 1953, in the aftermath of devastating flooding in Northern Europe, was comprehensively reviewed in 1995 when it became applicable to partner countries in addition to NATO member countries. As a result, the Euro-Atlantic Disaster Response Co-ordination Centre was established in 1998 to co-ordinate aid provided by different member and partner countries to a disaster-stricken area in a member or partner country. NATO also established a Euro-Atlantic Disaster Response Unit, which is a non- standing, multinational mix of national civil and military elements that have been volunteered by member or partner countries for deployment to the area of concern⁵⁴.

The Euro-Atlantic Disaster Response Coordination Centre (EADRCC) is a “24/7” focal point for coordinating disaster relief efforts among NATO member and partner countries. The EADRCC’s main function is to coordinate the response of NATO and partner countries to natural or man-made disasters within the Euro-Atlantic area. The Centre has guided consequence management efforts in more than 45 emergencies, including fighting floods and forest fires and dealing with the aftermath

⁵³ Chiaudani F., Improving coordination in humanitarian aid: reflections on the cluster system, <http://reliefweb.int/report/world/improving-coordination-humanitarian-aid-reflections-cluster-system>

⁵⁴ NATO, Crisis management, http://www.nato.int/cps/en/natolive/topics_49192.html

of earthquakes. Since 11 September 2011, the EADRCC has also been tasked with dealing with the consequences of CBRN incidents, including terrorist attacks. Most recently, the countries of the Mediterranean Dialogue (MD) and the Istanbul Cooperation Initiative (ICI) were given direct access to the Centre. The Centre also functions as an information-sharing tool for NATO and partner countries on disaster assistance. It organises seminars to discuss lessons learned from NATO-coordinated disaster response operations and exercises. In addition, it holds an annual large-scale field exercise with a realistic scenario for effective interaction. Recent exercises have included scenarios such as a terrorist attack using chemical agents.

All these tasks are performed in close cooperation with the European Union (in particular the Monitoring and Information Centre) and the United Nations Office for the Coordination of Humanitarian Affairs (UN/OCHA), which retains the primary role in the coordination of international disaster relief operations. The EADRCC is designed as a regional coordination mechanism, supporting and complementing the United Nations in its efforts. Furthermore, the EADRCC's primary function is coordination rather than direction. In the case of a disaster requiring international assistance, it is up to individual NATO and partner nations to decide whether to provide assistance, based on information received from the EADRCC.^[3]

Furthermore we can report that, at strategic level, CSDP Crisis management tasks are implemented by the following coordinated bodies: CMPD, EUMS, CPCC, Situation Centre, Satellite Centre, EDA.

Beside the CMPD, EUMS, CPCC described in the organisation chapter, the EEAS has a number of 24/7 monitoring and rapid response centres, notably the Situation Centre, the European Union Satellite Centre, the Watch-keeping Capability, and the Crisis Room. Their role is to purely gather information on crisis regions (within the realm of foreign, security and defence matters) and disseminate it to Member States, Brussels authorities, and EU actors on the ground. Discussions are currently ongoing internally as to the rationalisation of these response rooms. The European Defence Agency (EDA)'s role is instead to stimulate the development of capabilities meeting specific CSDP missions requirements. The Capability Development Plan identifies the needs in the capability field and suggests to MS different ways in which those capabilities should be shared, pooled or developed via common programmes in order to deliver deployable means for the conduct of CSDP operations.^[2]

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

For the aspect of CM concerned with the solidarity actions within the EU Member States, the work on SOPs is part of the recommendations towards the European Commission in the Council Conclusion on Host National Support of 2nd December 2010:

“Consider whether the use of agreed standards and certificates regarding the quality of assistance and personnel offered could facilitate overcoming existing legal issues/barriers and step up work on Standard Operational Procedures (SOPs) for modules so as to improve the overall Host Nation Support”⁵⁵.

For the International co-operation, instead, in 2007, the European Commission and OCHA agreed on Standing Operating Procedures (SOPs). These procedures have not been updated since then, thus not reflecting the merge of EU Civil Protection to DG ECHO and the new provisions of the Lisbon Treaty.

4.2 Operations planning

The recently adopted “implementing rules of pool of asset” give a mandate to ERCC for the definition of response plan for each kind of CM intervention. However, no specific standards to follow have been defined.

4.3 Logistics support in crises

When the transport is managed directly from the donor Member States, up to 55% of the costs of transporting assistance (and up to 85% in certain circumstances) can be co-financed by the European Commission. The case of 85% co-funding sees on the situation of the so called “registered asset”, the CM modules each member States have pre-declared as available to be employed, under voluntary base, in the CM operation coordinated from the Emergency Response Coordination Center (ERCC). Furthermore, a funding of 100% is foreseen in case of temporary warehousing of critical assets in transit during the transport toward and backward from the crisis areas.

Recently, the emergency defined by the Ebola crisis, create the condition in DG-ECHO for supporting a planned logistic, at least, in case of evacuation from the affected zone.

⁵⁵ Council conclusions on Host Nation Support,
http://www.consilium.europa.eu/uedocs/cms_data/docs/pressdata/en/jha/118145.pdf

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

Public information and warnings fall under the unique responsibility of the single Member States. None of the European Organisations or Institution is committed to this scope.

The 112 Emergency European Number, is however the standardised emergency number for the whole European Territory.

5 Capabilities

5.1 Human resources

Beside the EU Commission, EEAS and EU Council personnel operating the CM structures described at chapter 3, the CSDP has the possibility to mobilize other human resources during CM missions.

Civilian CSDP missions are conducted mainly using personnel seconded by MSs and all civilian personnel serve in the missions on a voluntary basis.

The EU states to be able to plan and conduct simultaneously a series of operations and missions, of varying scope⁵⁶:

- Two major stabilisation and reconstruction operations, with a suitable civilian component, supported by up to 10 000 troops for at least two years;
- Civilian-military humanitarian assistance operations lasting up to 90 days;
- Around a dozen CSDP civilian missions (inter alia police, rule-of-law, civilian administration, Civil Protection, security sector reform, and observation missions) of varying formats, including in rapid-response situations, together with a major mission (possibly up to 3000 experts) which could last several years.
- To take the decision to launch a mission within 5 days of the approval of the CM Concept by the Council and specific civilian CSDP capabilities to be deployable within 30 days of the decision to launch the mission.

Four main priority areas of EU civilian CM of CSDP, the following capabilities are committed:

- Police: To carry out police operations, from advisory, assistance and training tasks to missions. MSs have undertaken to provide more than 5000 police officers (5761), of which up to 1400 can be deployed in less than 30 days.
- Strengthening the rule of law: To strengthen or restore credible functioning judicial and penitentiary system. MSs have committed to provide 631 officers (prosecutors, judges, prison officers).
- Civilian administration: To strengthen or restore a functioning civil administration; a pool of experts of 565 in total to be deployed at very short notice.
- Civil Protection: The aim of the Civil Protection priority area in the context of EU CM was envisioned to provide, or assist in providing, all possible protection and support to ensure the survival of populations during a crisis while at the same time it was underlined and recognized that this type of interventions to respond emergencies are of a humanitarian nature. The priority area of Civil Protection has not gained the same weight as the other three priority areas of CSDP civilian CM.

⁵⁶ Jochen Rehl and Galia Glume, Handbook on CSDP Missions and Operations – The Common Security and Defence Policy of the European Union, http://eeas.europa.eu/csdp/structures-instruments-agencies/european-security-defence-college/pdf/handbook/final-handbook_on_csdp_missions_and_operations.pdf

Furthermore the mechanism is providing the so called Civilian Response Teams (CRTs). Civilian Response Teams are not per se a priority area but an instrument to be used for 1) early assessment of a crisis situation, 2) in support of the establishment of a civilian CSDP mission (when appropriate), 3) in temporary support of a EUSR or an ongoing civilian CM operation. Approximately 200 experts belong to the CRT pool with a variety of expertise.

5.2 Materiel (non-financial) resource

The main material resources connected with the European Civil Protection mechanism are not directly owned by the European Institution; the resources are committed from the MS organisations and organised by using the concept of Modules.

The Modules are considered by the Commission to be the type of resources most used and therefore needed for operations⁵⁷.

Modules are the heavy type of inventoried resources. They are the type of complex and large resources that would be mobilised for major disasters. The Modules are the results of an EU pilot project launched in 2007 with the objective to enhance European preparedness and response efforts. The Commission invited Member States to structure their national civil protection resources in so-called civil protection modules, consisting of task and needs-driven pre-defined multinational arrangements. This was a way to better structure the EU response system with self-sustained service packages. The intention was also to provide a standardised model for Member States to better structure and coordinate their resources.

Modules should therefore comply with a set of criteria/requirements defined in a technical framework under the Mechanism, in particular be self-sufficient - meaning deployable at short notice with the necessary logistics (accommodation, power supply, sanitation, storage, etc) for a period of 96 hours (or more, depending on the type of asset) – and interoperable together and with third responders. Modules could be established by Member States in 13 pre-defined areas of intervention to which the Commission added 4 additional categories in 2010 (see diagram). They were and are still considered to be the one most useful for disaster response. In January 2009, the European civil protection rapid response capacity included a total of 86 modules registered in the CECIS database. It was foreseen that this number would increase in 2010 by 39 additional modules, meaning 47% of the total number of modules registered with the effect of increasing the balance between the modules (see table hereunder).

⁵⁷ DG ECHO, EU Civil Protection mechanism, http://ec.europa.eu/echo/what/civil-protection/mechanism_en

Figure 8: CM Modules

The diagram shows that most of European capacity is concentrated in:

- medium urban search and rescue
- high capacity pumping
- CBRN detection and sampling
- advanced medical posts.

A few modules have also been registered for heavy urban search and rescue, water purification, forest fire fighting with planes, search and rescue in CBRN conditions, advanced medical posts with surgery, medical aerial evacuation and field hospitals. The Mechanism's capacity also includes technical assistance support teams (TASTs) providing support functions to the Modules and Assessment Teams, such as kitchens, shelter, IT, logistics, communications, etc. (of which 7 have been registered).

In addition to resources complying with the requirements of civil protection modules, Member States have additional response capabilities that can be deployed for external assistance on an ad hoc basis.

Since these assets are not standardised in modules, the inventory developed by Ecorys (see table hereunder) has some gaps, particularly because Member States' reporting varied in terms both of item descriptions and their quantification (if at all). Therefore, the table does not include quantities of these additional types of resources, because a meaningful attempt to quantify is not possible with the currently available information. Indeed, as already explained, the European Commission itself does not have a comprehensive, up-to-date database of non-standardised national assets. Furthermore, the ERCC (Emergency Response Coordination Centre) has not quantified assets such as tents and sandbags which are presumed to exist in large quantities.

Table 2: Response Resources by types

Other reported types of response resources	
First aid / medical care related resources	First aid and emergency care (including psychological and psychosocial support)
	Emergency mobile hospital
Logistics / transport related response resources	Transport, logistics and storage
Maritime response related resources	Marine Pollution team
	Marine SAR team
	Technical Diving Team
	Diving rescue team
	EMSA capacities (see description below)
Search and rescue related resources	Canine search and rescue team
Sampling and detection related resources	Detection and handling of explosive material
	Decontamination in case of a biological and or chemical attack
	Sample collection teams with equipment (Chemical)
	Decontamination in case of a radiological or nuclear attack
	Detection teams with equipment (Radioactivity)
	Ecological laboratory with mobile unit
Fire fighting related resources	Fleet of medium to high capacity aircraft used in 2007 by the Member States includes 24 for France, 16 for Italy, 18 for Portugal, 27 for Spain and 21 for Greece
Assistance / support related resources	Expert pool
	Coordination/assessment experts
	Water purification
	Container kitchens / Emergency food supplies
	Emergency shelter

In addition to Modules and national response resources, we can also add a third category of response capabilities, namely disaster-specific response tools financed directly by the EU, via its own agencies (such as oil spill response tools) or via so-called “pilot-projects” under the request of the

European Parliament (as is the case for firefighting related resources) (both are included in table 7 above).

The EU oil spill response capacity includes a set of pre-positioned response vessels not owned, but directly contracted by the European Maritime Safety Agency (EMSA) which can be used, through the ERCC, in case of civil protection needs⁵⁸. However, while the resources available are extensive, it is not certain that they are fully able to respond to major disasters, particularly as a rapid reaction force⁵⁹. The Figure and Table on page 61 indicate the current contracted EMSA specialised oil spill response vessels.

The EU also launched a pilot project, the EUFFTR – European Fire Fighting Tactical Reserve – with the aim of providing an overview of the firefighting fleets of the Member States. Information made available to the Commission included 24 medium to high capacity airplanes for France, 16 for Italy, 18 for Portugal, 27 for Spain and 21 for Greece. Some Member States not particularly subject to fire disasters do not have their own capabilities. As part of this pilot project the Commission also purchased with a framework contract two fire-fighting aircraft Canadair from a private company. These are located in Bastia under the responsibility of the French crisis management authorities, but are to be deployed directly by the ERCC according to a pre-defined timeframe. This is intended particularly to support countries without their own capabilities or provide a tactical reserve in case national resources are insufficient⁶⁰.

Furthermore, military resources can be requested if a disaster critically overwhelms non-military response capacities, as recalled by the so-called “European Consensus on Humanitarian Aid” signed by all EU Member States and Institutions. It underlines the limited and supportive role that military assets should play when used in a disaster relief context, and recalls the need to follow the relevant OCHA guidelines in this respect. The guidelines reaffirm the basic principles of humanitarian intervention (humanity, neutrality, and impartiality) and underline that military assets should play a complementary, last resort role in humanitarian and civil protection interventions:

- Military assets should be seen as a complementary tool to existing relief capabilities so as to provide specific support to specific requirements;
- All relief is under the overall responsibility of the affected state, and is complemented by military assets;
- Such assets should in principle be unarmed;
- Such assets should be used by the UN as a last resort, i.e., in the absence of other effective civilian solutions to fill an urgent need;
- The role of military assets should not be direct humanitarian assistance;
- The use of such assets should be clearly defined in time;
- Such assets should be self-supporting during their time of deployment to a disaster zone;

⁵⁸ ECORYS, Strengthening the EU capacity to respond to disasters, pp. 138-141.

⁵⁹ Ibid.

⁶⁰ European Commission, EU countries assist Greece in fighting forest fires, http://europa.eu/rapid/press-release_IP-09-1249_en.htm?locale=en

- On-site civ-mil coordination are under the guidance of the humanitarian aid coordinator. Critical areas for coordination include security, logistics, medical, transportation, and communications.

In the event of a major disaster the EUMS it is also able to provide a strategic movement coordination unit making use of the Multinational Coordination Centre for strategic lift in Athens and Eindhoven and coordinating with the relevant Point of Contacts in the MS.

“EUMS also runs databases that (i) are listing military assets of MS in the areas of transport, logistics, medical, CBRN (Chemical, biological, Radiological and Nuclear) and engineer support and (ii) are providing contact data of experts from various fields of expertise who can be called at short notice”⁶¹.

Finally, the ERCC has at its disposal, within the CECIS, a ‘Pool of Experts’ database. This database comprises experts disposing of Mechanism training (OPM or higher), who are “in principle available” at short notice for Assessment and Coordination missions sent through the ERCC. It was foreseen at its inception that Participating States would appoint Contact Points in charge of updating yearly the availability of experts. It should be noted, however, that the system was up for review by the end of 2009.

5.3 Training

The Civil Protection Mechanism runs an active and comprehensive training programme, offering experts a deeper knowledge of the requirements of European civil protection missions, and improving their coordination and assessment skills.

The programme offers a wide range of courses from basic training to high-level courses for future mission leaders. Special courses are also available aiming to prepare for specific aspects for missions, such as security training or assessments.^[1]

To ensure an efficient, rapid and flexible response, an extensive training programme is available for national technical, coordination and assessment experts, as well as for personnel involved in the civil protection modules.

The training programme is an essential part of the Community Mechanism. It is crucial in preparing experts for international civil protection assistance interventions inside, as well as outside the European Union. It also provides an excellent platform for experience-sharing and networking between national experts from participating countries. The programme involves training courses, joint simulation exercises and an exchange programme, where experts can learn first-hand about similar responsibilities under different national systems.

⁶¹ ACRIMAS Project, D2.1 Current CM Frameworks,
http://www.acrimas.eu/attachments/article/5/D2.1_ACRIMAS_Report_on_CM_Framework_v2-1.pdf

Since it was launched in 2004, the training programme has developed and expanded significantly and now includes 12 courses. The target group is wide, which opens the training programme to many different categories of experts. These can range from assessment and coordination experts to specialists within a certain field of work, such as marine pollution experts, environmental experts (landslides waste management, dam stability etc), experts in geo-hazards or logistics in emergency operations, and medical staff.

All courses combine theory and field experience, as well as international guidelines and standard operating procedures. They all contain practical exercises (field and table-top) based on different emergency scenarios where participants get the opportunity to practise their skills in a realistic setting.^[6] The proposed courses are represented in the following picture.

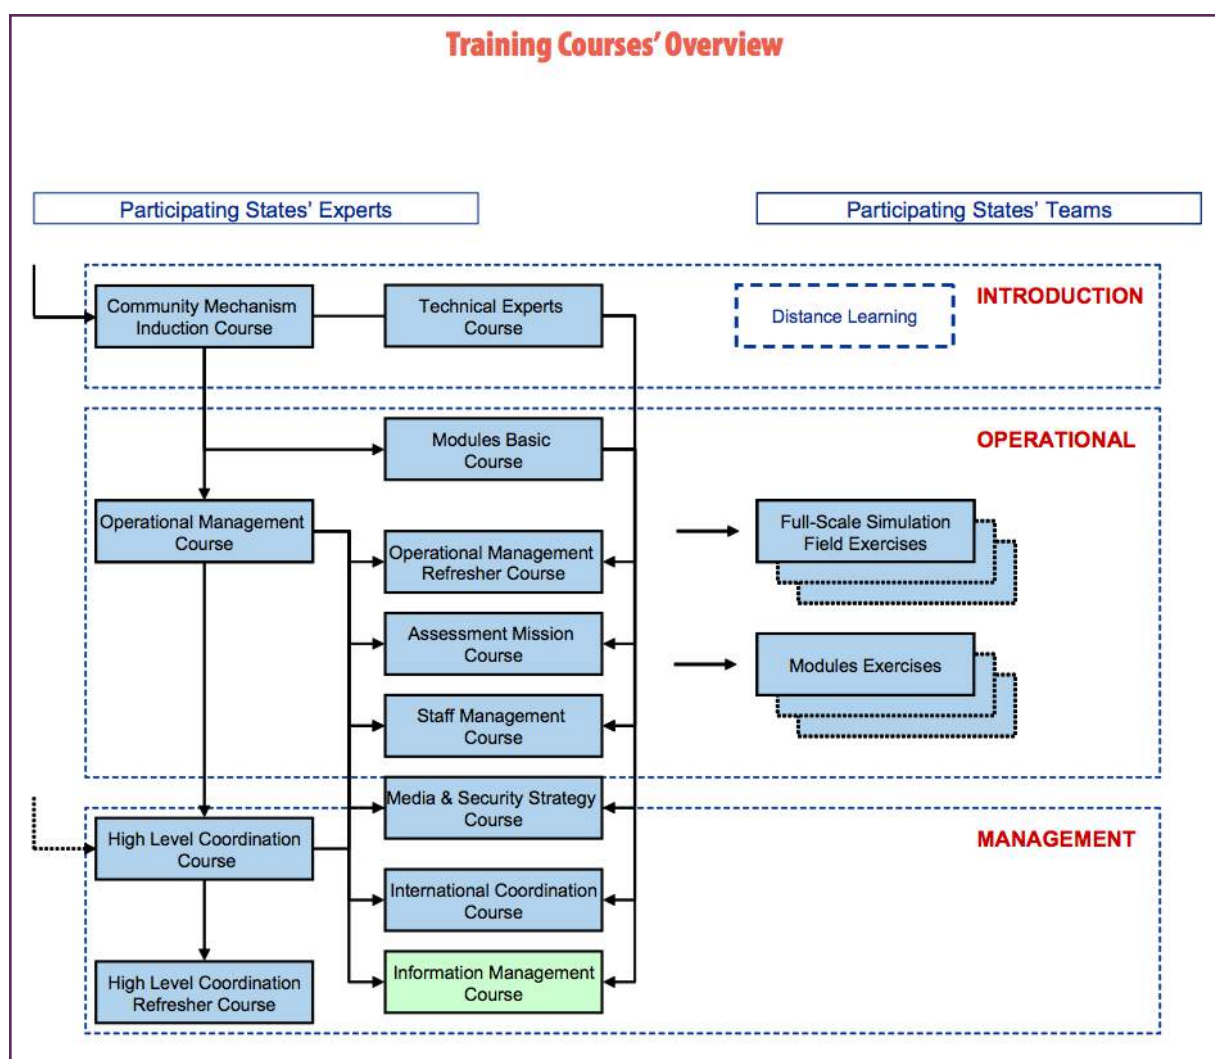

Figure 9: Training Courses

Trainings furthermore are grouped in these categories:

- Community Mechanism Induction Course (CMI). The Community Mechanism Induction Course (CMI) is a six-day introductory course and the entry point to all courses offered within the

Community Mechanism training programme. The course is aimed at team leaders, deputy team leaders, managers, experts and administrators who are likely to be involved in international civil protection assistance interventions. The overall objective of the CMI is to introduce participants to the Community Mechanism and provide them with the basic knowledge and skills to prepare themselves for international civil protection missions, both within and outside the Community Mechanism's geographical area.

- Operational Management Course (OPM). The Operational Management Course (OPM) is the second course in the training programme and is open to those who have previously followed the Community Mechanism Induction Course (CMI). The six-day course targets national experts and European Commission officials who have been selected as potential team members or liaison officers of an assessment or coordination team sent by the European Commission to facilitate assistance support and coordination in the field.
- High Level Coordination Course (HLC). The High Level Coordination course (HLC) is the third general course in the training programme and is aimed at experts who have been selected as managers of a team deployed by the European Commission to facilitate coordination assistance in emergencies. HLC participants should have followed the Community Mechanism Induction (CMI) course and the Operational Management Course (OPM), before attending this course.
- Operational Management Refresher Course (OPMR) and High Level Coordination Refresher Course (HLCR). The field of emergency response is a constantly changing environment. No two emergencies are exactly the same. New actors enter the field or existing ones have their mandate changed. Changing situations and the development of new techniques and equipment mean experts need to learn about the latest developments, as well as refresh knowledge gained on earlier courses. The training programme offers two such courses: the Operational Management Refresher Course (OPMR) and the High Level Coordination Refresher Course (HLCR). These courses are open to participants who have attended either the OPM or HLC.
- Assessment Mission Course (AMC). The Assessment Mission Course (AMC) is a five-day specialised course for those who have previously followed the Community Mechanism Induction (CMI) and the Operational Management Course (OPM). The intended target group is national experts and managers in the field of coordination, European Commission officials and experts from partner organisations likely to be involved in international civil protection interventions.
- Staff Management Course (SMC). The Staff Management Course (SMC) is one of the specialised courses open to participants who have completed the Operational Management Course (OPM). However, since this course is closely related to the Assessment Mission Course (AMC) and the Media and Security Strategy Course (MSC), it is recommended that participants who plan to attend all three courses do so in the following sequence: AMC, SMC, MSC.

- Media and Security Strategy Course (MSC). The six-day Media and Security Strategy Course (MSC) is one of the specialised courses open to participants who have completed the Operational Management Course (OPM). However, since this course is closely linked to the Assessment Mission Course (AMC) and the Staff Management Course (SMC), it is recommended that those who plan to attend all three courses should try to do so in the following sequence: AMC, SMC, MSC.
- International Coordination Course (ICC). The six-day International Coordination Course (ICC) is one of the specialised courses of the training programme and is open to participants who have completed the Operational Management Course (OPM).
- Information Management Course (IMC). The ability to provide accurate information in a timely manner to the appropriate stakeholders is of utmost importance during disaster response interventions in order to facilitate the delivery of assistance. Therefore, the five-day Information Management Course (IMC), focusing solely on information management, has been developed. The IMC is the latest addition to the training programme and is open to participants who have completed the Operational Management Course (OPM).
- Technical Experts Course (TEC). Experience from previous civil protection assistance interventions has shown that, as well as training assessment and coordination experts, there is also a need to train technical specialists for expert interventions. The Technical Experts Course (TEC) is a six-day course designed specifically for technical experts such as marine pollution and water management experts, environmental experts (landslides, waste management, dam stability etc), geo-hazard or logistics experts, medical staff and infrastructure engineers.
- Modules Basic Course (MBC). The Modules Basic Course (MBC) is a new course within the training programme. The target group is key staff from participating countries that would be deployed with their civil protection module to an emergency within or outside the European Union. Key staff can include team leaders, deputy team leaders, liaison officers or communications officers. It is recommended (but not compulsory) that participants attend the Community Mechanism Induction (CMI) course before going on to the Modules Basic Course (MBC).

For each cycle of training courses, the total number of course places are divided between the Participating States. This quota is based on the reported training needs of the country as well as the size of the country. To administrate training-related issues, each Participating State has appointed a national training coordinator who is responsible for identifying and nominating experts to attend the training courses. It is therefore not possible for individual national experts to sign up for a course directly. A list of national training coordinators can be found on the website of the Civil Protection Unit of the European Commission. Information on the training programme can also be found on the virtual On-Site Operations Coordination Centre (OSOCC), which is a virtual platform developed by the Emergency Response Coordination Centre (ERCC) in the United Nations Office for Coordination of Humanitarian Affairs (UN OCHA) in Geneva, Switzerland. To increase collaboration with other international actors and facilitate cooperation in the field, partners such as other European

Commission services, the United Nations and the Red Cross Red Crescent Movement are invited to participate in relevant courses.

The EU exchange of experts system is designed to complement a training programme tailored to the needs of civil protection interventions within the framework of the Community Mechanism for civil protection. It is open to the participating states of the civil protection mechanism and the following eligible third countries:

- Albania, Bosnia and Herzegovina, the former Yugoslav Republic of Macedonia, Montenegro, Serbia, Turkey and “Kosovo” (this designation is without prejudice to positions on status, and is in line with UNSCR 1244 and the ICJ Opinion on the Kosovo Declaration of Independence).
- Eastern Neighbourhood countries: Armenia, Azerbaijan, Belarus, Georgia, Moldova and Ukraine.
- Southern Neighbourhood Countries: Algeria, Egypt, Israel, Jordan, Lebanon, Libya, Morocco, Palestine and Tunisia.

The Civil Protection Mechanism's experts exchange system allows for the secondment of civil protection experts to participating states. This exchange of experts provides participants with knowledge and experience on all aspects of emergency intervention and the different approaches of national systems.

The objective is to learn different techniques used, study the approaches taken within other emergency services or other relevant organisations with special expertise, and/or present or follow short training modules. The duration of an exchange may vary from a few days to two weeks. By offering such a broad spectrum of possibilities, the EU exchange of experts makes a significant contribution to the further development of the Community mechanism for civil protection.

Since December 2006 the Federal Agency for Technical Relief (THW), Germany, has been appointed by the European Commission as coordinator of the EU exchange of experts. THW has been responsible for its promotion as well as for its administrative and financial management.

5.4 Procurement

5.4.1 Procurement regulation

In addition to financing decisions linked to humanitarian aid, the European Commission's Humanitarian Aid and Civil Protection department (ECHO) issues calls for tender for implementing specific activities. Such calls are regularly updated on the Calls for tender page (<http://ec.europa.eu/echo/node/623>).

The following table is reporting the call for tender topics from the 2008 up to date.

Table 3: DG-ECHO Calls for Tenders, 2008-2015 ^[1].

2015	Managing and further enhancing ECHO's ICT infrastructure and OMT's system
------	---

administration and user support

Framework contract for the production and distribution of professional audio-visual material on ECHO's actions in the world

Pilot project in the area of Early Warning System for natural disasters

Provision of expertise to assist policy development in Humanitarian Aid and Disaster Risk Management

Provision of Insurance services for ECHO office in Nairobi, Kenya

European Disaster Response Exercise (EDREX)

Framework Contracts for services related to offering capacity to design, plan, conduct and evaluate Union Civil Protection Mechanism Training Courses (8 Lots)

Exercises on civil protection modules, technical assistance and support teams and European Union civil protection teams (4 lots)

2014 Provision of Cloud Services for ECHO

Exercises on civil protection modules, technical assistance and support teams and European Union civil protection teams

Development of a programme for peer reviews in the framework of EU cooperation on civil protection and disaster risk management

Programme of Exchange of Civil Protection Experts

2013 Provision of VSat Service & Mobile Satellite Telephony & Data Services for DG ECHO

Provision and replenishment of medical kits and other medical supplies in the EU and in third countries

ECHO-FLIGHT Service - Provision of air transport service for the Directorate-General for Humanitarian Aid and Civil Protection - ECHO

Exercises on civil protection modules, technical assistance and support teams and European Union civil protection teams

EU Aid Volunteers: Preparatory actions 2013

Supply of training and support services to the Directorate-General for Humanitarian Aid and Civil Protection (ECHO)

Evaluation of Implementation of the European Consensus on Humanitarian Aid

2012 Multiple Framework Contract for the Evaluation of Humanitarian Aid and Civil Protection Activities

Provision of transport and other logistic support services, in the EU and in third countries, in

the framework of Civil Protection and Humanitarian Aid operations

Establishment of the European Emergency Response Centre – provision, installation and maintenance of specialised equipment for crisis rooms

Exercises on civil protection modules, technical assistance and support teams and European Union civil protection teams

Audit support services

Framework contract for the production and distribution of Video News on DG ECHO's actions in the world

2011 Framework contract for the production and distribution of Video News on DG ECHO's actions in the world

Provision of expertise to assist policy development in humanitarian aid

Exercises for Civil Protection Modules and Technical Assistance and Support Teams (2 lots)

Framework contract for services related to offering capacity to design, plan, conduct and evaluate Community Civil Protection Mechanism Courses (7 lots)

Common Emergency Communication and Information System

Framework Audit Contract

2010 Preparatory Action on an EU rapid response capability (2010/C 64)

Design, plan, conduct and evaluate exercises for civil protection modules and technical assistance and support teams (2010/S94-140246)

Organisation of a European exchange of experts in civil protection (2010/S75-111239)

Strengthening the EU disaster management capacity - good practices on disaster prevention (2010/S 37-053087)

2009 Service Contract to provide Aircraft ground and air support services for the Commission's Directorate-General for Humanitarian Aid (ECHO) in Sub-Saharan- Africa with focus on the Democratic Republic of Congo (DRC) and on Kenya

2008 Framework contract for training services in humanitarian aid contracts

Beside the tenders a series of service contracts are issued in order to procure a more wide range of services and products relevant to the more ordinary administration. As an example, in 2013, the Directorate-General for Humanitarian Aid & Civil Protection (ECHO) of the European Commission signed 30 service contracts covering inter alia web communication and development, audiovisual productions, communication support and service, publications and visibility material, press relations,

other general communication actions, e.g. awareness raising activities in relation to the EU Children of Peace initiative and the launch of the Emergency Response Coordination Centre. The relevant contracts for provision of services are detailed below.

Table 4: DG-ECHO Service Contracts, 2013⁶².

Contract n°	Contractor	Action	Amount in EUR
ECHO/INF/BUD/2013/00001	SYSTEMAT	PURCHASE OF IT EQUIPEMENT	654,51

5.4.2 Procurement procedures

The procurement of major services (training, logistic frameworks, etc.) are defined by the single Unit within the European Commission Directorate General in the form of “call for proposal”. This preliminary definition is then posed under an “inter-service consultation” where all the other Directorate Generals could provide suggested amendment, and under a consultation given from the relevant Program Committee composed by representatives of each Member States. The final configuration will finally be published as part of the annual work programme implementation.

5.5 Niche capabilities

No niche capabilities are available directly under the EU organisations dealing with the Crisis Management.

Driving Innovation in Crisis Management for **E**uropean **R**esilience

UNITED NATIONS (UN)

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: ECORYS (Laura Birkman, Rachel Beerman and Linette de Swart)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by EOS and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

On 19 December 1991, the General Assembly adopted the UN General Assembly resolution 46/182 on “Strengthening of the coordination of humanitarian emergency assistance of the United Nations”, outlining an enhanced framework for international humanitarian assistance. When providing emergency assistance, the international community is guided by this resolution. Among the guiding principles for humanitarian assistance, it states that humanitarian assistance must be provided in accordance with the principles of humanity, neutrality and impartiality and with the consent of the affected country; each state has the responsibility first and foremost to take care of the victims of natural disasters and other emergencies occurring on its territory; affected states in need of assistance should facilitate the work of these organisations in implementing assistance.

In the field of disaster and crisis management, the UN General Assembly itself does not have any operational role in conducting disaster management activities, but rather is responsible for launching many of the programmes, which are then carried out by the various UN offices and UN Member States governments. Through its many offices, agencies, programmes and funds the UN supports nations to reduce hazard vulnerability while building local institutional capacity. It is among the first organisations to arrive when disaster strikes, and in the aftermath it remains on the ground to assist recovery. Each of these UN bodies has been given a mandate to provide or coordinate international crisis management assistance within their respective field. Therefore, this report focuses on the three most prominent bodies that have mandates pertaining to crisis management and disaster risk reduction, namely the UNISDR, UNDP and OCHA.

UNISDR serves as the focal point for all international disaster risk reduction efforts, supported by UNDP, which has lead operational responsibility for natural disaster mitigation, prevention and preparedness. OCHA, together with the Inter-Agency Standing Committee (IASC) is the arm of the UN responsible for bringing together national and international humanitarian actors in the event of an emergency or crisis to ensure a coherent response, while UNDP serves as the leader of Early Recovery Cluster, coordinating and implementing all early recovery activities in the aftermath of a disaster. Financing for preparedness and response is provided through various combinations of the UN Regular Budget as well as from Member States’ voluntary contributions.

1 Policy

The General Assembly, established in 1945 under the Charter of the United Nations, occupies a central position as the chief deliberative, policymaking and representative organ of the United Nations. It comprises all 192 Members of the UN and provides a forum for multilateral discussion of all international issues covered by the Charter. It also plays a significant role in the process of standard-setting and the codification of international law (See chapter 2). The Assembly meets in regular session intensively from September to December each year, and thereafter as required (UNISDR, 2013).

The Main Committees of the General Assembly deliberate the items, seeking to harmonize the various approaches of States. They then present their recommendations, generally in the form of draft resolutions and decisions, to a plenary meeting of the Assembly for its consideration. The six Main Committees are:

- Disarmament and International Security Committee
- Economic and Financial Committee
- Social, Humanitarian and Cultural Committee
- Special Political and Decolonization Committee
- Administrative and Budgetary Committee
- Legal Committee) (UNISDR 2013

The UN system is comprised of many offices and agencies, programmes and funds working throughout the world. Each organization has its own governing body, budget and secretariat. In the field of disaster and crisis management, the UN General Assembly itself does not have any operational role in conducting disaster management activities, but rather is responsible for launching many of the programmes, which are then carried out by the various UN offices and UN Member State governments. Each has been given a mandate to provide or coordinate international crisis management assistance within their respective field.

1.1 Risk Assessment

The UN define risk as “the probability of harmful consequences — casualties, damaged property, lost livelihoods, disrupted economic activity, and damage to the environment —resulting from interactions between natural or human-induced hazards and vulnerable conditions”, and risk assessment as a “process to determine the nature and extent of such risk, by analysing hazards and evaluating existing conditions of vulnerability that together could potentially harm exposed people, property, services, livelihoods and the environment on which they depend” (UNDP 2010). Among the main UN bodies with a specific mandate pertaining to risk assessment are United Nations Development Programme (UNDP) and the UN Office for Disaster Risk Reduction (UNISDR).

Risk assessment is an important part of UNDP disaster risk reduction (DRR) projects and programmes. The main UNDP support services in the field of risk assessment are:

- **Capacity development.** UNDP provides guidance and technical assistance to governments for the establishment of disaster risk assessment and related institutional arrangements; assesses hazard monitoring and mapping capacities to support gap identification; supports local government to undertake risk assessments for determining areas of resettlement and recovery after a disaster.
- **Methodology and tool development⁶³.** UNDP has developed specific methodologies and tools to conduct multi-hazard risk assessment; guidance on impact assessment of climate change; support to its partners to assess existing capacities, identifying gaps, and assisting to help install mechanisms to address gaps.
- **National disaster observatory (NDO) development.** UNDP provides support for the development of NDOs. These are local institutions that systematically collect, compile and interpret historic disaster information and data.
- **Utilization of risk analysis for DRR planning.** UNDP supports governments to incorporate and apply risk assessments to disaster risk reduction strategies on all levels. UNDP also helps to standardise risk assessments as the basis for the design, funding and implementation of DRR/risk management projects. (UNDP 2010).

Figure 10 displays the UNDP's 7-step plan for comprehensive risk assessment.

⁶³ UNDP distinguishes between two levels of risk assessment: national and local. A national assessment is a strategic one that supports the design of national DRR strategies, policy and regulations, DRM programming and budget allocation. A local assessment is operational in nature, intended for DRR action planning, contingency planning, pre-disaster recovery planning, and proper urban planning.

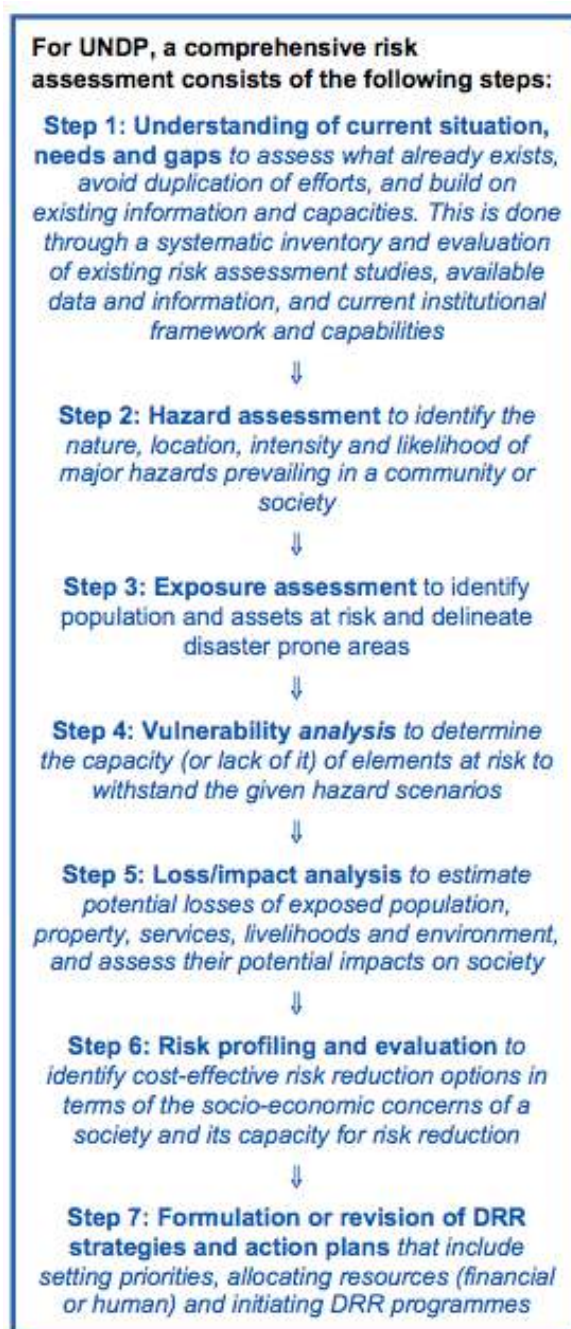

Figure 10: UNDP steps for comprehensive risk assessment⁶⁴

1.2 Policy and Governance

Through its many offices, agencies and programmes, the UN supports nations to reduce hazard vulnerability while building local institutional capacity, is among the first organisations to arrive when disaster strikes and, in the aftermath, it remains on the ground to assist recovery. Each has been given a mandate to provide or coordinate international crisis management assistance within their

⁶⁴ UNDP – Bureau for Crisis Prevention and Recovery (2010). “Disaster Risk Assessment,” *Thematic Briefs*, October 2010.

respective field. This report focuses on the three most prominent bodies that have mandates pertaining to crisis management and disaster risk reduction, namely the **UNISDR**, **UNDP** and **UN-OCHA**.

1.2.1 Strategy scope and focus

The strategic approach of the three main UN bodies to crisis management and disaster risk reduction covers all necessary activities for prevention (including resilience actions), preparedness, response (including mitigation) and recovery. Each of the three main bodies has its own strategic focus and operational mandate, which collectively provide the foundations for the overarching UN strategic approach to crisis management and disaster risk reduction. The main elements are summarised below:

UN Office for Disaster Risk Reduction (UNISDR)

UN Office for Disaster Risk Reduction (UNISDR) is the inter-agency secretariat that was established in December 1999 with the General Assembly Resolution 54/219 to ensure the implementation of the International Strategy for Disaster Reduction (ISDR), which was adopted with the same resolution (A/RES/54/219).⁶⁵ UNISDR is the office for disaster risk reduction (DRR)⁶⁶, while the ISDR is a strategic conceptual framework (UNISDR, 2013).

The ISDR, launched in 2000 by the Economic and Social Council and the General Assembly, is a strategic and conceptual framework, implemented by a system of partnerships⁶⁷, with the objective to foster and support a global DRR movement. It was established as an inter-agency framework and mechanism (inter-agency task force on disaster reduction and an inter-agency secretariat) to serve as a focal point within the United Nations system for promoting public awareness and commitment, expanding networks and partnerships, and improving knowledge about disaster causes and options for risk reduction. It builds on the Yokohama Strategy and Plan of Action and as follow-up to the International Decade for Natural Disaster Reduction (UNISDR, 2005).

It is underpinned by the *Sendai Framework for Disaster Risk Reduction 2015-2030* (Sendai Framework), which is the overall framework for implementing international DRR endorsed by the UN General Assembly (A/RES/69/283) following the 2015 Third UN World Conference on Disaster Risk Reduction (WCDRR) in Sendai, Japan on 18 March 2015. The Sendai Framework is the successor

⁶⁵ UNISDR is the successor arrangement to the International Decade for Natural Disaster Reduction (IDNDR). Information on the mandate of the ISDR can be found at: <http://www.unisdr.org/who-we-are/international-strategy-for-disaster-reduction>

⁶⁶ UNISDR defines DRR as “the concept and practice of reducing disaster risks through systematic efforts to analyse and manage the causal factors of disasters, including through reduced exposure to hazards, lessened vulnerability of people and property, wise management of land and the environment, and improved preparedness for adverse events.” See UNISDR terminology on disaster risk reduction: <http://www.unisdr.org/we/inform/terminology>

⁶⁷ Partners include Governments, inter-governmental and non-governmental organisations, international financial institutions, scientific and technical bodies and specialized networks as well as civil society and the private sector.

instrument to the *Hyogo Framework for Action 2005-2015: Building the Resilience of Nations and Communities to Disasters*. It comprises seven targets and four priorities for action aimed at the following outcome:

*The substantial reduction of disaster risk and losses in lives, livelihoods and health and in the economic, physical, social, cultural and environmental assets of persons, businesses, communities and countries.*⁶⁸

The seven global targets are as follows:

- (a) Substantially reduce global disaster mortality by 2030, aiming to lower average per 100,000 global mortality rate in the decade 2020-2030 compared to the period 2005-2015.*
- (b) Substantially reduce the number of affected people globally by 2030, to lower average global figure per 100,000 in the decade 2020 -2030 compared to the period 2005-2015.*
- (c) Reduce direct disaster economic loss in relation to global GDP by 2030.*
- (d) Substantially reduce disaster damage to critical infrastructure and disruption of basic services, among them health and educational facilities, including through developing their resilience by 2030.*
- (e) Substantially increase the number of countries with national and local disaster risk reduction strategies by 2020.*
- (f) Substantially enhance international cooperation to developing countries through adequate and sustainable support to complement their national actions for implementation of this Framework by 2030.*
- (g) Substantially increase the availability of and access to multi-hazard early warning systems and disaster risk information and assessments to the people by 2030.*⁶⁹

The four priorities for action are:

- Priority 1. Understanding disaster risk
- Priority 2. Strengthening disaster risk governance to manage disaster risk
- Priority 3. Investing in disaster risk reduction for resilience
- Priority 4. Enhancing disaster preparedness for effective response and to “Build Back Better” in recovery, rehabilitation and reconstruction⁷⁰

The UNISDR is the focal point for the implementation of the Sendai Framework. Paragraph 48 (c) of the Sendai Framework calls upon “the United Nations Office for Disaster Risk Reduction (UNISDR), in particular, to support the implementation, follow-up and review of this framework through [...] generating evidence-based and practical guidance for implementation in close collaboration with States, and through mobilization of experts; reinforcing a culture of prevention in relevant stakeholders [...]”. A number of targeted Sendai Framework implementation guidelines to support the process are in development.

⁶⁸ UNISDR (2015a), Sendai Framework for Disaster Risk Reduction 2015-2030, Available http://www.preventionweb.net/files/43291_sendaimrameworkfordrren.pdf

⁶⁹ UNISDR (2015a), Sendai Framework, paragraph 18.

⁷⁰ Ibid.

United Nations Development Program (UNDP)

The UNDP is the UN's global development network, helping to build nations that are able to withstand crisis and deliver their own solutions to global and national development challenges. UNDP is active in 177 countries and territories around the world.

The UNDP Strategic Plan 2014-2017 includes key areas of work specifically related to disaster risk reduction and resilience-building (see section 1.5). These actions fall under the Area of Work 3 entitled "Resilience-building". The Strategic Plan states that all areas of work proposed in the Plan "will help build resilience whether, for instance, through greater employment and livelihoods, more equitable access to resources, better protection against economic and environmental shocks, peaceful settlement of disputes or progress towards democratic governance" (UNDP, 2013a). Under the "resilience-building" theme, UNDP's work will focus on two additional issues: "rapid and effective recovery from conflict-induced crises in those cases where prevention has fallen short; and a much stronger ability to prepare for and deal with the consequences of natural disasters, especially as they are exacerbated by climate change" (Ibid).

Figure 11: DRR Focus of UNDP⁷¹

⁷¹ UNDP, "Changing with the World - UNDP Strategic Plan: 2014-2017," New York: UNDP, 2013. Accessed 30 October 2014.

The Plan appears to address both pre- and post-disaster work, which states,

A major focus will be on what happens before disasters strike. This will include support across a range of issues: disaster risk assessment looking, for example, at geophysical, weather/climatic and other hazards, including those that are low intensity but high frequency, as well as differentiated vulnerabilities by social and economic groups such as women, female-headed households and populations located in the poorest regions; policies and long-term planning and investment frameworks that are disaster risk-sensitive, integrate disaster risk reduction with adaptation to climate change and address differentiated social and economic impacts; and preparedness for disaster management and recovery at the sub-national and national levels, including innovation to manage risks through insurance and resilient infrastructure.

The other major focus will be on what happens after disasters strike. This will address post-disaster planning for recovery and preparation of recovery and reconstruction plans and programmes that are inclusive of and accountable to displaced populations, women and other excluded groups. This will be reinforced through assistance for better coordination and implementation of early recovery programmes with a focus on local economic conditions[...]⁷²

Office for Coordination of Humanitarian Affairs (OCHA)

The Office for Coordination of Humanitarian Affairs (OCHA), in collaboration with the Inter-Agency Standing Committee (IASC), is the arm of the UN responsible for bringing together national and international humanitarian actors in the event of an emergency or crisis, to ensure a coherent response.

Through the cluster system (section 3.1.3), OCHA appears to cover all phases of the crisis management cycle. Although OCHA's primary strategic focus is on coordinating emergency response, the agency is also engaged in risk-reduction (section 1.2.4). OCHA sees emergency preparedness and DRR as critical to building community and household resilience (UNISDR, 2013). UN-OCHA defines preparedness as,

Emergency preparedness is the knowledge and capacity developed by governments, recovery organizations, communities and individuals to anticipate, respond to and recover from the impact of potential, imminent or current hazard events, or emergency situations that call for a humanitarian response.

Emergency preparedness requires long-term, comprehensive engagement in the framework of disaster risk reduction (DRR). DRR activities include strengthening early warning and preparedness, and mobilizing and coordinating international disaster assistance. Priority Five of the Hyogo Framework for Action highlights the essential role of disaster preparedness in saving lives and livelihoods, particularly when integrated into an overall DRR approach.⁷³

⁷² UNDP, "Strategic Plan: 2014-2017," p. 36-37.

⁷³ UN-OCHA, "Preparedness," accessed 18 November 2014, <http://www.unocha.org/what-we-do/coordination/preparedness/overview>.

1.2.2 Monitoring and analytical support to policy making; R&D

Two UNSIDR programmes identified contribute to monitoring and analytical support to policy making and R&D activities. These are:

The **programme on Risk Informed Public Policy and Investment**, which assist governments and stakeholders worldwide to:

- systematically account for disaster losses;
- develop profiles of both intensive¹ and extensive² risk at the national level;
- explore the rationale for risk-informed public policy-making and investment; and
- support the enabling environment for wider engagement of local governments.

This programme also contributes to a strengthened global evidence base on disaster losses, and progress on DRR through the publication of the 2015 Global Assessment Report (UNISDR, 2015b).

The UNSIDR **Scientific and Technical Advisory Group (STAG)**, which undertakes scientific and technical research with the purpose to provide technical advice and support in the formulation and implementation of activities carried out by the DRR community. STAG's 2013 report "Using science for disaster risk reduction" includes case studies which provide specific examples of scientific learning employed and applied to enhance DRR policy making.⁷⁴

1.2.3 Policy for Prevention

UN General Assembly Resolution 46/182 (1991) sets out the following policy for prevention:

The international community should adequately assist developing countries in strengthening their capacity in disaster prevention and mitigation, both at the national and regional levels, for example, in establishing and enhancing integrated programmes in this regard.

In order to reduce the impact of disasters there should be increased awareness of the need for establishing disaster mitigation strategies, particularly in disaster-prone countries. There should be greater exchange and dissemination of existing and new technical information related to the assessment, prediction and mitigation of disasters. As called for in the International Decade for Natural Disaster Reduction, efforts should be intensified to develop measures for prevention and mitigation of natural disasters and similar emergencies through programmes of technical assistance and modalities for favourable access to, and transfer of, relevant technology.

⁷⁴ UNISDR, "Science and Technology Research Institutions, Organizations and Networks," accessed 19 November 2015 <http://www.unisdr.org/partners/academia-research>.
<http://www.unisdr.org/partners/academia-research>.

Organizations of the United Nations system involved in the funding and the provision of assistance relevant to the prevention of emergencies should be provided with sufficient and readily available resources.⁷⁵

The UNISDR serves as the focal point within the UN System for coordinating and supporting implementation of disaster risk reduction policy and activities, while UNDP has the responsibility of the Emergency Relief Coordinator (ERC)⁷⁶ regarding operational activities for natural disaster mitigation, prevention and preparedness. (See section 1.2.1).

The UN policy for prevention and mitigation is promoted through development projects implemented with the assistance of governments, organisations and citizens and with the objective of ensuring that appropriate disaster risk-reduction (and response) measures are included in development activities.

1.2.4 Policy for Preparedness

UN policy for preparedness, as outlined in General Assembly resolution 46/182, envisions a direct linkage between preparedness and economic growth and sustainable development. This is particularly the case in the context of disaster-prone developing countries where “emergencies reflect the underlying crisis in development facing developing countries.” (Annex, Part 1, para. 10). The resolution states:

International relief assistance should supplement national efforts to improve the capacities of developing countries to mitigate the effects of natural disasters expeditiously and effectively and to cope efficiently with all emergencies. The United Nations should enhance its efforts to assist developing countries to strengthen their capacity to respond to disasters, at the national and regional levels, as appropriate.⁷⁷

As with its policy for prevention, the UN policy for preparedness is promoted through development projects that aim to boost local and regional preparedness capacity, e.g., through the development of early warning systems and monitoring and forecasting routines. Specifically,

⁷⁵ General Assembly resolution A/RES/46/182: “Strengthening of the coordination of humanitarian emergency assistance of the United Nations,” Annex, part II: 13-14, 16, 19 December 1991.

⁷⁶ General Assembly Resolution 46/182 established the position of the Emergency Relief Coordinator, providing it with nine clear areas of responsibility. Among them are: coordinating humanitarian assistance, facilitating access to emergency areas, organizing needs-assessment missions, preparing joint appeals and mobilizing resources. The UN transferred to the UNDP these responsibilities under the General Assembly Resolution 52/12 (1997).

⁷⁷ A/RES/46/182, Annex, part III, para. 18-20, 1991.

On the basis of existing mandates and drawing upon monitoring arrangements available within the system, the United Nations should intensify efforts, building upon the existing capacities of relevant organizations and entities of the United Nations, for the systematic pooling, analysis and dissemination of early-warning information on natural disasters and other emergencies. In this context, the United Nations should consider making use as appropriate of the early-warning capacities of Governments and intergovernmental and non-governmental organizations.

*Early-warning information should be made available in an unrestricted and timely manner to all interested Governments and concerned authorities [...]*⁷⁸

UNISDR and UNDP are the two central entities responsible for UN policy on preparedness. UNISDR has the mandate to coordinate international efforts on DRR while UNDP has the mandate to undertake operational activities for disaster mitigation, prevention and preparedness. UNDP carries out its work, together with partner agencies such as OCHA, to support nationally and locally driven initiatives under the auspices of the Hyogo Framework for Action, which aims to substantially reduce disaster losses by 2015.

UNDP policy for preparedness has 4 central components:

- **Preparing Governments.** UNDP works with governments to build capacity and ensure that laws, policies and institutions capable of assessing disaster risk and evolving early warning systems are developed.
- **Preparing Communities.** UNDP helps to raise awareness and develop the skills necessary for effectively responding to threats.
- **Preparing the UN.** Inter-Agency Contingency Plans, which allow for coordination and financial resource planning, are developed in order to prepare the UN system for disasters. The plans are directed by OCHA and bring together experts who prepare hypothetical disaster profiles and conduct training exercises. UNDP maintains a database of skilled experts available for deployment to disaster zones on short notice in order to ensure rapid response to a catastrophe (Issue Brief, Disaster Preparedness, 2013).
- **Partnerships for Preparedness.** UNDP, the World Bank, the EC and the local Government partner to undertake comprehensive post disaster needs assessments in the immediate aftermath of a disaster. These assessments enable a better understanding of the extent of damage and loss and are the first step in designing a response to inform subsequent activities (UNDP, 2013b).

OCHA is also involved in pre-crisis preparedness. As the coordinator of international response operations, OCHA's preparedness activities primarily aim to create favourable conditions for a successful emergency response in the event of a crisis. Specifically, OCHA's emergency preparedness responsibilities aim to strengthen the following areas: (1) OCHA's internal response capabilities; (2) the capability of the in-country members [of the humanitarian coordination system] to make a

⁷⁸ Ibid.

coordinated emergency response, and; (3) the capacity of local, regional and national authorities/organisations to request and/or mobilise international humanitarian assistance and to effectively work with the in-country humanitarian coordination system (UNISDR, 2013).

1.2.5 Policy for Response

UN General Assembly resolution 46/182 outlines several contingency funding arrangements (see section 1.3.2) and additional measures for rapid response in relation to UN policy for response. Concerning the additional measures, the following are outlined:

The United Nations should, building upon the existing capacities of relevant organizations, establish a central register of all specialized personnel and teams of technical specialists, as well as relief supplies, equipment and services available within the United Nations system and from Governments and intergovernmental and non-governmental organizations that can be called upon at short notice by the United Nations.

The United Nations should continue to make appropriate arrangements with interested Governments and intergovernmental and non-governmental organizations to enable it to have more expeditious access, when necessary, to their emergency relief capacities, including food reserves, emergency stockpiles and personnel, as well as logistic support. In the context of the annual report to the General Assembly mentioned in paragraph 35 (i) below, the Secretary-General is requested to report on progress in this regard.

Special emergency rules and procedures should be developed by the United Nations to enable all organizations to disburse quickly emergency funds, and to procure emergency supplies and equipment, as well as to recruit emergency staff.⁷⁹

The lead body responsible for coordinating response operations in the event of a crisis is UN-OCHA. As stated in the ACRIMAS report (2011),

When crises and catastrophes strike outside the EU, the UN (namely the UN Office for the Coordination of Humanitarian Affairs, OCHA), has got the overall responsibility to coordinate all humanitarian assistance to a stricken country. This is a provision that is highly acknowledged within the EU, among the Commission and most of the Member States.⁸⁰

The OCHA Emergency Relief Coordinator (ERC) heads the UN response to emergency situations when disaster strikes. The ERC works with a committee of a number of UN agencies and associated bodies depending on the problems specific to the event. These may include UNICEF, UNDP, UNHCR, WFP and so on.

⁷⁹ A/RES/46/182, Annex, part IV para. 27-29, 1991.

⁸⁰ Hans-Martin Pastuszka, 2008, "Report on Current CM Framework," Aftermath CM System-of-systems Demonstration (FP7 ACRIMAS project, January 2011), 30-31.

The key players during the search-and-rescue (SAR) phase are the international urban SAR teams that comprise the **International Search and Rescue Advisory Group (INSARAG)**. This network of countries and organisations is chaired by OCHA Geneva's Emergency Services Branch (ESB).

1.2.6 Policy for Relief and Recovery

UN General Assembly resolution 46/182 outlines the following with regards to UN policy for relief and recovery:

Emergency assistance must be provided in ways that will be supportive of recovery and long-term development. Development assistance organizations of the United Nations system should be involved at an early stage and should collaborate closely with those responsible for emergency relief and recovery, within their existing mandates.

*International cooperation and support for rehabilitation and reconstruction should continue with sustained intensity after the initial relief stage. The rehabilitation phase should be used as an opportunity to restructure and improve facilities and services destroyed by emergencies in order to enable them to withstand the impact of future emergencies.*⁸¹

UNDP is the lead agency on early recovery and has inherited responsibilities from the Inter-Agency Standing Committee (IASC), the body responsible for inter-agency cooperation in the humanitarian system. UNDP hosts the Cluster Working Group on Early Recovery (CWGER). The Recovery Unit of UNDP (under BCPR) operates when the response or relief phases of the disaster has ended, but recovery has yet to fully commence. The Early Recovery approach⁸² as set out in a UNDP policy paper comprises "a set of specific programmatic actions to help people move from humanitarian relief towards self-sustaining development" (UNDP, 2012). The roles of the CWGER include the promotion and clarification of early recovery as a concept, and to ensure that it is adopted in within the context of humanitarian responses in the event of a disaster/emergency or crisis. As outlined in the policy paper (2012), the CWGER's action focuses on four main strands of action:

Providing direct strategic and coordination support to Humanitarian Coordinators (HCs), Resident Coordinators (RCs), Deputy Special Representatives of the Secretary-General, Humanitarian Country Teams (HCTs) and Cluster Lead Agencies at the country level; (ii) Defining and coordinating early recovery work that is not covered by other clusters (e.g. governance, non-agricultural livelihoods); (iii) Providing initiative and guidance on the integration of early recovery in the work of other clusters, and inter-cluster coordination of early recovery; and (iv) Influencing the global policy agenda on humanitarian financing, civilian

⁸¹ A/RES/46/182, Annex, part VII para. 40-41, 1991.

⁸² "Early" refers to the fact that the need to look beyond relief is immediate; 'Recovery' refers to the aim to ensure a more resilient people than before the crisis and because of the actions to prepare the ground for longer-term recovery and development.

capacities, and strategic planning to strengthen the potential for, and impact of early recovery within international crisis response and recovery efforts.⁸³

At the country level,

UNDP helps HC/RCs and the HCT to integrate early recovery approaches into the humanitarian response through the deployment of Early Recovery Advisors (ERAs). ERAs work across the humanitarian community, and help develop common strategies to strengthen the links between relief, recovery and development – including in needs assessments, appeals and the work of all clusters. UNDP’s Bureau for Crisis Prevention and Recovery (BCPR) maintains an inter-agency roster for quick ERA deployment on behalf of the CWGER.⁸⁴

UNDP also acts as an implementing agency. In the wake of a natural disaster (e.g., earthquake, flood, etc.), UNDP works with its partners to ensure public services re-commence functioning as early as possible after the event; train those affected with relevant skills, such as construction techniques, as well as train local public servants to ensure that reconstructed infrastructure meets a minimum code of disaster resistance. Underlying causes are addressed and better crisis observation and early warning systems are erected. This work typically includes: emergency employment to restart the local economy, rehabilitation of community infrastructure; debris management and local governance support.

1.3 Financing

1.3.1 Investing in preparedness

Financing for disaster preparedness and response is provided through a number of instruments. These include the UN Trust Fund for Disaster Risk Reduction and several pooled funds managed by OCHA.

The UNISDR is almost entirely funded from extra-budgetary support. The only support provided through the UN regular budget is one D1 staff to coordinate the UNISDR’s regional programme activities. The post was first approved for the 2012-2013 biennium and subsequently confirmed for the 2014-2015 biennium (UNISDR 2015b). UNISDR provides its funding through the **Trust Fund for Disaster Reduction**, which relies entirely on voluntary contributions, with the majority of its resources being earmarked by donors. According to figures reported in its *Annual Report for 2014*, UNISDR raised US\$ 37.7 million in 2014 (i.e. 90% of the US\$41.7 million target for the year and 47% of the biennium target of US\$80 million). The report further states that “Un-earmarked funding of over US\$1 million each from Finland, the Netherlands, Sweden and Switzerland was invaluable. The

⁸³ UNDP (2012), “UNDP and Early Recovery,” Geneva: UNDP-BCPR, November 2012. Accessed 8 Nov. 2014. <http://www.undp.org/content/undp/en/home/librarypage/crisis-prevention-and-recovery/undp-in-early-recovery/>

⁸⁴ Ibid.

proportion of earmarked and un-earmarked funding received in 2014 was 69% and 31%, respectively” (UNISDR 2015b). Figure 12 shows the contributions received and pledged⁸⁵ for the biennium 2014-2015 as of 14 September 2015.

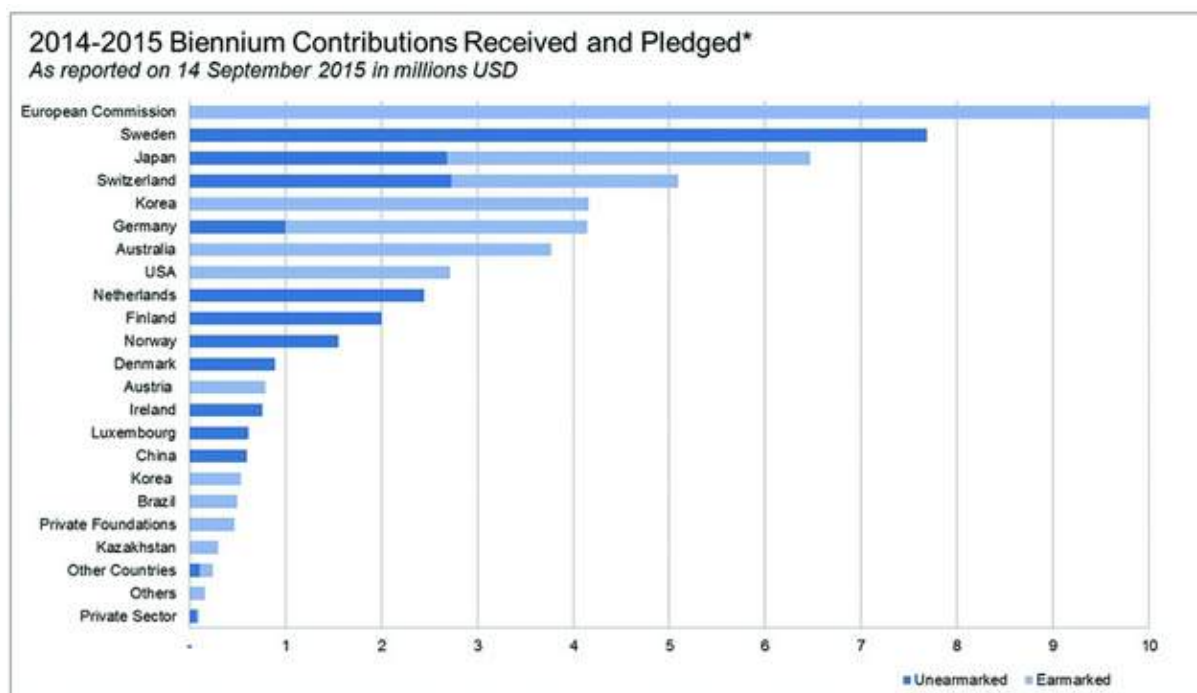

Figure 12: 2014 Contributions Received and Pledged⁸⁶

In terms of financing for disaster response, as the organization responsible for leading the coordination of response operations, OCHA plays an important role in financing the costs of response. OCHA is funded from the UN Regular Budget as well as from Member States’ voluntary contributions for its ability to deliver on its UN General Assembly mandate.⁸⁷

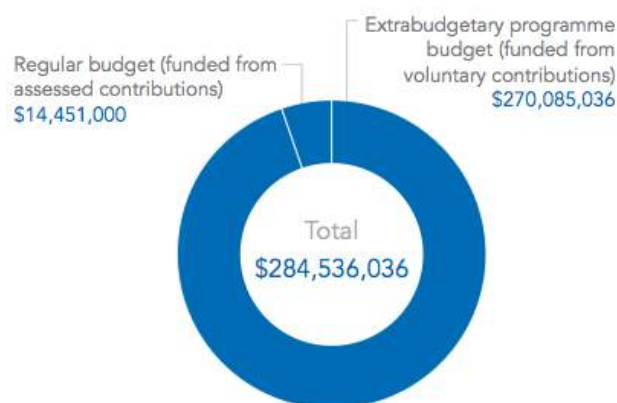

OCHA’s plans and budget for 2014 and 2015 are based on its 2014-2017 Strategic Plan, with delivery against the plan budgeted at \$331.8 million in 2014 and \$321.7 million in 2015 (up from \$285.4 million in 2012), including an appropriation of 0.4 per cent from the global UN regular budget to cover \$14.5 million in programme requirements. Seventy – three per cent of OCHA’s budget covers staff costs of its 2,154 national and international staff located around the world (see 5.1).

⁸⁵ A pledge is a non-binding announcement of an intended contribution or allocation by a donor. Data for total pledged contributions not yet realized are unavailable at the time of writing.

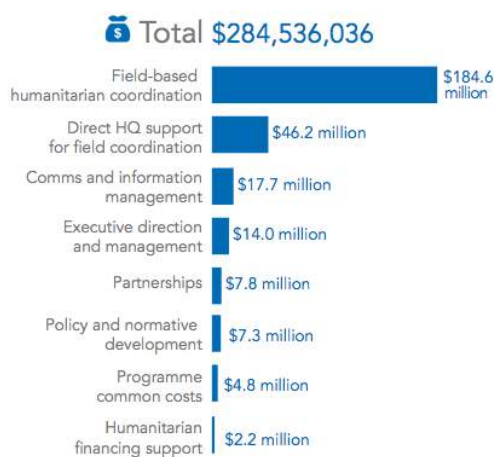

⁸⁶ UNISDR website, “Donor Partnerships”, accessed 19 November 2015 <http://www.unisdr.org/who-we-are/donors>

⁸⁷ The UN General Assembly approves the Regular Budget every two years. The Regular Budget is funded from assessed contributions paid by each Member State on the basis of a formula that takes into account each Member States’ relative GDP. However, because regular budget allocations have remained rather static in recent years, it has had to increasingly rely on extra-budgetary resources.

⁸⁸ OCHA in 2014 & 2015: Plan and Budget.

Figure 14: UN-OCHA 2014 Budget Summary⁸⁹

1.3.2 Investing in consequence management

Both UN-OCHA and UNDP play an important role in the management of financing for consequence management.

In the event of a disaster or crisis, the UN can immediately provide assistance through the use of pooled funds managed by OCHA. There are two types of pooled funds: the **Central Emergency Response Fund (CERF)** and **Country-based Pooled Funds (CBPFs)**. The major distinction between these funds is that the CERF covers all countries, whereas the CBPFs respond only to specific humanitarian situations in 17 countries. For the latter, funds are allocated directly to international and national NGOs for the implementation of projects, whereas NGOs do not have access to CERF funds directly (UN-OCHA, Humanitarian Financing). The CERF is funded through voluntary contributions from across 125 UN Member States and the private sector, and administered by the ERC. Voluntary contributions to CERF amounted to US \$270.1 million in 2014 and an estimated US \$262.3 in 2015 (up from \$234.4 million in 2012).

In the immediate aftermath of a disaster, it is the Resident or Humanitarian Coordinator (RC/HC) that can make an application for CERF funds in order to cover priority projects from UN agencies. Funds are released immediately if the requests meet CERF's criteria, i.e. needs are urgent and the activities funded will save lives.⁹⁰

The **UNDP Crisis Prevention and Recovery Thematic Trust Fund (CPR TTF)** is a flexible funding mechanism allowing UNDP to address both crisis prevention and recovery needs. It is designed for quick action following a natural disaster as well as for reducing disaster risk. Since 2000, the fund has mobilized more than USD\$ 1 billion from across 100 countries. It is managed by the UNDP's Bureau for Crisis Prevention and Recovery (BCPR), responsible for both its fiduciary oversight and programmatic results. The CPR TTF accepts unearmarked as well as earmarked contributions that either benefit individual programme countries or target one of its priority outcome areas (conflict, disaster, early recovery and gender equality)

UNDP interventions carried out on the bankroll of this fund support a range of crisis prevention and recovery interventions, including conflict prevention, disaster risk reduction and a variety of post-crisis/post-conflict recovery and transition objectives.⁹¹

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

The IASC Guidance note on Early Recovery outlines the importance of post-disaster assessment for both lessons learning exercises as well as for policy-making. It states,

All clusters should conduct retrospective reviews when coordination mechanisms wind down and handover begins. Lesson learning exercises and After-Action Reviews are tools that can provide useful guidance and results with little effort. They are useful tools for quickly changing environments and emergencies and can be built into either the programmatic or the early recovery coordination cycle and be conducted at all levels (community, district, national, network etc.). Documenting and discussing ‘what went well’ and ‘what did not go well’ will inform decision-makers and future early recovery operations. Outcome evaluations are usually carried out mid-term or after a programme ends. Given the relatively short time-frame of early recovery programmes, rapid approaches to outcome evaluation are recommended, such as ex-post comparisons of target groups, after action reviews, lesson learned exercises, or real-time evaluations (RTEs). A real-time evaluation feeds back its findings for immediate use while the programme or portfolio of programmes is still being implemented. It should be carried out in the early stages of a response, and ideally, though not necessarily, be repeated during the project cycle. The approach emphasizes participation by agency staff, and the reporting method makes accessibility of results across agencies a priority, particularly rapid discussion of results with the implementing staff. Hence findings and recommendations are delivered briefly in verbal and written form, typically before leaving the field, and final reports are kept short.⁹²

As the lead agency responsible for response operations, post-disaster assessment is central to OCHA’s ability to deliver an effective and effectual response. The OCHA Policy Brief on “Slow-onset emergencies” (2011) indicates that:

The evaluation of the impact of early response mechanisms, should support monitoring and evaluation of early response initiatives so there is some clear proof that they work. By adopting an evidence-based approach, the case for early response rather than late response will gain credibility...In order to secure stable and sufficient funding for early response (or any other disaster risk reduction activity) rigorous impact assessment must be carried out. Links with research and academic institutions in the design of appropriate early response activities can help ensure monitoring and evaluation is included.⁹³

OCHA conducts evaluations to promote transparency, accountability and learning through systematic and objective judgments about the relevance, efficiency, effectiveness and impact of humanitarian interventions. Internal evaluations are typically undertaken at the request of the ERC and assess OCHA’s internal performance. OCHA may also undertake reviews that analyse specific tasks or

⁹² IASC, “IASC Guidance Note on Early Recovery,” 2008, p. 35.

⁹³ OCHA Policy Brief (No. 6) “OCHA and slow-onset emergencies”, 2011.

themes covered by work plan activities. Reviews are undertaken by external consultants and generally use similar methods as evaluations.

1.4.2 Departmental Lessons Learned systems

Organisational learning is an important part of OCHA's strategy. Lessons-Learned Reviews take the form of participatory exercises led by a facilitator with the aim to help the organization and partners learn from experience, and to incorporate these lessons into future activities, programming and institutional memory. Such exercises are carried out once an emergency situation has stabilized and involve the parties taking part in the emergency operation, including agencies, donors, NGOs, Governments, representatives of the affected population.

In 2012, OCHA launched the OCHA Organizational Learning Strategy (OLS), laying out "a multi-year plan to draw from lessons from evaluations, audits and performance reporting, and to develop the capacities of OCHA staff to perform their jobs better." The OLS also establishes enhanced learning architecture that takes advantage of learning opportunities from within and outside the organization.

1.4.3 Centralised (national) Lessons Learned system

Not applicable to the UN.

1.4.4 International exchange for Lessons Learned

International activities pertaining to the sharing of experiences and lessons learned are central to the HFA framework,

Stimulate the exchange, compilation, analysis, summary and dissemination of best practices, lessons learned, available technologies and programmes, to support disaster risk reduction in its capacity as an international information clearinghouse; maintain a global information platform on disaster risk reduction and a web-based register "portfolio" of disaster risk reduction programmes and initiatives implemented by States and through regional and international partnerships;⁹⁴

Provide for and support, through bilateral and multilateral channels, the implementation of this Framework for Action in disaster-prone developing countries, including through financial and technical assistance, addressing debt sustainability, technology transfer on mutually agreed terms, and public-private partnerships, and encourage North-South and South-South cooperation.⁹⁵

⁹⁴ To serve as a tool for sharing experience and methodologies on disaster reduction efforts. States and relevant organizations are invited to actively contribute to the knowledge-building process by registering their own effort on a voluntary basis in consideration of the global progress of the Conference outcomes.

⁹⁵ HFA, 2005, 18.

Within the framework of the UNDP-EU partnership, in 2008 the EU, the World Bank and the UNDP signed a joint declaration committing to collaborate and develop a common approach to post-crisis needs assessments and recovery planning. The joint declaration encompasses assessments needed after a disaster (PDNA) (as well as after a conflict – PCNA).⁹⁶

1.4.5 Regular policy reviews

Regular policy reviews are mandated by the UN for all of the agencies involved in crisis management, and have been built into the respective frameworks accordingly. The Secretary General undertakes a review of the Implementation of the ISDR on an annual basis.⁹⁷ Every two years multi-stakeholder reviews of HFA progress are presented at the UNISDR-coordinated Global Platform for Disaster Risk Reduction (GPDRR).⁹⁸

The UNDP Strategic Plan 2014-2017 (2013) indicates that continuous review and adjustment of strategy will be cornerstones to its approach and regular business plan monitoring. A Mid-Term Review of the Strategic Plan is planned for 2015-2016 and an independent evaluation of the Plan will be conducted by the Evaluation Office towards the end of the planning cycle. The latter will provide inputs into preparations for the Successor Plan.

OCHA undertakes reviews and evaluations as described in section 1.4.1.

1.5 Resilience

UNISDR, UNDP and OCHA all have as part of their strategic focus the building of resilience to disasters. General Assembly resolution 64/200 on International Strategy for Disaster Reduction (2010) acknowledged that “certain measures for DRR in the context of the HFA can also support adaptation to climate change, and emphasizing the importance of strengthening the resilience of nations and communities to natural disasters” (A/RES/64/200). The ISDR promotes global resilience to the effects of hazards and seeks to reduce losses resulting from disasters by:

- Increasing public awareness
- Obtaining commitment from public authorities
- Stimulating interdisciplinary and intersectoral partnership and expanding risk-reduction networking at all levels

⁹⁶ UNDP website, “UNDP-EU Partnership on reducing risks from disasters – Post Disaster Needs Assessment,” http://www.undp.org/content/brussels/en/home/partnerships_initiatives/results/EU-UNDP-PDNA.html.

⁹⁷ The reports are published on the UNISDR website, available: <http://www.unisdr.org/we/inform/resolutions-reports>.

⁹⁸ Links to the review reports can be found here: <http://www.preventionweb.net/english/hyogo/framework/?pid:47&pil:1>

- Enhancing scientific research on the causes and effects of natural disasters and natural hazards, respectively.⁹⁹

In its Strategic Plan, the UNDP defines resilience as,

*‘Resilience’ is an inherent as well acquired condition achieved by managing risks over time at individual, household, community and societal levels in ways that minimize costs, build capacity to manage and sustain development momentum, and maximize transformative potential. ‘Risks’ are factors of a magnitude and intensity able to both disrupt development progress and inflict significant direct and indirect costs.*¹⁰⁰

A major project in the field of resilience is the “Building Resilience to Disasters in the Western Balkans and Turkey” project, implemented jointly by UNISDR and WMO. Launched in May 2012, the project is supported by the European Commission DG Enlargement through the Instrument for Pre-Accession (IPA). The beneficiary countries are Albania, Bosnia and Herzegovina, Croatia, the Former Yugoslav Republic of Macedonia, Montenegro, Serbia, Kosovo and Turkey (Gencer, 2014).

1.6 Information sharing and data protection

The UN agencies are committed to the sharing of data and information and principles of transparency. Regarding volunteers, the UN General Assembly resolution 46/182 states:

*The United Nations should, building upon the existing capacities of relevant organizations, establish a central register of all specialized personnel and teams of technical specialists, as well as relief supplies, equipment and services available within the United Nations system and from Governments and intergovernmental and non-governmental organizations that can be called upon at short notice by the United Nations.*¹⁰¹

UNDP, for example, maintains a database of skilled experts who can deploy at disaster zones on short notice.

Information sharing between UN-OCHA and the relevant EU bodies is formalised in the *Commission Decision of 27 October 2004 (2005/EC/160) approving the exchange of letters between the UNOCHA and the Commission of the European Communities concerning their cooperation in the framework of disaster response (in case of simultaneous interventions in a country affected by a disaster)*. The Annex to this Decision includes an agreement between the two parties to “ensure regular information exchanges” both in the preparedness phase and in the response phase to a disaster in which both parties are active. The exchange of information in the preparedness phase refers to, *inter alia*, including alert notification, policy and operational issues, as well as schedule meetings and workshops. In the response phase, this may include exchanging information on situation reports and

⁹⁹ UNISDR website, “ISDR – What is the International Strategy?”, <https://www.unisdr.org/who-we-are/international-strategy-for-disaster-reduction>.

¹⁰⁰ UNDP Strategic Plan: 2014-2017, 34.

¹⁰¹ A/RES/46/182, Annex, part IV, para. 27, 1991.

situation updates, identification of priority needs and resource requirements, planned and scheduled deployment of resources, resource mobilization (including support modules) to avoid overlap and duplication of efforts, details of the coordinators and assets which could be available (European Commission, 2005).

The UN considers social media tools as providing a wealth of new opportunities for communications, engagement and information sharing. New support systems are being set up, such as with OCHA Field Information Service (FIS) and partners to use these tools for information collection where appropriate. The UN teams up with volunteer communities to exploit online technologies and crowdsourcing methods in order to turn new sources of raw data into useful intelligence that can help aid response on the ground. It has teamed up with MapAction, Crisis Mappers and GISCorps to develop the Digital Humanitarian Network (DHNetwork). It is a network-of-networks that forms a consortium of Volunteer & Technical Communities (V&TCs), which then provide an interface between formal, professional humanitarian networks and informal volunteer & technical networks.

2 Legislation

2.1 Crisis (emergency, disaster) management concept

Signed in San Francisco on 26 June 1945 at the conclusion of the United Nations Conference on International Organization, the Charter of the United Nations came into force on 24 October 1945. Concerning crisis (emergency, disaster) management, article 1.3 specifically states the objective to “achieve international co-operation in solving international problems of an economic, social, cultural, or humanitarian character [...]” (T-1945, Art. 1.3). In service to these common ends, the UN is to be “a centre for harmonizing the actions of nations” (Ibid).

Under the Charter, each Government retains absolute authority within the borders of its own territory. Therefore the responsibility and authority to assist and meet the needs of a society in the event of a crisis (emergency, disaster) lies with the Government. As such, all international assistance is provided in support of national authorities and based upon request, irrespective of the desire of international organizations to respond immediately.

The UN General Assembly resolution 46/182, on “Strengthening of the coordination of humanitarian emergency assistance of the United Nations,” adopted on 19 December 1991, outlines an enhanced framework for international humanitarian assistance. The resolution set out 12 guiding principles for humanitarian relief, including from prevention and preparedness to rehabilitation and development (Hyogo Framework for Action 2005). The international community is guided by this resolution, 46/182, when it provides emergency assistance.

The resolution also outlines the responsibilities and authorities of the States as follows:

- Humanitarian assistance should be provided with the consent of the affected country and in accordance with the principles of humanity, neutrality and impartiality;
- Each State has the responsibility first and foremost to take care of the victims of natural disasters and other emergencies occurring on its territory.
- States whose populations are in need of humanitarian assistance are called upon to facilitate the work of these organizations in implementing humanitarian assistance (A/46/182).

Each year, a number of humanitarian resolutions are negotiated by the Member States in the General Assembly, the Economic and Social Council and the Security Council. The new resolutions build on the GA resolution 46/182, further expanding the norms and guidance in support of humanitarian action.

2.2 General crisis (emergency, disaster) management law

In line with the Charter, no international organization has the authority to tell another organization what to do. The UN is not a world government and it does not make laws; rather it is an organisation of States that operates through consensus. It provides the means to formulate policies on matters with a global reach. As such, several United Nations agencies or bodies have been given a mandate to provide or coordinate assistance within their field of crisis management operation, but lack authority to command, direct or order. This privilege remains with State authorities only (OCHA, 2013).

As stated in the ACRIMAS report (2011),

*There are no legal provisions for disaster response in an international context beyond customary law. There are, however, non-binding guidelines and agreement that have been developed, for examples within the framework of the Inter-Agency Standing Committee (IASC), which are highly accepted among most of the humanitarian organisations. Humanity, neutrality, impartiality and independence are the leading principles for humanitarian assistance. Moreover, the so-called “humanitarian imperative” prevails, which means that humanitarian needs that occur in a country first shall be managed by the affected country. However, if the state or other institutions in the country are not able to manage the humanitarian situation, other countries and organisations have got a responsibility to provide support in accordance with international law.*¹⁰²

2.3 Emergency rule

Not applicable.

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

Not applicable.

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

Not applicable.

¹⁰² Hans-Martin Pastuszka, FP7 ACRIMAS project, 2011, 30-31. Accessed 18 November 2008.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

United Nations General Assembly resolution 56/38 of 10 January 2002 elaborates on ways for governments and civil society to support volunteerism and recommended that governments support volunteerism by creating a favourable environment, which includes “enabling fiscal, legislative and other frameworks”, and specifically within this category, to “introduce enabling legislation”.

Non-binding guidelines have been developed as part of the Code of Conduct for the International Red Cross and Red Crescent Movement and NGOs in Disaster Relief (V-1994).

2.7 Legal regulations for international engagements of first responders and crisis managers

Rules for international engagements of first responders are outlined in General Assembly Resolution 46/182 as discussed in chapter 1.

3 Organisation

The United Nations System is comprised of the six principal organs of the United Nations, 15 agencies and a range of other programmes, bodies and Related Organizations. The 6 principal organs are:

1. the General Assembly,
2. the Security Council,
3. the Economic and Social Council,
4. the Trusteeship Council,
5. the International Court of Justice and
6. the Secretariat

The full system organisation chart is presented in Figure 15 below.

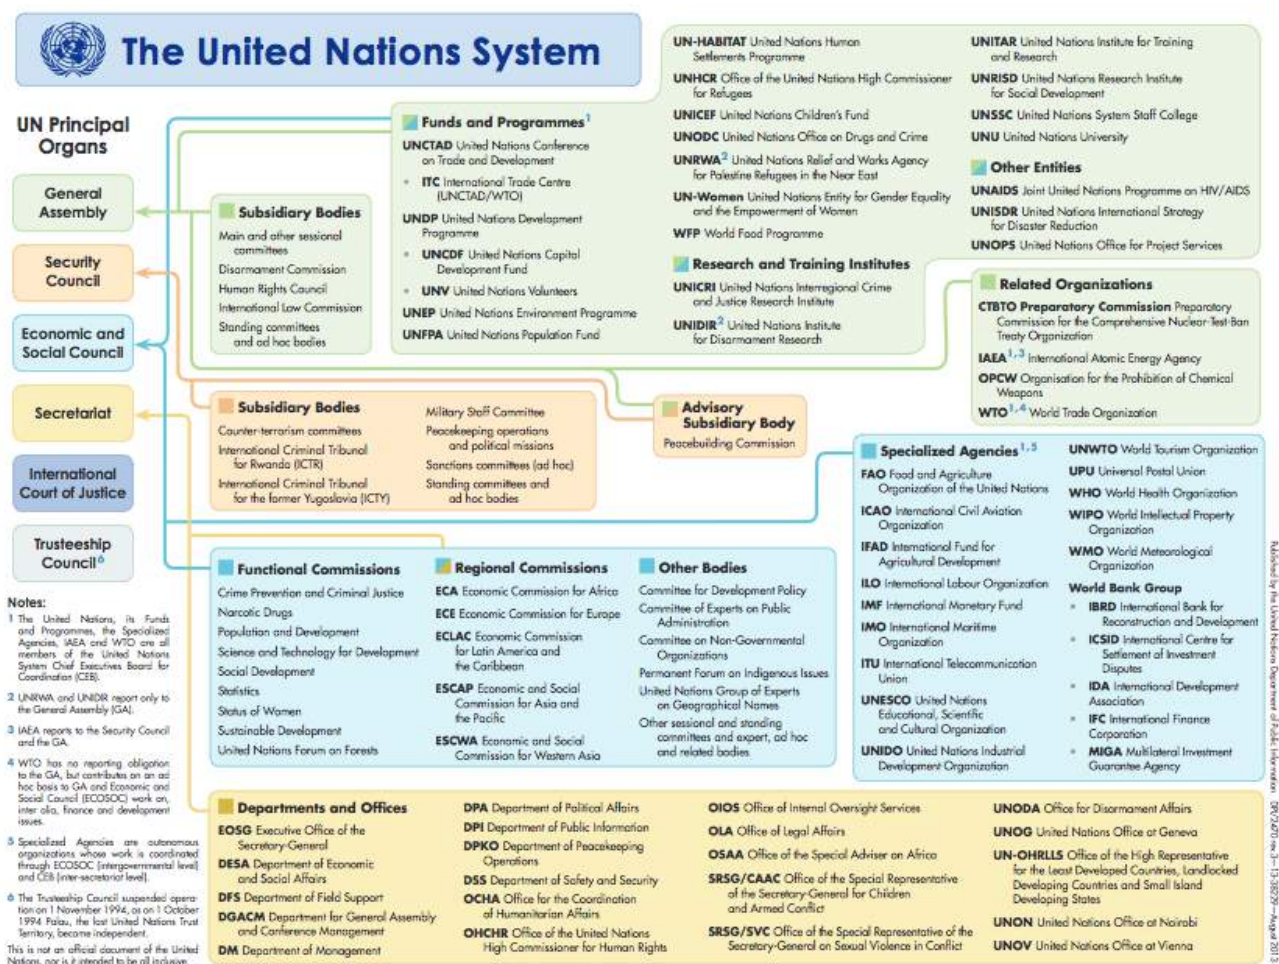

Figure 15: UN System Organisation Chart¹⁰³

¹⁰³ UN Website. For a full directory of the System and organisation charts, see www.un.org and www.unsceb.org (the website of the UN System Chief Executives Board for Coordination).

3.1 Organisational chart

Through its many offices, agencies and programmes, the UN supports nations to reduce hazard vulnerability while building local institutional capacity. In the field of disaster and crisis management, the UN General Assembly itself does not have any operational role in conducting disaster management activities, but rather is responsible for launching many of the programmes, which are then carried out by the various UN offices and UN Member States governments. Each has been given a mandate to provide or coordinate international crisis management assistance within their respective field. The three most prominent bodies that have mandates pertaining to crisis management and disaster risk reduction, namely the UNISDR, UNDP and OCHA.

3.1.1 UNISDR

UNISDR is the inter-agency secretariat responsible for the implementation of the International Strategy for Disaster Reduction (ISDR). UNISDR is the office for DRR, while the ISDR is a strategic conceptual framework (section 1.2.1). In December 2001, General Assembly resolution A/RES/56/195 specified that the mandate of UNISDR is “to serve as the focal point in the United Nations system for the coordination of disaster reduction and to ensure synergies among the disaster-reduction activities of the United Nations system and regional organizations and activities in socio-economic and humanitarian fields.” The UNISDR is also the focal point for the implementation of the Sendai Framework and for the organization of the Global Platform for Disaster Risk Reduction (UN General Assembly Resolution 61/198), under the leadership of the **Special Representative of the Secretary-General (SRSG)**.

UNISDR areas of work:

UNISDR **coordinates** international efforts on DRR. Its vision, based on the strategic goals of the HFA, is to integrate DRR into sustainable development policies and planning; develop and strengthen institutions, mechanisms and capacities to build resilience to hazards; and incorporate risk reduction approaches into emergency preparedness, response, and recovery programmes. UNISDR is charged with the preparation and follow-up of the biennial Global Platform for Disaster Risk Reduction that was first established in 2006 by GA resolution 61/198. The Platform is the main global forum for disaster risk reduction, providing strategic and coherent guidance for the implementation of the Hyogo Framework. UNISDR **advocates** for greater investment in DRR and for the integration of DRR into policies and programmes for climate change adaptation. UNISDR **campaigns** to increase awareness of DRR benefits and to empower individuals reduce their own vulnerability. On-going campaigns focus on safer schools and hospitals, as well as resilient cities. Finally, UNISDR **informs** and connects people by providing tools such as the risk reduction website, PreventionWeb, publications on good practices, country profiles and the Global Assessment Report on DRR. The latter is an authoritative analysis of global disaster risks and trends (UNISDR, 2012).

Headquartered in Geneva, the UNISDR implements its mandate through five regional offices. The offices are based in Asia (Bangkok), Africa (Nairobi), Europe (Brussels), Arab States (Cairo) and Latin America and the Caribbean (Panama). It also maintains a UN HQ liaison office in New York, a liaison

office in Bonn and presences in Kobe, (Japan), Suva, (Fiji), Incheon, (Republic of Korea), Almaty, (Kazakhstan) and Rio (Brazil) (UNISDR 2013).

Regional platforms are intended to serve as a forum for exchanging information and knowledge, and coordinating efforts in crisis management. In Europe, this is carried out through the European Forum for Disaster Risk Reduction (EFDRR). It provides advocacy for effective action to reduce disasters while focusing on contemporary issues of importance needed to promote a good political climate for implementation of the Hyogo Framework for Action.

3.1.2 UNDP

The UNDP is the UN's global development network and is active in 177 countries and territories around the world. Through its country offices, UNDP supports disaster prone countries in the development of comprehensive DRR programmes. In 1998, the UN transferred to the UNDP "the responsibilities of the **Emergency Relief Coordinator** for operational activities for natural disaster mitigation, prevention and preparedness" (A/RES/52/12B, para 16). With this decision, UNDP assumed operational responsibility for natural disaster mitigation, prevention and preparedness.

UNDP is involved in supporting countries with high levels of disaster risk to develop their DRM capacity at national and local levels. A large part of this has been dedicated to strengthening governance arrangements for DRR, including legislative frameworks and institutional systems and providing guidance for managing natural hazard risks.

On the global level, UNDP provides a range of services to high-risk countries with the objective to support the development of their disaster risk management capacity at the local and national levels. A large part of this has been dedicated to strengthening governance arrangements for DRR, including legislative frameworks and institutional systems and providing guidance for managing natural hazard risks. Additional services provided include policy guidance, advocacy, technical assistance, global knowledge sharing and partnership building with their global counterparts. The key thematic areas of its services include the following:

- Global Risk Identification Programme
- Capacity for Disaster Reduction Initiative
- Climate Risk Management
- Urban Risk Management
- Governance and Mainstreaming of Disaster Risk Reduction into Development Planning
- Gender Sensitive Disaster Reduction and Recovery
- International Recovery Platform (Preventionweb, "BCPR-UNDP").

In 2001, the **Bureau for Crisis Prevention and Recovery (BCPR)** was created following the recognition by UNDP's Executive Board that, "crisis prevention and disaster mitigation should be integral parts of sustainable human development strategies" (DP/2002/2). The BCPR provides the UNDP with technical and financial support to carry out its DRR work in disaster-prone countries, which includes

*development of comprehensive disaster risk reduction (DRR) programmes, strengthening of institutional and legislative systems, implementation of community-level disaster preparedness activities, including contingency planning and early warning, and establishment of coordination mechanisms to ensure the integration of risk reduction into human development as well as the development of national capacities for recovery planning.*¹⁰⁴

The BCPR serves as the practice leader for crisis prevention and recovery within UNDP. On the ground, BCPR works closely with country offices and their national counterparts, providing technical assistance, best practices and financial resources in support of their prevention and recovery activities.

Finally, UNDP plays a key leadership role in the implementation of the International Strategy for Disaster Reduction (ISDR) (section 1.2.1) through UNISDR mechanisms such as the International Recovery Platform, Global Risk Identification Programme, Capacity for Disaster Reduction Initiative and Partnership for Environment and Disaster Risk Reduction (Ibid).

3.1.3 UN-OCHA

OCHA, in collaboration with the Inter-Agency Standing Committee (IASC), is the arm of the UN responsible for bringing together national and international humanitarian actors in the event of an emergency or crisis, to ensure a coherent response. OCHA ensures that a framework is in place through which all actors involved may contribute to the overall response effort. OCHA's primary role is to support the **UN Resident Coordinator (RC)** or **Humanitarian Coordinator (HC)**, generally the most senior UN official in the country, and ensuring that coordination takes place. At the most basic level, this means ensuring that a consensus view is reached between the main responders as to what is the main problem, what are the priorities, what is going to be done about it and how it is going to be done. OCHA is part of the UN Secretariat.

The head of the OCHA, the **Under-Secretary General (USG)/Emergency Relief Coordinator (ERC)**, reports directly to the Secretary-General of the UN and is responsible for the oversight of all emergencies requiring UN humanitarian assistance. The USG/ERC acts the central focal point for governmental, intergovernmental and non-governmental relief activities and also chairs the IASC (see 3.1.4) as the ERC.

OCHA has two main coordinative functions in the event of a crisis or disaster. First, it coordinates the humanitarian actors within the **"cluster system"**. Clusters are groups of UN and non-UN humanitarian organisations in each of the main sectors of humanitarian action (e.g., water, logistics, emergency shelter) and have clear responsibilities for coordinating in the event of a disaster. There are around 10 clusters (Table 5) which are led by appointed cluster leads (UN bodies). The IASC is responsible for designating the clusters in a given scenario.

¹⁰⁴ PreventionWeb, "Bureau for Crisis Prevention and Recovery – UNDP (BCPR-UNDP)," accessed 18 November 2014. <http://www.preventionweb.net/english/professional/contacts/profile.php?id=2724>.

Table 5. UN-OCHA Clusters and Cluster Leads¹⁰⁵

Cluster	Lead Agency
Coordination of camps	UNHCR / IOM
Water and sanitation	UNICEF
Health	WHO
Emergency shelter	UNHCR / IFRC
Food and nutrition	UNICEF
IT/Telecommunications	OCHA / UNICEF / WFP
Logistics	WFP
Early recovery	UNDP
Education	UNICEF and Save the Children Alliance
Agriculture	FAO

The Cluster Lead Agency is the focal point for a given cluster. In global terms, the Cluster Lead is responsible for strengthening system-wide preparedness and coordinating technical capacity to respond to humanitarian agencies in their respective sector. At the country level, Cluster Leads are the main contacts for a government and the various teams to ensure that humanitarian activities are coordinated. When a disaster strikes, it is the RC/HC and the Humanitarian Country Team (HCT) in the affected country that are responsible for facilitating preparedness of the response operation through the clusters. OCHA provides direct support to the HC and HCT, facilitates inter-cluster coordination and advises the HC and HCT on the activation of the cluster approach and the coordination structures to employ (IASC, 2015).

The second coordinative function of OCHA is the coordination of humanitarian actors within the **On-side Operations Coordination Centre (OSOCC)**. This concept was originally developed jointly by OCHA and the International Search and Rescue Advisory Group network to assist affected countries in coordinating relief efforts and international search-and-rescue efforts following an earthquake. However, it is now used for any sudden-onset disaster involving international relief resources. The concept has been used during numerous disasters including floods, hurricanes, tsunamis and complex emergencies.

An OSOCC has three primary objectives:

- To be a link between international responders and the Government of the affected country;
- To provide a system for coordinating and facilitating the activities of international relief efforts at a disaster site, notably following an earthquake, where the coordination of many international USAR teams is critical to ensure optimal rescue efforts;

¹⁰⁵ UN-OCHA, "UNDAC Field Handbook 2013," 6th Edition, Section A, p. 10.

- To provide a platform for cooperation, coordination and information management among international humanitarian agencies.

The OSOCC's size and functions vary according to the scale of the disaster. However, the basic structure (shown in the graphic below) should be modified to suit the requirements of each situation.

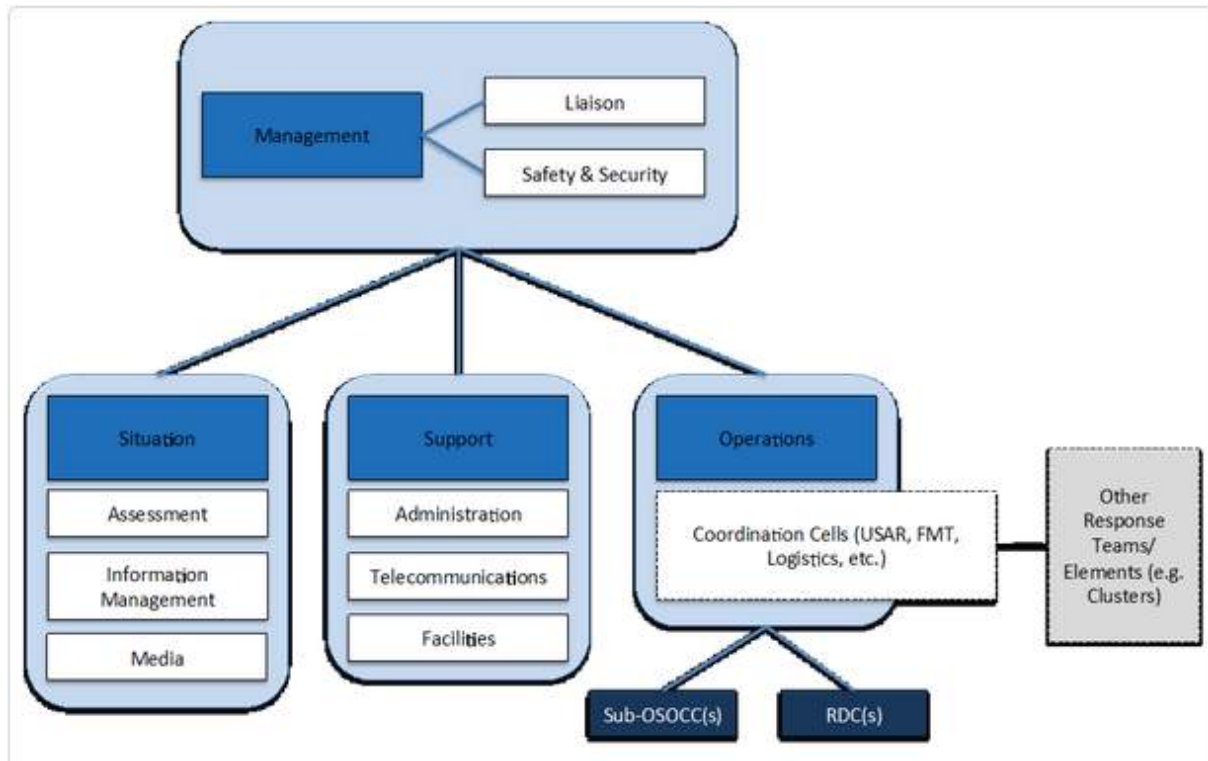

Figure 16: OSOCC Management Structure¹⁰⁶

Within OCHA, the **Emergency Services Branch (ESB)** is responsible for developing, mobilizing and coordinating the deployment of OCHA's international rapid response tools and services such as such the **United Nations Disaster Assessment and Coordination (UNDAC) system**, the **International Search and Rescue Advisory Group (INSARAG)** and civil-military coordination, cluster approach, needs assessment, HC/RC coordination support, information management and humanitarian financing systems (CERF, CAP, Flash Appeals). The ESB is comprised of various sections, through which it channels its capabilities, services and tools. These are:

- Emergency Relief Coordination Centre (ERCC)
- Field Coordination Support Section (FCSS)
- Civil-Military Coordination Section (CMCS)
- Environmental Emergencies Unit (EEU)
- Logistics Support Unit (LSU)
- Surge Capacity Section (SCS)
- Emergency Preparedness Section (EPS)
- Field Information Services Unit (FIS)

¹⁰⁶ UN-OCHA website, "OSOCC & RDC," accessed 19 November 2015 <http://www.unocha.org/what-we-do/coordination-tools/osocc-rdc/overview>,

- Information Technology Section (ITS)
- Integrated Regional Information Networks (IRIN)
- ReliefWeb

A brief description of each of the Sections is taken from the MSB Handbook (2009):

Emergency Relief Coordination Centre (ERCC) – The ERCC is OCHA's coordination centre, designed to support the organization's coordination role in disasters and humanitarian emergencies. This includes internal coordination among OCHA's Geneva, New York and regional / field offices as well as the coordination of other humanitarian actors and disaster responders worldwide.

Field Coordination Support Section (FCSS) – FCSS manages the UN Disaster Assessment and Coordination (UNDAC) system, the International Search and Rescue Advisory Group (INSARAG), the Americas Support Team (AST) and the International and Asia-Pacific Humanitarian Partnerships (IHP/APHP). UNDAC is a network of deployable disaster management professionals nominated and funded by governments and organizations. INSARAG is a network of urban search and rescue (USAR) providers that defines global standards for earthquake response. Both are discussed in detailed below. AST/IHP/APHP are networks of providers of Support Modules (equipment and staff) that can be deployed at short notice and at no cost to support UNDAC missions and other humanitarian actors in the field. As such, FCSS manages partnerships with NGOs, Private Sector and governmental/intergovernmental networks that support OCHA's role in establishing on-site coordination in sudden onset disasters.

Civil-Military Coordination Section (CMCS) – On behalf of the humanitarian community, CMCS facilitates and coordinates the access to and use of foreign Military and Civil Defence Assets (MCDA) in countries affected by humanitarian emergencies. CMCS is the focal point for governments, international organizations and military and civil defence establishments for the employment of these assets in humanitarian situations. It is also the focal point for United Nations Humanitarian Civil-Military Coordination (UN-CMCoord) in the United Nations system. UN-CMCoord is defined as the essential dialogue and interaction between civilian and military actors in humanitarian emergencies that is necessary to protect and promote humanitarian principles; avoid competition; minimize inconsistency; and, when appropriate, pursue common goals.

Environmental Emergencies Unit (EEU) – EEU is the United Nations mechanism to mobilize and coordinate the international response to environmental emergencies caused by natural disasters, industrial accidents and complex emergencies. It is a partnership mechanism between OCHA and the United Nations Environment Programme.

Logistics Support Unit (LSU) – LSU is OCHA's focal point for non-military logistics and participates in inter-agency humanitarian logistics coordination mechanisms.

Surge Capacity Section (SCS) – SCS maintains external partnerships for the provision of critical human resource needs following emergencies and disasters through the rapid and effective mobilization of additional expertise.

Emergency Preparedness Section (EPS) – EPS supports at-risk countries to reduce disaster risks by preparing for an effective response to humanitarian emergencies in line with the Hyogo Framework of Action, Priority 5 – Disaster Preparedness for Effective Response. In particular, the section partners with International Strategy for Disaster Reduction (ISDR) and UNDP (UN Development Programme) / BCPR (Bureau for Crisis Prevention and Recovery) in the Capacity for Disaster Reduction Initiative (CADRI) for the development of sustainable disaster risk reduction capacities in the UN system as well as for Governments.

Field Information Services Unit (FIS) – FIS develops information management tools for OCHA's field offices. It also deploys Humanitarian Information Centres (HICs) or smaller information management teams to emergencies.

Information Technology Section (ITS) – ITS provides information and communications technology (ICT) infrastructure, services and support to OCHA and coordinates inter-agency ICT activities.

Integrated Regional Information Networks (IRIN) – IRIN is a leading global provider of multimedia humanitarian news and analysis.

ReliefWeb - ReliefWeb is the world's leading on-line gateway to information on humanitarian emergencies and disasters.¹⁰⁷

3.1.4 The Inter-Agency Standing Committee

The Inter-Agency Standing Committee (IASC) was established in 1992 in response to UN GA Resolution 46/182 on the strengthening of humanitarian assistance. The IASC, together with Executive Committee for Humanitarian Affairs (ECHA), forms the primary mechanism for inter-agency coordination of humanitarian assistance (GA Resolution 48/57), policy development and decision-making involving the key UN and non-UN humanitarian partners. It was established in June 1992 in response to UN GA Resolution 46/182 on the strengthening of humanitarian assistance.

The following are the primary objectives of the IASC:

- Develop and agree on system-wide humanitarian policies and on a common ethical framework for humanitarian activities

¹⁰⁷ Swedish Civil Contingencies Agency, "International CEP Handbook. Civil Emergency Planning in the NATO/EAPC Countries." Swedish Civil Contingencies Agency (MSB), 2009. Accessed 18 September 2014. <https://www.msb.se/RibData/Filer/pdf/24677.pdf>.

- Allocate responsibilities among agencies involved in humanitarian programmes
- Identify where gaps exist in mandates or where operational capacity is lacking;
- Resolve disputes or disagreements among humanitarian agencies on system-wide humanitarian issues (UNISDR 2013).

The IASC formulates humanitarian policy that ensures a coordinated and effective response to all kinds of disaster and emergency situations. IASC is the main decisional body for humanitarian issues and is responsible for planning the types of missions to be taken, as well for proposing policy, guidelines and priorities to be made. Membership and structure of the IASC is discussed in section 3.1.4.

Members of the IASC include: FAO, OCHA, UNDP, UNFPA, UN-HABITAT, UNHCR, UNICEF, WFP, WHO. Standing Invitees of the IASC include: ICRC, ICVA, IFRC, InterAction, IOM, OHCHR, RSG on Human Rights of IDPs, SCHR and the World Bank.

Coordination in the IASC takes place at several different levels. This is shown in Figure 17.

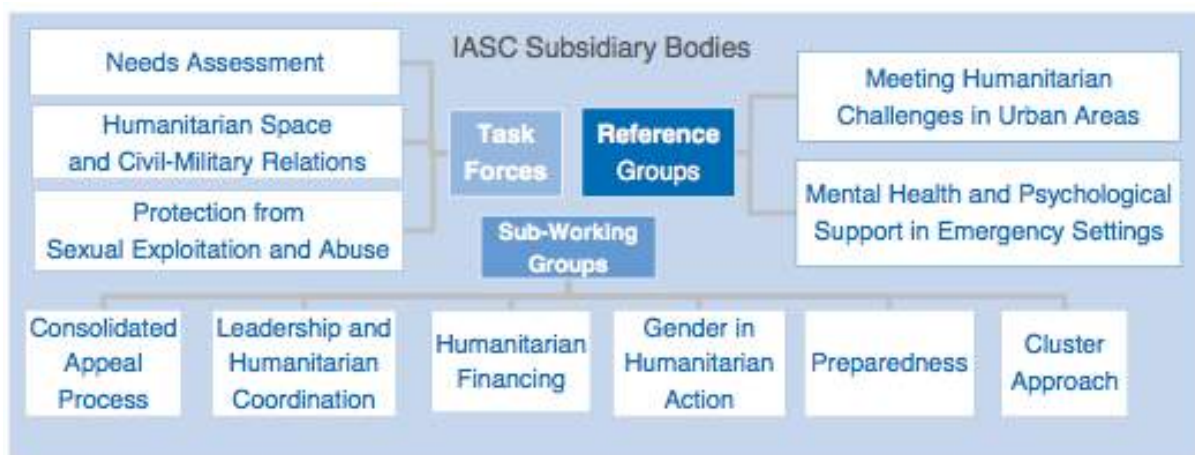

Figure 17: IASC Subsidiary Bodies¹⁰⁸

The organisations that comprise the IASC are headed by the IASC Principals, while the emergency directors or other directors of the IASC organisations are brought together within the IASC Working Group. The IASC Principals and the IASC Working Group may be assisted by IASC Subsidiary Bodies, which may be sub-working groups, task forces or reference groups, for work on specific policy questions and related tasks. Guidance, tools and handbooks produced by these groups are referred to as “IASC products”.

¹⁰⁸ OCHA (2012). “Inter-Agency Standing Committee.” *OCHA on Message*, March 2012.

3.2 Organisational cooperation

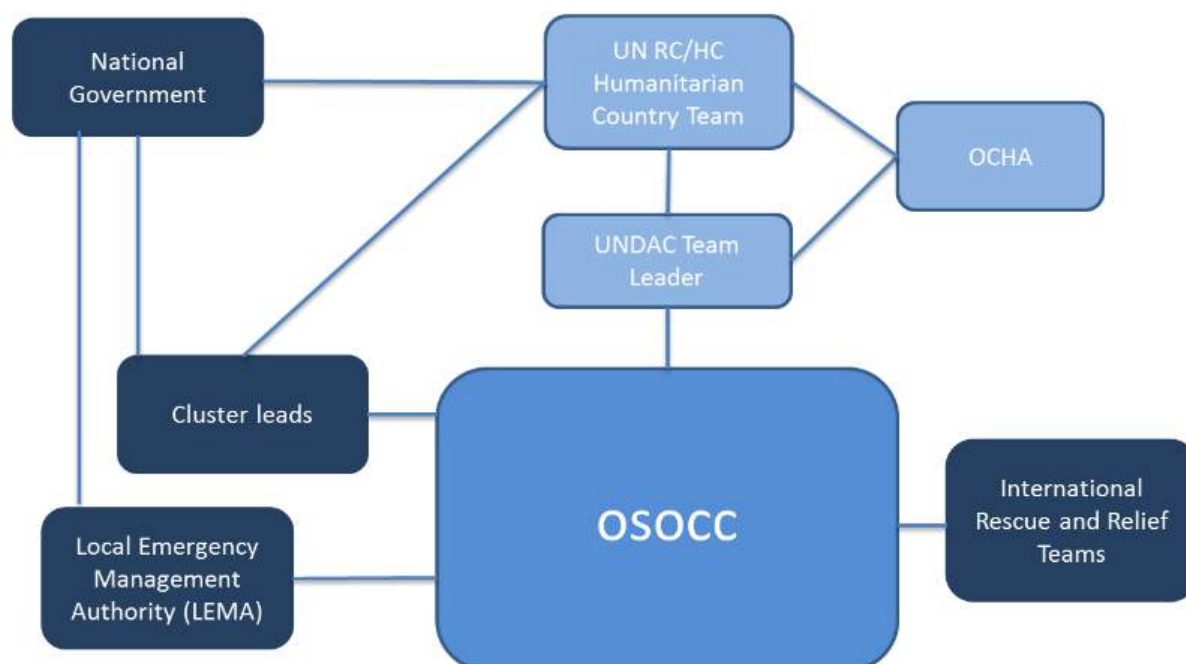

3.2.1 Operational cooperation

In the event of a crisis or disaster occurring outside the EU, the UN – chiefly through the UN-OCHA – is responsible for coordinating all humanitarian assistance to the country in question. As stated in the ACRIMAS report,

This is a provision that is highly acknowledged within the EU, among the Commission and most of the Member States. When the EU Civil Protection Mechanism was established in 2001, Member States humanitarian assistance to an affected country could from that day on not only be given for example bilaterally or through the UN, but also through the EU. Thus there was a need to broaden cooperation between the EU and UN as regards humanitarian assistance from the already existing cooperation in relation to financial aid to cooperation in humanitarian assistance missions as well....¹⁰⁹

When a natural disaster strikes, OCHA can deploy self-contained and fully equipped response coordination specialists within 24-48 hours through the **United Nations Disaster Assessment and Coordination (UNDAC) system**. UNDAC comprises a standby team of volunteer emergency managers with varied skills. The **On-Site Operations Coordination Centres (OSOCC)** is established as soon as possible by the first arriving international urban search-and-rescue team or UNDAC team deployed by OCHA.

The following illustration shows how the OSOCC works with other entities once it has been established.

¹⁰⁹ Hans-Martin Pastuszka, "Report on Current CM Framework," Aftermath CM System-of-systems Demonstration (FP7 ACRIMAS project, January 2011), 30-31. Accessed 18 November 2008.

Figure 18: OSOCC Context¹¹⁰

The OSOCC Guidelines state,

The OSOCC generally reports to the UNDAC Team Leader, who in turn ensures that activities of the OSOCC are aligned with the strategic direction of the UN RC/HC and the HCT, and supported by OCHA. In cases where an UNDAC Team is not deployed, the OSOCC may report directly to the UN RC/HC.

The OSOCC works in support of the affected government in coordinating the efforts of international response organisations. Within the affected country, the Local Emergency Management Agency (LEMA) is responsible for the overall command, coordination and management of the response operation, thus the OSOCC maintains a strong connection to the LEMA throughout operations.

In addition to the entities within OCHA and within the affected country, the OSOCC supports and collaborates with Cluster Leads and responding teams. This can be done through integration in the OSOCC structure, including physically being located in the OSOCC facility, and/or through formal or informal liaison.¹¹¹

3.2.2 Organisational cooperation

The IASC and ECHA form the primary mechanism for inter-agency coordination of humanitarian assistance within the UN system.

Below the system-level of coordination, many other UN agencies and programmes have mandates pertaining to organisational cooperation for capacity development, both internally and with other UN bodies. For example, the Emergency Preparedness Section (EPS) of the ESB partners with ISDR and UNDP/BCPR, in the CADRI initiative to develop sustainable DRR capacities both within the UN system and for Governments. The UNISDR has established numerous mechanisms for organisational coordination, including the national and regional platforms and thematic platforms led by specialised agencies or technical institutions.

UN coordination with EU mechanisms

UN has a significant relationship with the EU. The EU is a major donor to UN agencies and programmes. Financial relations are governed through a financial and administrative framework agreement signed in 2003.

Under Council Decision 1313/2013 Art. 5(2) and Art 13(3), the European Commission, at the request of the United Nations or its agencies, “may deploy an expert team on site to provide advice” on preventive actions as well as on preparedness measures. The latter covers training, exercises, lessons learnt and knowledge dissemination. Article 9 further specifies that preparedness actions of the

¹¹⁰ UN-OCHA, FCSS “OSOCC Guidelines,” December 2014.

https://docs.unocha.org/sites/dms/Documents/2014%20OSOCC%20Guidelines_FINAL.pdf.

¹¹¹ Ibid, p. 11.

Member States to support the needs of the Union Mechanism must be “able to cooperate with other Union bodies and/or international institutions, in particular the UN, as appropriate”.

Regarding disaster response assistance interventions outside the EU, support actions undertaken either by the Member States or the Union as a whole are to be facilitated by the Union Mechanism and “shall be fully integrated with the overall coordination provided by the United Nations Office for the Coordination of Humanitarian Affairs (OCHA), and shall respect its leading role” (Council Decision 1313/2013, Art. 16).

Finally, in terms of response operational coordination, the European Commission’s Humanitarian Aid and Civil Protection Organization (ECHO) is a regular preparedness and response partner of the UNDAC system. UNDAC members may work with, or train with, the EU’s Emergency Response Coordination Centre (ERCC), which is a part of the EU CPM, as well as with European Union Civil Protection Teams (EUCPTs) that have been deployed. The ERCC, operated by ECHO, is operational at all times and serves as the European focal point for information management, offering assistance and coordination of deployed assets (which include thirteen rapid response modules). The EUCPTs are comprised of experts that are highly skilled in areas such as coordination and assessment. The operational relationship between UNDAC and EUCPT can range from “general liaison” to “integration” depending on the location and scale of an emergency (OCHA, 2013).

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

There are many written SOPs pertaining to the respective UN bodies and sub-teams involved in crisis management and disaster risk reduction, including for specific occasions. An exhaustive list of all existing SOPs across all relevant UN bodies could not be developed or obtained within the context of this study, thus specific information on the scope of the SOPs, their acceptance by the involved parties and the manner and frequency of tests conducted is not available. However, a few examples are as follows:

SOP for Early Recovery Operations

The 2008 IASC Guidance note on Early Recovery includes in the Annex an overview of SOPs for designating sector/cluster leads in major new emergencies in the first 24 hours of an emergency, as well as in ongoing emergencies.

STANDARD OPERATING PROCEDURES FOR DESIGNATING SECTOR/CLUSTER LEADS IN MAJOR NEW EMERGENCIES

At the onset of the emergency (if possible, within the first 24 hours):

Step 1. The HC (or RC, in countries where an HC has not been appointed) consults national authorities/counterparts and relevant IASC partners at the country level (NGOs, international organizations, the International Red Cross and Red Crescent Movement and UN agencies) to determine priority sectors or areas of activity for the emergency; which agencies are best placed to assume the role of sector/cluster lead for each one; what thematic groups are needed to address cross-cutting issues; and what support is needed from OCHA and other actors in terms of common tools and services.

Step 2. Based on these consultations, the HC (or RC) draws up a proposed list of sectors with designated sector/cluster leads for each. The HC (or RC) may also propose the establishment of thematic groups for particular priority cross-cutting issues. The HC (or RC) forwards this list to the Emergency Relief Coordinator (ERC), addressed to holmes@un.org, requesting endorsement within 24 hours from the full IASC at the global level.

Step 3. The ERC shares this proposal with the IASC, requesting endorsement or alternative proposals.

Within 24 hours of receiving the proposal from the HC (or RC)

Step 4. The ERC ensures agreement is reached within the IASC at the global level. Where agencies at the global level propose arrangements that differ from those initially proposed by the HC (or RC), the ERC consults the HC (or RC) and IASC further in order to reach agreement.

Step 5. The ERC communicates the decision reached to the HC (or RC) and all relevant partners at global level.

Step 6. The HC (or RC) informs the host government and all relevant country-level partners of agreed arrangements within the international humanitarian response. Common Humanitarian Action Plans and appeal documents should clearly state the agreed priority sectors and the designated leads for each.

Figure 19: SOP for designating sector/cluster leads in major new emergencies¹¹²

The next figure details the SOP for Early Recovery support after the first 24 hours of the emergency have passed.

¹¹² IASC, "Guidance Note on Early Recovery," 2008.

Trigger for SOP- Imminent crisis event in a country (a new crisis or dramatic deterioration of an existing situation)

STEP	ACTION	TIMELINE
PRE-CRISIS OR SUDDEN IMPACT CRISIS EVENT		
1	Contact RC/HC and request SITREP from country	Pre-Crisis OR Within 24 Hrs
2	Issue Stand By "Alert" Message"	Pre-Crisis OR Within 24 Hrs
3	Activate individual stand-by emergency procedures.	Pre-Crisis OR Within 24 Hrs
INITIAL ASSESSMENT		
4	IA Country Team meets to decide scale of emergency	Pre-Crisis OR Within 24 Hrs
4a	LEVEL 1 RESPONSE Monitor situation closely and remind RC of available support services	Pre-Crisis OR Within 48 Hrs
RAPID RESPONSE		
4b	LEVEL 2 RESPONSE Brief and deploy "ER Specialist" to country (with or without UNDAC Team)	Pre-Crisis / Within 48 Hrs
POST CRISIS		
4c	ERC ¹ consults with IA HQ Agencies on cluster activation request	Within 5 days
5	Cluster approach is adopted for country X	Within 5 Days
6	LEVEL 3 RESPONSE 1st emergency meeting	Within 5 Days
SURGE IMPLEMENTATION		
7	Brief and deploy "ER Advisor" to country	Within 7 Days
8	Link with existing coordination and information networks including other Global Clusters.	Within 7 Days
9	2nd CWGER emergency meeting and decide on Joint or IA assessment mission	Within 1-2 Weeks.
10	Fund and Deploy Joint ER Needs Assessment "IA SURGE team." • Conduct Joint Needs Assessment • Develop IA Strategic Framework	Within 2-3 Weeks for up to four (4) weeks.
11	Evaluate Needs Assessment and IA Strategic Framework	Within 4-5 Weeks.
12	Mobilize funds for implementation of IA Strategic Framework	Within 6-8 Weeks.
13	IA Strategic Framework implementation.	Within 10-12 weeks for up to 18 months.
14	Coordinate implementation of IA ER Strategic Framework	Up to 18 months
SURGE DEACTIVATION		
15	"ER-Coord/Advisor" converts to "Recovery Coordinator/Advisor" OR exits country.	Within 2-18 months
16	Hand over programmes and exit country	Within 2-18 months
17	3rd CWGER (after action) meeting and lessons-learned exercise.	Within 1-2 years
18	Publication/dissemination of lessons learned.	Within 1-2 years

Figure 20: Standard operating procedures for activation and deployment of Early Recovery Support for Disasters¹¹³

SOPs between EU bodies and UN-OCHA

The EU and OCHA agreed on SOPs in 2004, which are set out in the Commission Decision *on approving the exchange of letters between the UNOCHA and the Commission of the European Communities concerning their cooperation in the framework of disaster response (in case of simultaneous interventions in a country affected by a disaster)*. These are very general and outline overall principles to ensure continued and enhanced coordination in response operations in situations in which both the EU and UN bodies are deployed. However it does not appear these have been updated since then, thus not reflecting the merge of EU CP to DG ECHO and the new provisions of the Lisbon Treaty (Commission, 2005).

4.2 Operations planning

There are many operations planning documents to guide the activities of the operational actors in the event of a crisis. These can be retrieved in English on the respective websites of the different UN bodies. Examples include:

- UNDAC Field Handbook (2013)
- OSOCC Guidelines (December 2014)
- Guidance note on Using the Cluster Approach to Strengthen Humanitarian Response (OCHA, November 2006)
- Inter-Agency Contingency Planning Guidelines for Humanitarian Assistance (IASC, December 2007)
- Operational Guidance on Responsibilities of Cluster/Sector Leads and OCHA in Information Management (OCHA, December 2008)
- IASC Handbook for RCs and HCs on Emergency Preparedness and Response (IASC, March 2011)
- IASC Emergency Response Preparedness (ERP) (Draft for field testing) (IASC, July 2015)
- Reference Module for the Implementation of the Humanitarian Programme Cycle (IASC, July 2015)
- Reference Module for Cluster Coordination at Country Level (IASC, revised July 2015)

EU-UN planning

The EU CPM developed an SOP manual that includes guidance on the most important parts of the command, control and coordination structure at the operational level during operations in non-EU countries. The manual states,

During emergencies outside the EU, the command, control and coordination structure is established by the affected country and/or UN OCHA – UNDAC team if asked for by the affected country. In case of the latter, the EU CP team may be fully or partially integrated into the OSOCC structure formed by the UNDAC team depending on an agreement between the UN OCHA and MIC prior the EU CP team's deployment.

¹¹³ IASC, “Guidance Note on Early Recovery,” 2008, Annex 8.

The diagram also shows the potential position of national coordination teams that PS may deploy for example in case of a deployment of a big number of CP modules/teams (e.g. Haiti earthquake 2010, etc.). In case the national coordination teams are not present, the operational control is executed directly by the OSOCC.¹¹⁴

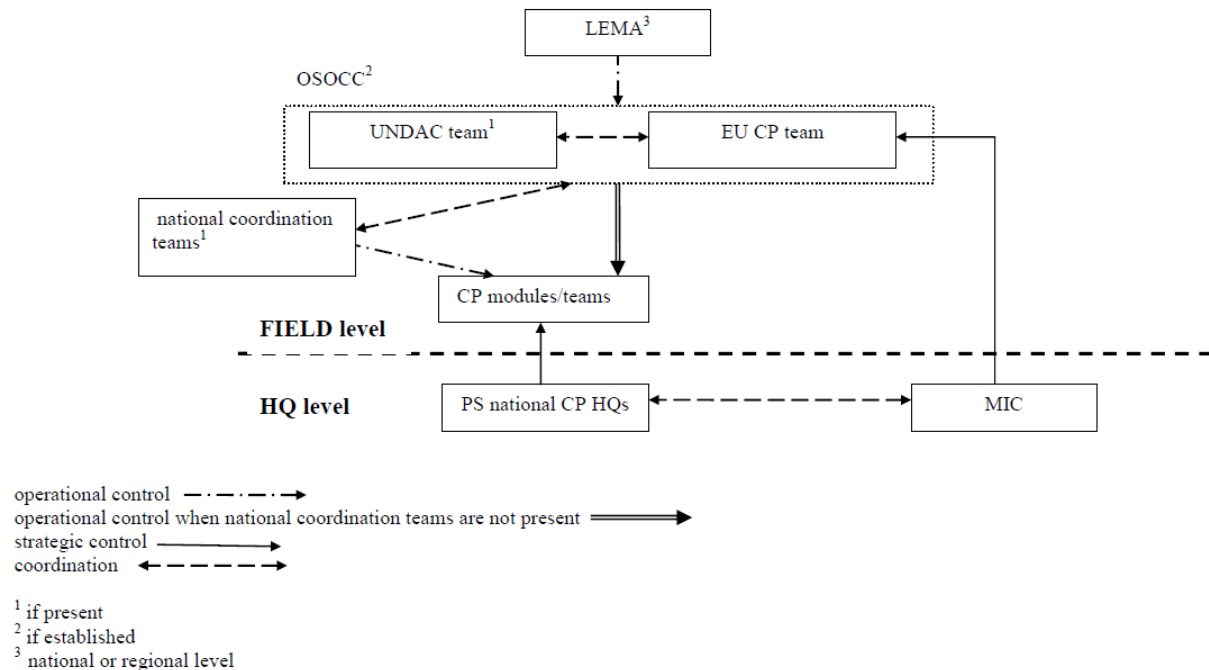

Figure 21: On-site command, control and coordination structure during emergencies outside the EU¹¹⁵

This manual also outlines the most important lines of reporting and information exchange among the main actors at the operational level during operations in EU and non-EU countries. It states,

*The leaders of the CP modules/teams should report during the on-site operation to the on-site commander minimum on a daily basis at a time set up by the on-site commander and inform the EU CP team about its activities minimum on a daily basis at a time agreed between the MIC and the modules/teams reflecting the operational needs and time zone of the operation location.*¹¹⁶

¹¹⁴ EU Civil Protection Mechanism, Guidelines for Standard Operating Procedures (SOP) for Civil Protection Modules, available <http://ipafloods.ipacivilprotection.eu/images/DOCs/EUSOPguidelines.pdf>.

¹¹⁵ Ibid.

¹¹⁶ Ibid.

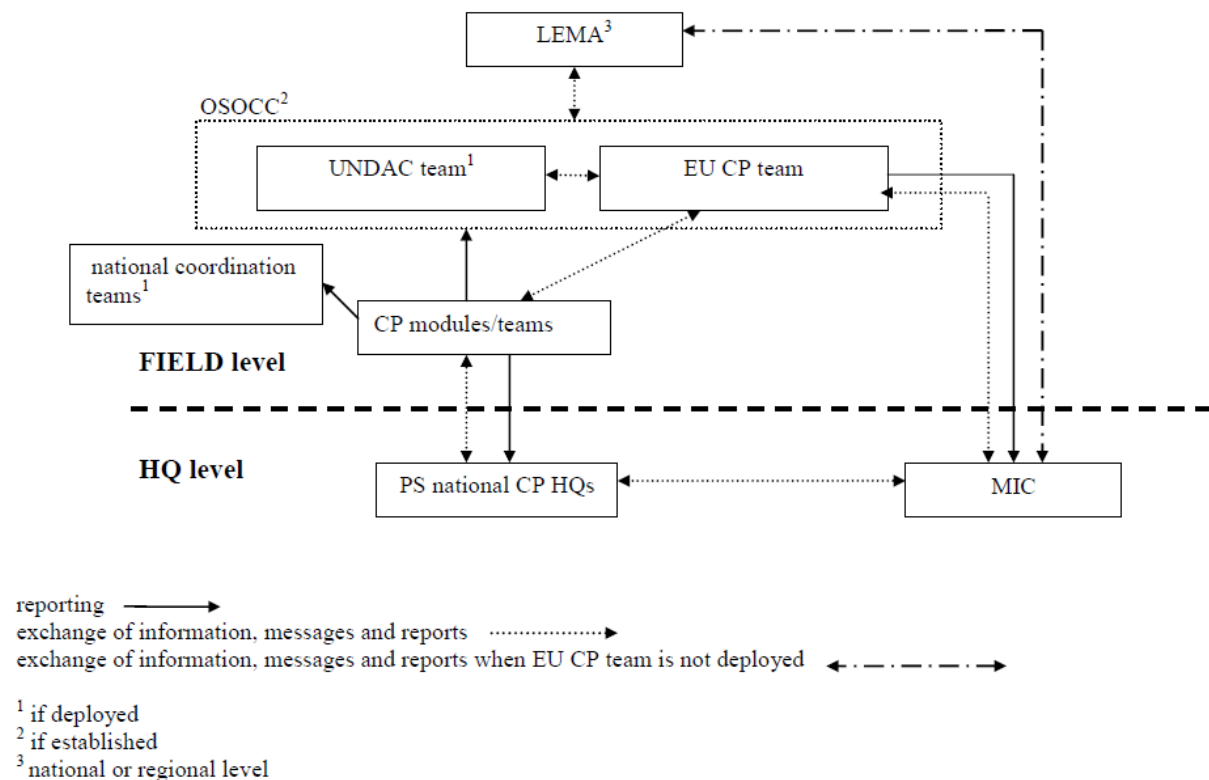

Figure 22: Reporting Lines during emergencies outside the EU¹¹⁷

4.3 Logistics support in crises

A variety of UN organisations are involved in logistics operations, which vary depending on the specific situation. Organizations commonly involved in logistics operations include:

- World Food Programme (WFP)
- United Nations Development Programme (UNDP)
- Office for Coordination of Humanitarian Affairs (OCHA)
- United Nations High Commissioner for Refugees (UNHCR)
- United Nations Children's Fund (UNICEF)
- World Health Organization (WHO)
- International Committee of the Red Cross (ICRC)
- International Federation of Red Cross and Red Crescent Societies (IFRC)
- Non-governmental organizations (NGOs)
- Armed forces
- Private sector entities
- National authorities (OCHA, 2013).

¹¹⁷ EU Civil Protection Mechanism, Guidelines for Standard Operating Procedures (SOP) for Civil Protection Modules, available <http://ipafloods.ipacivilprotection.eu/images/DOCs/EUSOPguidelines.pdf>.

High-level roles and responsibilities of logistics support operations are as follows:

The **Logistics Support Unit (LSU)** of the ESB OCHA is the focal point for non-military logistics and participates in inter-agency humanitarian logistics coordination mechanisms. The logistics support in OCHA encompasses:

1. Maintaining an equipment reserve for OCHA;
2. Facilitating the relationship and cooperation between OCHA's corporate partner, Deutsche Post-DHL, and the Logistics Cluster in relation to providing airport-handling teams during humanitarian relief operations;
3. Ensuring, in cooperation with a number of donor governments, the adequate and timely provision of non-food items to relief operation. These are stored in the UN Humanitarian Response Depot;
4. Maintaining close relationships with the World Customs Organisation and IFRC to initiate discussions with Member States, and promote the implementation of customs-facilitation measures for importing emergency relief items;
5. Ensuring in partnership with the Logistics Cluster, the overall management of the global mapping of emergency stockpiles.¹¹⁸

Disaster Response Teams (DRTs) are established via the strategic partnership between DHL, Deutsche Post World Net and OCHA to support the relief efforts of the UN system and the international community. The teams provide logistical expertise for incoming shipments of relief goods and help to ensure an uninterrupted and effective relief supply chain at the airport closest to the scene of sudden-onset natural disaster.

OCHA also stockpiles relief goods (see 5.2).

Regarding the use of **military logistics support**,

*the Civil-Military Coordination Section (CMCS) of the ESB of the UN-OCHA, facilitates and coordinates on behalf of the humanitarian community, the access to and use of foreign Military and Civil Defence Assets (MCDA) in countries affected by humanitarian emergencies. CMCS is the focal point for governments, international organizations and military and civil defence establishments for the employment of these assets in humanitarian situations. It is also the focal point for United Nations Humanitarian Civil-Military Coordination (UN-CMCoord) in the United Nations system. UN-CMCoord is defined as the essential dialogue and interaction between civilian and military actors in humanitarian emergencies that is necessary to protect and promote humanitarian principles; avoid competition; minimize inconsistency; and, when appropriate, pursue common goals.*¹¹⁹

¹¹⁹ MSB Handbook, p. 291.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

Communication

When an emergency occurs, OCHA's information management officers immediately start working with key partners to produce standard information products to support coordination of all the humanitarian organizations and the response operation. These include the Who What Where (3W) database, contact lists and meeting schedules. Tools such as the information need assessment and maps are made available to support better relief planning and action. The following sections within the ESB of UN OCHA are involved in crisis communication (described in section 3.1.3).

- *Field Information Services Unit (FIS);*
- *Information Technology Section (ITS);*
- *Integrated Regional Information Networks (IRIN);*
- *ReliefWeb.*

Alert systems

The UN launched a plan for a global early warning system in 2005 to reduce the deadly toll of natural hazards, combining speedy transmission of data with training of populations at risk in a strategy that experts say could have saved scores of thousands of lives. No significant progress has been made in this area.¹²⁰

The IASC Humanitarian Early Warning Service (HEWSweb) is an interagency partnership project aimed at establishing a common platform for humanitarian early warnings and forecasts for natural hazards. The service has been developed by WFP who is responsible for coordinating and managing the overall information content, design, and organization of HEWSweb on behalf of the Inter-Agency Standing Committee and its members (UNISDR, 2013).

UNISDR is actively promoting (Global) Early warning systems via the PPWE (Platform for the Promotion of Early Warning). This organisation, which started operations in 2004, will help the development of early warning and preparedness systems by advocating for better early warning systems, especially in development assistance policy and programs, collecting and disseminating information on best practices, and stimulating cooperation among early warning actors and the development of new ways to improve early warning systems.¹²¹

In addition, OCHA utilises several different electronic platforms as dissemination and information gathering tools in the event of a crisis or disaster/emergency. These are:

¹²⁰ UN, "UN Launches plans for global early warning system on natural disasters," *UN News Centre*, 19 January 2005, accessed 19 November 2015,

<http://www.un.org/apps/news/story.asp?NewsID=13077&Cr=natural&Cr1=disaster#.VG37ADZgXcs>

¹²¹ Platform for the Promotion of Early Warning," UNISDR, accessed 19 November 2015,

<http://www.unisdr.org/2006/ppew/ew-actors/un-authorities.htm>.

- **Virtual OSOCC** provides a platform for incoming and outgoing information exchange between responding governments and organisations that is operationally relevant to the UNDAC team throughout a relief operation. Users may provide comments on existing information in real-time and discuss relevant issues of concern with response team members.
- **HumanitarianResponse.info** is the platform for exchange of information with the wider community. Specific pages are set up for a given emergency situation. Tools are provided for meeting scheduling, contact directories and publishing information graphic related to the response.
- **ReliefWeb** is OCHA's humanitarian information Internet web page. It posts information from all humanitarian partners in addition to OCHA's own information
- **The Integrated Regional Information Network (IRIN)** serves as a humanitarian news agency through free-of-charge email subscription. IRIN reports are also posted on ReliefWeb. It is based in three locations in Africa: Nairobi, Johannesburg and Abidjan.

For more information, see the websites of the above mentioned platforms and organisations.

5 Capabilities

5.1 Human resources

The total number of personnel and resources of the three main crisis and disaster-related UN bodies is as follows:

As per June 2012 **UNISDR workforce** comprises 100 individuals (UNISDR, 2012).

UNDP employs more than 200 full time DRR practitioners, covering all regions, with special attention to the 60 highest risk countries (UNISDR 2013).

UN-OCHA's staff, 2,145 in total, is working through its regional and country offices and deploys staff at short notice to emergencies. It also supports several surge-capacity mechanisms (see below) and networks that enable the broader humanitarian community to respond rapidly to disasters and conflicts (UN-OCHA).

2014 STAFF MEMBERS BY LOCATION

Figure 23: UN-OCHA staff members by location, 2014 ¹²²

Capacity to mobilise

OCHA can quickly deploy specialised humanitarian personnel – i.e. surge staff – to support efforts on the ground, particularly in situations where local capacity is overwhelmed, in response to a new or

¹²² UN-OCHA, "OCHA in 2014 & 2015: Plan and Budget," accessed 19 November 2015, <http://www.unocha.org/ochain/2014-15/financial-plan>.

escalating humanitarian crisis. OCHA sets up an office in the affected country, or reinforces an existing office. OCHA has a standby team of volunteering emergency managers with varied skills. These individuals are from over 60 developed and developing countries, international agencies and NGOs. Deployed OCHA personnel can include specialists in humanitarian affairs, information management, civil-military coordination and public information. The teams can deploy within 24-48 hours of a disaster anywhere in the world.¹²³

Involvement of Volunteers, NGOs and the Private sector

OCHA maintains a number of operational partnerships with partner organizations, Governmental agencies, NGOs and the private sector, which all provide specialized support services both to the UNDAC team as well as to the wider humanitarian community. These services include logistical support modules such as ICT support, base camps, office and vehicle support, which the International Humanitarian Partnership (IHP), the Asia-Pacific Humanitarian Partnership (APHP) and the Americas Support Team (AST) can provide in order to enable an UNDAC team, OCHA staff and humanitarian organizations to work self-sufficiently in a disaster area.

Technical partnerships of the UNDAC system include NGOs such as MapAction and Telecoms sans Frontières (TSF), which can deploy with an UNDAC team and offer services such as emergency mapping and emergency telecommunications in disaster areas worldwide. UNOSAT is another operational partner, which provides satellite imagery and geographic information easily accessible to the humanitarian community. From the private sector, FCSS is closely collaborating with the DHL Disaster Response Teams who provide airport handling and logistics services to the affected country and international responders.

5.2 Materiel (non-financial) resources

UN-OCHA has a warehouse in Pisa, Italy – the UN Humanitarian Response Depot (UNHRD) – in which it stores stockpiles of relief goods that can be easily mobilised and delivered to disaster-stricken countries. The UNHRD is therefore a logistics and relief facility. The warehouse is managed by the WFP. When international assistance is sought in a disaster or emergency, the Humanitarian Coordinator, the United Nations Resident Coordinator/UNDP Resident Representative, the OCHA regional/field office or the relevant clusters are the channels for a request to OCHA for goods to be dispatched.¹²⁴

The UNDAC system additionally deploys personal and mission equipment for the UNDAC teams to be self-sufficient in the field (OCHA, 2013).

Military aid is foreseen in the Guidelines for the Domestic Facilitation and Regulation of International Disaster Relief and Initial Recovery Assistance,” (V-2007, para. 11):

¹²³ UN-OCHA website, “Surge capacity,” accessed 19 November 2015 <http://www.unocha.org/what-we-do/coordination-tools/surge-capacity/overview>

¹²⁴ UN-OCHA website, “Logistics Support”

“Military assets should be deployed for disaster relief or initial recovery assistance only at the request or with the express consent of the affected State, after having considered comparable civilian alternatives. Prior to any such deployment, terms and conditions (including such issues as the duration of deployment, whether they must be unarmed or may be armed the use of their national uniforms, and mechanisms for cooperation with civilian actors) are to be agreed by the affected and assisting States.”¹²⁵

United Nations Humanitarian Civil-Military Coordination (UN-CMCoord) facilitates dialogue and interaction between civilian and military actors when a response effort involves the deployment of national and/or foreign military actors, assets or paramilitary organisations alongside international humanitarian organisations.¹²⁶

5.3 Training

Training is organised by all organisations separately. Major training initiatives are discussed below:

UNDP requires all RR/RCs and UNDP Country Directors/DRRs to be trained on early recovery and surge policies, practices and implementation tools. This also includes policy of rotation in recovery and crisis projects. Cross-training is organised with OCHA (UNDP, 2008).

UNDAC training consists of the following courses:

- The **UNDAC Induction course**: a series of 3 pre-Induction webinars followed by a 2-week intensive training course, upon successful completion of which participants are out on the UNDAC emergency roster provided that they sign the contract. UNDAC members are expected to make themselves available at least 2-3 times a year for emergency missions.
- The **UNDAC Refresher Courses**: a series of 4-5 day training course, which UNDAC members are required to take every 2 years in order to keep abreast of developments in methodology and the humanitarian context and improve their capacity to be operational in missions.

In addition, UNDAC members are encouraged to take other available courses such as:

- OSOCC courses, Civil Military Coordination courses, and Assessment courses and others.
- Courses provided by other entities, such as the EC Civil Protection Mechanism. (UNDAC, “Methodology and Training”)

¹²⁵ UN, 2011, International Legal Frameworks for Humanitarian Advocacy – Compendium.

¹²⁶ OCHA website, “Humanitarian Civil-Military Coordination (UN-CMCoord)” available <http://www.unocha.org/what-we-do/coordination-tools/UN-CMCoord/overview>,

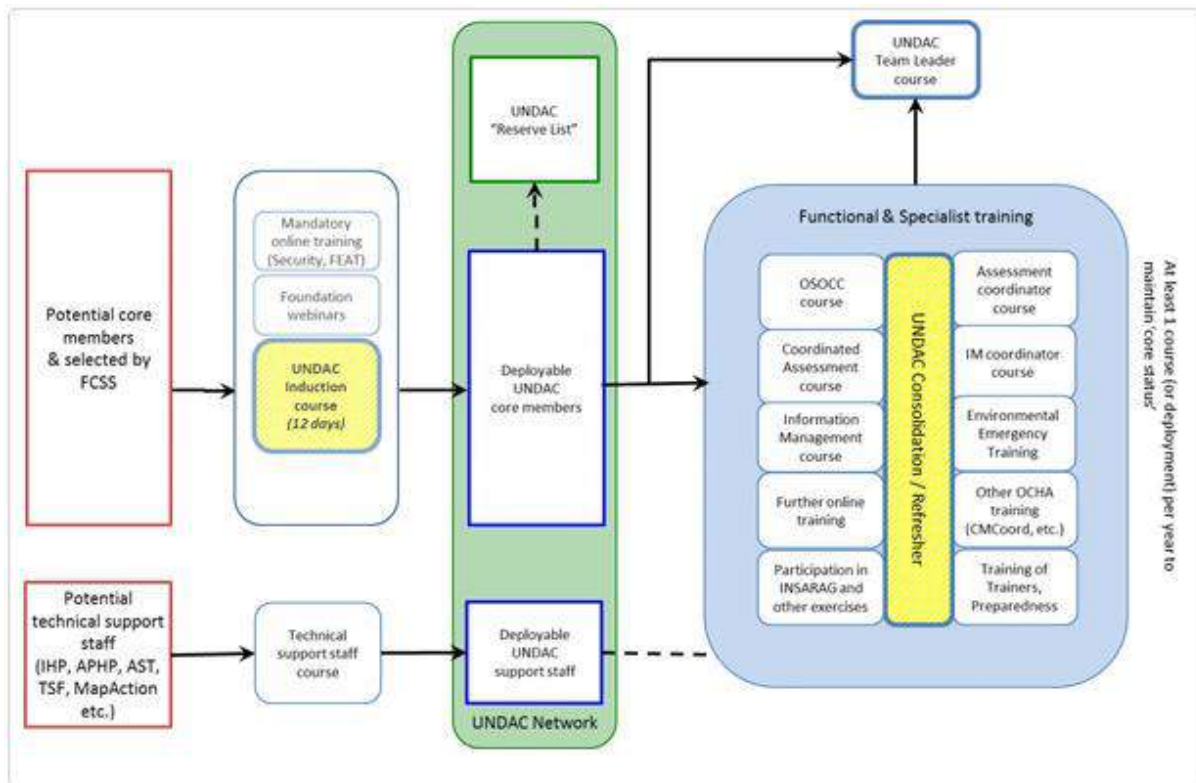

Figure 24: UNDAC Training¹²⁷

OSOCC training courses are managed and delivered by the FCSS of ESB. According to the website:

- OSOCC training courses are designed to train the participants in the OSOCC methodology, i.e. to establish a platform for coordination in a large-scale emergency with a multi-organization response. Furthermore, participants will receive training in the establishment of a Reception/Departure Centre (RDC) and Sub-OSOCC.
- The target audience for the course is urban search and rescue (USAR) liaison officers and team leaders, national emergency managers, cluster coordinators, coordinators from NGOs and from regional and international emergency management organizations, UNDAC members and technical support staff.¹²⁸

UNISDR sees training as an active part of the preparedness approach. Disaster risk reduction and education is organised as an interactive process of mutual learning between people and institutions. Therefore the organisation organises education of people living in high risk zones (UNISDR, 2013).

¹²⁷ UN-OCHA, "Methodology and Training," accessed <http://www.unocha.org/what-we-do/coordination-tools/undac/methodology-training>.

¹²⁸ UN-OCHA, "OSOCC & RDC".

5.4 Procurement

5.4.1 Procurement regulation

The UN has provided a manual for procurement, which is a compendium of regulations approved by the General Assembly and related rules published by the UN.

Scope

The procurement includes all actions for the acquisition, by purchase or lease, of property.

Procedures

The UN uses a centralized electronic register of vendors for sourcing the supply of UN needs for goods, services and works. Vendors can apply for this. The UN evaluates vendor's applications to determine whether the application complies with the UN requirements (article 7.2). These criteria are codified in article 7.6 and relate to basic information on the vendor, legal status and owners and directors etc. Article 7.5 provides the pre-requisites for vendors. For example, vendors need to declare they are not declared bankrupt or are under formal investigation.

The following general principles need to be taken into account throughout the procurement process (rule 5.12):

- Best value for money;
- Fairness, integrity and transparency;
- Effective international competition;
- The interest of the United Nations.

A key element of best value for money is identifying vendors to fulfil the needs of the contracting authority. The aim is to have multiple vendors which meet the requirements, so that competitive prices can be obtained. In order to achieve this, the contracting authority can use the UN Global Market Place, Request for Expressions of Interests, Requests for Information etc. The contracting authority shall invite all vendors registered for the works being procured that are interested. In some cases the number of vendors can be limited for example when the list of vendors is long and impractical to use, or when security issues justify a limitation (article 9.5). In order to ensure an appropriate level of competition, a minimum number of vendors should be invited. This depends on the value of the contract (article 9.6).

The UN has three kinds of procedures:

- The informal method of solicitation;
- The formal invitation to bid;
- The formal request for proposals.

In the informal method of solicitation, a Request of Quotation (RFQ) shall be used for the procurement of goods, services and works with standard and clear specifications and a value between US\$ 4,000 and US\$ 40,000. Contracts with a value less than US\$ 4,000 can be procured directly.

The formal invitation to bid (ITB) shall be used for the procurement of goods with standard and clear specifications and a total value exceeding US\$ 40,000. The contract will be awarded to the qualified bidder whose bid substantially conforms to the requirements and is evaluated to have the lowest costs. When a formal request for proposals has been used, the contract shall be awarded to the qualified proposer whose proposal is most responsive to the requirements (rule 105.15).

The request for proposals shall be used for procurement that cannot be quantitatively or qualitatively expressed in sufficient detail for the ITB. The procurement officer shall post an REOI notice on the UN Global Marketplace. This is optional when the value of the contract is below US \$ 200.000.

In several cases, the formal method may not be in the best interest of the UN. The UN can determine this, for example when there is no competitive marketplace for the procurement; when the formal procedure has not given satisfactory results or when the UN otherwise determines that a formal solicitation will not give satisfactory results. These and other exceptions are listed in rule 105.16. In these cases, the UN may solicit a single vendor for a particular procurement.

Award criteria

The procurement contracts shall be awarded on the basis of effective competition. The competitive process shall include (rule 105.14):

- Acquisition planning for developing an overall procurement strategy and methodologies;
- Market research for identifying potential suppliers;
- Consideration of prudent commercial practices;
- Methods of solicitation;
- Public bid openings.

The technical evaluation team shall conduct the technical evaluation, based on the evaluation criteria and their relative weight. The evaluation criteria are factors or specific areas of consideration that are part of the requirement specifications, TOR or SOW. The criteria should be discrete, measurable, exhaustive and verifiable components of the goods, services or works required and provide a basis for assessing each Vendor's ability to provide the required goods, services or works. It captures all underlying factors of the definition of best value for money. The specific criteria will depend on the nature of the public contract.

5.5 Niche capabilities

The niche capabilities of the UN bodies active in crisis management are as follows:

- country office presence and trust of partners;
- capacity development and thematic focus;
- UN System Coordination through the RC system;
- capacity to build global partnerships for comprehensive DRR programmes and existing networks;
- know-how and expertise to manage post-disaster recovery assessments and coordination of the Global Early Recovery Cluster (i.e. UNDP).

CIV-MIL

Armed Forces' Support to Civilian Authorities

Study on Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) of using armed forces in crisis management and disaster response

Valeri Ratchev, Todor Tagarev (CSDM)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by ECORYS and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

This study reviews this portion of the so-called ‘internal roles of the armed forces’ that relates to crisis situations emerging as a result of natural or man-made disasters. It addresses the ability of the armed forces (norms, procedures and relevant capabilities) to provide valuable support to civilian authorities in such crises.

The term ‘*support to civilian authorities*’ (SCA) refers to normative requirements to the national armed forces to contribute to the civil protection against natural and other disasters, as well as to the process by which local authorities can request military assistance from the central government in times of emergency. It also relates to the regulations and procedures for sending the country’s military personnel abroad to provide emergency support in cases of natural or other disasters.

The countries, subject of the DRIVER study,¹²⁹ represent variety of historical traditions, constitutional arrangements and/or legal provisions that determine mechanisms of using armed forces’ personnel and equipment for emergency response, rescue and relief. In this diversity some countries continue to view all military functions within the concept of the ‘total defence,’ while others have moved more quickly towards separation of civil protection from national defence.

The common characteristic throughout the cases studied is that countries tend to expand the functions beyond mere defence in an attempt to make the national military more relevant to the widening spectrum of security threats and the citizens’ expectations and demands. Most countries, and especially the members of NATO, EU, and other European countries, have determined three basic roles of the armed forces: (1) defence (collective/national); (2) contribution to international peace and stability; and (3) support to the civil authorities and the population in cases of emergencies.

For the relevant understanding of the third role, it is important to underline that it is as important as the other two, but the core military capabilities are usually built around the first and, to some extent, to the second role. In most cases the military is seen as ‘the last resort’ with a supporting role to civilian authorities for responding to crises of natural or technogenic origin.

The practice, however, very much depends on additional factors such as maturity of the civil society (level of volunteerism), decentralisation of the state power, size of the country and the military, and most of all, on the frequency, scope and destructiveness of the natural and man-made disasters.

The international contribution by military personnel and assets in providing emergency support is also on the increase. Efforts within EU and NATO have an inspiring effect on national preparations in three main dimensions: strengthening regional co-operation (cross-border missions), increasing the distance of engagement from the national territory (across Europe and beyond), and strengthening military-specific niche capabilities for rapid response, rescue and recovery operations (fire-fighting from the air, response to chemical, biological and radiological threats, pandemics, etc.).

¹²⁹ This study refers to specific aspects of the use of armed forces in support of civil authorities in Austria, Bulgaria, Croatia, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Ireland, Israel, Italy, Latvia, Lithuania, The Netherlands, Norway, Poland, Portugal, Romania, Slovak Republic, Spain, Sweden, Turkey, and The United Kingdom. The countries are selected in order to better frame the problem space of the study and to illustrate the diversity in the practices of civil-military cooperation and coordination in EU Member States and selected adjacent countries.

1 Policy of using military for domestic disaster response and relief

The authentic idea¹³⁰ of having ‘armed power’ in the hands of the ruler involved a dual purpose, i.e. to protect the ruler from both external and internal threats. One of the remarkable Indian philosophers Chanakya (under the pseudonym Kautilya) in his work “Arthashastra – the Science of Polity” explained about 2300 years ago this aspect of governance in the following way:

The king and the kingdom are the primary elements of the state. The troubles of the king might be either external or internal. Internal troubles are more serious than external troubles, which are like a danger arising from lurking snake.¹³¹

Some authors see that “...in the public mind, there is an association between disaster relief and military involvement; indeed, there is often an expectation that military units will assist the civilian population in the immediate aftermath of large-scale emergencies” and find earliest recorded cases in the times of Alexander the Great.¹³²

The term “support to civilian authorities” belongs to the modern times, but is not really new in defence policy analysis. It is related to the time of splitting security of the state on external and internal and the relevant separation of the armed powers into ‘military’ and ‘police.’ To provide support to civilian authorities usually means to respond to their request to use military force for law enforcement purposes when the capacity of local police or militia have not been sufficient to maintain the political status quo. In this context, the regimes “made distinction between using the army for internal and external security duties.”¹³³

Post-World War II Europe adopted what was conceivably most wide-ranging use of the military in civil affairs. It is important to recognise the influence this had both on military doctrines of civil involvement and on development of the international relief system and the approaches that relief agencies have used since then. While the involvement of the military in relief operations has some impressive examples, such as the 1948-49 Berlin airlift, a specific military function between the ‘war time’ and ‘peace time’ has been established in both NATO and Warsaw Pact countries – the ‘civil defence.’ On one hand, this has been the mechanism to engage the huge capacity of the armed forces in support of civil authorities and local population in any emergency. The term ‘defence’ in this case is more related to ‘protection’ and ‘support’ than to the wartime defence of the nation.

On the other hand, ‘civil defence’ has been seen as an instrument to dilute the boundary between long peace life and the potentially rapid transition to war in public psychological and organisational aspects. Despite the formal differences between the Cold War communist states and the Western

¹³⁰ Thomas Hobbes pointed to the role of “the sovereign” as a ruler who takes responsibility to protect subordinated people – whether they want that or not. See Thomas Hobbes, *Leviathan* (Cambridge; New York: Cambridge University Press, 1996), pp. 115-122.

¹³¹ B.K. Chaturvedi, *Kautilya’s Arthashastra* (Dimond Pocket Books, 2001), p. 128. Quoted also by Brig. P.K. Mallick in his 2007 article “Role of the Armed Forces in Internal Security: Time for Review,” *CLAWS Journal* (Winter 2007).

¹³³ Mallick, “Role of the Armed Forces in Internal Security: Time for Review,” p. 68.

nations, in both the defence against military aggression has been seen as ‘traditional’ role of the armed forces, while all other roles have been qualified as ‘non-traditional’ or ‘supporting’ roles.¹³⁴

Since the end of the Cold War, the wider application of the concept of ‘comprehensive security’ has led to expansion of the non-traditional roles in both the external and internal domain. At the international arena, these are the variety of peace operations, some of them at the brink of a real war (the so called peace-making), military humanitarian missions including for post-conflict, natural disasters and pandemics support, as well as different forms of military partnerships and confidence and security building measures. Later, to the list was added the fight against international terrorism and related military interventions, along with engagements under the policy of ‘responsibility to protect.’¹³⁵

Internally, there is a trend of expanding the non-military roles of the national armed forces. A DCAF-sponsored study underlines that “Governments and societies have been contemplating the appropriateness of newly defined or previously mainly secondary purposes for their armed forces, which extend beyond their core role of national defence.”¹³⁶ The authors of that study identify the following groups of internal military roles:¹³⁷

Table 6: Internal roles and specific tasks performed by the armed forces.

Law enforcement-related tasks	Disaster assistance-related tasks	Environmental assistance-related tasks	Cross-over tasks	Miscellaneous community assistance
Public order Counterterrorism Border control Drug enforcement Law enforcement Crime investigation Support for major public events Building and personnel security Cyber operations Intelligence gathering	Domestic catastrophe response Disaster relief	Environmental protection	Search and rescue Training Monitoring Equipment and facility provision Miscellaneous maritime activities Scientific research	Examples include colour guard for parades; harvest support

Source: Albrecht Schnabel and Marc Krupanski, *Mapping Evolving Internal Roles of the Armed Forces* (Geneva: Geneva Centre for the Democratic Control of Armed Forces, 2012).

If one takes the disaster assistance role in focus, then again two general cases are identified. The use of military forces, or personnel and assets for international aid in cases of natural or man-made disasters is expanding in scope and form. In the first case, the engagement of military is necessary to provide security and vital service support to traditional humanitarian actors, for example the provision of transportation, theatre communications, air-evacuation, etc. In the second case, the militaries

¹³⁴ On a finer level of examination, definitions may be specific to individual countries.

¹³⁵ See the section “Responsibility to protect populations from genocide, war crimes, ethnic cleansing and crimes against humanity,” in 2005 World Summit Outcome, UN General Assembly Resolution A/RES/60/1, 24 October 2005, available at www.un.org/en/preventgenocide/adviser/responsibility.shtml.

¹³⁶ Albrecht Schnabel and Marc Krupanski, *Mapping Evolving Internal Roles of the Armed Forces* (Geneva: Geneva Centre for the Democratic Control of Armed Forces, 2012).

¹³⁷ Schnabel and Krupanski, p. 19.

have been assigned a major role in extremely dangerous humanitarian situations, such as the case of Ebola pandemics in Western Africa. The primary objective of humanitarian support and aid is to save lives, alleviate suffering, and maintain human dignity.

The trend of expanding military roles in international disaster response, relief and humanitarian operations is not supported unanimously. According to Charles-Antoine Hofmann and Laura Hudson from the British Red Cross

Humanitarian actors view these developments with a wary eye. In the US, the NGO consortium Inter-Action has raised concerns about the newly established US Command for Africa (AFRICOM), whose tasks include supporting humanitarian assistance. Growing interest within the European Union in deploying civil defence and military assets outside EU territory has prompted similar concerns. Critics of the military's involvement in relief claim that it is inefficient, inappropriate, inadequate and expensive, contrary to humanitarian principles and driven by political imperatives rather than humanitarian need.¹³⁸

As a result of such concerns, the international aspect of the military activities and the related impact on civil-military relations is fairly well studied and codified in terms of case-specific codes of conduct and field manuals.¹³⁹

The use of military for internal emergency response is the less controversial compared to all other forms of internal use of military as it meets the highest public demands about 'the role of the state in cases of people in trouble' and has indisputable political value. There is no country that explicitly restricts the use of armed forces in domestic emergencies. Just the opposite, as a rule, support to civil authorities is defined as one of the core doctrinal roles of the national military. Obviously, the countries within the scope of this study avoid the formula of 'civil defence' (the dominant idea of which is during the peacetime to make the population better prepared for war) towards 'civil protection' (with focus on the protection of the life and health of the people and their property as their constitutional citizen right).

'Civil protection' is defined as an effort at all levels of government and private actors to protect people, infrastructure, the functioning of central and local administration from hazards of a natural and man-made character. The determination of the respective military roles depends largely on a country's specific traditions, available emergency response capacities, national culture on volunteering and securing life and property, political-administrative organisation of the state, etc.

Despite the recent development, one principle is clearly followed in Europe: the country's system of civil protection is civilian-based and dominated, while the military has only a supporting role. The military could be neither the key factor for prevention and resilience, nor are they completely able to restore damaged technical and social infrastructure. Armed forces have a supportive role set in law, policy, and practice. The responsibility for response and for command in an emergency is for the civil

¹³⁸ Charles-Antoine Hofmann and Laura Hudson, "Military responses to natural disasters: last resort or inevitable trend," *Humanitarian Exchange Magazine* 44 (September 2009), quote on pp. 29-30.

¹³⁹ See for instance United Nations, *Civil-Military Coordination Officer Field Handbook*, version E 1.0 (10 March 2008); UN Office for the Coordination of Humanitarian Affairs, *United Nations Disaster Assessment and Coordination* (UNDAC Field Handbook), 6th ed., 2013; UNOCHA Publications on *Humanitarian Civil-Military Coordination*, available at www.unocha.org/what-we-do/coordination-tools/UN-CMCoord/publications; see in particular *Guidelines on the Use of Foreign Military and Civil Defence Assets in Disaster Relief* (Oslo Guidelines), rev. 1.1 (UNOCHA, 2007); USIP *Guidelines for Relations between US Armed Forces and NGOs in Hostile or Potentially Hostile Environments* (2007); Oxfam, *OI Policy Compendium Note on the Provision of Aid by Foreign Military Forces*, Update (April 2012).

authorities. Based on the international experience, the conceptual construct of the military involvement in civil protection may include:

- Legally defined rules of military operations at home;
- Military support provided upon the request of a civil authority, for concrete aims/ operation (there might be a few exceptions to this rule);
- The military provide what is required and what is possible;
- They operate under civil direction and management, remaining within their military chain of command;
- Military engagement is limited in time and should not lead towards building civil dependence on the military presence;
- All military operations are funded or reimbursed by the state budget or other sources.

However, even these principles of military involvement are under pressure. The first reason is the growing number of large and extremely dangerous disasters in which the military capabilities are used as first response. A second reason is the expanding list of new issues recently seen as threatening the civil domain, e.g. threats to cyber security, vulnerabilities of critical infrastructures, potential terrorist use of chemical, biological, or radiological agents, massive illegal immigration, etc. And third, there are various 'institutional' factors driving the growing interest of the military in responding to disasters: assisting relief efforts can improve the military's image and provide training opportunities, and may also be a way for the military to diversify their role at a time when armed forces throughout the European countries are experiencing budget cuts. With an increase in the incidence of natural disasters, national militaries can be expected to play a bigger role – particularly in large-scale disasters, where the capacity of civil authorities may be stretched.

From the military point of view, in the nations covered by the study, the conceptualisation of their 'new' roles, also in cases of emergency, is dominantly politically driven. Theoretically, even pacifists would probably admit that no one can respond as quickly and efficiently to a major disaster at home as the military. The proliferation of roles, different and distanced from those related to 'national defence' (deterrence, defence, offence), is related to doctrinal changes, additional equipment (not always relevant to the classical military roles), and new training (including in case-specific rules of engagement). When all these developments are well funded and gradually applied, the military experience the change as relevant to their culture and working style. When the addition of new military roles is limited to the approval of a doctrinal text, then the military face significant challenges in terms of motivation, legal arrangements of their activity and, most of all, the development of relevant capabilities.

Another important conceptual issue is generated by the fact that the engagement of (the European) military in emergencies at home is much more common, compared to their use in military combat operations at home or on European soil. The peacetime military air policing, maritime patrolling, combat training, etc. are not so 'visible' as is their support to civil authorities. This tendency is building a sense of politically and publicly driven rearrangement of the doctrinal military roles, despite that very rarely they are prioritised as 'first,' 'second,' 'third' role/mission, etc. Such thinking may affect the development of military capabilities (for example, obtaining specialised, emergency-relevant equipment instead of equipment required for combat roles), operations planning (any major disaster response requires deliberate planning and relevant training), ability to communicate and work with local authorities in cases when they are under existential threats and stress. The recent military en-

gements in emergency response operations (including ground, urban, air, and maritime search and rescue) already require country-specific land, naval and air capabilities, planning and training.

At the same time, any serious military preparations to support the civil authorities in emergencies raise scepticism whether this signals a ‘creeping militarism’¹⁴⁰ into the civilian culture and erodes the traditional civil democratic presumption that prevents authorities from using the military in home affairs in a manner, that makes society dependent on them. However, such discussions only demonstrate how important is the nation-specific, so-called disaster sub-culture and tradition. It represents the historical adaptations that societies made in order to cope with disasters. Those nations, that have developed within society self-sufficient capacity to survive in major disasters (including wars) are more prone to rely on civilian-based disaster management than on distanced state agencies; they see the military support as valuable, but mostly in cases of specific incidents (as CBRN threats¹⁴¹) and in providing immediate and large-scale logistic support (sheltering, transportation, water supply, etc.).

Nations that have less consolidated civilian capacity and have experienced failure in coping with severe disasters usually tend to follow more agency-based approach to disaster management; they view the military as a real asset that has been built on public expenditures and, consequently, has to be used to the maximum of their capacity. Although broadly applying international best practices in building a modern disaster management system, such nations tend to compensate internal civilian deficits by improvising with additional military roles. Therefore, it needs to be emphasised that successful implementation of best practices requires not only gathering comprehensive information for the formal side of other nations’ experience, but also understanding the respective organisational culture.

Obviously, the concepts and policies of using armed forces for civil protection in disasters and manmade incidents vary within the framework presented above, and they have been rapidly evolving since the end of the Cold war. Reflecting this tendency, a 2008 Venice Commission report underlines that, in the case of disaster response and relief operations, there are constitutions that explicitly regulate the use of the military, as those of Germany, Switzerland, and others. In other states, such as Denmark, even in the absence of specific constitutional provisions delineating the military’s role in domestic crisis situations, the Minister of Defence is authorised to instruct the armed forces to provide humanitarian assistance at home. Other legal systems authorise armed forces to take part in mitigating the effects of natural disasters and extraordinary threats to the environment, and to participate in search and rescue missions. Poland, Italy and Spain are among the countries with such legal acts. In the United Kingdom, the armed forces have the same powers and obligations as any citizen, to provide support when the civil power requires assistance in battling a disaster. Finally, some states, such as Spain, have special units within the armed forces to perform these assistance tasks.¹⁴²

As a general trend, modern national security concepts, part of which is disaster management, are expanding not only in scope. There is an obvious tendency of mixing the traditional focus on the attrib-

¹⁴⁰ Siobhan Morrissey, “Should the Military Be Called in for Natural Disasters?” *Time*, 31 December 2008, available at <http://content.time.com/time/nation/article/0,8599,1869089,00.html>.

utes of the state (sovereignty, independence, territorial integrity) with securing the functions that are vital to the society. Achieving a consolidated goal of providing “safety of population, security of society, sovereignty of state,”¹⁴³ requires a set of innovative decisions, including redrafting institutional roles (including those of the military), building a new framework for reinforcing the local authorities by the state, achieving a higher level of interagency collaboration, planning and multiagency operations, implementation of the concept of resilience, and systematic efforts to develop relevant civil security culture.

¹⁴³ On the example of Finland’s *Strategy for Securing the Functions Vital to Society* (2006), available at http://www.defmin.fi/en/publications/strategy_documents/the_strategy_for_securing_the_functions_vital_to_society_2006.

2 Legal framework of using armed forces for domestic disaster response and relief

Provision of support to civilian authorities in natural and manmade disasters is a non-armed mission for the national military. From a societal point view, such support is vital and it should be provided in case of any need. From a legal point of view, the domestic use of armed forces may raise constitutional concerns and debates, depending on the country-specific constitutional paradigm, security culture, and historical experience.¹⁴⁴

The core issues at stake are the principle of non-domestic use of armed forces and the delimitation of jurisdiction among various governmental agencies. By definition, any use of armed forces for domestic civil protection should respect the protection of the democratic fundamental values and political liberties. In practice, the policy of securing society can easily harm the freedom of citizens. Likewise, the priority of liberal democratic traditions can create obstacles to undertaking effective security measures.

In order to overcome these obstacles, some nations have decided to introduce specific texts in basic laws and thus to establish the chain of responsibilities and command in exceptional circumstances, other than war. Other countries have introduced specific parliamentary acts to provide a framework, mandate and decision-making procedures on domestic use of armed forces and the respective operations. Usually, these are emergency management laws, or laws about the status of the national military or, in some cases, the police. In some countries included in the study, such decisions are mandated to the executive power under parliamentary control. No matter what the case is, the norms on using armed forces respect relevant international norms or standards, in particular the principle of democratic control over domestic operations of the military.

2.1 International norms and standards

There are no international regulations addressing specifically the roles of armed forces. Nevertheless, several intergovernmental organisations have adopted documents, which include provisions for or limitations on the role of armed forces in terms of permissible and non-permissible operations.

The most widely recognised source of detailed international norms on missions and roles of armed forces is the OSCE's *Code of Conduct on Politico-Military Aspects of Security*.¹⁴⁵ The Code stipulates that while each State is free to choose its own security arrangements, they must be in accordance

1.1.1.1.1 ¹⁴⁴ See, for example, UK Parliament's *Constitutional arrangements for the use of armed force*, available at www.publications.parliament.uk/pa/ld201314/ldselect/ldconst/46/4606.htm; Elizabeth Ward, *Call Out the Troops: an examination of the legal basis for Australian Defence Force involvement in 'non-defence' matters*, Research Paper 8 1997-98, available at www.aph.gov.au/About_Parliament/Parliamentary_Departments/Parliamentary_Library/pubs/rp/RP9798/98rp08; Scott R. Tkacz, "In Katrina 's Wake: Rethinking the Military's Role in Domestic Emergencies," *William & Mary Bill of Rights Journal* 15, no. 1 (2006), Article 11, available at <http://scholarship.law.wm.edu/wmborj/vol15/iss1/11>.

¹⁴⁵ *Code of Conduct on Politico-Military Aspects of Security*, DOC.FSC/1/95 (Budapest: Organisation for Security and Co-operation in Europe, 3 December 1994).

with international law and OSCE Commitments (Art. 10). With regard to internal security, the armed forces' missions need to be in conformity with constitutional procedures, under the effective control of constitutional authorities and subject to the rule of law (Art. 36).

In 2005, the Parliamentary Assembly of the Council of Europe adopted *Recommendation 1713/2005* that called upon Council of Europe Member States to adhere to the principles of democratic oversight of the security sector, including intelligence services, police, border guards and the armed forces. With regard to the armed forces, the Recommendation stipulates that, "National security is the armed forces' main duty. This essential function must not be diluted by assigning auxiliary tasks to the armed forces, save in exceptional circumstances."¹⁴⁶

Solidarity is one of the normative, institutional, and psychological pillars of the European Union. In accordance with the Solidarity Clause of the Treaty of Lisbon (2009, Title VII),¹⁴⁷ the Union and its Member States act jointly in the spirit of solidarity if another Member State is a subject of a terrorist attack or a victim of a natural or manmade disaster and, as a result, requests assistance (Art. 188R). First, the Union shall mobilise all the instruments at its disposal, including the military resources made available by the member states. Secondly, the other member states shall provide assistance upon the request of the political authorities of a Member State. Thus, the obligation for mutual assistance is one of the engines of the collective security within the Union and its Common Foreign and Security Policy. In accordance with this obligation, any member country not only has the opportunity to receive aid and assistance in case of a serious security threat or emergency, but also should take obligations to establish capabilities to provide and receive assistance. The EU's Crisis Co-ordination Arrangements (CCA) have been designed for situations in which a crisis is so far-reaching or politically significant that, to manage it, the co-ordination of EU measures is required and the regular decision-making procedures of the Council cannot be employed, for example due to time pressure.¹⁴⁸ The CCA guarantee the EU's joint situational picture and determine how the EU bodies and Member States co-operate in a situation where two or more Member States face a disaster or an emergency situation (including terrorism-related situations). The presidency of the EU activates the coordination mechanisms after negotiating with the Member State(s) involved. Being the contact point for the Crisis Co-ordination Arrangements, concrete measures are taken by the Situation Centre (SitCen) of the Council.¹⁴⁹

NATO has established procedures for Cooperation for Disaster Assistance in Peacetime since 1953, applicable only between the member countries.¹⁵⁰ In December 1992, the North Atlantic Council agreed that, upon a request to provide disaster assistance by a relevant international organisation, NATO should be ready to employ these procedures also in case of a disaster outside NATO's bounda-

ries. Consequently, the NATO Policy on Disaster Assistance in Peacetime was revised, and the following modalities for assistance to NATO-member countries have been agreed:¹⁵¹

- If a country outside the Alliance requires assistance, arrangements normally would be a matter between the assisting member country and the stricken country. However, the assisting member country, having obtained information on the requirements of the stricken country, should communicate this information and information on the assistance given to the member countries and the Secretary General through the Alliance-wide communications systems;
- Similarly, an international organisation acting with the consent of a stricken country outside the Alliance may contact the Secretary General requesting assistance. In such cases the Secretary General will activate the necessary elements of the International Staff to take steps to urgently promote the necessary assistance. The Civil Emergency Planning (CEP) of NATO also aims to support the core functions of the Alliance.

In addition to the Oslo Guidelines, the United Nations Office for the Coordination of Humanitarian Affairs (OCHA) provides an extensive reference guide for members of UNDAC teams before and during a mission to a disaster or emergency that presents, *inter alia*, principles and mechanisms of coordination of military and civilian assets.¹⁵²

2.2 Constitutionally determined disaster response and relief missions of the military

Throughout the countries under review, there are different forms of constitutional arrangements of military engagements in domestic disaster response. Some—Germany, Italy, Poland, The Netherlands, Austria and others—regulate the overall internal security and protection roles of the military.

However, the examples bellow illustrate that other constitutions directly prescribe some supporting disaster management roles to the military and even determine the types and scale of disasters in the response to which they might be engaged. In some cases, the constitutional courts (or relevant institutions) have made decisions that expand or clarify the range on military domestic arrangements.

Examples:

- The Constitution (The Basic Law) of Germany and its interpretations in the last decade are illustrative of the recent trend towards expansion of the domestic roles of the military. It provides regulations on how assistance to the local authorities during disasters shall be provided. Article 35 (2) stipulates that “in order to respond to a grave accident or a natural disaster, a *Land* may call for the assistance of Police Forces of other *Länder* or of personnel and facilities of other administrative authorities, of the Armed Forces, or of the Federal Border Police.” The same article, paragraph (3) is even more concrete, determining that “If the *natural disaster* or accident endangers the territory of more than one *Land*, the Federal Government, insofar as is necessary to combat the danger, may instruct the Land governments to place police forces at the disposal of other *Länder*, and may deploy units of the Federal Border Police or the *Armed Forces* to support the police. In this context, the measures taken by the

¹⁵¹ NATO Civil Emergency Planning, *NATO’s Role in Disaster Assistance*, Second edition (Brussels: Euro-Atlantic Disaster Response Coordination Centre, 2001).

¹⁵² See section D.5 “Civil Military Coordination” in the UNDAC Field Handbook, 6th edition (UN Office for the Coordination of Humanitarian Affairs, 2013).

Federal Government shall be rescinded at any time at the demand of the *Bundesrat*, and in any event as soon as the danger is removed.”¹⁵³ The further interpretation of this article and its overall paradigm illustrates the observation made earlier in this report that under the pressure of the on-going expansion of unexpected threats and growing number of disasters of natural and manmade origin the nations and their judiciary elites are willing to emancipate from the Twentieth century legal frameworks and expand the use of national military. According to Justus Leicht, in 2012, six years after ruling that the use of the military for domestic purposes was unconstitutional, the Supreme Court has allowed the use of weapons during army deployments inside Germany. The court interpreted Art. 35 (quoted above) to permit the armed forces to intervene in any case involving “damage of catastrophic dimensions.”¹⁵⁴

- In Poland, the Constitution determines the role of the armed forces in a ‘conservative’ manner: “The Armed Forces of the Republic of Poland shall safeguard the independence and territorial integrity of the State, and shall ensure the security and inviolability of its borders” (Art. 26, 1).¹⁵⁵ However, the Constitutional Court (*Trybunał Konstytucyjny*) in 2000 has decided that such definition does not exclude that the armed forces may have important role for the internal security, “although their involvement here might turn out to be of an auxiliary character.”¹⁵⁶ Article 3(1a) of the Defence Act, added in 1997, stipulates that the armed forces may take part in combatting the effects of natural disasters and extraordinary threats to the environment, and in search and rescue missions.¹⁵⁷ Further, the Statute on the Deployment of Polish Armed Forces Abroad permits the forces to take part in rescue, search and humanitarian missions.¹⁵⁸
- Italy follows a policy of comprehensive use of armed forces and Carabinieri for domestic security and protection purposes. The basic law stipulates just that “[t]he defence of the country is a sacred duty for every citizen.”¹⁵⁹ The armed forces are expected to guarantee their support to the national civil protection service in all emergencies. The military is ready to intervene in cases of disaster, always under military command, but under the overall responsibility and coordination of the civilian authority in charge of the rescue operations. For that reason, a number of military personnel are permanently deployed within the Department of Civil Protection. They are responsible for planning and operations in specific fields such as air operations in case of forest fires and maritime operations in case of emergencies at sea.
- As in Poland and Italy, the Constitution of The Netherlands defines the armed forces roles so broadly that the text hardly places any limitations on the use of the military: Article 97 declares that “1. There shall be armed forces for the defence and protection of the interests of

¹⁵³ Basic Law of the Federal Republic of Germany, as of October 2010 (Italics added by the authors).

¹⁵⁷ *Ibid.*, p. 37.

¹⁵⁸ *Ibid.*, p. 38.

¹⁵⁹ Constitution of the Italian Republic (Roma: Senato della Repubblica, n.a), Art. 52.

the Kingdom, and in order to maintain and promote the international legal order.”¹⁶⁰ Based on this legal set-up, it is the Minister of Defence who, elaborating the constitutional text, sets out the main tasks of the Dutch armed forces in the following way:¹⁶¹

- Protecting Dutch and Allied territory, including the Caribbean parts of the Kingdom;
- Promoting stability and the international rule of law;
- Supporting civil authorities in upholding the law and providing disaster relief and humanitarian assistance, both nationally and internationally.

According to the Defence Doctrine, “this list is not hierarchical: the tasks are equal and must be executable at all times. The likelihood that a certain task will need to be executed may vary considerably over time.”¹⁶² Within such a legal framework, the Dutch armed forces have a comprehensive role in the national civil protection policy and operations in cases of shortfalls in the capacities of civil organisations. The core military domestic operations include emergency relief, search and rescue, along with security and enforcement of public order. The Defence Doctrine explains that “In doing so, the armed forces have developed into a structural security partner to the police, fire service and medical services in accidents and disasters. In principle, the whole of the armed forces is available for this third main task, which also includes a number of routine activities, such as explosive ordnance disposal, coastguard operations in the North Sea, ...” (Art. 3.4.3). The core principle in providing military assistance to the civilian authorities in cases of natural and manmade disasters is that it always has to be a civil authority’s request for support (usually, by the chairperson of the security region), addressed to the key horizontal emergency co-ordinator – the Minister of Security and Justice, who will then investigate the way the support shall be provided. If there is no other civil agency available and capable to provide the required support, then it could be addressed to the Minister of Defence and the CHOD can then act on the Minister’s behalf in deciding whether to provide military assistance (Art. 3.5.2).

- The Austrian Federal Constitution subscribes to the concept of “universal national defence. Its task is to preserve the Federal territory’s outside independence as well as its inviolability and its unity, especially as regards the maintenance and defence of permanent neutrality.”¹⁶³ The military defence of Austria is conducted on the principles of a militia system, while in addition to the typical defence mission the federal military are obliged “to render assistance in the case of natural catastrophes and disasters of exceptional magnitude.”¹⁶⁴ The same article, paragraph 5, provides opportunity for the military, acting on a decision the Minister of Defence (as determined in the Defence Law), to undertake interventions on its own initiative for the purposes of civil protection against natural and other disasters and catastrophes. Such interventions are “... admissible only if circumstances outside their control have put it beyond capacity of the competent officials to effect intervention by the

¹⁶³ Federal Constitutional Law, Art. 9a(1). See Austrian Federal Constitutional Laws (selection), p. 10.

¹⁶⁴ *Ibid.*, Art. 79, para. 2.

military and irreparable damage [for] the community at large would arise from a further wait...” (Art. 79, para. 5).¹⁶⁵ Under these constitutional arrangements of the internal tasks, the Austrian Armed Forces furthermore have to:

- Protect the constitutionally established institutions and the democratic freedoms of the population;
- Maintain order and security inside the country;
- Render assistance in the case of natural catastrophes and disasters of exceptional magnitude.¹⁶⁶

It can be inferred from these legal arrangements, that the legislator has left the determination of what means ‘exceptional magnitude’ to the executive decision-maker. From a legal point of view, experts like G. Nolte, H. Krieger, H. Prantl, and R. Gaier assume that such lack of clarity may lead to irrelevant use of the armed forces for domestic purposes.¹⁶⁷ However, from the point of view of civil protection policy, such ‘freedom’ provides options for more relevant decisions as the assessment of ‘exceptional magnitude’ is set in a local context: in one area, ‘exceptional’ could be an event with much smaller magnitude than that of another area, but the danger for the people could be similar.

- The Constitution of Croatia provides legal ground for domestic disaster response missions of the armed forces: “In the circumstances provided by Articles 17 and 100 of the Constitution, the armed forces may, if the nature of jeopardy demands so, be used as assistance to police and other governmental bodies.”¹⁶⁸ According to the same article “The armed forces of the Republic of Croatia may also be deployed to assist fire fighting and rescue operations and surveillance and protection of the rights of the Republic of Croatia at sea.”¹⁶⁹ The other related key Croatian legal acts on military roles in cases of disaster response and relief—the *Protection and Rescue Act* and the *Law on Defence*—provide the legal framework reflecting the principle that the military participates in protection and rescue activities if called upon by competent authorities, in cases where the available civilian protection and rescue resources are not sufficient. The capacity of the armed forces is seen as supporting, and their operations in protection and rescue should be co-ordinated with the Ministry of Internal Affairs and Administration.¹⁷⁰

2.3 Domestic military missions defined by laws and other acts

In almost all countries subject of this review, the armed forces provide support to the civilian authorities and the population in response to a range of natural and manmade disasters. The arrangements are either expressly permitting (through constitutional provisions, statutes or governmental acts) or not explicitly prohibiting performance of these tasks by the military. The focus of the legal

¹⁷⁰ *Protection and Rescue Act*, Art. 8, available in Croatian at <http://www.duzs.hr/page.aspx?PageID=604>.

acts is usually on manmade and natural disasters, including biological disasters. The type of activities of the armed forces in case of disasters can be relief operations in cases of natural disaster and humanitarian catastrophes, or assistance in case of biological disasters.

From a legal point of view, the armed forces are part of the executive structures of the state. Respectively, the roles of armed forces in safeguarding national security and defence are decided either through constitutional arrangements, by specific laws (commonly laws on defence, on the armed forces, or on emergency management/ disaster protection act) or by executive decisions.

In most of the countries under review, the constitutional arrangements on deploying the armed forces are relatively frugal. In practice, such arrangements actually provide a wide range of opportunities to the members of parliaments to regulate the domestic use of armed forces for everything they view as important and relevant. These regulations could be in the form of specific defence or emergency laws, parliamentary decisions, or approval of executive documents such as security strategy, military strategy, crisis management concept, or defence (military) doctrine. Any parliamentary decision should be in line with the constitution and, obviously, not be challenged by the Constitutional Court. As the legal experts Nolte and Krieger explain, in such legal environment it is less clear whether a law or another Parliamentary act is in accordance with the constitution, which may provoke “significant and very diverse debate” on the limits of employing the of military, militarisation of societies, the spirit of the constitution, respect of democratic freedoms, etc.¹⁷¹

Examples of evolving roles of the armed forces in the domestic affairs and emergencies illustrate this statement:

- In France, no pertinent constitutional or parliamentary act determines the role of the national military in domestic affairs. However, the Defence White Paper (issued by the President in 2013) declares, “[t]he engagement of the armed forces to support homeland security and civil security in the event of a major crisis could involve up to 10,000 personnel from the land forces, together with appropriate resources provided by the navy and the air force.”¹⁷² The White Paper also determines the National Gendarmerie, as an armed force under the operational control of the Ministry of Interior, to be able to “... respond rapidly to crisis situations or natural disasters, and it can therefore be deployed alongside the armed forces.”¹⁷³ As a recent development in France, the national-level of domestic crisis management is consolidated in the General Secretariat for Defence and National Security and the Inter-ministerial Crisis Centre (under the leadership of the Prime-Minister). Providing thus civilian and political control, the armed forces will act in a crisis situation at the request of the civilian authority, under military command, to support or supplement the internal security forces (police and gendarmerie, fire brigade and civilian security organisations).¹⁷⁴
- In Denmark, there are no specific constitutional provisions to delineate the military’s role in domestic crisis situations. Article 7 of the Defence Act, however, stipulates that “the Defence Forces, according to the specified decision of the Minister of Defence and after negotiations

¹⁷¹ Georg Nolte and Heike Krieger, “European Military Law Systems: General Comparative Report,” in Georg Nolte, ed., *European Military Law Systems* (Berlin: De Gruyter Recht, 2003).

¹⁷² *French White Paper on Defence and National Security*, foreword by François Hollande, President of the French Republic (2013), p. 86.

¹⁷³ *Ibid.*, p. 92.

¹⁷⁴ *Ibid.*, p. 104.

with other ministers involved, be allowed to undertake other tasks.”¹⁷⁵ Thus, the military can support the Police and the Danish Emergency Management Agency if a serious accident or a catastrophe strikes Denmark.¹⁷⁶ This article introduces the interpretation that despite the existence of particularly explained tasks,¹⁷⁷ under direct executive decision the armed forces may take action within the domestic civil protection domain. The Danish concept of ‘total defence’ actually means *collective emergency preparedness* with the aim “to ensure an efficient and coordinated effort by its combined resources in connection with crises, catastrophes, or other major incidents. The purpose is to maintain vital public functions and to protect the lives and properties of the population.”¹⁷⁸ This means that the Minister of Defence is authorised to develop and use military capabilities in order to reduce the civil society’s vulnerability and to increase its robustness so that society is more able to resist potential new challenges and risks. The capacities for emergency management, including those of the Defence Forces, are expected therefore to be continuously adjusted in keeping up with societal developments. This allows the Minister of Defence to determine tasks of the Ministry of Defence, in addition to the once defined by Law, as the following:

- Monitoring of maritime traffic and maritime environment;
 - Rescue services and handling of pollution at sea;
 - Assistance to the police;
 - Assistance to fire and rescue services at both national and municipal levels.¹⁷⁹
- Likewise, in Belgium no constitutional or other legal prescriptions exist in relation to the provision of military support to civil authorities in domestic emergencies, but the armed forces might be used in exceptional cases when civilian capacity is not sufficient. According to the Ministerial Circular NPU-1 of 26 October 2006, whenever civilian means are exhausted, military support can be considered and requested through the competent authority. In case of a municipal level of emergency, an agreement by the governor is compulsory.¹⁸⁰
 - The language of Spain’s Constitution of 1978¹⁸¹ clearly distinguishes the armed forces from the forces of public order, i.e. the Civil Guard and the Police, which had been treated as part of the armed forces under the applicable organic law of the Franco regime. Article 8 of the democratic constitution states that “1. The Armed Forces, consisting of the army, the navy, and the air force, have as their mission the guarantee of the sovereignty and independence

¹⁸⁰ European Commission, “Belgium - Emergency planning,” in *Vademecum – Civil protection*, available at http://ec.europa.eu/echo/files/civil_protection/vademecum/be/2-be-2.html.

¹⁸¹ Constitution passed by the Cortes Generales in plenary meetings of the Congress of Deputies and the Senate, and ratified by referendum of the Spanish people in 1978.

of Spain, the defence of its territorial integrity, and the constitutional order.”¹⁸² Article 30 provides ground for co-operation between the military and the civil protection system in cases of natural and manmade disasters. It stipulates that citizens have the right and the duty to ‘defend Spain’ through a military or civilian service, and further that the “duties of citizens in the event of serious risk, catastrophe or public calamity may be regulated by law.”¹⁸³ In response to the new constitutional requirements, the 1980 *Organic Act on National Defence* stipulated that the Government shall arrange the contribution of whatever kind of resource that is necessary (human, material, etc., public or private), defined the concept of *civil defence*, and stated that the Armed Forces will cooperate at the request of civil authorities. An amendment of the same act in 1984 introduced the concept of *civil protection* and thus integrated the wartime civil defence with the peacetime civil protection functions. In this line of developments, a Royal Decree of 1996 established a new structure of the Ministry of Defence and defined the functions of the Defence Policy Directorate in relation to civil preparedness, civil emergency planning and the armed forces contribution to disaster relief operations. As a result, the role of the Spanish military for the civil protection has grown significantly not only from legal, but also from operational point of view. The establishment of special military formation (see Chapter 3.2) for provision of support to the civilian authorities in cases of emergencies has been the next step in the same direction. However, since 1984 legal regulations have been introduced to place decision making on domestic emergencies under full civilian control and to make the military only an operational body.

- In the Swedish Constitution, the national military is treated as “an instrument of the Government”¹⁸⁴ serving the purpose of “the defence of the Kingdom” and states that “The Government may deploy the armed forces of the Realm in accordance with international law to meet an armed attack against the Realm or to prevent a violation of its territory.”¹⁸⁵ However, as this statement relates more to the “external defence” and is linked to the Art. 51 of the UN Charter, an important role for determining the internal mission of the armed forces in support to the civil authorities in cases of emergencies is provided by the *Ordinance on Logistic and Material Support of the Armed Forces to Civil Authorities*.¹⁸⁶
- Finland’s Ministry of Defence and the Armed Forces’ role in disaster response and relief has been legally designated as the function of “supporting the other authorities.” According to the Government’s 2010 *Security Strategy for Society*, “these functions comprise executive assistance, participation in disaster response and support to an authority in providing assistance to another state.”¹⁸⁷ The Strategy requires that the armed forces develop and maintain readiness to provide support to the civilian authorities with the following key capabilities:
 - “Area surveillance capability;
 - Field communication systems;

¹⁸² Ibid. Section 8.

¹⁸³ Ibid., Section 30.

¹⁸⁴ The Swedish Constitution consists of four fundamental laws: the Instrument of Government, the Act of Succession, the Freedom of the Press Act, and the Fundamental Law on Freedom of Expression.

¹⁸⁵ The Instrument of Government, Chapter 15. War and Danger of War, Art. 13.

¹⁸⁷ Security Strategy for Society, Government Resolution 16.12.2010, p. 28.

- Search and oil spill recovery readiness on land and at sea;
 - Intelligence, analysis and decontamination of CBRNE;
 - Fire fighting;
 - Rescue and clearing;
 - Clearing of explosives;
 - Building of temporary bridges and roads;
 - First aid and evacuation;
 - Land, sea and air transports;
 - SAR by helicopters;
 - Guarding duties;
 - Accommodation and maintenance services; and
 - Expert assistance.”¹⁸⁸
- In the UK, the military tasking is determined at the doctrinal level ¹⁸⁹ under the following four generic headings: “Standing Home Commitments,” “Standing Strategic,” “Standing Overseas Commitments,” and “Contingent Operations Overseas.” The Standing Home Commitments tasks encompass the inter-department efforts to provide security and sovereignty at home. The military role in these efforts in regard to domestic security, or “Standing Home Commitments,” encompasses four military tasks, including “MT 2.1: *Military Aid to Civil Authorities*”:

Military Aid to Civil Authorities (MACA) covers the provision of military support to the civil power, OGDs (Other Government Departments) and the community at large. This support is provided on an emergency basis and fielded from irreducible spare capacity. Specialist capabilities are provided when requested by OGDs, including routine Explosive Ordnance Disposal (EOD), partially funded by the Home Office, and a major contribution to the Search and Rescue (SAR) cover for the UK. It also includes support to the maintenance of Government in times of crisis and conflict.¹⁹⁰

Defence contributes to the UK resilience through the provision of a number of guaranteed niche capabilities and a process of augmenting civil authorities and structures when civilian capacity is overwhelmed. The Ministry of Defence augments the capacity of civilian agencies responding to specific requests for a planned response or to a crisis. This means that augmentation by the military is not guaranteed and depends on the complex assessment of a concrete situation. MACA is subdivided into Military Aid to the Civil Community, Military Aid to the Civil Power and Military Aid to other Government Departments. In practice, military capabilities, generated for the implementation of other domestic military tasks as *Integrity of UK Waters* and *Integrity of UK Space* are routinely employed in support of the local civil authorities.

- The Irish Defence Forces have the role of aiding the Civil Power, which in practice means to assist, when requested, An Garda Síochána [the police force of Ireland], who have primary

responsibility for maintaining law and order, including the protection of the internal security of the State.¹⁹¹ They also participate in multinational peace support, crisis management and humanitarian relief operations in support of the United Nations. From time to time, the Irish Defence Forces may be tasked to conduct search and rescue; air ambulance service; assistance on the occasion of natural or other disasters; assistance in connection with the maintenance of essential services; assistance in combating oil pollution at sea.¹⁹² For example, in response to the 2004 Indian Ocean Tsunami, from January till March 2005 the Defence Forces deployed a team of specialist logistic officers to the United Nations Joint Logistics Centre in Sri Lanka and performed tasks in relation to road and transport assessments, gathering, compiling and disseminating information for all UN Agencies, foreign military and international non-governmental organisations.¹⁹³

- The Kingdom of Norway's Constitution does not specify internal roles of the armed forces. According to Article 25 of the Constitution, the control of the armed forces is among the King's prerogatives, in principle meaning that the Parliament (*Stortinget*) may not give directions as to how this authority shall be exercised. This power is in practice exercised by the Government and, within the Government, by the Minister of Defence. However, since the introduction of the principle of parliamentarism in 1884 (implying that the Government is depending on the continuing support of the Parliament), the Defence Minister is constitutionally and politically responsible to the Parliament for all activities carried out by the Ministry, by the armed forces as a whole and by other subordinated departments. Furthermore, the Government needs the authorisation of the Parliament to pass any new acts regarding the armed forces, as well as for the defence budget. The loose formulation of the purpose of the armed forces to defend Norwegian territory, people and interests provides a room for flexible interpretation.¹⁹⁴ Consequently, the main principle for crisis management is *the principle of responsibility*, which states that each ministry and government agency has a responsibility for internal security within its own field. In order to prevent unhealthy competition or gaps in assigned responsibility, the Ministry of Justice and Police provides horizontal co-ordination through the Directorate of Civil Protection and Emergency Planning. Norway's core emergency management organisation – the Civil Defence—is subordinated to the Ministry of Justice and the Police. Its current purpose is mainly to provide support activities in civil emergencies during peacetime, whereas previously its most important task was to protect against the dangers of war. Norway has no paramilitary or internal security forces. However, the Civil Defence personnel are uniformed and under the protection of relevant Geneva Conventions. The core tasks of the Norwegian military are to provide military defence and contribute to international peacekeeping missions. One of the nine tasks of the military, elaborated in the long-term defence plan,¹⁹⁵ is to “contribute to the safeguarding of public safety and other

central social tasks.”¹⁹⁶ The long-term defence plan also requires that “the size and equipment of individual elements shall take into account the requirement to provide support to the civil community.”¹⁹⁷ In this context, an extensive civil-military co-operation has been established between the Ministry of Defence and the Directorate of Civil Protection and Emergency Planning within the Ministry of Justice and the Police.

- The Romanian Armed Forces’ mission is “to guarantee the state sovereignty, independence and unity, territorial integrity and constitutional democracy.”¹⁹⁸ Their contribution to the national disaster response and relief preparations is based on deliberate and contingency plans that are co-ordinated by the civil emergency management authorities (under the control of the Minister of the Interior). The implementation of those plans and all necessary rapid reaction measures is organised and commanded by the Chief of the General Staff under the leadership of the Minister of Defence. All direct military engagements are co-ordinated with the Governmental Commission for Disaster Relief.
- Similarly to the Romanian case, the Constitution of Bulgaria determines a ‘classical’ role of the armed forces: “The armed forces shall guarantee the sovereignty, security and independence of the country and shall defend its territorial integrity.”¹⁹⁹ The Law on Defence and Armed Forces adds to defence and defence preparedness activities “... 9. Maintaining and using armed forces in disasters; 10. Participation in containing and/or mitigating the consequences of disasters.”²⁰⁰ The White Paper of Defence of 2010, as well as previous versions, elaborates a third mission of the armed forces “Contribution to the national security in peacetime,” that includes “maintaining capabilities of early warning for potential risks and threats; activities for control of the air and maritime space; operations for containing and neutralising terrorist, extremist and crime groups; protection of strategic sites; protection and support to the population in natural disasters, accidents, and environmental catastrophes; neutralising unexploded ordnance; provision of humanitarian assistance; contribution to migration control; rescue and evacuation activities; assistance, when necessary, to other state bodies, organisations, and local authorities, for preventing and overcoming the consequences of terrorist attacks, natural disasters, ecological and industrial catastrophes, and dangerous dissemination of infectious diseases.”²⁰¹ From policy point of view, the involvement of military capabilities and assets is formally seen as last resort, only in cases when the available civilian capacity is overwhelmed. In practice, however, the military are called to support disaster response fairly often, e.g. for aerial surveillance and reconnaissance, search and rescue from the air, provision of heavy transport vehicles in snow storms and heavy icing, etc.

- According to the *Armed Forces Law* (2002), the Slovak military may be tasked to provide support to civilian authorities in emergency situations and in cases of introduction of state of emergency, to perform air search and rescue operations, and to provide air medical transport.²⁰²
- Although the system of protection against natural and other disasters in Slovenia is separated from the defence system and is non-military in nature, the Slovenian armed forces can also participate in protection, rescue and relief tasks in cases, where available civilian forces and resources are insufficient. Among the examples is the participation of the airborne unit with helicopters in mountain rescue operations and the contribution to fighting forest fires. The participation of the armed forces has to be approved by the Minister of Defence on the initiative of the Civil Protection Commander of the Republic of Slovenia.²⁰³
- The Constitution of the Czech Republic stipulates that the government shall decide on dispatching Czech military forces outside the territory of the Czech Republic for “... c) participation in rescue operations in case of natural, industrial and ecological disasters,”²⁰⁴ but does not regulate the internal use of the armed forces for similar purposes. However, since the basic law does not constrain the use of the military in such cases, the *Military Strategy of the Czech Republic* (2012) determines the mission of the military in support of the civil authorities in emergency situations in the following manner: “The Armed Forces of the Czech Republic may support national civilian authorities on the state’s territory in the framework of the Integrated Rescue System (IRS), particularly in the consequence management of large-scale natural disasters and industrial or environmental incidents. In cases when the internal security and security of citizens are under serious threat, the Ministry of Defence may assign forces and assets in order to support and reinforce the Police of the Czech Republic (PCR). To that effect, forces are assigned to the extent necessary and subject to their availability. In principle, the entirety of the Armed Forces of the Czech Republic, including the Armed Forces’ Active Reserve Force, may be used in support of the IRS and PCR.”²⁰⁵
- In Estonia, the *Estonian Defence Forces Organisation Act* (2009) determines one of the functions of the Defence Forces as “... 4) participation in the resolution of a state of emergency and an emergency situation and the ensuring of the security on the bases of and pursuant to the procedure provided by law.”²⁰⁶ The Law also explicitly states that such assistance could be provided only if the police forces are not able to operate or their capacity is insufficient. The internal military mission of support should be performed without using direct coercion in any form.²⁰⁷

²⁰⁶ Estonian Defence Forces Organisation Act, passed 19 June 2008, Art. 3(1), point 4.

²⁰⁷ Ibid., Article 3(4).

- The legal arrangements on the domestic use of the armed forces of Latvia are defined by the *National Armed Forces Law* (1999).²⁰⁸ Accordingly, the national Armed Forces should provide support to “[...] 2) the system of civil protection – in preventive and reactive measures, in measures for the elimination of consequences caused by emergency situations, as well as rescue and search operations.”²⁰⁹ Another article of the Law provides details on the military ‘measures’ that might be undertaken by the armed forces in the following way: “[...] 3) destroy explosive devices; 4) perform coast guard functions, co-ordinate and perform human search and rescue operations at sea, eliminate the effects of accidents occurred at sea, participate in ecological surveillance and control of the navigation regime.”²¹⁰ And at the ‘highest’ level, one of fundamental tasks of the armed forces is determined as “the participation in the prevention of situations that constitute a threat to the State in accordance with the procedures specified in regulatory enactments.”²¹¹ Paragraph 2 of the same article makes an open statement that “[...] the units (sub-units) of the National Armed Forces may become involved in the performance of other tasks not provided for in this Law by an order of the Cabinet.”²¹²
- In Lithuania, the *Law on the Organisation of the National Defence System and Military Service* stipulates that “1. The principal tasks of the Army in peacetime shall be: [...] in the cases specified by the law, provide assistance to other state and municipal institutions.”²¹³ In the elaboration of functions of the paramilitary volunteer force, the Law determines one other function as, “training of volunteer servicemen, preparation of elements of the Volunteer Forces for defence within their own territory and for the performance of joint defence tasks, protection of the defence infrastructure and strategic objects, assistance in the event of natural disasters and calamities.”²¹⁴
- In Portugal, the key civil protection role is dedicated to the National Republican Guard (NRG) – a formation with military status and organisation (similar to Carabinieri and Gendarmerie), which operates under the Minister of Interior’s control in any situation except war or military crisis. Among others, one of the NRG’s principal missions is to “aid and protect the citizens as well as defend and preserve the goods which are found to be in a dangerous situation, due to causes originating from human actions or acts of nature.”²¹⁵ Performing this mission, civilian organisations and the military cooperate in the following areas:
 - Forest fire-related activities (prevention, fire-fighting support and post-fire activities);
 - Reinforcement of civil personnel in health and medical emergencies;
 - Search and rescue;

- Logistical support for operations;
- Infrastructure rehabilitation;
- Terrestrial, aerial and maritime reconnaissance activities.²¹⁶

In terms of organisation, the NRG is built into three hierarchical levels, with 20 district commands, 128 detachments and 534 units. It has also a reserve unit, organised and prepared, among others, for K-9 intervention,²¹⁷ search and rescue, and explosive ordnance disposal and underground security.²¹⁸ The NRG has a total staff of 24,736 military and 1,111 civilians, who carry out their missions throughout 94 percent of the national territory accounting for 53,8 percent of the population.²¹⁹

- Greece and Turkey are between the few countries covered by the study assigning a lesser role of the armed forces in disaster response and relief, as prescribed in legislation. In practice, the military contribution in both countries is essential in a variety of cases, but respective decisions are made ad-hoc, via legal or governmental acts. In the aftermath of the August 1999 earthquake, the Turkish Armed Forces made the decision to form a battalion-size search and rescue unit subordinate to Special Forces Command with the intent to better cope with large-scale natural disasters. The special unit is called 'Natural Disasters Search and Rescue Battalion' (see Chapter 3.2 below). Logistics support in crises is provided through a number of sources, including private logistics providers, non-governmental logistics providers and military logistics support. The Turkish Armed Forces, for example, maintain logistics support coordination centres to ensure timely response in the event of emergencies. During the Lake Van earthquake in 2011, military aircraft were made available for delivering SAR forces and other rescue workers, equipment and aid (e.g., blankets, tents, etc.). Military support is anticipated in all provincial plans for all emergency situations, as foreseen in the relevant regulations.
- In Israel, the Home Front Command operates in various emergency situations, specialising in civilian protection to save lives. In emergencies, this Command operates to its fullest capabilities, using all its resources in order to instruct the civilian population on how to cope with the threats facing Israel. The Home Front Command operates search and rescue missions in Israel and around the world, aiding in rescue and recovery from incidents such as terror attacks, floods, conflagrations, etc.²²⁰

3 Organisation for using armed forces in domestic disaster response and relief

3.1 Models of military employment in disaster response operations

In most countries, disaster response and relief capacities are spread across different agencies and levels – national, regional, and local. Disaster management or civil protection agencies, medical emergency services, firefighting brigades, police forces, armed forces, business emergency units, volunteer organisations and specialised NGOs can contribute capabilities to emergency response depending on the nature of the crisis and their institutional structures and mandate.

Central governments need to be able to scale up emergency response capability to react in a timely manner since many current emergencies are complex, often broader than initially anticipated and with multiple effects. To cope with these challenges, the regions and municipalities need reinforcements to their own capabilities. In many countries, additional national emergency forces are specifically trained and equipped to provide ‘surge’ capacities. Effective co-operation is an issue of legal arrangements, depends also on inter-agency planning, standardised procedures, and interoperability of the equipment and command and control systems.

In all countries in this review, the armed forces play an important role in domestic disaster response and relief, particularly during large-scale natural disasters, industrial catastrophes and incidents related to the spread of specific dangerous agents, e.g. chemical, biological and radiological. Due to their special expertise, equipment and high operational readiness, they might be called upon in the first line of responders or to reinforce the core civilian forces.

The experience in disaster response and relief of the countries under review is quite comprehensive and bounded with variety of different political, institutional, operational, etc. factors. Some researchers find controversy in the very use of armed forces for civil protection, asking to what extent the military engagement in domestic civil affairs is appropriate.²²¹ Obviously, the practice of an individual country on the use of the military is affected by a combination of normative dynamics and specific interests, positioning it distinctly along the civilian-military power continuum or civil-military relations.

The following typology of the employment of military units and assets in cases of domestic natural and manmade disasters is based on the UK document *Operations in The UK: The Defence Contribution to Resilience*,²²² reflecting also the legal arrangement and military doctrinal documents of reviewed countries:

²²¹ See, for instance, David Etkin, Kenneth McBey, and Cliff Trollope, “The Military and Disaster Management: A Canadian Perspective on the Issue,” n.d., available at www.crhnet.ca/sites/default/files/library/Etkin.pdf.

²²² The Development, Concepts and Doctrine Centre, *Operations in The UK: The Defence Contribution to Resilience*, Joint Doctrine Publication 02 (JDP 02) (Shrivenham: Ministry of Defence, 2007), available at <http://www.army.mod.uk/documents/general/jdp02ed2.pdf>.

- *Military augmentation of civil authorities and forces.* This is a model where military has a supporting role. It is applicable when the country has a well-established multilevel (usually – national, regional and local) disaster response system with relatively large number of professional rescuers and volunteers. The use of the military might be based on deliberate planning or as ad-hoc immediate response, especially in cases when they are physically closer to the threatened area, than the civil protection forces. Popular roles are flood and fire fighting, debris clearance, post-disaster security and control. The guiding principle here is that military personnel should be used only to provide extraordinary services during the emergency and/or to supplement civilian units if there is a manpower shortage. In this case the military are operating under the control of civilian authorities, while preserving their own internal chain of command. The successful application of this model requires joint civil-military planning and training under variety of scenarios. Unified standards of operations are also required. A higher level of implementation of this model involves co-ordinated capability planning.
- *Deployment of military assets.* This is the most common model as it does not require specific legislation, planning and command arrangements. Military assets in this case are personnel (not units), individual means, specialised machines and equipment and various elements of typical military logistic kits, e.g. tents, blankets, stoves, equipment for water supply, electricity generators, etc. They could be provided together with personnel or simply delivered to the responsible authorities. All the operations in this model are led entirely by civilians. This model does not require joint planning and capabilities' development.
- *Systematic use of designated military units.* Development of special military units for disaster response, rescue and relief may have different reasons – traditions, a large territory, complex disaster relief in overseas territories, search for efficiency in the development of capabilities that are relevant in peacetime, crisis and war, a decision not to loose military capabilities during defence reforms and downsizing of personnel, etc. Among the most common cases are the use of military CBRN protection units for such type of crisis response and relief and military medical capabilities.

The military units might operate entirely under military command. Alternatively, the operational control can be delegated to the core national crisis management authority. In any case, they are between the first responders in emergency. In this model, the military units should be fully interoperable with the civilian disaster response structures in terms of doctrine, equipment and standard operating procedures. Some military units may perform permanent national civil functions as meteorological surveys, radiological control, production of geographic, geomagnetic, and hydrographic reference materials, etc.

- *Military responsibility for particular civil functions.* In some cases, the military are prepared to take over certain functions from civil authorities in emergency. Usually, such practice is a result of specific long-lasting capability developments, when it is considered more efficient to continue to provide these functions by the military rather than building a new civilian capacity. In other cases such arrangements may reflect the 'total defence' model. However, when the function is deliberately planned and legally regulated, it might be effectively applied. As a

general rule, if the respective decisions are made *ad-hoc*, such a mandate is not suitable for the military.

- *Use of the military in security and police roles.* This model is implemented in those national legal arrangements and policies that do not distinguish between military's domestic functions in providing public order and disaster response. In cases of large-scale disasters, pandemics or industrial accidents, one of the operational tasks is the isolation of the area in order to prevent marauding and spread of criminality. In other cases, local people enduring severe damages may react by violent anti-government actions. Both cases are sensitive, since the military might be provoked to use force against the citizens. Consequently, such practice requires legal introduction of an emergency statute that precisely determines the civilian-led chain of command, and the tasks and rules of engagement of the military.

This typology refers to the operational level of civil-military co-operation.²²³ At the 'upper' level is the civil-military co-ordination, i.e. the mechanism of crisis management decision-making, including on the use of armed forces.

3.2 Special military formations for disaster response

As already pointed out, the countries included in this review may have different reasons to establish special military units and even forces. However, usually key reason is immediate response (i.e. in less than five hours) by providing some essential services. The tasking, structure, equipment and training of the special military disaster response units are much closely co-ordinated with those of the other components of the national civil protection system than those of ordinary military formations. Their chain of command is adapted to civilian decision-making and management system. However, the special military disaster response units are, first of all, part of the national military, and should be able to take part in operations of the armed forces at any time, and without specific training or other adaptation (for example, instead of humanitarian search and rescue to conduct combat search and rescue).

From organisational point of view, the special military formations for disaster response have several common core components:

- Command and control;
- Communications and information;
- Specific support.

Their operations differ from typical military operations and may require specific training.

The units differ according to their range of operations and level of readiness, as well as their composition of professional, i.e. 'active duty,' and reserve staff. The presumption is that the critical support and services are provided by professional elements in all situations, quickly and effectively, and against a persistent threat the reserve elements increase both sustainability and performance of the assistance, provided to local people and the authorities.

²²³ Here, the term 'civil-military cooperation' differs from the CIMIC concept, which originally applies only to military interventions (humanitarian, peacekeeping, peace enforcement) abroad. See for instance Peter Rehse, "CIMIC: Concepts, Definitions and Practice," *Heft 136* (Hamburg: Universität Hamburg and IFSH, 2004).

Below we present examples of special military formations for disaster response from the countries under review.²²⁴

- After Spain suffered from a variety of massive natural disasters in the early 2000s,²²⁵ the Spanish Government decided in 2005 to establish a Military Emergency Unit (UME – Unidad Militar de Emergencias) as a new branch in the armed forces. The MEU is a permanent joint force, dedicated and highly specialised to intervene in emergencies in order to complement and reinforce the Spanish Civil Protection System. The unit maintains a high-level readiness for intervention and is deployable throughout the country and abroad. It is able to provide support in fighting fires, aiding in natural or environmental disasters (either natural or manmade) and situations of extreme hazard. Support will be primarily focused on sanitation, distribution of supplies, the establishment of infrastructures, surveillance of areas susceptible to environmental aggressions or ecological damages, and possibly clean-up and recovery. The UME's special capabilities provide for response to CBRN threats to the population.

According to a number of royal, legal and governmental acts, issued between 2005 and 2011, the Military Emergencies Unit may be deployed when any of the following emergency situations occurs:

- Emergencies that have their origin in natural hazards, including floods, earthquakes, landslides, extreme snowfall and other adverse meteorological phenomena of great magnitude;
- Forest fires;
- Emergencies, resulting from technological hazards, among which are chemical, nuclear, radiological and biological hazards;
- Emergencies, which are the result of terrorist attacks or illegal and violent acts, including those against critical infrastructures, dangerous installations or acts involving nuclear, biological, radiological or chemical agents;
- Environmental pollution;
- Any other act, upon the Prime Minister's decision.

The UME has five intervention battalions, located in Madrid, Sevilla, Valencia, Zaragoza and Leon, a support regiment, a CIS battalion, and a transportation battalion. The aviation component includes a helicopter battalion and 43rd Air Force Group with a mission for fire fighting and aviation search and rescue (To meet the mission, 43rd Group has 14 CL-215T and 3 CL-415 airplanes). The UME's HQ is at Torrejon Air Base (22 km from Madrid). The total number of personnel is up to 4000.

- For disaster protection purposes, the Bulgarian Military Medical Academy and its subordinate military hospitals maintain specialised Rapid Reaction Military Medical Team, based in Sofia, with 15 teams: 4 – surgery; 2 – resuscitation; 2 – therapeutic; 1 – toxicological; 1 – obstetrics- gynaecological; 1 – epidemiological; 2 – for infectious diseases; 2 – resuscitation

²²⁴ While Switzerland is not included in the study, the Swiss Armed Forces also maintain units in the Special Forces Command tasked to provide "protection and intervention in support of civilian authorities in Switzerland; ..." See <http://www.vtg.admin.ch/internet/vtg/en/home/themen/ksk.html>.

²²⁵ Catastrophes, such as the serious fire, which affected the province of Guadalajara in 2005; fires over thousands of hectares in Galicia in 2006; the sinking of the ship "Prestige," which blackened the Galician coast.

teams for aerial medical evacuation).²²⁶ The Team has also specialised transport vehicles (4 ambulances; 1 mobile treatment cabinet – therapeutic room; 1 mobile paediatric room; 1 mobile obstetrics- gynaecological room; 1 mobile surgery room; 1 mobile resuscitation room; 1 mobile dressing vehicle; 1 bus for sanitary evacuation. Each of the Academy regional branches in Plovdiv, Varna, and Pleven maintain 3 teams (surgery; resuscitation; therapeutic) with the respective specialised vehicles.

- Turkish Armed Forces Natural Disasters Search and Rescue Battalion (NDSAR) was established by a decision of the General Staff of May 31st, 2001 (after the August 17th 1999 earthquake) to carry out special tasks for natural or man-made disasters such as earthquakes, conflagrations, floods, avalanches, erosion; to conduct SAR missions for missing personnel; and take protective measures in cases of Chemical, Biological, Radiological and Nuclear (CBRN) attacks. NDSAR is equipped and trained to carry out any of its assigned missions worldwide. It is officially stated that NDSAR has conducted SAR tasks successfully at home and abroad regardless of the weather and terrain conditions and has the capability to accomplish any SAR mission in the future.²²⁷
- The National Search and Rescue Unit of the Israel Defence Forces placed under the Home Front Command is a highly skilled force trained to execute special search and rescue missions, both in Israel and abroad. The unit was founded in 1983, and its expertise is in rescuing people trapped under ruins. The unit is comprised primarily of reservists who are always on call, with prepared kits to enable immediate departure, and a small core of soldiers in mandatory service. In addition to the rescue teams, the unit employs doctors, engineers, operators of mechanical engineering equipment and handlers of rescue dogs. The unit is on-call 24 hours a day and is deployed whenever there is a disaster – an earthquake, tsunami, conventional or unconventional terrorist attack.²²⁸
- The Oketz ('Sting') Unit (K-9) of Israel Defence Forces is considered to be one of the most professional canine fighting forces in the world, both for their counter-terror methods and their treatment of dogs. Each soldier is partnered to a dog, which they train to sniff out explosives, track down terrorists and neutralise hostile threats. The soldiers go into the field with their canine partners and do everything together, from searching terror facilities to finding people under ruins.
- The Austrian Armed Forces have established in 1990 a Disaster Relief Unit (AFDRU), which is organised and trained for deployment abroad in up to 10 hours upon receiving an order. However, there are no constraints to the deployment of the unit in case of domestic emergencies. The tasks of AFDRU are varied and depend on the particular application. Its main tasks are search and rescue in urban terrain after earthquakes and treatment of drinking water after earthquakes and floods. Since AFDRU specialists (e.g. chemists, physicists, structural

²²⁶ Air transport is provided by other military units or companies.

²²⁷ See Natural Disasters Search and Rescue Battalion (NDSAR), available at www.tsk.tr/20_ingilizce_tsktr/3_general_issues/natural-disasters-search-and-rescue-sar.html.

²²⁸ Home Front Command, available at www.idfblog.com/about-the-idf/idf-units/regional-commands/home-front-command/.

engineers, crisis and emergency managers, doctors, technicians) are active in different fields, AFDRU can also respond well to exceptional events and take corresponding measure.²²⁹

3.3 Multinational disaster response and relief formations

Disaster management often requires equipment and expertise that not each country may obtain. In many cases, the speed of response is important in order to prevent further spill-over effects of the disaster. The international experience illustrates that in several large-scale disasters (as the Nepal earthquake in 2015²³⁰) and in very specific cases (as the Malaysian aircraft that went missing on 8 March 2014²³¹) the international military operations may bring disaster response capabilities of the required types and quality, and on time. This collaboration often makes the difference between success and failure during recovery operations.

Moreover, multi-national military formations for assistance in natural and manmade disasters, which started appearing recently, may be the prospective solution for a growing demand of specific capabilities for civil protection. They are established along common sources of risks such as big rivers, shared sea space or mountains, regular large forest fires, and others. The multinational formations provide mutually reinforcing capabilities and usually maintain high operational readiness. Examples of such formations include:

- TISA (TISZA) battalion's mission is the surveillance and urgent interventions in natural disaster situations along the Tisa River and participation in other disaster relief operations. Hungary, Romania, Slovakia and Ukraine are the contributing countries. National elements follow respective national laws and rules. A national contingent's staff of the battalion may not exceed 200 persons, and should be no less than 100 persons. The national contingents follow their national organisational structure and are stationed on the territory of their own state. They execute their tasks with their own equipment. In 2012, the chairman of TISA regional initiative Steering Group proposed that the multinational battalion's area of responsibility is extended also to the Danube River area during the next missions assigned. If the proposal of the Steering Group Chairman is seen as feasible and accepted by the member states, the importance of the regional TISA initiative would increase also by attracting new countries in the region. (Serbia was seen as a perspective member of the multinational battalion,²³² but, as of the writing of this report, the proposal has not been accepted by another country.)
- Germany, Poland and Denmark have developed comprehensive military co-operation since 1995. The ministers of defence of Denmark, Germany and Poland decided to establish a Danish-German-Polish military corps – Multinational Corps Northeast (MNC NE) –with Headquarters located in Szczecin, Poland. According to the trilateral Convention, "Within the limits of national constitutions and in accordance with the provisions of the Charter of the

United Nations, pursuant to the decisions taken by the competent national authorities, the Corps will be tasked: [...] to plan, prepare and on request to conduct humanitarian and rescue missions including natural disaster relief missions.”²³³

²³³ Convention between The Government of the Federal Republic of Germany, The Government of the Kingdom of Denmark, and The Government of the Republic of Poland on the Multinational Corps Northeast, 5 September 1998, Art. 3(1).

4 Specific military capabilities for domestic disaster response and relief

The country-specific method of building disaster management capabilities depends mostly on the construct of national security strategy and policy. An integrated approach to the national security sector is seen as more effective and efficient for capability management than the traditional single-department model.²³⁴ The building blocks of an integrated approach might include:

- A national security concept that integrates the security attributes of the state (independence, sovereignty, territorial integrity, etc.) with securing the vital functions of society;
- A national security strategy that provides consolidated management, employment, command and control throughout the entire 'conflict continuum' – peace, conflict, crisis, war, and post-conflict relief;
- Strategic management of the security sector based on co-ordinated organisations-specific aims, structures, standards of operations, and capabilities;
- A crisis management model based on balancing decentralisation and self-reliance with centralised leadership and reinforcement;
- 'Bounding' legislation²³⁵ and policy of its implementation that stimulate the national crisis response culture, building resilience, volunteerism and readiness to provide aid to others.

As it seen from the review, some countries are moving decisively on this path – Finland, Sweden, Italy, Norway, France, UK and others have made considerable progress in the last decade. These countries' approach to building cost-effective disaster response capabilities is based on a well-argued set of vital functions of the society and desired end-states, realistic threat scenarios, precise institutional tasking and co-ordinated capability development. Thus, nations aim to avoid both gaps and duplication already at the level of strategy and policy planning.

Critical for the disaster response relevant capabilities is also the transformation of former civil defence systems into ones for civil protection. The focus of civil defence is on wartime readiness, and what the system provides in normal, i.e. 'peacetime,' conditions is seen as of secondary importance. Civil defence requires complete centralisation, as this is a wartime function, and the principle of subsidiarity is not applicable. The focus of the civil protection system, on the other hand, is on the daily life of the people and these infrastructures and services that provide the vital societal functions. Such a system is expected to be decentralised to some degree through application of the principles of subsidiarity, mutual reinforcement and smooth transferability from normal towards crisis and wartime situations.

Surprising and severe natural and manmade disasters call for a massive co-ordinated reaction on a short notice. While the primary responsibility for disaster response lies with civilian agencies at local, regional, and state levels, military forces also have manpower, equipment, training and organisation

²³⁴ The value of the integrated approach is well illustrated by the recent UK Government decisions on national security. See, for example, *Fact Sheet 21: Coordinating Our National Security Approach*, available at https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/62503/Factsheet21-Coordinating-Our-National-Security-Approach.pdf.

²³⁵ And not 'prescriptive' legislation.

allowing them to strengthen the response, rescue and relief efforts. The degree in which their capabilities will be developed and utilised depends on the set of considerations explained above. While for the international engagement of military for humanitarian purposes there are some international guidelines,²³⁶ the adherence to such framework in military engagement for domestic purposes is a matter of a national choice. Nevertheless, most of the armies of the countries under this review have made disaster response, search and rescue, and relief an important part of their capability programmes, offering rapid response and performing medical assistance, logistical support, air support, aid distribution, protection and recovery in natural disasters, industrial accidents and other domestic emergencies.²³⁷

The special military capabilities, which are different from the typical military equipment, used by the countries under this review, are important for several disaster management tasks.

Search and Rescue

- Search and rescue operations might be performed on land, at sea or large water basins or flooded areas, and in urban environment. SAR involves the location, extrication, and initial medical stabilisation of victims of natural and manmade disasters or technological accidents.
- On land: search and rescue helicopters of the EC 135 P2 type, medical helicopters of Super Puma and Cougar type; Pumping water and sludge mobile equipment;
- On water: inflatable boats, rigid aluminium boats;
- In urban environment: air scenting or trailing (and tracking) dogs.

Transportation

Transportation is provided mostly from the affected area towards main military or civilian operational bases:

- Transport helicopters, e.g. Eurocopter EC 135 and Super Puma, Boeing Chinook heavy CH-47, Bell UH-1H, Agusta-Bell 212 and other types;
- All-terrain vehicles (trucks, vans, buses) for transporting people and equipment;
- Heavy trucks;
- Multiplatform special vehicle supply & recovery off-road;
- Cranes with towing capacity of more than 20 tons.

Emergency primary medical care

Capabilities to deliver immediate first aid on the scene:

- Military multipurpose, air-portable, high mobility off-road primary medical ambulance vehicles with good payload capacity of URO VAMTAC, HUMVEE, and others types;
- Role 1 field military hospital (could be enhanced by adding surgery capacity).

Chemical, biological and radiological reconnaissance and decontamination

- Towing or self-propelled capacity for radiological, biological and chemical reconnaissance, assessment and decontamination of personnel, equipment, terrain, and vehicles.

²³⁶ See for example the Guidelines on the Use of Foreign Military and Civil Defence Assets in Disaster Relief, or 'Oslo Guidelines.'

²³⁷ See also Elisabeth Fischer, *Disaster Response: The Role of a Humanitarian Military*, Army-technology.com, 26 July 2011; and Charles-Antoine Hofmann and Laura Hudson, "Military responses to natural disasters: last resort or inevitable trend?" *Humanitarian Exchange Magazine* 44 (2009).

Providing or producing drinking water

- Mobile military water processing equipment;
- Water tank trucks.

Fire fighting

- Rotary of fixed wing air platforms, with capacity to load 4-5,000 litres or more, such as Bombardier CL-415, Canadair' CL-215-T and other types;
- Heavy forest fire trucks such as IVECO ML140E28W and other types;
- Heavy water tank trucks;
- Submersible pumps.

Providing interim emergency shelter

- Rapid deployable shelters – family or larger size for up to 100 people (ADAM type), equipped with electrical and heating systems;
- Electricity generators;
- Field kitchens;
- Mobile sanitation equipment.

Engineering for providing minimum essential access to affected areas

- Loaders;
- Excavators;
- Wheels tractors;
- Backhoes;
- Tilt rucks;
- Machines with capacity to work in tight spaces;
- Snowplough trucks (depending on the climate).

*Field communications and command and control*²³⁸

- Command and control structure and capabilities that allow for effective communications between deployed military formations, with the local authorities and the other state agencies involved in the response and relief efforts, including international contributors: Combat Network C4ISR radio (PR4G) type; radio communications, able to connect with aeronautical and civilian systems of mobile (TETRA, TETRAPOL) and satellite (INMARSAT, THURAYA) type; Information systems and network management, capable of managing messaging, mapping and receiving, and distributing SAT TV and broadcasting;
- Rapidly deployable command post(s) with universal applications for command, control and communications in the disaster area;
- Rapidly deployable shelter system for the command post (or trailer type).

Area security, including delivery of aid

- Military police all-terrain multi-purpose patrol vehicles of Land Rover RWMIK, M1117, Plasan Sand Cat and other types;
- Trained and disciplined personnel.

²³⁸ For details on the cooperation between EU and NATO in the development of C4ISR for crisis management purposes see Amleto Gabellone, "NATO-EU Cooperation on C4ISR Capabilities for Crisis Management," *Information & Security: An International Journal* 27, no. 1 (2011): 28-47.

5 Impact on civil-military relations

This review indicates a tendency to expand not so much the ‘domestic roles’ of the national military, but the ways in which the armed forces contribute to immediate disaster response, rescue and relief operations. The provision of military support to civil authorities and the people takes place in a specific context of the civil-military relations. As the UK Disaster Relief Operations Doctrine²³⁹ explains, natural and manmade disasters and catastrophes are source of humanitarian crises: if not addressed rapidly and effectively, they can deteriorate quickly and bring significant and comprehensive political, social, economic and security effects.

The studies of Katzenstein (1996)²⁴⁰ and Hofstede et al. (2010)²⁴¹ argue that democratic nations, that have developed a culture of securing people’s life and property, have a better capacity to survive an emergency with less damage; they are socially more coherent and politically stable. These studies claim that nations least able to withstand the effects of natural disaster, or at greatest risk to manmade disaster, are also prone to political instability, civil disorder and unrest.

From this standpoint, the use of military in domestic emergency operations should be timely and effective. However, any military engagement should stay within the framework of the established principles of the democratic civil-military relations²⁴² and should not challenge the human rights and citizen freedoms. The following points might be considered:

- *Decisions concerning armed forces always remain in civilian hands and, if force is used, it is commensurate with the concrete disaster response and relief needs.* The application of this principle guarantees that the use of military is a component of the (civilian) government’s crisis management policy, and not on a military initiative.
- *Any military engagement is based on political guidance and follows the requirements of transparency and accountability.* The Minister of Defence is the principle agent on behalf of the Government, who has full command authority over the military contingent and its operations. The minister is obliged to provide timely and detailed information on the character of military engagement and the results. He/she is responsible for the performance of the military both politically (to the public and the Parliament) and legally (for the issued executive orders).
- *The operational chain of command is led by a civilian authority.* Governments build national crisis management systems that are headed by a political body and are supported by a civilian permanent administration. The principle of civilian leadership is spread throughout all levels of the systems (national, regional and local). Civilians determine the tasks and charac-

ter of any military operation within the affected area, while the militaries maintain their internal chain of command.

- *The role of military in domestic emergency operations is defined under the principles of subsidiarity and proportionality.* This principle has different meaning, depending on the design of the national crisis management system. When the military have special units for disaster response, search and rescue, and relief they receive concrete and, in some cases, primary role, depending on the nature of the emergency. When the military provide general support or assets, then their role is strictly supportive and proportional.
- *Any military engagement is seen as temporary.* The highest value of the military is their high readiness and rapid reaction, but their core role is defence and military security. The governments avoid challenging this role with prolonged engagement in disaster relief operations.
- *The military role and operations are professionally prepared and the equipment they use is relevant to the missions.* Generally, the governments' position is that major disasters cannot be handled successfully without adequate preparation. In most of the cases under study that includes: case specific legal arrangements; equipment, relevant to the role; military specific and inter-agency training; co-ordinated planning; integrated alert system; and joint reporting mechanism. The military leadership is responsible to determine which military formation should be prepared and engaged in a disaster response mission and what are the relevant operational requirements (as the practice confirms, the military engagements are costly as the military equipment is often much more expensive than any comparative civilian equipment).

* * * * *

In conclusion, this brief review illustrates the existence of a common tendency: as the security environment is becoming more complex and the range of natural and manmade disasters is expanding, the role of the military in domestic disaster response and relief is growing. As the overall aims of any military engagement in domestic emergency are to save life, to relieve suffering, to limit damages and to restore, as quickly as possible, the essential functions of societies, the governments will use any opportunity and asset to respond effectively, and that includes the deployment of armed forces. Disaster response and relief are not the main tasks of the military, but are the ones that become increasingly relevant. Sometimes solutions offered by the military are the '*ultima ratio*' in saving lives and providing survival capabilities; there is hardly a scenario where military forces can be excluded.²⁴³

The military are under pressure for quick and comprehensive transformation. The core problem is that the simultaneous change in the strategic environment and domestic security needs generate political, military and management dilemmas about the roles, tasks, organisation, equipment and operations of the military at home and abroad. The countries under this study look for resolving

²⁴³ A lesson learned by the Austrian armed forces. See Michael Schuster, National and International Disaster Response, presentation at the NBC Defence School "Lise Meitner," slide 31, available at <http://www.advantageaustria.org/vn/events/MODschuster.pdf>.

these dilemmas through comprehensive security sector reforms, including transformation of national crisis management systems.

Driving Innovation in Crisis Management for **E**uropean **R**esilience

AUSTRIA

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: AIT (Bettina Jager, Georg Neubauer)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by CSDM and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

In 2003, the Ministry of the Interior became the main responsible federal organisation for the coordination of disaster protection management, crisis management and international disaster relief. In this context, the Federal Crisis and Disaster Protection Management was established and became a major pillar of civil defence in Austria. It defines the measures and responsibilities in crisis and disaster case on the basis of two fundamental principles: the principle of subsidiarity and the principle of solidarity. The first principle is a political maxim specifying that intervention measures have to be implemented in the sense of self-help acting on the lowest possible level, e.g. the local level. This implies a bottom-up principle ensuring that measures necessary to manage crisis and disasters, are as long as possible performed by local organizations. The second principle ensures that in a case of an event, which exceeds the capacities at the local level, the community mechanism to overcome the crisis and disasters will be activated, ensuring that challenges are tackled with the help from the next higher organisational level. While the departments at the federal state are mainly responsible for prevention and financial recovery measures, the authorities of the provinces operate as the core institutions in response to natural as well as other types of crisis and disasters. Therefore the provinces have been featured with special rights for governing this issue. In crisis and disaster cases the Federal Alarm Centre of the state acts as a central hub for the crisis staffs of the authorities. There the responsibility to alert and warn the general public in crisis and disaster situations has been located (Jachs 2011a). At its regional counterparts – the Alarm Centres of the Federal Provinces, the incoming emergency calls will be taken by authorized call takers, who have an overview about the available resources and can alert the competent operational organization. According to the magnitude of the disaster, proper authorities are assigned to manage the events. The governmental authorities of the provinces are authorized to assign accredited emergency service organisations with disaster relief duties.

Several accredited emergency services exist in Austria, such as the Red Cross, Arbeitersamariterbund (“Workers’ Samaritan Association”) or the emergency helicopter C16. Moreover, the fire brigades, the water rescue, the rescue dogs brigade and the crisis intervention services need to be mentioned. In addition, the Austrian Armed Forces play an important role in the response to disasters. Apart from the duty of the national military defence, the protection of residuals and public facilities as well as the assistance in emergency cases are core tasks of the Austrian Armed Forces (Ministry of Defence and Sports 2014). After an official request, special units will be engaged independent from the fact, that the mission is taking place in Austria or abroad.

Austria benefits from initiatives of a well-established civil society. Voluntary organisations contribute to a network of civil defence at all spatial levels in Austria. Well-trained professionals and volunteers fulfil several duties in the area of civil protection. A longstanding expertise in risk assessment and a ramified network of cooperation with other countries and international organisations build a basis for comprehensive risk management capabilities in Austria. The knowledge-based approach will be continued in multiple projects within the context of cooperation between the science, industry and governmental stakeholders.

Although, there are no official statistics, the annual expenditures for preparedness measures of disaster management can be estimated at about 0.1 percent of GDP (status of 2013).

1 Policy

Austria is constituted as a federal, parliamentary, and democratic Republic. The Austrian government consists of the Federal Chancellor and the ministers and the Federal President assumes the role of the head of the state, which was considered more as a representative function. The administration structure is divided into the nine provinces²⁴⁴ Vorarlberg, Tyrol, Salzburg, Carinthia, Upper Austria, Styria, Lower Austria, Vienna and Burgenland (from the West to the East), 80 districts and 2,354 municipalities. The federal Republic of Austria is located in the heart of Central Europe and incorporates an area of 83,855 square kilometres. In relation to the total population of 8,504,850 people, 66 percent lives in urban areas (United Nations, Department of Economic and Social Affairs, Population Division 2014). Austria is bordered in the West by Switzerland and Liechtenstein, by the Czech Republic and Germany in the North, by Hungary and Slovakia in the East and at the southern border to Italy and Slovenia. Austria is a highly-developed industrialised nation and has an important service sector. As main industrial sectors, food and luxury commodities, mechanical engineering and steel construction, chemicals and vehicle manufacturing have been considered. Due to Austria's impressive landscape, tourism is a core sector of the economy. Widely known as a well-watered country, an innovative market sector for hydroelectric power emerged in the last decade. Furthermore, it has its own resources of petroleum and natural gas.

The Crisis and Disaster Protection Management of Austria is continuously decentralized and organized on a federal basis. This approach considers that the different political levels hold various competences and know-how, which are suitable to manage issues more efficiently. Interrelationships between levels and actors with vague divisions of responsibilities present a challenge for analysing roles and the actors' spheres of influence (Benz and Zimmer 2010). As in other legal materials in Austria, also in disaster management there is a three-way division of competence. The state is assuming the key part in defining prevention measures and establishing a framework for the implementation and the financing of mitigation measures (Jachs 2011b). The response to disasters mainly falls within the remit of the provinces. While the federal provinces are engaged in establishing a preparedness structure and planning of the response to disasters, as executive units local authorities (municipalities) are mainly responsible for carrying out these response missions.

On the base of a federal law, each province is authorized to create rules and laws on their own (Bußjäger 2003). Civil defence laws regulate how processes must be organized in contrast to normal life to minimize the impact of various kinds of disasters. The extend of validity of the civil defence - laws usually encompasses both the affected communities as well as the aid workers and support staff members, and finally the authority itself, depending on the country and the possible disaster scenarios. The different coordination procedures in the provinces are due to different national regulations governing for instance unequal definitions of crisis and disaster and regionally specific coordination structures. On behalf of crisis and disaster protection authorities, various emergency organizations are accredited to fulfil emergency missions in crisis and disaster situations (Jachs 2011b). Frequently they also use different systems and tools to carry out their tasks. Particularly, the

²⁴⁴ The term provinces of Austria corresponds to federated states – a synonym for counties, called “Bundesländer” in German.

applied systems of several cooperating units are connected and ensure interoperability between organizations and authorities.

1.1 Risk Assessment

As shown in Figure 25, four climate zones are influencing Austria. The Alpine Climate dominates the Austria because the Alps extend over 62.8 percent of the surface area and stretch across the West to the East of Austria. According to that, an Alpine Climate heavily influences regions from the West to the East while there are some Atlantic influences in the West and the North-West. The Eastern areas are belonging to the Continental climate zone and are characterised by a Pannonian climate, which causes, on the one hand, summer with hot weather and low precipitation, and on the other hand, cool-temperate winter. The northern area is characterised by a moderate Central European transition climate with (sub-)polar flows. Further South, there is the Illyrian climate with a sub-Mediterranean climate is prevailing. Considering these different starting positions of the climatic region, each of them has another risk profile. As stated by the Environment Agency Austria (2014), “63 percent of the national territory is under permanent risk of natural hazards like floods, debris flows and avalanches. Only 37 percent of the national territory is suitable for permanent settlement and that is under high pressure from competing for land uses.”

http://www.umweltbundesamt.at/en/soer/soer2010_partc/soer2010_intro/; accessed: 11th October, 2014)

As can be seen in Table 7, a total of 32 events have been observed in the period from 1994 to 2014, which have caused about 30 casualties and a total damage of approximately EUR 6.7 billion. With 72.4 percent of the total floods constitute the largest part of the economic damage, which has been reaffirmed by PreventionWeb (2014). Austria ranks on the 133th place indexed with 3.58 percent in

the World Risk Report (2014).²⁴⁵ As identified in the World Development Report (2013), in the period from 2003-2012, Austria was affected by eight major natural incidents but had been spared from epidemics as well as pandemics. According to **Es ist eine ungültige Quelle angegeben.** infectious diseases have lost importance in recent decades in Austria, nevertheless, probably due the mobility of people the importance of some infectious diseases is increasing again. About 560 people corresponding to 0.8 % of the population deceased due to infectious diseases in 2007 in Austria. In the same year most often reported infectious diseases were bacterial food poisoning (about 10,200 cases), scarlet fever (about 2,050 cases) and infectious hepatitis (1,830 cases). 64 individuals were infected with AIDS that year. Influenza is one of the most common infectious diseases in Austria, every year up to 400,000 persons are infected by influenza and up to 6,000 of them die due to medical complications arising from this disease **Es ist eine ungültige Quelle angegeben..**

Table 7: Overview on disasters in Austria from 1994 to 2014 (EDA 2014, PreventionWeb 2014),

Date	Event	Type of Event	Affected/Killed	Est. damage (€)
1994 January	Storm	Natural Disaster	not known	2,000000
1995 June	Flood	Natural Disaster	not known/2	2,00000
1995 August	Transport accident – Braz, Vorarlberg	Technological Disaster	100/4	not known
1996 June	Flood	Natural Disaster	not known	5,000000
1997 July	Flood	Natural Disaster	not known/3	175,000000
1998 April	Earthquake – Arnoldstein, Carinthia	Natural Disaster	not known	not known
1998 July	Mine Accident – Lassing, Styria	Technological Disaster	not known/11	not known
1999 January	Transport accident – Deutschlandsberg	Technological Disaster	32/18	not known
1999 February	Avalanche – Galtür, Tyrol	Natural Disaster	10,000/50	41,570000
1999 May	Flood	Natural Disaster	not known/3	320000
1999 May	Tunnel Fire – Tauern tunnel, Salzburg	Technological Disaster	50/12	not known
2000 March	Avalanche – Kitzsteinhorn	Natural Disaster	not known/13	not known
2000 May	Storm – Styria	Natural Disaster	not known	20,000000
2000 October	Fire-Disaster – Kaprun, Salzburg	Technological Disaster	162/155	not known
2002 August	Danube Flood	Natural Disaster	60,000/9	2,900000000
2002 October	Storm	Natural Disaster	not known/2	5,000000
2002 November	Storm – Salzburg	Natural Disaster	300/1	not known
2003	Extreme temperature – Heat	Natural Disaster	not known/345	280,000000

²⁴⁵ The World Risk Report (UNU-EHS and Alliance Development Works 2014) expresses the risk “of becoming a victim of a disaster as a result of vulnerability and natural hazards such as earthquakes, storms, floods, droughts and sea level rise” on the basis of multiplying the exposure towards natural hazards, susceptibility depending on infrastructure, etc., coping capacities depending on the governmental structure, etc. and adaptive capacities related to future natural hazards and the impacts of climate change.

July/August	wave			
2005 July	Flood	Natural Disaster	900/not known	not known
2005 August	Alps Flood	Natural Disaster	not known/4	700,000000
2005 December	Extreme temperature – Extreme Winter Conditions	Natural Disaster	not known	not known
2006 March	Flood	Natural Disaster	516/not known	not known
2007 January	Extra-tropical Storms	Natural Disaster	not known	400,000000
2007 July	Extreme Temperature – Heat wave	Natural Disaster	not known/5	not known
2008 February	Fire accident – Egg	Technological Disaster	5/12	not known
2008 February	Storm	Natural Disaster	not known/4	500,000000
2009 June	Flood	Natural Disaster	not known/1	200,000000
2009 July	Storm	Natural Disaster	not known	500,000000
2009 July	Flood	Natural Disaster	not known	not known
2009 December	Extreme Temperature – Cold Wave	Natural Disaster	not known/2	not known
2012 February	Extreme Temperature – Cold Wave	Natural Disaster	not known/5	not known
2013 June	Flood	Natural Disaster	200/4	1,000000000

Regarding the frequency of the occurrence, as displayed in Figure 26, with eleven events, flood ranks on the first position, followed by storms with seven events and four transport accidents.

Figure 26: Pie chart over the occurrence of natural and technological disasters in Austria between 1994 and 2014
Available at: http://www.emdat.be/disaster_list/index.html; accessed: 11th August, 2014

1.1.1 Natural hazards

Potyka (2012a) highlighted that among others Austria is mainly affected by floods and landslides during the summer period and avalanches in the winter season. Referring to the Disaster statistic of Austria, presented by PreventionWeb (2014) during the period from 1980 to 2010 most people had been affected by floods, wet as well as dry mass movements and storms. While storms have occurred more frequently than floods, they have a higher impact of the economic loss. The case of extreme temperature in the “record-summer” in July/August 2003 caused the highest death toll at a stroke. In the frame of a common exposure to several natural hazards, the most relevant events listed in Table 7 will be discussed separately in the following paragraphs.

1.1.1.1 Avalanche

Due to the fact, that Austria has a big share of alpine area, from what significantly more than half has been defined as torrent as well as snow avalanche catchment areas, only 37 percent of the state territory can be used for permanent settlement (Environment Agency Austria 2014).

The past has shown that, despite avalanches have not recognised as the most commonly appearing events, they have caused a lot of human losses and about 35,000 damages to buildings (BMLFUW 2014a). Regarding the spatial distribution of avalanches in Austria, the BMLFUW (2012) stated, that a particularly high density of hazardous events has been registered in western parts of Austria and in eastern foothills of the Alps (see Figure 27).

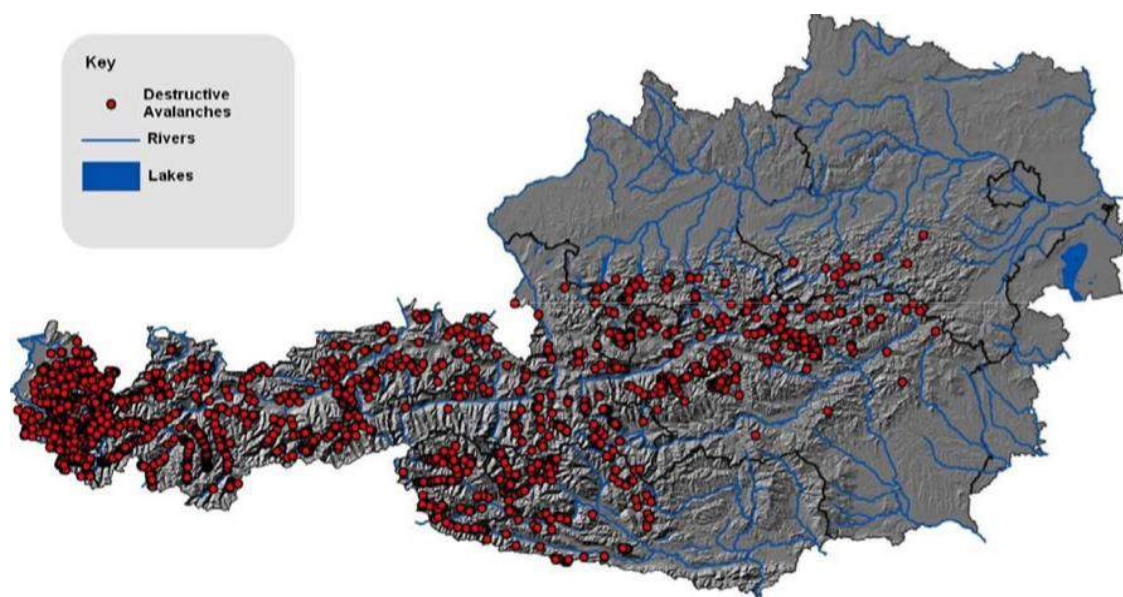

Figure 27: Spatial distribution of avalanche events in Austria

Available at: <http://www.fao.org/forestry/21310-09fd2cebf0189b5f2651d6182ff08a6aa.pdf>; accessed: 3rd October, 2014

Recent catastrophic events contributed to a higher public awareness for this hazard type. In general, a distinction between material and personnel damage has been made. According to the loss data base of the BFW, the highest percentage of material damage has been recorded in Salzburg and Styria (BMLFUW 2012). Based on an observation of a reference period over 25 years, avalanche disasters claimed an annual average of 30.3 personnel injuries. The BFW explained that the death

rate results mainly from serious accidents in high alpine regions and is often caused by entering an unsecured piste. In order to manage alpine risks, several risk-monitoring initiatives have been established in Austria. Different institutions operate avalanche databases with varying emphases – in sum, the avalanche documentation of the BFW and the IAN amounts to 12,000 data sets. Furthermore, Austria participates at some international research programs in the field of forecasting and protecting from Alpine hazards – to name some examples: MANFRED – Management strategies to adapt Alpine Space forests to climate change risks; ALP-Water-Scarce-Management – Water management strategies against water scarcity in the Alps; SicALP – Site protection in limestone Alps by means of forest regeneration measures.

Regarding the financial issue, it has been declared by the BMLFUW (2014a):

Torrent, avalanche and erosion control measures are financed from the Disaster Relief Fund of the Federal State (Disaster Relief Fund Act). Subsidies are granted subject to the provisions of the Hydraulic Engineering Assistance Act, which defines the terms and conditions under which subsidisation is provided as well as the principles of the planning and implementation of control measures. However, comprehensive protection against alpine natural hazards includes also organisational measures (emergency alert, alarm, evacuation) and civil disaster control, tasks, which are mostly implemented by the Federal Provinces.

Aiming at a sustainable mitigation strategy, Austria reverts to gentle protection measures. Due to the fact, that Austria is around 50 percent covered by forest, around 20 percent of this will be utilised as protection forest (BMLFUW 2007). As illustrated in Figure 28, within the Forest Development Plan, a protection function of 30.73 percent is determined for Austrian Forests (BMLFUW 2009). Within the Forest Act, the term protection forest has been specified by differing between site-protecting forests and object-protecting forests. The public will finance costs of the treatment for an object-protecting forest because it is dedicated to protecting human lives and culture. In contrast, expenses for the site protecting forest are mainly for the forest owner's account.

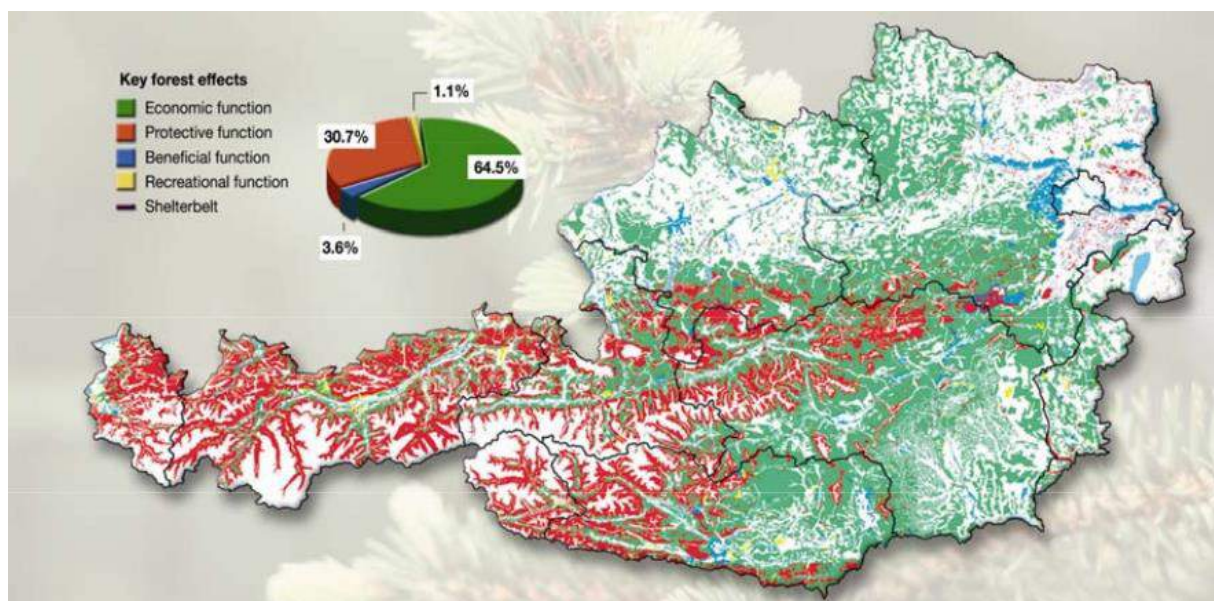

Figure 28: Forest Development Plan (FDP) of Austria

Available at: <http://www.fao.org/forestry/21310-09fd2ceb0189b5f2651d6182ff08a6aa.pdf>; accessed: 22nd September, 2014

As it is laid down by the Austrian Forest Act (Federal Law Gazette 2002), the governor of the provinces and the district administrative authorities, in that function especially the municipalities are practically responsible for the implementation of the law. On this base, the Forest Development Plan, the guidelines for Hazard Zone Plans and Forestry Plan have been defined. Furthermore, the Torrent Control Act and the Austrian Protection Forest Strategy regulate the avalanche protection measures in Austria.

1.1.1.2 Flood

Until now, the most damages of flood have been caused by the Central Europe floods in June 2013, which have also affected the Czech Republic, Germany, Hungary, Serbia, Slovakia and Switzerland (Reliefweb 2014). In the frame of the event, 6 fatalities have been recorded and an economic loss of approximately EUR 0.87 billion in the four most affected regions Lower Austria, Upper Austria, Salzburg and Tyrol. With a total loss of EUR 2.9 billion, the previous flood of August 2002 was labelled as “flood of the century” (Profil 2013). Beginning with heavy rainfalls in August, the Danube water levels raised and the overburdening of feeder rivers caused material damages and even personnel injuries (Bossong and Hegemann 2013). With an average annual precipitation of around 1,100 mm Austria is perceived as one of Europe’s most water-wealthy countries (BMLFUW 2014b). In mountain areas, heavy rainfalls occur frequently (Zwittkovits 1983). For the Austrian exposure to flood risk, mainly the two categories river flooding and flash floods will be relevant (Blöschl 2013). While flash floods are characterised by short, small-scale but intensive precipitation, the soil moisture of an affected area plays an additional crucial role for the cause of river flooding. If a certain proportion of the precipitation cannot be drained, the likelihood of a flood will increase. As stated by Gutknecht et al. (2002), a high humidity was observed in the affected regions during the flood in 2002. This factor was reaffirmed in 2006, in which a coincidence of a relatively moderate rainfall in March and high soil moisture caused the March-Flood in March.

In contrast, flash floods are more likely to cause spatial limited mudslides and landslides in mountain areas, but also represent a significant risk for wide asphalt areas in cities (Blöschl 2013). From a risk monitoring perspective, Figure 29 provides an overview of the spatial dispersion of flood and mudflows in Austria. It demonstrates clearly, a concentration of mudflows especially in the western part of Austria, which is due to its mountainous topography and an accumulation of prone-flood in the North and the South of Austria as well at the border regions in the east and the west. Within these areas, Vorarlberg, Tyrol, Salzburg and Carinthia account for around 62 percent of the total recorded torrential events with material damages or personnel injuries.

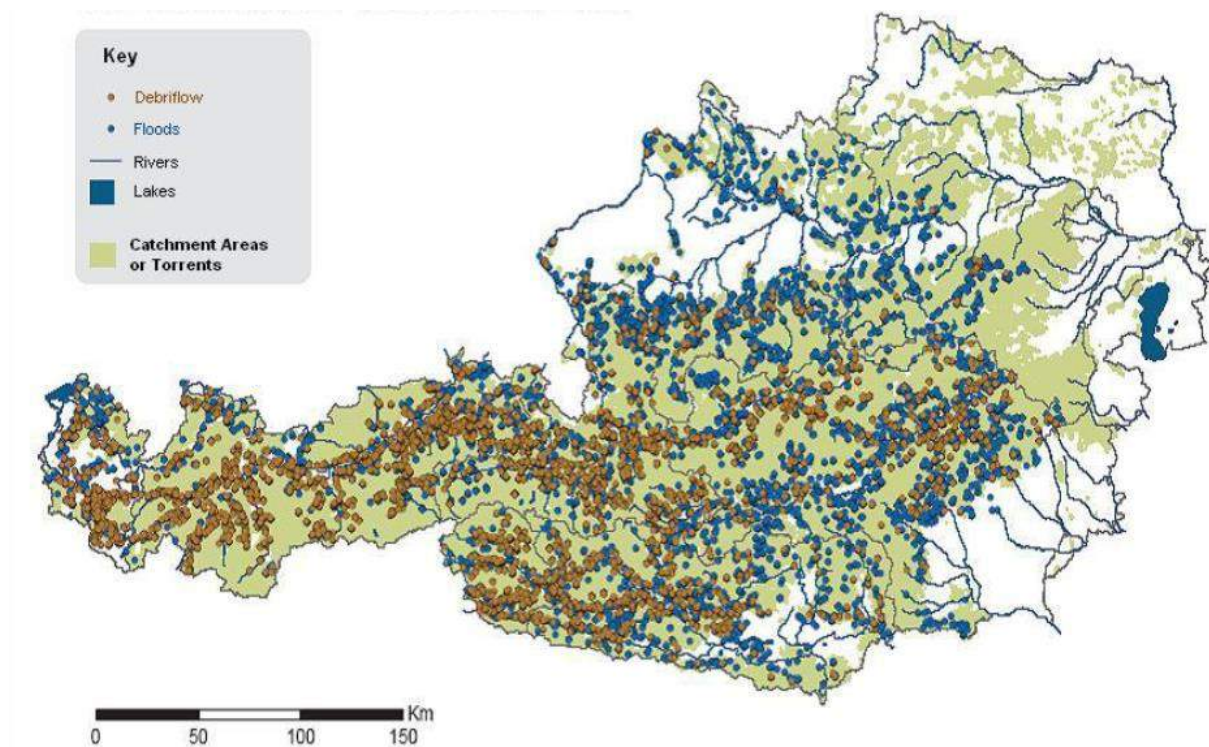

Figure 29: Spatial dispersion of torrential events

(blue bullet = prone-flood areas, brown bullet = risk of mud flows). Available at: <http://www.fao.org/forestry/21310-09fd2ceb0189b5f2651d6182ff08a6aa.pdf>; accessed: 11th September, 2014

The strategic direction of Torrent and Avalanche Control is located at the department III/5 of the Federal Ministry for Agriculture, Forestry, Environment and Water Management. Additionally, the strategic actor is responsible for the planning and the construction of technical and biological measures to protect against natural hazards (BMLFUW 2014c). Within the management of flood risk, various responsibilities result due to a federalist constitution of Austria. By identifying flood-discharge areas and danger zones, the Federal Water Engineering Administration provides expert opinion for the local regional planning and is also engaged in communicating the threat of flooding to the citizens. Departmental cooperation has been established with the Federal Ministry for Agriculture, Forestry, Environment and Water Management (department IV/6) and the offices of the Provincial government. The Austrian Ministry for Transport, Innovation and Technology/"via donau," together with competent offices of the provincial government, is responsible for flooding issues concerning the Danube, March and Thaya,. The "via donau" is a limited liability company, founded by the Austrian Ministry for Transport, Innovation and Technology, entrusted with the administration and preservation of Federal waterways. In addition, the "via donau" is operating the shipping information system DoRIS (Donau River Information Services) (BMLFUW 2014d).

Austria maintains an integrated geo-database, where flood risks and their adverse consequences can be assessed by a "total risk per river stretch" on the basis of a combination of past and future floods. As indicated by ICPDR (ICPDR 2012), as a result a total of about 1,840 square kilometres relating to 5.2 percent of the total river length that has been assessed - are classified as having high or very high flood risk in the Austrian part of the Danube River Basin.

1.1.1.3 Further hazards

Although Austria is not a typical earthquake area, due to the Alpine tectonics several seismic activity has been identified in Austria. To a yearly average, about 600 earthquakes occur in Austria, from which humans will perceive only 10 percent. Embleton-Hamann (2007) stated, that every 46.3 years an earthquake of epicentral intensity $I_0 > 7^\circ$ can be expected, which would cause heavy damages on buildings. Approximately all 15 to 30 years, earthquakes reached an intensity to cause medium damage on buildings. Certain Austrian regions exhibit a more frequent tendency of earthquakes than others. In particular, the Vienna Basin, the Mur-Mürz Valley, the Inn River Valley and the Lavant Valley region of Carinthia are the most prominent earthquake regions of Austria. Figure 30 provides an overview on the seismic activity²⁴⁶ perceived by the Austrian population since 1900, while only technically registered earthquakes have been suppressed. Within the article of Embleton-Hamann (2007), Villach (a city in Carinthia), Murau (a region of Styria) and Neulengbach (a city in Lower Austria) have been identified as the three regions with the most hazard potential. Furthermore, there it has been indicated, that the biggest spatial earthquake zone is stretched from the Mur-Mürz Valley to the Vienna basin. Approximately all 15 to 30 years, earthquakes reached an intensity to cause medium damage on buildings and only in an interval of 75 to 100 years they cause heavy damages on buildings.

Figure 30: Epicentre map of Austria
provided by ZAMG. Available at: <https://www.zamg.ac.at/cms/de/geophysik/erdbeben/erdbeben-in-oesterreich/erdbebengefaehrungszonen-in-oesterreich>; accessed: 11th June, 2014.

Since 1992, ZAMG (2014a) has never registered a higher value than $I_0 = 6^\circ$ on the European Macro seismic Scale. The total of eight registered earthquakes, which have reached intensity higher than $I_0 = 6^\circ$ and have caused damages to buildings in the last 20 years have distributed as followed: Styria 4, Lower Austria 2 and Carinthia and Tyrol in each case one event.

According to ZAMG (2014b), the analysis of historically relevant areas provides cyclical repetition rates of these events, which build the basis for an estimation of the average of intensity and the occurrence of an event. On this knowledge basis, risk reduction strategies have been implemented

²⁴⁶ As “perceived” earthquakes, seismic activities with an epicentral intensity higher than 3° on the 12-class European Macroseismic Scale (EMS-98) have been defined.

for vulnerable regions, i.e. by zoning of the previously affected areas within an earthquake catalogue. Prevention measures play an important role in avoiding or limiting the potential impact of an earthquake, economically as well as life-saving. Furthermore, the provision of knowledge from an applied research, i.e. in the area of risk mapping, risk monitoring etc. will improve the basis of decision-making ability of responsible bodies. Thereby, appropriate deployment plans for the case of an event can be created and specific training programmes can be prepared for the rescue workers. In addition, the most relevant relief organisations for the emergency – fire brigades, emergency services, the Austrian Armed Forces and the police can be adjusted to known hazard scenarios (ZAMG 2014b). Especially, with earthquake-proof construction of historical buildings and critical objects mitigation will be achieved.

The Austrian Institute for Standards has contributed to the mitigation strategy by launching the standard “ÖNORM B 4015” concerning the establishment of a building code for an earthquake-proof design (2002). Hausmann et al. (2010) emphasised the importance of seismic risk mapping for the areas with a high residential density and for those, where critical infrastructures are located.

As illustrated in Table 7, the heat wave in August 2003 caused 345 deaths. It has been found out, that the so-called tropical days are the main driver for healthy risks. Especially, the number of days with a temperature higher than 30°C and not lower than 25°C constitutes a decisive factor. In the frame of the StartClim project (2005), it has been found out, that since the middle of the last century the number of hot days has increased significantly. As a consequence, the mortality rate has increased in Austria by 12.6 percent in the course of only six days in August. In combination with a lack of precipitation, drought caused high financial damages (about EUR 197 million) and the agricultural sector probably suffered the most, i.e. 30 percent of fodder deficit has been registered in Austria (Strosser et al. 2012). Frequently, heat wave phenomena have been discussed in the context of climate change. Based on the findings of the Centre for Climate Adaption (2014), “a widespread warming trend in both daily minimum and maximum temperatures was confirmed for homogenized time series of temperature data covering the period 1948-2009”. Looking at the extreme temperature in August 2003, which has reached 38.5° in Styria – 2013 a new record with 40.5°C has been registered in Lower Austria (ZAMG 2013). Extremely cold temperatures might cause material damages, but will not lead directly dangerous effects. An increased likelihood of avalanches, as a result from more frequent heavy precipitation events in winter has been assumed for central and northern Europe (Centre for Climate Adaption 2014). From an economic perspective, (thunder)storms and hail have also been taking into account for the risk profile of Austria. Especially in the summer periods between June and July, thunderstorms have been frequently accompanied by hail, which can cause damages to private property, i.e. cars, building facades, etc. as well as to the agricultural sector. Austria’s position has been identified as located in the middle of the European hail epicentre. Due to this fact, particular big hailstones with a diameter of more than 2 cm can be observed several times a year. As an example, in 2004 hail caused damages beyond EUR 20 million (SKYWARN Austria 2014). Considering the frequency of the occurrence, storms are belonging to the more frequent phenomena. Influenced by an Atlantic depression, the average wind speeds reach about 103 km per hour.

Additionally, hurricane-like winds might be triggered by warm winds, resulting from an extensive foehn situation. SKYWARN Austria indicated (2014), that a common occurrence of downbursts and winds with hurricane strengths can be registered in Austria. High wind strengths have been recorded

in peripheral areas of Austria, in particular for the South-East of Styria and the Western part of Upper Austria.

1.1.2 Technological hazards

In the context of this chapter technological disaster means a man-made, but not intentionally triggered event. In the reference period of the last twenty years, six major technological disasters have been recorded in Austria. As illustrated in Table 7, especially the accidents in Kaprun and Deutschlandsberg caused heavy damages of and caused a lot of fatalities with a total of about 180 persons. Since the nuclear disaster of Chernobyl in 1986, Austria became aware of the potential nuclear hazard. Although, Austria does not operate a nuclear reactor by its own, only in distances of about 30 km and more from Austrian borders, several nuclear power stations are in operation (see Figure 31).

Figure 31: Nuclear power stations in Austria's neighbouring states
Acquired from (BMLFUW - V/7 Radiation Protection 2013).

It has been indicated by experts of the BMLFUW (2013), that hazards of radiological emergencies might also result from transport accidents with radioactive material or might be caused by a terroristic attack. In order to be promptly informed, Austria has established a close cooperation with neighbouring states to exchange data obtained from radiological monitoring stations in each state (International Atomic Energy Agency 1986). Furthermore, the Department of Radiation Protection at the BMLFUW operates an automatically radiation early warning system, which detects data of the measuring network and sounds the alarm, if values exceed the limit. In the case of an emergency, an alerting path must be maintained. The Federal Alarm Centre, located at the EKC serves then as an information hub of the Federal Ministry of the Interior (Jachs 2011b). Since a bilateral or international notification has been receipt, a 24-hour stand-by service will be informed. Simultaneously the emergency will be communicated to the general public and the responsible authorities at the federal and the provincial level, as well as appropriate emergency personnel will be notified. In sum, stakeholders at the community, the provincial, the federal as well as the international level will participate in a radiological emergency case (BMLFUW - V/7 Radiation Protection 2013). This strong involvement of several stakeholder types can be also recognised based on the curriculum of training programs. Special ABC-training courses for emergency personnel, i.e.

the Austrian Armed Forces are organised by the Austrian Research Centre GmbH (Seibersdorf/Austria) and the International Atomic Energy Agency (IAEA).

1.2 Policy and Governance

Based upon the “SKKM Strategy 2020” of the Federal Ministry of the Interior (2009), traditionally the Crisis and Disaster Management in Austria is built upon the principle of three pillars. As shown in Figure 32, these pillars comprise measures of the authorities, of the emergency organizations and self-protection measures of the citizens. This model can be complemented by the involvement of selected economic stakeholders as well as by the contribution from the scientific community.

Figure 32: Three-pillar-model of the Crisis and Disaster Management in Austria

Measures of the authorities

Authorities are obliged to operate a preventive protection and a responsive protection in the case of an incident by prescribing provisional measures, coordinating protection activities and organizing the administrative process. Regarding the response phase of the crisis management cycle, authorities have to define strategic goals, instruct emergency forces and assistance staff by official jurisdiction and the usage of coercive measures. The tasks of the authorities are perceived as obligatory tasks and include the establishment of a framework and providing financial resources. According to the various phase of crisis and disaster management, civil defence and disaster protection require the support of hierarchically ascending administrative entities in emergency procedures because the competences are shared between the state, the provinces and the municipalities (Jachs 2011b).

Measures of the disaster relief units (emergency organization)

One characteristic of the Austrian Crisis and Disaster Protection Management is the strong involvement of voluntary organizations, which enable an easy access to a huge amount of human resources. Due to the fact that there is no single organisation in Austria, which will be mainly responsible for the response to disasters, related duties will be organized by voluntary organisations. The Austrian Fire Brigades as well as the rescue services have gained the most attention in this area. Regarding the possibility to request assistance from the Austrian Armed Forces, if the capacities are insufficient, their deployment is regulated by the Law concerning the military service § 2 (1)c), where it has been defined, that in the case of major emergencies, the provincial governor, the head of the district or the Major of a municipality are authorized to request for assistance (Jachs 2011a).

The security headquarters or warning centres of the Federal Provinces are the central control points for request and organize emergency services in Austria. On behalf of crisis and disaster protection authorities, various emergency organizations are accredited to fulfil emergency missions in crisis and

disaster situations, some are mentioned below. “The Austrian Red Cross (ARC) is a private organization based on the ideal of selfless charity and motivated by non-profit thinking. Operating independently, it performs humanitarian tasks with the help of volunteers and employees in order to assist all people in need, at home and abroad.”²⁴⁷

The Austrian Fire Brigade consists of umbrella organizations at the district, provincial and federal level and is together with the ambulance services and the Austrian Red Cross the most important stakeholder in protection against natural hazards. Furthermore, the Arbeitersamariterbund (workers' Samaritan association), the service of the Emergency helicopter C16, the Water rescue, the Rescue dogs brigade and the Crisis intervention team is strongly involved in emergency operations. Security agencies and its bodies, e.g. the federal police, support disaster protection authorities in the response phase by providing data to authorities and field support. For preparedness, the federal fire brigades, the ARC as well as disaster relief authorities have developed civil defence plans, mainly consisting of plans for alerting and operations as well as procedures (Jachs 2011b).

Measures of citizens (individuals and companies)

As an important part of mechanism of civil defence and disaster protection, individuals are encouraged to local self-protection measures and neighbouring help (Federal Ministry of the Interior 2009). Also companies have specific obligations in the case of an event. Everyone has the obligation to notify appropriate institutions and organizations in the case of a hazardous notice. Responsible authorities are authorized to force individuals and companies to cooperate and collaborate with authorities, to follow their instructions and to tolerate the utilization of private equipment.

Support from economic stakeholders

With stakeholders from the economy a close cooperation regarding the implementation of protection measures, fostering industrial resilience and risk mapping has been envisaged.

According to Jachs (2011b), operator of critical infrastructures in Austria will be regularly involved in committees addressing the preparation of protection strategies and risk profiles. Within the ANVIL report (2013), it has been noted that operators of critical infrastructures can be required to provide special equipment, e.g. emergency operation trains.

Contribution of the scientific community

Especially in the frame of risk mapping and monitoring, a comprehensive collaboration between research institutes, the academia and governmental departments of the state and the provinces has been established. Several state departments have introduced their own research departments.

²⁴⁷http://www.refworld.org/cgi-bin/texis/vtx/rwmain?page=publisher&publisher=AUT_RC&type=&coi=NGA&docid=&skip=0

1.2.1 Strategy scope and focus

A question that arises beforehand is what “all necessary activities” includes in this context since so far there is neither a general nor a European disaster management model, which would define the scope of all activities (Expert Interview 2014). Thus, the answer must be subjective to a certain extent. The expert at the MoI indicated that the current national disaster management strategy, which has a time frame until 2020, basically aims at the whole disaster management cycle but, nevertheless, there is a noticeable focus on preparedness issues like education and training of key response personnel, the promotion of new response technologies like decision support systems, simulation tools and also on an improved organizational framework for cooperation and coordination in the response phase. It is noteworthy that like in other legal matters in Austria, and thereby also in disaster management, there is a three-way division of competence. The state is not assuming overall responsibility but the key part in defining prevention measures and establishing a framework for the implementation and the financing of mitigation projects while the federal provinces are primarily engaged in establishing a preparedness structure and planning the response to disasters. The local authorities (municipalities) as executive units are mainly responsible for carrying out these response missions on the first intervention level and for that purpose they also provide the majority of response resources.

In general, strategic decision-makers in Austria are pursuing an all-hazard approach, but the priority-setting derived on the basis of the hazard experience in the last twenty years (Expert Interview 2014). Realistic scenarios, depending on the probability of occurrence of the event, their potential impacts and appropriate coping capabilities have shaped the awareness at the strategic level. Due to the fact that there is no primarily responsible for risks, separate foci on natural hazards have been defined by Austrian provinces, depending on the particular affectedness of the province. Although technological disasters had devastating effects in the past, e.g. the heavy fire disaster in Kaprun (in the Austrian province of Salzburg) on 11 November 2000, or the mine accident in Lassing (province of Styria) in July 1998, there is an emphasis on natural hazards.

Since high-risk plants are not very strong represented in Austria and SEVESO facilities are well regulated, Austria is not highly exposed by technological disasters. Floods have offered a big challenge for Austria, while avalanches deemed probable, but remain locally. In the most of the cases, personal injury could be prevented and natural hazards are limited to material damage – especially storms and floods generate the most significant economic losses. The higher feasibility to protect against more frequent risks like the impact of flooding but – as explained by the expert at the MoI – not against more rare events like a plane crash is reflected in policies and the legislation (2014). Because a big earthquake occurs once every four hundred years, mainly structural protection measures have been implemented in that area, i.e. historic buildings have been made earthquake-proof.

Like in many countries, there is still a noticeable tendency to pay highest attention to the response and the prevention phase, while there is a lower priority for the recovery phase. Nevertheless, recovery from disasters has always been achieved quickly due to the availability of public funding, a large number of volunteers and additional spontaneous volunteers and private donations. In the recovery phase after bigger events usually a higher number of diversified actors come into play, which is not permanently engaged with disaster management structures, which makes planning for this phase even more difficult. The preparedness phase and the response phase rather constitute

priorities for the state's level. Finally, the individual phases can be weighted as illustrated in the pie chart in Figure 33.

Figure 33: Pie chart about the strategic focus on the phases of the Disaster Life-Cycle

Although the national security strategy pursues an all-hazard approach, due to the national experience of the last twenty years, there is an emphasis on natural hazards. Based on the interconnectedness, also non-natural disasters have to be considered in Austria, especially pandemic hazards like the Swine Influenza in April 2009 (Reliefweb 2014).

The identification, presentation and the assessment of relevant natural hazards, e.g. by the mean of hazard zone plans, constitutes a relevant element of the integrated risk management.

As pointed out by the department of the Facility-related Water Management at the BMLFUW (2012):

Findings of the hazard assessment will be considered within the phases of the risk cycle including the management of disasters, the regeneration in the aftermath of a disaster as well as preventive measures. By providing a comprehensive presentation of natural hazards, the response phase is supported by preventive measures before a disaster occurs. As a part of the prevention, the activation of emergency services, i.e. fire brigades, etc., the provision of human and material operating resources, as well as warning and alerting mechanisms have been implemented.

1.2.2 Monitoring and analytical support to policy making; R&D

The academic sector is well integrated into governmental activities. Several research programmes are in place, which provide opportunities for the academic sector to engage with governmental bodies in research activities. Programs like the Climate Fund and the KIRAS security research program line have contributed considerable strides to disaster management to enumerate some academic important initiatives. Cooperation has been established for instance in cooperation with the University of Natural Resources and Life Sciences, Vienna, the University of Vienna or other

universities. International attention has for example been gained by the findings of projects like FloodRisk I and II, which have promoted a fully integrated and comprehensive approach to flood risk management.

The Federal state has launched multiple programmes to promote the protection capacities of various hazards. Research programmes are often focusing on an interdisciplinary or even a trans-disciplinary work in the area of hazard protection. In particular, the Ministry of Science and Research, the Ministry for Transport, Innovation and Technology and the Ministry of Economy, Family and Youth are strongly involved in research and technology. Associated to these ministries, there have been three agencies set up to manage the funding of research and science as well as development and innovation in Austria. These are the Austrian Science Fund, the Austrian Research Promotion Agency and the “Austria Wirtschaftsservice” (“Austrian Business Service”). For example, the Austrian Research Promotion Agency (FFG) – hosted by the Austrian Ministry for Transport, Innovation and Technology and the Federal Ministry of Science, Research and Economics concentrates on diverse security issues, inter alia at the Protection of Critical Infrastructure and the development of systems to manage or prevent various threats. Institutions as the Austrian National Bank, the Federal provinces as well as ministerial departments provide an incentive to promote research in the area of protection against hazards. As example, The Department of Natural Hazards and Alpine Timberline – located at the Federal Research and Training Centre for Forests, Natural Hazards and Landscape Austria, is a research institution dedicated to the development of practice-oriented methods for the sustainable protection of human settlements and infrastructure²⁴⁸. As main tasks the department is concerned with the monitoring of several natural hazards, their analysis and the development of countermeasures. The BFW is an Austrian federal, multidisciplinary research and education centre which holds the legal status of an institution under public law. Planning and protection measures will be funded by national and provincial programs, as well as by the EFRE fund of the European Union. Furthermore, the risk prevention of the natural hazards insurance completes the adjustment of losses by the Federal State. Austria does not confine oneself to one overall initiative, but generates benefit from many small programs. As mentioned by Mol (2014), important initiatives have been established in cooperation with the University of Agricultural Sciences and Natural Resources, the University of Vienna and the University of Innsbruck. Furthermore, projects of the AlpS, the Climate Fund and the KIRAS program line have contributed considerable strides to disaster management.

1.2.3 Policy for Prevention

At first of all, within the Austrian National Crisis and Disaster Protection Management emphasis is placed on mitigation concepts, including the avoidance of natural hazards by the construction of hazard zone plans and spatial planning. Furthermore, flood protection initiatives and torrent and avalanche control as well as avoidance strategies for technical disasters fall into mitigation measures. The establishment and the maintenance of disaster relief organisations and the promoting of disaster protection planning by encouraging mines rescue services, pandemic planning and radiation protection planning are important prevention measures. Furthermore, the crisis education and the training of professional and volunteered staff have a long tradition in Austria.

²⁴⁸ Information about the department is available at: <http://bfw.ac.at/rz/bfwcms.web?dok=4905>; accessed at: July 14th, 2014.

As a particular type of preventive measures, the policy papers European Programme for Critical Infrastructure Protection (EPCIP) and its national counterpart, the Austrian Programme for Critical Infrastructure Protection (APCIP) are concerned with the protection of critical infrastructures. “Europe's critical infrastructures are highly connected and highly interdependent. ... Interconnectedness and interdependence make these infrastructures more vulnerable to disruption or destruction”²⁴⁹. The purpose of EPCIP (COMMISSION OF THE EUROPEAN COMMUNITIES 2004) is to ensure that there are adequate and equal levels of protective security on critical infrastructure, minimal single points of failure and rapid, tested recovery arrangements throughout the Union. EPCIP would be an ongoing process and regular review will be required to keep abreast of the issues and concerns within the community. Success shall be measured by (i) The Member States governments’ identification and establishment of inventories of critical infrastructures in their jurisdictions according to the EPCIP drawn up priorities; (ii) Businesses collaborating within sectors and with government to share information, and reduce the likelihood of incidents causing widespread or lengthy disruption to critical infrastructures; (iii) The European Community resolves to establish a common approach to tackling the security of critical infrastructures through cooperation of all public and private actors.

A shared responsibility can be also observed within the prevention phase of the disaster life-cycle. According to specific hazard types, regional authorities are coordinated with the responsible federal authorities. Based on the state’s legislative power in the area of shipping, aviation and railway, the state plays an important role in the protection against human induced and technological hazards. In contrast, the provinces are exercising sovereign rights in the area of natural hazards – apart from the flood protection mandate of the Federal Ministry of Agriculture, Forestry, Environment and Water Management. As an example, the risk zoning initiative of the Federal Ministry of Agriculture, Forestry, Environment and Water Management has been prioritized in consultation with the corresponding authorities of the Austrian provinces (Expert Interview 2014). At the strategic level, prevention measures are primarily concentrated on risk analysis and hazard monitoring. The risk assessment approach complies with the European standards, which have to be implemented since 2013. In Austria, the prevention strategy has been geared towards the knowledge about probable hazards, related risks and a nation-specific vulnerability assessment. This strategic approach has been also reflected in academic programmes, which are aiming at a trans-disciplinary research of risks by encouraging the participation of stakeholders from politics, administration and multiple scientific disciplines. The MoI indicated, that a common consensus about prevention priorities amongst the various stakeholders have been achieved by the knowledge based approach to policy making (2014). In case of a need, also economic stakeholders will be involved. As defined in the APCIP, the protection strategy for critical infrastructures is to be made under cooperation of the responsible ministries, public bodies and relevant infrastructure managers. Furthermore, special education and training programs are tailored for economic partners, especially for energy providers, because provincial governments are holding parts of their companies.

1.2.4 Policy for Preparedness

As mentioned above, preparedness is initiated at the level of the federal provinces. Stipulated by the arrangement Art 15a B-VG about the establishment and operation of an alerting and alarm system,

²⁴⁹ http://ec.europa.eu/councils/bx20041216/com_2004_702_en.pdf

the Federal provinces are induced to contribute to the preparedness by establishing warning centre, construct control and command centres as well as to manage operating centres (Jachs 2011a). They have the competence to establish emergency and relief organizations, provide an appropriate infrastructure and organise training events. Within the SKKM Strategy 2020 (2009), the core issues of preparedness have been supplemented with the recommendation to promote special technical skills and education programs and optimize coordination and cooperation structures. Despite the recent economic crisis, a slight increase of membership could be registered in voluntary organisations in Austria. Thereby, issues regarding the material equipment of these organizations or the creation of a national framework for a continued payment of remuneration will be raised. Due to the fact, that the source of financing volunteering is not very transparent – also municipalities do not pay the entire costs, financial adjustments or compensations from the Disaster Relief Fund seem to be possible operative requirements for the strategic level (Expert Interview 2014).

1.2.5 Policy for Response

The expert at the MoI (2014) indicated , that the response to disasters is based on the principle of subsidiarity encompassing a high degree of delegation of competence to the local and regional level. As emphasised by the BMLFUW (2012), public safety authorities and organisations – namely the fire brigades, the emergency services, the police, the armed forces and aid organisations are the key players within the response phase. Jachs (2011b) points out, that the response strategy comprises the danger removal by the government agencies, the mobilisation of disaster relief organisations, the command and control of disaster response operations, a cross border mutual aid system, the legal arrangement of the contributing rescue workers as well as media work and crisis communication. The response to disasters is based on the principles of competence (at local level) and delegation (subsidiary intervention to higher layers of administration, in case of necessity) and involves several departments at the municipal, district and provincial level. In the light of the sovereignty principle, the provinces instead of the federal state are the central control body of governing response activities. Competences to response to a concrete event are highly developed at the local level of communities, which are not steered centrally.

Although, the efficiency of the recent organisation principle is not clear at the first glance, the MoI emphasised that distributed responsibilities, in particular the decisive competences at the local level, become apparent in the case of an event during the relief and response phase (2014).

The capacity of local communities to response rapidly to known threats is owed to the circumstances that municipalities dispose of their own locally available utilities. The high level of self-initiative of the communities in is an advantage of the distributed administrative systems and accordingly high is the local commitment. The Federal Ministry of the Interior assumes the role of a strategic coordinator and raises cross-cutting issues, which exceed the spatial dimension of the individual provinces, e.g. cross-border missions and the establishment of early warning systems (2014). On the basis of several arrangements, the Federal Ministry of the Interior acts as a focal point by providing an interface for the systematic exchange of information between the regional level and the international level (Jachs 2011b).

1.2.6 Policy for Relief and Recovery

The BMLFUW (2012) has specified that the regeneration after a disaster means the rehabilitation of damaged buildings, infrastructure and transport routes as well as the financial settlement of the damage. As is evident from the national legislation, the approach and the means used in the preparedness and the response phases are covered by appropriate paragraphs in the legislation on disaster management. There is no rule, which defines recovery activities, because – from a legal perspective – the disaster management is ending with the response phase. The same pattern pertains at the policy level – there are programs concerning the prevention/mitigation of hazards and the protection against threats, but there is no recovery plan. Based on the hierarchical structure of the federal state, there is a clear division of subject-matter jurisdiction – while the state is responsible for the rehabilitation of essential infrastructures, the provinces attend to restore roads and the municipalities establish the community infrastructure. However, voluntary emergency/relief organisations have developed approaches for recovery. From a strategic viewpoint, the Mol argued that Austria has sufficient capacities for recovery and therefore, recovery is mainly considered as a financial issue (2014), while relief organisations are concerned with the reconstruction of buildings and infrastructure as well as the reimbursement. Two important instruments are the disaster relief fund and the solidarity fund of the European Union (Jachs 2011b). The disaster relief fund as an important financing instrument becomes also effective in the recovery phase. Financial provision has been made to individuals, including the payment of compensation to flood victims and to administrative units by granting financial alleviation, e.g. tax deferment or charge exemption. The civil society and the local economy express its solidarity and offers support, e.g. private donations to the victims of natural disasters or the offer of favourable loans for affected persons by banks or the “Austria Wirtschaftsservice” (Expert Interview 2014).

1.3 Financing

1.3.1 Investing in preparedness

As indicated by BMLFUW IV/5 (2013), the federal state provides as a central financing instrument for the natural hazard prevention the disaster relief fund, which will be financed at a rate of 1.1 percent of the annual revenue from some taxes, e.g. income, gain or cooperation taxes. The Federal Ministry of Finances administrates the funds and recorded a distribution of subsidies in the amount of EUR 1,873.71 million for the period 2002 to 2006. In sum, based on the financial resources from the Disaster Relief Fund, federal funding and financial contribution of the provinces, a total amount of EUR 4 billion will be provided from 2007 until 2016 for protecting against natural hazards. Due to the fact, that disaster relief falls within the competences of the provinces, their expenditures will be replaced by the federal state. As illustrated in Figure 34, three quarters of the committed funding was reserved for prevention (73.3 percent), followed by costs to remedy the damage with about 17.8 percent and reimbursements for means used in missions with 8.9 percent. The Law on a Fund for Catastrophes provides a budget for the establishment of disaster risk reduction on the national level by ordering the raising of financial means and regulating in detail their expenditure within Austria. Dedicated to finance prevention measures, a further substantial reinforce of the fund in the amount of € 47.5 million from Federal funds has been decided in 2013 (Federal Ministry of Finance 2014).

A clear focus on natural hazards – about ¾ of the fund, can be identified in Austria (Jachs 2011b). In accordance to the principle of subsidiarity, the provinces have their own budgets for DRR issues as well as the municipalities.

Although, there are no official statistics, the annual expenditures for preparedness measures of disaster management are estimated to be about 0.1 percent of the GDP (status of 2013).

Figure 34: Distribution of financial resources of the disaster fund
Source: Federal Ministry of Finance (2014)

In the light of the Tsunami disaster in 2004, the Austrian government decided to establish a fund for response to disasters abroad. The budget of this fund is dedicated to financial aid in the aftermath of disasters as well as for the prevention against hazards. The Federal Ministry for Europe, Integration and Foreign Affairs (BMeiA) is administering the fund while the Austrian Development Agency (ADA) assumes the supervision of the fund. The Foreign Disaster Relief Fund regulated by the law on a Fund for disasters abroad, Art. 1-3 and provides for the establishment of a budget on national level to make contributions to combat disasters abroad (Federal Ministry for European and International Affairs and Austrian Development Agency 2009)

As illustrated in the Figure 35, the federal state, the provinces and municipalities of Austria allocate an annual amount of EUR 120 million for torrent, avalanche and erosion control. The largest share of 54 percent is used for torrent control, followed by 14 percent for avalanche control and 11 percent for protection forest and management of catchment areas. Only 4 percent of the sum is dedicated to implementing measures against rocks fall and slides (BMLFUW 2009).

Figure 35: Distribution of funds for measures to protect against some natural hazards
 Source: BMLFUW 2009.

1.3.2 Investing in consequence management

Annually, the federal government spent more than EUR 200 million on natural disaster management. The bulk of this funding is channelled through the Federal Disaster Fund, which receives 1.1 percent of federal tax revenue. One quarter of the Federal Disaster Relief Fund is used to compensate households and businesses for losses from natural disasters. At present, neither individuals nor businesses bear the full cost of their exposure to climate risk, which effectively acts as a subsidy for development in high-risk areas (OECD 2013).

After an event, the reconstruction and stabilisation has top priority. There are some possibilities to fund certain recovery measures by the disaster relief fund or the solidarity fund of the European Union. The disaster relief fund is dedicated to finance prevention measures as well as recovery measures. The settlement is processed by an official request of the provinces, which take 40 percent of the total amount. Damages to private property as well as to public infrastructure will be covered by the fund. The BMLFUW IV/5 (2013) stated, that the disaster relief fund satisfies about 20 percent or 30 percent of the loss from disaster of private households and companies. By application for permit at the municipalities, subsidies will be paid out to aggrieved persons. This fund co-finances the operating equipment for fire brigades as well as warning and alerting systems.

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

It was indicated by the expert that organisational learning in Austria is mostly based on the experience from real events, which might become disasters in Austria or in neighbouring countries

(Expert Interview 2014). Several developments and projects have been put in place in the last decades as results of lessons learned from disasters. A mining disaster in 1988 for instance led to a fundamental adaptation and reorganisation of emergency service for mines. A major avalanche in 1989 was the starting point for improvements in avalanche warning and protection. Although, there was not a general governmental evaluation of the floods in 2002, individual insights caused several adjustments. As a result of the disaster assessment of the tunnel blaze in Kaprun in 2000, the analysis concluded a lack of preparedness and information (CRiSMART 2014). On the one hand, the personnel of the mountain railway had not been trained for this kind of situation; they had received training for other types of accidents, but not for a tunnel fire. On the other hand, there was no awareness of the threat of a fire, because the train and the tunnel were considered to be fireproof. Apart from the shortfalls, the crisis response was smooth because there was an existing crisis management plan in Kaprun. “This plan had been designed for a possible accident at the local power station, but it was quite useful for structuring the rescue work in Kaprun.”²⁵⁰

Frequently, results from research project have set the starting point for learning processes. The evaluation of the floods in 2002 in the frame of the projects Flood Risk I and II caused an institutionalisation of flood protection, legislative amendments of the Water Act, etc. A follow-up project FloodRisk II was launched after the recent floods in 2013 in order to evaluate the achievement of these two projects. Also, the case of the Icelandic Ash has revealed a demand for optimization and awareness of rare dangers to mention another concrete example (Expert Interview 2014). A number of other projects could be mentioned as well. According to the BMLFUW (2012) lessons learnt have been considered within the prevention phase and will further direct the realisation of protection measures.

1.4.2 Departmental Lessons Learned systems

The expert at the MoI (2014) explained, that events will be reviewed either in the course of regular coordination meetings, initiated by the ministry concerned or by the competent authority on the basis of the departmental principle or in specific working groups if necessary. In that frame inter-ministerial working groups can be established to discuss hazard potentials and take appropriate actions.

1.4.3 Centralised (national) Lessons Learned system

Once a year, a meeting will be held to coordinate the state and the provinces, as well as individual departments and relief organisations. In the case of a cross-border event, a shared situational awareness will be reached by information exchange systems, located at the Federal Ministry of the Interior. The Federal Ministry of the Interior participates at the INSARAG and is also the main contact point for providing humanitarian aid. Within the last conference of Forum Alpach, the Ministry of the Interior organised a workshop about that issue together with UNOCHA. If there is no event, the bi- and multilateral information exchange is organised in the frame of experts’ meeting (mostly in Brussels). At the time, a close cooperation has been established with representatives from Switzerland and Germany.

²⁵⁰

http://www.fhs.se/Documents/Externwebben/forskning/centrumbildningar/Crismart/Forskning/Fallbanken/KAPRUN_T.PDF

It was critically noted by Bossong and Hegemann (2013) that the most investigations deal with technical aspects of a disaster, e.g. torrent control and hazard zoning.

1.4.4 International exchange for Lessons Learned

Exchange of knowledge in Austria is organised on a geo-strategical level in the aftermath of real events. As stated by the expert at the MoI (2014), additionally, insights gained from the supranational level or international organisations like the WHO have stimulated the examination of global threats, e.g. pandemics or epidemics. If a case of a global threat becomes apparent, the competent ministry conveys a conference to discuss the potential threat for the nation with all number of ministries. The MOI usually takes part in lessons learned meeting under the EU civil defence mechanism and shares the results with other national stakeholders (Expert Interview 2014).

1.4.5 Regular policy reviews

As indicated by Bossong and Hegemann (2013), apart from some attention-getting events, there was only less interest on crisis events in Parliament. Mostly, financial aspects, e.g. compensation were raised within debates, but also further protection strategies. Bossong and Hegemann (2013) counted 23 important reforms as a result of disaster experience, which changed the shape of the Austrian Civil Defence System (the Austrian Civil Defence System is based on five pillars: authorities, first responders, the population, science and economy. The Federal Crisis and Disaster Protection Management is a central element of the Civil Defence System) . Finally, a nation-wide capacity of disaster management was established based on the initiative of the Federal government.

1.5 Resilience

Within the Austrian Security Strategy (2013), the security policy referred to the concept of resilience as “restoring the proper functioning of the state and society in the aftermath of crises”. Resilience has not become a conventional term in the Austrian linguistic usage.

With regard to the Hyogo Framework for Action, where an emphasis is on the strengthening of the local resilience, Austria is fully on schedule. The well-established principle of sovereignty and subsidiarity is fostering the self-capacities on the community level. The community-based approach is supported by a strong civil society and effects a comprehensive protection against the impacts of natural disasters. A big part of the initiatives at the local level are concerning preparedness activities, and therefore, the national resilience concept is strongly related to that phase.

1.6 Information sharing and data protection

Data exchange with third states is done in specific areas on the basis of bilateral agreements. The Austrian Federal Ministry of Agriculture, Forestry, Environment and Water Management, for instance, has already established programmes to exchange information about relevant threats and monitoring systems from neighbouring countries on the basis of special agreements related to nuclear incidents. Other data like meteorological data are also shared with corresponding institutions (Expert Interview 2014).

On the basis of intergovernmental agreements, experts have access to measurement data of the systems of neighbouring countries. In the case of releases of radioactivity in a connected country, effects bear on Austria can be estimated at an early stage. As can be seen in Figure 36, an access to exposure levels of nearly all European member states will be achieved via the link to the European platform EURDEP.

Figure 36: Automatic online data exchange between Austria and neighbouring countries as well as link to the European platform EURDEP

Available at: <http://www.bmlfuw.gv.at/umwelt/strahlen-atom/strahlenschutz/strahlen-warn-system/sfws.html>.

In cooperation with the Austrian radio channel Ö3, which is a programme of the Austrian Broadcasting Corporation (ORF) and the Austrian Cross, Team Austria²⁵¹ was founded in 2007. The initiative is purposing the recruitment, mobilising and coordination of spontaneous volunteers in advance. Thus will be lead to a more efficient assistance of volunteers in the case of a disaster. Via a volunteer's platform, crisis committees and authorities are enabled to get access of about 35,000 pre-registered volunteers. At the moment, a crowd-tasking feature for fostering resilience by improving the management of volunteers is being developed within the research project RE-ACTA.²⁵² This approach is further pursued in the frame of DRIVER. According to the Data Protection Act, the protection of the personal integrity has priority. Albeit, if the forwarding of personal data is in the interest of the affected person, i.e. in the frame of the search for missing persons by relatives, the reasons will be balanced. However, only involved organisations exchange personal data among each other, e.g. the emergency service forward information about missing persons to the police, because the search for missing persons is the duty of the police. Also, between the provinces and hospitals data will be exchanged. With regard to data about terrorist activities, data will be available for the Federal Agency for State Protection and Counter Terrorism (BVT) and operative units, but there is no central data management because there is no central unit for data retention (Expert Interview 2014). The Provincial Laws, e.g. the Vienna Data Protection Law envisages an own phrase for dealing with the registration of individuals. The Austrian Federal Ministry of Agriculture, Forestry, Environment and Water Management has already established programmes to exchange information about relevant threats from neighbouring countries on the basis of agreements, e.g. about nuclear incidents and more general – meteorological data (Expert Interview 2014). According to the Data

²⁵¹ Web-Page about Team Austria: <http://oe3.orf.at/teamoesterreich>; accessed: July 14th, 2014.

²⁵² RE-ACTA project: <http://blog.rotekreuz.at/reacta/beispiel-seite/>; accessed: July 14th, 2014.

Protection Act, the protection of the personal integrity has priority. Albeit, if the forwarding of personal data falls within the predominant interest of the affected person, e.g. in the frame of the search for missing persons by relatives, the reasons will be balanced. However, only involved organisations exchange personal data among each other, e.g. the emergency service forward information about missing persons to the police, because the search for missing persons is the duty of the police (Expert Interview 2014). Some provincial laws envisage an own phrase for dealing with the registration of individuals.

2 Legislation

2.1 Crisis (emergency, disaster) management concept

In general, there are three documents, which can be considered as the basis for shaping the Austrian approach of civil defence.

SKKM 2020 Strategy

As the main strategic document at the national level, the Ministry of the Interior developed the “SKKM 2020 Strategy”, which defines some basis elements of the Austrian civil defence. The strategy is in compliance with the security and defence doctrine (adopted in 2001) and in addition, it provides amendments concerning the internal security. Therein, the pillars of the National Crisis and Disaster Protection Management were defined (Federal Ministry of the Interior 2009). In July 2009, the Federal Government took notice of the report and approved it. Within the SKKM 2020 Strategy, several commitments to European strategies, such as the prevention strategy, were made and the need for harmonisation between the Federal State, the Federal Provinces and response organisations in disaster cases was addressed. As explained by Potyka (2012), the coordination activity of the SKKM, is a service by the Federal Ministry of the Interior to the provinces.

The main principles, mentioned within the SKKM 2020 Strategy are:

- Considering the principle of self-sufficiency and subsidiarity.
- Ensuring a comprehensive network of danger avert and disaster relief on the basis of volunteers and professionals.
- Easy access to military assistance.
- Promoting self-protection capability of the general public by civil protection initiatives.
- Increasing the level of intervention by concluding cross-border cooperation.
- Respecting the principles of non-discrimination, independency, need-orientation and efficiency in international disaster aid.

In order to achieve the aims of an optimal risk and hazard mitigation, early detection, ensuring a high level of preparedness, efficient and rapid response as well as a quick return to normality after disasters, several tools and measures were specified. Basic elements include technical innovations, stimulation of trainings and education across organisations, improvement of the coordination structure. As an example, recommendations to establish curricula for strategic, tactical and operative staff were addressed. Amongst others, a focus lies on a research-driven and science-based approach to strengthen the disaster management capacity in Austria. In addition, an emphasis was given to the disaster relief fund as the core financial instrument, which provides ¾ of the budget for flood protection and avalanche control and 8.9 percent for operative respond and surge arrangements. Within the document, the traditional three-pillar-model of civil defence (measures of authorities, respond organisations and self-provision of the population) was extended to include the citizens extra as well as the economy. With regard to the Directive 2008/114/EC²⁵³, the strategy indicated the

²⁵³ Directive 2008/114/EC issues the identification and designation of European critical infrastructures and the assessment of the need to improve their protection.

involvement of operators of Critical Infrastructures in prevention, mitigation, response and relief measures.

Austrian Security Strategy

The Austrian Security Strategy, adopted in 2013, provides a framework for shaping the security policy (Federal Chancellery of the Republic of Austria 2013). Regarding Austria's relationship with EU, UN, NATO, PfP (Partnership for Peace), EAPC (Euro-Atlantic Partnership Council) and OSCE (Organisation for Security and Cooperation in Europe), a clear statement was made to efforts establishing a common space of security. Therein, the cooperation of the international stakeholders in accordance with the principle of a division of labour for comparative advantage was emphasised. Within the strategy, main sources of threats were defined (Federal Chancellery of the Republic of Austria 2013):

- international terrorism
- the proliferation of weapons of mass destruction
- domestic and regional conflicts or turmoil that affect Europe or have global repercussions
- "state failure"
- natural or technological (man-made, non intentional) disasters
- attacks against the security of IT systems
- threats to the strategic infrastructure
- transnational organised crime
- drug trafficking, crime, corruption
- illegal migration; unsuccessful integration
- the scarcity of resources (energy, food, water)
- climate change, environmental damage and pandemics
- piracy and threats to the transport routes
- the repercussions of the international financial and economic crisis on security

In order to overcome threats in an adequate way, it was defined to continue contributions to PfP (Partnership for Peace) in the security area. Particularly, military interoperability, participation in operations, and the utilisation of cooperation opportunities offered will be ensured by an intense cooperation with other PfP-States.

Within the strategy, special mention was made to the role of the Austrian Armed Forces in internal security. Their participation in national and international crisis management operations recorded remarkable success. In the cases of a natural disaster, threat to a Critical Infrastructure or policing operations, civil authorities can request the Austrian Armed Forces for assistance. Based on multiple areas of the deployment of Austrian Armed Forces, the strategy determines the availability of at least 12,500 soldiers to be deployed in the event of domestic disaster relief operations.

Austrian Programme for Critical Infrastructure Protection (APCIP)

As already indicated in chapter 1.2.3, the Austrian Programme for Critical Infrastructure Protection (APCIP) addresses the protection of critical infrastructures as an approach for specific threats. Therein, the measures to implement APCIP on the national level of Austria were reflected (Federal Chancellor of Austria 2013). In order to achieve the objectives, defined by APCIP (European Programme for Critical Infrastructure Protection), an individual investigation of country specific threats and critical infrastructure was conducted. As a part of the vulnerability analysis, the following domains have been examined: the Constitutional Institutions, the Energy Sector, Information and Communication Technologies, Water Supply, Food, Health and Social Affairs, Finance, Transport and

Distribution Systems, Chemical Industry, research organizations and emergency and rescue workers. The Action plan proposes the drawing up of a list with strategically important infrastructures in Austria and their prioritization, the definition of standards of protection and security, the implementation of protection measures, the development and the establishment of cooperation regarding the information management and the evaluation of the implemented measures. An orientation on the Critical Infrastructure Warning Information Network (CIWIN), which is part of the European Programme for Critical Infrastructure Protection (EPCIP) have been considered.

2.2 General crisis (emergency, disaster) management law

The Austrian Federal constitution does not indicate an own matter of powers and responsibilities for disaster protection or disaster relief. Therefore crisis and disaster management in Austria refers to a *fragmented horizontal competence* with different legislative responsibilities and laws depending on the specific case of an event (Jachs 2011b). The disaster response system in Austria includes mechanisms to prevent and to ward off disasters. As in other fields of public administration in Austria, legislative and executive responsibilities concerning disaster management are divided between the Federal Government and the Federal Provinces. Exceptions exist, where cases are inseparable matters of the federation, e.g. the radiation protection falls within the competence of the federation. The civil defence laws address the affected communities and the aid workers, support staff members and the authority itself. The different coordination procedures of the provinces are due to the nine different national regulations resulting from unequal definitions of crisis and disaster and regionally specific coordination structures. In Austria, the shaping of the internal security follows the principle of optimizing the warning systems, ensuring cooperation between all bodies with regional civil defence authorities and emergency services based on the legal requirements of the National Crisis and Disaster Protection Management (SKKM).

The National Law Desk Survey conducted by Potyka (2012) concluded:

In substance, there is no national disaster management law, but only national disaster management coordination by the Ministry of the Interior. However, particular legal regulations (e.g. in the fields of customs, traffic etc.) also take account of the needs in case of disaster, which facilitates national activities in the field of disaster management.

In 2009, the directive to mitigate the risks of flooding for health, environment, heritage and economic affairs was implemented in national law (European Parliament and the Council 2007). Thus, competences of the federal state and the provinces were affected in the area of disaster protection, environmental protection as well as flood and avalanche protection (Hornich 2013). Furthermore, the legislation about the Union Civil Protection Mechanism which contributes to the implementation of Article 222 TFEU stipulating the obligation to provide aid in the spirit of solidarity in case of a terrorist attack or disaster came into force in 2014 (European Union 2013).

There is no primary act of disaster management on the state level, but the provinces have established laws on disaster relief or disaster protection on their own. Provinces have enacted regulations regarding the disaster response and the disaster preparedness. Within the report of Potyka, an overview on relevant disaster related laws have been provided (2012). Disaster mitigation, prevention and disaster risk reduction have been covered by the Austria Forest Act (2002). The Water Act defines water-specific mitigation and prevention strategies (Federal Law Gazette 1959). As

already mentioned in previous chapters, also the Law on Defence (2001) is a disaster related regulation at the national level.

At the level of municipalities, districts and provinces the following plans are available (Jachs (2011a), Jachs (2011b)):

- Disaster Protection Plan
- Special Alarm Plan for certain disasters, like tunnel accidents
- Emergency Plans for SEVESO establishments
- National Intervention Plan for radiological emergencies
- Pandemic Plan
- Plan on the Early Warning System: Radiation Early Warning System, Weather Warning, Communicable Diseases
- Plans on the flood prediction model

2.3 Emergency rule

In Austria, no emergency rule exists in the ordinary sense of the word, but what is involved is an extended transfer of legislative power if the Parliament is unable to meet and to perform its functions (EUROPEAN COMMISSION FOR DEMOCRACY THROUGH LAW 1995).

Bossong and Hegemann (2013) reaffirmed this finding and explained:

There are no rules for a general state of emergency including derogations from civil liberties and democratic oversight. Emergency laws are to be differentiated from a local or regional state of disaster that allows for the upscaling of competences. As determined by Art. 18-II B-VG, the federal president can put in place provisional legal acts at the suggestion of the federal government for the prevention of an “obvious, irreparable damage for the society” if the national parliament is not able to convene.

As indicated by Khake (2009), the power to take measures in times of crisis or emergency in order to provide necessary supplies was transferred to the executive body of Austria. In detail, the Constitution of the Republic of Austria entitles the federal authorities to take special measures to ensure basic supplies in times of war, threats to the constitutional order and public security, natural disasters or other calamities are provided for.

On the recommendation of the Federal Government, the President of the Republic of Austria is authorised to take necessary measures by way of provisional law - amending ordinances, if the Parliament is not assembled, or if it cannot meet in time, or is impeded from action by circumstances beyond its control, to prevent obvious and irreparable damage to the community (EUROPEAN COMMISSION FOR DEMOCRACY THROUGH LAW 1995). It was further pointed out, that such an “ordinance requires the countersignature of the Federal Government. Such ordinances must be submitted by the Federal Government to the National Council (comment: a chamber of the parliament) without delay. Within four weeks of submission, the National Council must either vote a

corresponding Federal Law in place of the ordinance or pass a resolution demanding that the ordinance immediately be invalidated.”²⁵⁴

Within the Constitution, the Austrian Armed Forces are foreseen to “protect the constitutional order and public security by assisting in cases of natural disaster or other serious calamities. This implicates the right of the Armed Forces to intervene on their own initiative in certain cases when civilian authorities are incapacitated” (Khakee 2009).

The web page of the Parliament of the Republic of Austria provides the following information (2014):

The Austrian Federal constitution determines for the state of emergency special emergency provisions, namely the deployment of armed forces, an emergency decree of the Federal President, an emergency decree of the Federal of the Federal provinces as well as a direct Federal land management by the governor of the province. Emergencies in the face of wars, natural disasters and comparable events pertain as exceptional circumstances. In the course of a state of emergency, the Federal President can modify laws and order certain measures to be taken by emergency decree, can decide to move the seat of the chief organs of the state and the National Council to a different location. The Standing Sub-Committee has a particularly important role to play in exceptional situations – natural disasters or the outbreak of a war: if the National Council cannot meet, the Federal President can issue emergency decrees, but only when proposed by the Federal Government, which in turn requires the approval of the Standing Sub-Committee of the Main Committee.

The constitutional law limits the emergency decree by prohibiting:

- the amendment of Federal constitutional provisions
- a permanent financial burden on the Federal State, the Federal provinces, the municipalities or financial obligation of citizens
- the sale of state property
- measures concerning labour law, social security and insurance act system, Chamber of Workers and Employees, right of association.

Since the Second Republic has been proclaimed, the emergency decree has never been applied (Austrian Parliament (2014)).

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

Due to the fact, that crisis and disasters might cross the borders of the federal provinces or the federal state, which require an overall coordination, the national government has the power to coordinate disaster relief (Potyka 2010). On Federal level, the Law on Federal Ministries defines that the Ministry of the Interior is responsible for the coordination of the federal crisis management, governmental Crisis and Disaster Protection and the International Disaster Response (Bossong and Hegemann 2013).

²⁵⁴ [http://www.venice.coe.int/webforms/documents/default.aspx?pdffile=CDL-STD\(1995\)012-e](http://www.venice.coe.int/webforms/documents/default.aspx?pdffile=CDL-STD(1995)012-e)

According to the principle of a divided administration, relevant legislation for risk and disaster management can be identified at the three administrative levels (Leitgeb and Rudolf-Miklau 2004). In particular, nine legal acts by the state constitute the disaster management framework in Austria.

- Water Act
- Forest Act
- Torrent Control Act
- Water Construction Financing Act
- Disaster Relief Fund Act
- Ordinance on Hazard Mapping
- Guidelines on Hazard Mapping
- Technical Directive for Torrent and Avalanche Control
- Directive for Cost- Benefit- Analysis on Torrent and Avalanche Control Measures

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

According to the general clause of Article 15 (1) of the Federal Constitutional Law, the response to crisis and disasters is primarily a matter of the provinces. Each province is authorized to create appropriate rules and laws on their own (Bußjäger 2003). This means that the Federal provinces are mandated to organize disaster relief services and resources for emergency assistance and disaster relief operations. “In case of local emergencies, regional laws generally foresee official responsibility for relief measures and their management to rest with district administrations or mayors, while major disasters fall under the competences of regional administrations.” (European Commission 2014)

In Austria, nine different laws exist, which take influence of the structure of the Land centres. Civil defence laws regulate how processes, in contrast to normal life, must be organized to minimize the impact of disasters of various kinds. The civil protection laws are on one hand relevant for the affected communities and on the other hand, aid workers, support staff members, finally the authorities themselves. Depending on the country and the possible disaster scenarios, the laws are adopted at various levels. Potyka (2010) indicated that the provinces use different terminologies of disaster, which caused a plurality of the legal scope.

At the level of federal provinces, mainly three laws influence the Austrian disaster management.

- Civil defence Acts
- Areal Planning Regulations
- Building Trade Acts

Due to the executive nature of municipalities, the sphere of disaster management has been shaped by ordinances of the community. Furthermore, at the local level of municipalities and communities the following regulations play an important role (Leitgeb and Rudolf-Miklau 2004):

- Hazard Maps on Torrent and Avalanche Control
- Area planning scheme
- Local development concepts
- Development scheme
- Planning and building permissions

- Alarm and action plans for disasters

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

The involvement of voluntary organisations in disaster relief is regulated on the basis of nine provincial laws, which may differ in some kind. However, there is no unified law on that issue. In the case of any damage, caused by a volunteer, the cost must be covered by the Disaster Relief Fund Law on Official Responsibility (Amtshaftungsgesetz), BGBl. Nr. 20/1949 as amended by BGBl. Nr.537/1984) (Austria, 1984).

2.7 Legal regulations for international engagements of first responders and crisis managers

As stated by Potyka (2010), the Federal Ministry of the Interior is the competent authority to coordinate disaster relief in Austria. The legislation does not specify extra procedures for international assistance and Austrian relief. However, bilateral agreements are in place between Germany, Croatia, Liechtenstein, Jordan, Slovakia, Switzerland, Slovenia, Czech Republic and Hungary.

Regarding the regulation for the international deployment of rescue workers, it has been stated by Potyka (2010):

Foreign state aid providers requested by Austria would possibly have to be regarded as employed by the competent Austrian authorities. Furthermore, the Austrian authorities or their legal entities (federation, federal state and community) would generally be responsible and accountable for the actions of these foreign aid providers.

According to the Law Implementing the Aliens Act (No. 188/2005), "nationals of non-EU states are exempted from visa obligations for the length of the transit if they are part of the flight crew or attendants of an emergency or rescue flight or are otherwise active as rescuers in the event of disasters or accidents." Travel Visas will also be granted for relief workers for the duration of three months. Regarding the liability, "foreign state aid providers requested by Austria would possibly have to be regarded as employed by the competent Austrian authorities. Furthermore, the Austrian authorities or their legal entities (federation, federal state and community) would generally be responsible and accountable for the actions of these foreign aid providers." At the moment, law does not specify certain qualifications of the relief workers. The security services are responsible for the safety of relief workers, premises, transport, equipment and goods. It was stated, that some rescue services have "fleet insurance policies" because of the number of vehicles they have.

Potyka indicated that provisions were made for the exemption of import duties for relief supplies and relief items of disaster relief teams. The Federal Ministry of Economics, Family and Youth has to ensure a rapid supply of relief items, simplifying the bureaucratic hindrance. Exceptions of the import and export of medical products are covered by the Narcotic Drugs Act.

3 Organisation

3.1 Organisational chart

The Disaster Management in Austria is organized decentralised with different responsibilities on the various spatial levels. As illustrated in Figure 37, the management of crisis and disasters calls different actors and responsibilities on stage.

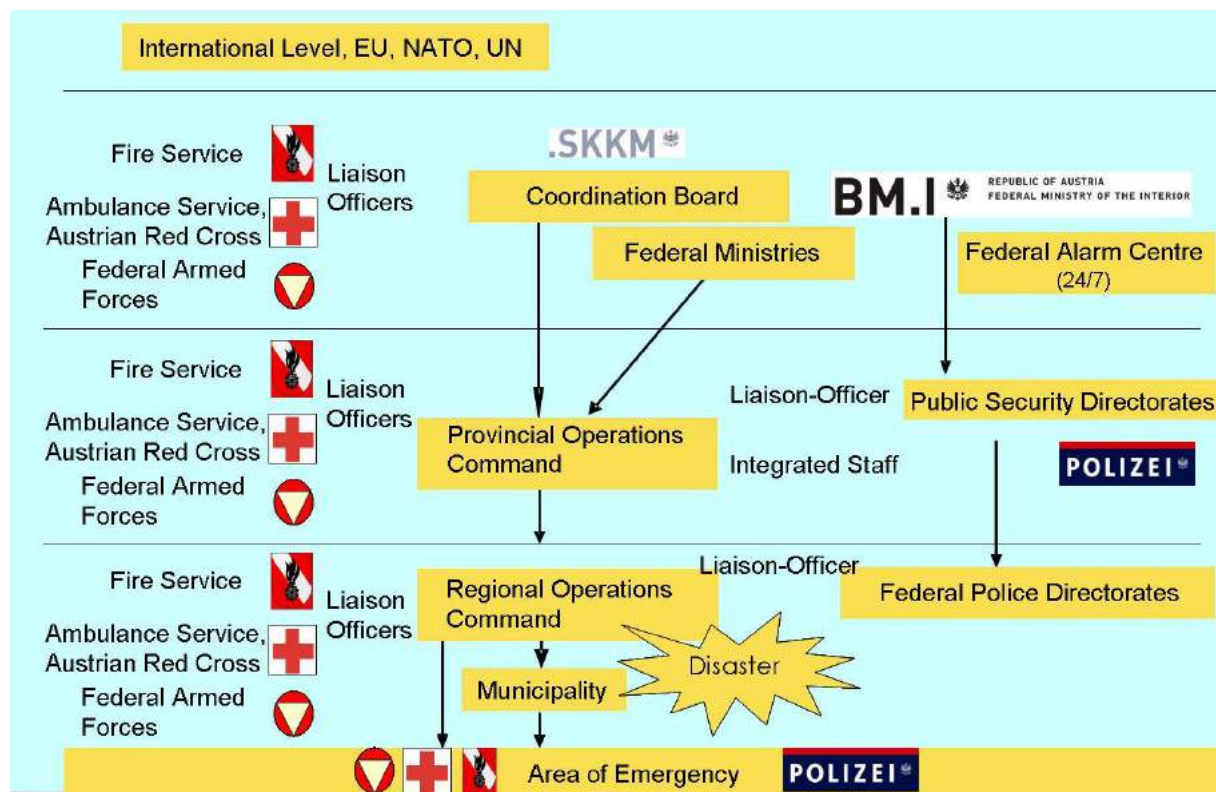

Figure 37: Organizational Chart of the disaster management in Austria

Available at: http://ec.europa.eu/echo/files/civil_protection/vademecum/at/2-at-1.html; accessed: 14th June, 2014.

The Federal Crisis and Disaster Protection Management (SKKM) is located at the Federal Ministry of the Interior (FMI) and acts as a centre for coordinating measurements of authorities and relief organizations in the case of particular hazards, hazardous events and disasters. Chaired by the Executive Vice President of public safety, the council of ministers, where Federal Ministries, provinces and relief organizations are represented, decided to establish an administrative organization for the coordination of public safety - the Federal Crisis and Disaster Protection Management (called SKKM). The responsibility area of the department II/4 of the Federal Ministry of the Interior is divided into National Crisis and Disaster Protection Management (SKKM) and Civil Protection (Federal Ministry of the Interior 2014).

As explained by Jachs (2005), in the frame of the preparation for the World Conference on Disaster Reduction:

At the federal level, a co-ordinating committee was set up for crisis and disaster management. This committee consists of representatives of all ministries, offices of provincial governments,

the major rescue organisations and representatives of media. Similar co-ordinating committees are established at the level of provinces and districts. According to the magnitude of a disaster co-ordination is done by district administrative units, provincial governments or the federal government.

An overview of the composition of the Coordination Committee, chaired by the Federal Ministry of the Interior is provided by Figure 38.

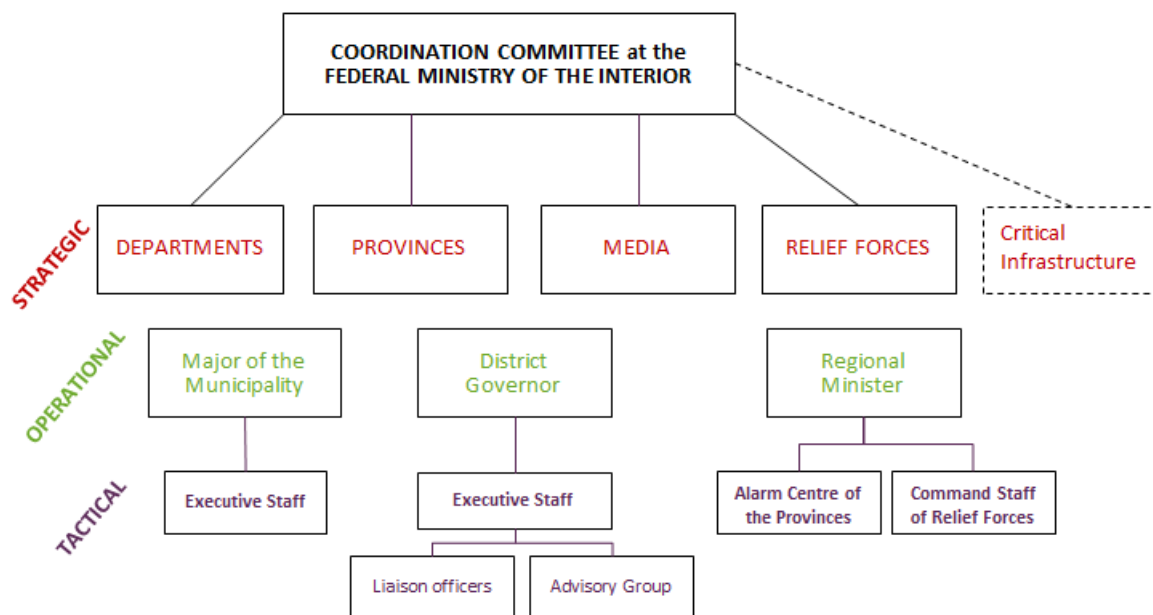

Figure 38: Structure of the Coordination Committee in Disaster Management

Within the Coordination Committee, strategic, operational as well as tactical actors are represented.

The BWZ serves as the central point for the combined warning and alarm system of the Federal Government and the Federal Provinces and is the permanent observatory for the radiation early warning system. It is connected with the information system of the Warning Centres of the Federal Provinces (LWZ), all competent centres on a federal and regional level, the relief and rescue organisations, such as Fire Brigade, Red Cross, Alpine Rescue Organisation, as well as the contact points on a bilateral (neighbouring states), supranational (EU–ERCC), multinational (NATO partnership for peace), and international (UN) level (Federal Ministry of the Interior 2014).

As another step to implement the National Crisis and Disaster Protection Management (SKKM), the provinces assume a strategic part in disaster protection. Measures are managed partly in cooperation with the federation. Each Federal Province has a duty to ensure an efficient disaster protection at the level of district and Federal Province by entrusting appropriate authorities (Jachs 2011a). The disaster relief service of the provinces includes the country's fire brigade association, its institutions and equipment, as well as relief (forces) organizations and personnel resources. The authorities of the provinces operate as the core institutions to manage events; therefore they are featured with special rights for governing the crisis and disaster management. In consequence, every

country has established alerting and warning systems. “Their task is to warn and alert the public in case of imminent danger and to coordinate rescue and relief forces during major disasters.”²⁵⁵ .

As soon as an incident exceeds the capabilities of the local authority, the responsibilities are transferred to the next high level. If an event extends the territory beyond the competence of a municipality, the district authority assumes the role of leading disaster protection authority. The government of the Federal State is called into action if an event cannot be managed with the capabilities of the district level and/or exceeds the political area of the district.

Within reasonable limits, the municipalities have the responsibility to ensure an effective disaster protection. In the case of an event, municipalities are obligated to provide mutual help. Fire brigades have to carry out supporting measures if a certain alert level is reached. Furthermore, the governments of the provinces are authorized to request the assistance of the municipalities for prevention and response activities on district level. Following the principle of subsidiarity, the Mayor of a municipality, the district authority or the government of the provinces are acting as the major authorities for managing the local disaster response.

Based on the coordination approach, the media, especially the ORF as the state broadcasting station, participate at coordination meetings. Mandated with a public service mission, ORF is recognised as a trustworthy source of information about current events. In emergencies, a permanent communication will be established between the EKC and the ORF (also with the APA – the Austrian Press Agency), which will disseminate serious information to the public (Jachs 2011c).

Furthermore, private business is covered within the civil security strategy based on specific regulations. They address certain economic sectors in particular. Especially, for risky or high-vulnerable industries appropriate standards and instructions exist. Each province disaster management law addresses certain regulations. As indicated by Bossong and Hegemann (2013), especially those companies, which are operating hospitals or mines or dealing with dangerous goods, require emergency plans. The strong focus on specific industrial partners has been reflected in the Austrian Programme for Critical Infrastructure Protection. Bossong and Hegemann have illustrated the relationship on the basis of some examples, which will be summarised below. Due to the fact, that the ASFINAG is responsible for tunnel safety and transport issues, a close cooperation with the state-owned infrastructure corporation exists to prevent transport accidents. Also, the ÖBB, as the Federal Railway Company, is integrated in issues regarding the transportation security. The security of the supply chain is amongst others addressed to the power providing company “Verbund AG”, which is a relevant stakeholder in the field of energy security. Last but not least, the ELG – as the Austrian Central Stockholding Entity is considered as a critical infrastructure because it is responsible for the holding of emergency stocks. As illustrated in Figure 38, these four companies – labelled as Critical Infrastructures, will be optionally consulted, if a relevant issue has been raised.

3.2 Organisational cooperation

Within the “National Crisis and Disaster Protection Management Strategy 2020”, it has been defined that the Federal Ministry of the Interior acts as the head of the coordinating body. Chaired by the Director-General for Public Security, the strategic level of the coordination body will comprises of the representatives of the federal ministries, the offices of the Provincial governments and accredited

²⁵⁵ <http://erccportal.jrc.ec.europa.eu/vademecum/at/2-at-4.html>

emergency services, i.e. ARC, ASBÖ, ÖBFV and ÖBRD. Core issues at that level cover an overall information exchange, the definition of strategic action points and fundamental aspects of an emergency. If a cross-border event will require coordination, the Mol is authorized to establish specialist groups by requesting the Austrian Press Agency, the media as well as experts. Legally, cross-border missions are directed by bi- and multilateral agreements of regions, provinces and the state, which define the request and the provision of assistance. Apart from regional agreements between a province of Austria and a neighbouring region or a neighbouring country, the Federal Ministry of the Interior is processing the assistance, i.e. the organisation of the deployment of domestic forces in a third country and vice versa (Expert Interview 2014).

Tactically, the commander of emergency services, i.e. the commander of the fire brigade or the commander of the National Rescue Operations Unit of the Austrian Red Cross, will be able to expand their staff on its own. As it has been stated within the “SKKM Strategy 2020”, the federal structure benefits from an easy access to military forces of the authorities at all spatial levels (2009). Due to the fact, that the disaster management at the national level is based on an interdepartmental cooperation by the superordinate Coordination Committee, several federal ministries are strongly involved in National Crisis and Disaster Protection Management. The Federal Ministry of the Interior is concerned with the strategically processing of assistance interventions, its preparation and execution. The processing of logistic flows, e.g. transport, crossing of borders in the frame of foreign aid and customs matters also lies in its competence area. Furthermore, a permanent communication to other contact points like the NATO, UN and the media is ensured. The preparation of final reports for submission to the Federal Government and the securing of the financing of response activities are required (Jachs 2011b). According to the legislation (listed in 2.4.), the Federal Ministry for Agriculture, Forestry, Environment and Water Management (BMLFUW) is the main strategic responsible prevention measures in Austria. As an authority of the BMLFUW, the Federal Forest Engineering Service for Torrent and Avalanche Control together with the technically specialised district authorities at the provincial level fulfil their duties on the community level (Leitgeb and Rudolf-Miklau 2004). The strategic direction of Torrent and Avalanche Control is located at the department III/5 of the Federal Ministry for Agriculture, Forestry, Environment and Water Management. Additionally, the strategic actor is responsible for the planning and the construction of technical and biological measures to protect against natural hazards (Stiefelmeyer and Sattler 2012). Within the management of flood risk, various responsibilities result due to federalist constitution of Austria. By identifying flood-discharge areas and risk zones, the Federal Water Engineering Administration provides expert opinion for the local regional planning and is also engaged in communicating the threat of flooding to the citizens. Departmental cooperation has been established with the Federal Ministry for Agriculture, Forestry, Environment and Water Management (department IV/6) and the offices of the Provincial government. The department IV/5 - Torrent and Avalanches Control, takes the strategically regulation of the protection against natural hazards, e.g. torrents, avalanches, rock falls, mudslides and floods. According to the Austrian Radiological Protection Act and the EURATOM Treaty (Art. 35), Austria is obliged to operate an Environmental Monitoring Network. In the case of exceeding thresholds, the Federal Ministry of Agriculture, Forestry, Environment and Water Management are responsible for the alerting procedure. Therefore, it uses the real-time forecasting system TAMOS, which is also applied at the ZAMG. In Austria, 335 automatically ODL-measurement devices for the measure of the gamma radiation are installed. These systems send status messages to the data centre of the radiation early warning system (BMLFUW, V/7 2009). A part of the disaster relief fund is dedicated for immediate measures

of the Federal Ministry of Agriculture, Forestry, Environment and Water Management. This department is also assigned with the development of appropriate approaches and strategies for preparedness, prevention and mitigation, as well as the coordination of the expert analyses. The supervision of analysis on natural area and the geographical information system NIAS-Forts are core tasks, which the department is responsible for. Research activities are initiated projects in the area of services for torrent and avalanche barriers. As a subordinate agency of the Federal Ministry of Science, Research and Economy, the ZAMG, is a state service for observatories of meteorological, geophysical and air chemistry measurements. The ZAMG has to fulfil substantial statutory tasks and but has also a partial legal personality to act under private law. Flood events concerning the Danube, March and/or Thaya, the "via donau" as an executive body of the Federal Ministry for Transport, Innovation and Technology shares the responsibility with competent offices of the provincial government (BMLFUW 2014c). The "via donau" is a limited liability company, founded by the Austrian Ministry for Transport, Innovation and Technology, entrusted with the administration and preservation of Federal waterways. In addition, the "via donau" is operating the shipping information system DoRIS (Donau River Information Services). In general, the Federal Ministry of Traffic, Innovation and Technology is responsible for events, which focusing on transport accidents, while the Federal Ministry of Health deals with epidemics and the Federal Ministry of Economy, Family and Youth covers mining disasters (Bossong and Hegemann 2013).

Austria has signed international agreements for assistance in disaster situations. The agreements are formal international treaties and include provisions on the responsible agencies, the modalities of border crossing, coordination and command as well as costs and compensation. Cross-border missions are on the one hand directed by European or international legislation and rules of procedures and also by bi- and multilateral agreements of regions, provinces and the state, which define the request and the provision of assistance. The basic provisions of the agreements are largely similar and follow the first agreement signed with Germany. Furthermore, the non-nuclear country Austria has entered into bilateral agreements on nuclear safety with eight countries in Eastern and Central Europe (Bossong and Hegemann 2013). The Federal Ministry of the Interior is coordinating Austria's contribution to international disaster relief assistance in collaboration with other ministries, the federal provinces and emergency services (Jachs 2011b). Apart from regional agreements between a province of Austria and a neighbouring region or a neighbouring country the Federal Ministry of the Interior is also processing the assistance, i.e. the organisation of the deployment of domestic forces in a third country and vice versa (Expert Interview 2014). For this purpose the Mol relies on the established response organizations in Austria and does not maintain specific extra capacities. Modules for EU interventions for instance which were registered at the CECIS are operationally managed by regional fire brigade associations and mobilized upon request of the MOI. Referring to the ANVIL report, Austria had offered international assistance in 59 cases between 2003 and 2010 (Bossong and Hegemann 2013). Due to the fragmented civil security system, assistance is usually provided by various local and state- level actors. There are also some special units that are frequently used for international assistance, such as the Medium Urban Search and Rescue Unit of the Workers Samaritan Association (ASBÖ 2010) and the International Response Team of the Austrian Red Cross (ARC). There Federal Ministry of the Interior (Mol) is authorized to set up crisis teams and act with the Federal Warning Centre as contact point for official requests.

The Mol established efficient communication structures with:

- DG ECHO, Brussels

- NATO - Euro Atlantic Disaster Response Coordination Centre (EADRCC), Brussels
- UNITED NATIONS - Office for the Coordination of Humanitarian Affairs (UN-OCHA), Geneva.

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

Austria has several generic plans and policies with recommendations on how to deal with disasters. Apart from instructions, checklists or contact directories, there is no overall plan on the national level. It has been explained by Jachs (2005), contingency plans are available for municipalities, districts and provinces. Therein risks have been described, specific measures defined and information about available resources provided. The MoI emphasised, “Disaster management does not work like a recipe” – the persons acting in an event are well educated, have a good grasp and the capabilities to cope with different scenarios. This can be achieved through a comprehensive planning process and continuous training on the job and frequent lessons learned. On the national level, there are only a limited number of plans for large-scale and cross-border events like nuclear emergencies and pandemics. Plans are partly published like the national response plan for nuclear emergencies. As an example, the document “Leading in disaster operations” was published by the MoI in 2006.²⁵⁶ It provides guidelines for staff commanders in the area of situational awareness, leadership, technical equipment, responsibilities, etc. As far as a written procedure already exists, it will be applied (2014). Experiences show, that written procedures are frequently not up to date – they need to be upgraded from event to event. Written plans rather build the basis to evaluate the performance within an event. The building regulation illustrates an exceptional case; in this regulation detailed directions have been stipulated. No extra regulation has been defined the priority-setting in the case of co-occurring events. Due to the clear division of competences on each level, this scenario will not receive particular attention. The Austrian Red Cross frequently participates at the development of standards in the field of humanitarian aid, as well as in drafting operation procedures with a specific focus on threats or intra-organisational tasks and inter-organisational cooperation.

4.2 Operations planning

From a strategic viewpoint, standardisation plays a vital role in improving current procedures and structures. **¡Error! No se encuentra el origen de la referencia.** will provide a short overview on some relevant standards in the area of civil defence, disaster management, etc., mentioned by Jachs (2011b).

Table 8: Overview on some relevant standards in the area of disaster management operations

Standard	Title	Brief description
ISO/DIS 22320	Societal Security – Emergency Management – Requirements for Command and Control	It's a standard about leadership in disaster relief and emergency management as well as for trans-organisational coordination. It is similar to the document “Leading in disaster operations”.

²⁵⁶ The Document “Führen in Katastropheneinsätzen” (“Leading in disaster operations” is available at: http://www.bmi.gv.at/cms/BMI_Service/Richtlinie_fuer_das_Fuehren_im_Katastropheneinsatz.pdf, (only in german); accessed: 21st January, 2014.

ISO/PAS 22399	Societal Security-Guideline for Incident Preparedness and Operational Continuity Management	It is a best practice for emergency prevention and continuity planning.
ÖNORM S 2304	Integrated disaster management	Terms and definitions in the context of the management of disasters, emergencies and crisis; considering interoperability
ÖNORM S 2310	Risk, security and crisis management	Selection and verification criteria for persons appointed for crisis management, disaster prevention, cost reduction
ONR 192320	Crisis and disaster management	Integrated operation control with particular consideration of different management methods, considering cross-border events
ONR 12261-7	Crisis management	Digital exchange of geographic data considering decision making and usage of geo-data for training
IEEE Standard 1512-2006	Incident Management	<ul style="list-style-type: none"> • Emergency Management Centres • Exchange of data about public safety and emergency management • common incident management message sets – Abstract Syntax Notation One ("ASN.1" or "ASN") • Incidents (transportation-related events)

4.3 Logistics support in crises

In Austria's decentralised civil security system, local crisis management agencies and emergency organisation provide the bulk of the necessary logistics (Bossong and Hegemann 2013).

In particular, the Fire Service provides special assets for emergencies. To give an example, the special equipment from a command vehicle is listed here (FEU (2014))

- *“long-term breathing apparatus*
- *protective clothing*
- *power supply units with illumination equipment*
- *evacuation pump units*
- *hydraulic rescue equipment*
- *pneumatic and hydraulic lifting equipment*
- *flame cutters*
- *grinding cutters*
- *chain saws*
- *air compressors with drilling implements*
- *blasting equipment*
- *all kinds of tools*
- *sand bags, etc. “*

In the case of disasters, the federal provinces are authorized to avail resources of individuals and private (logistic) providers for an adequate compensation by a formal decision. Disaster management authorities on each level are legitimated to call for back-up and request personnel or material

resources from the military. Authorities of the provincial governments assign services from designated relief organisations, which are regulated by legal acts of the provinces (Expert Interview 2014).

It has been found out by Bossong and Hegemann (2013):

“There are no specialised independent agencies with an overall mandate for civil security at the federal and regional level. Though private companies are required to observe a number of formal obligations and increasingly participate in some coordination and consultation structures, privatisation and outsourcing do not play a significant role in Austrian civil security.”

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

As it was declared by the BMLFUW (2012), the information policy is a part of the prevention too. The focus is on the self-empowerment and the knowing about hazards by the citizen to promote their self-provision capacities. Facing cross-border crisis and disasters, the Federal State acts as an information hub and a coordinator of wide spreading events, therefore the Emergency Operation and Coordination Centre was established in 2006. The operative element of the National Crisis and Disaster Protection Management (SKKM) is the Federal Warning Centre; it is a permanently manned service location and generates situation awareness in crisis and disasters (Jachs 2011b).

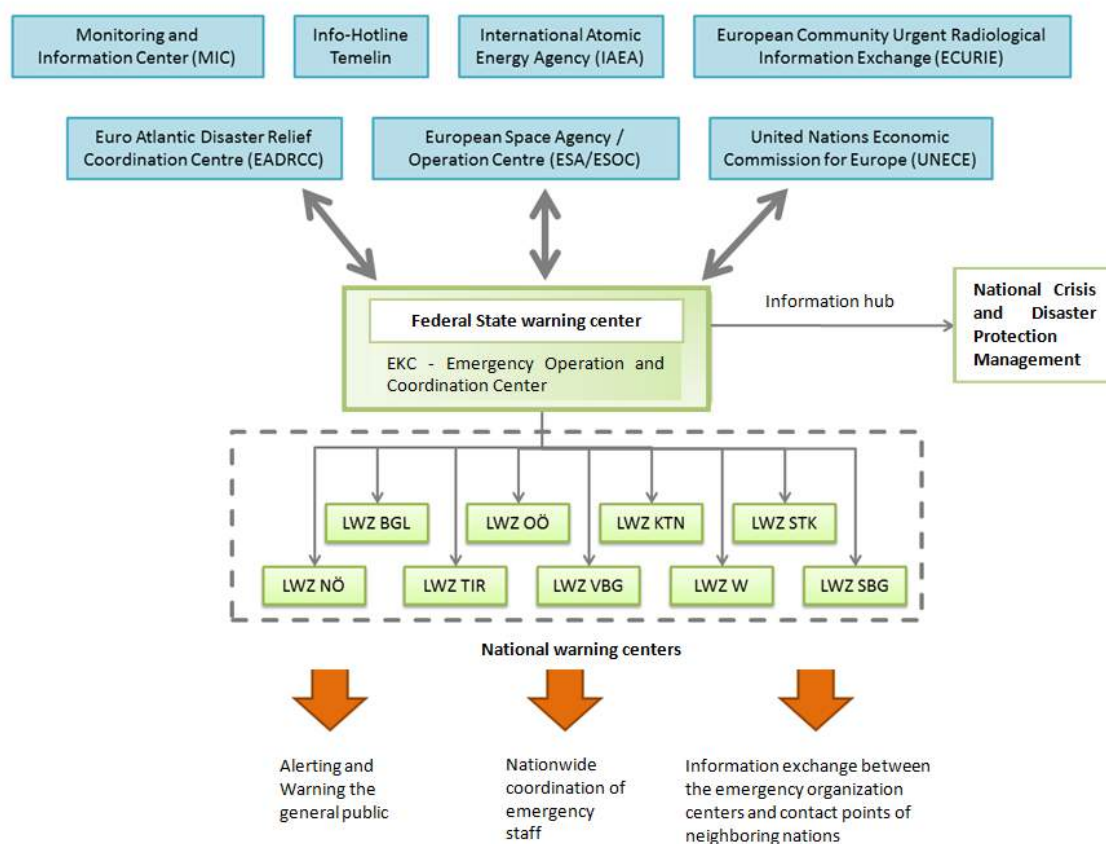

Figure 39: Information flow in disaster situations between the EU and emergency response authorities in Austria

As illustrated in Figure 39, if a large-area event occurs in Austria or its neighbour states, the information will be concentrated at the Federal warning centre, aiming at a rapid communication exchange between authorities inside Austria and foreign warning systems. As contact point for the Info-Hotline Temelin, the ECURIE, the IAEA, the ERCC, the EADRCC and the ESA/ESOC and the Federal warning centres stay in contact with the centres of the countries (Jachs 2011a).

The federal legislator directs the establishment of security centres or warning centres in each province and mandates the development, upgrading and administration of alerting and warning systems to ensure immediately situational awareness. In crisis and disaster case the alert and warning centres (LWZ) acts as a central hub for emergency services by providing appropriate facilities and modern technology. They are responsible to alert and warn the general public in crisis and disaster situations and take regional coordinating actions for their respective countries. Incoming emergency calls are taken by authorized call takers, who have an overview about the available resources and can alert the responsible organization or authority. In 2011, 6.9 billion incoming emergency calls were registered in Austria (Federal Ministry of the Interior 2010). Additionally, their tasks include to link communication between emergency organizations and the neighbouring nations. In the warning and alerting centres of the Federal Provinces, information from various (sensor) systems is merged and registers water levels, wind strength and even radiation levels. They are connected transnationally and enable information exchange beyond national and organizational borders, e.g. information from the Central Institute for Meteorology and Geodynamics, which is Austria's national weather service agency.

5 Capabilities

5.1 Human resources

As explained by Potyka (2012):

However, since disasters have to be remedied in the first place by the persons affected, subsequently also by the local community and the population of the entire region where the disaster occurs, the provinces as well as the municipalities also hold extensive competences in this field. On the local and regional level, the voluntary fire brigades play an important role in combating disasters, both natural and man-made.

In Austria, authorities can draw on approximately 413,000 relief forces in the response to disasters. About 85 percent of the total human resources will be volunteers (BMASK 2009). About 14.2 percent of the volunteers have been actively engaged in disaster relief and rescue service (STATISTIK AUSTRIA 2008). As stated by the research institute in 2013, this means a voluntary resource of 360,000 persons (2013). In 2008, 413,000 Austrians were engaged voluntarily and 37.4 percent of them have been regularly participated in disaster missions, which represented about 1,576 hours per week.

The Fire Brigades (ÖBFV) were considered as an acknowledged, traditional organisation. They assume manifold tasks, including fire-fighting, averting dangers and disaster relief. Their organisation principle is based on the various provincial laws. They are organised locally and are operating on the behalf of the municipalities. Fire Brigades exhibit a high degree of technical know-how.

The ASBÖ is second largest ambulance in Austria. It is concerned with daily routine tasks, i.e. patient transportation as well as with emergency-related task, such as disaster relief, refugee settlement and providing the rescue dog group. The JUH is not represented in all provinces in Austria, but in the capital city Vienna, it is providing emergency aid.

As a special-skilled force, the ÖBRD is mainly concerned with accidents and emergencies in mountain regions. Therein it performs annually about 7,000 missions.

The Christopherus Helicopter Rescue Service, accompanied to the ÖAMTC is another specialized organisation, dedicated to provide quickly help in relief missions. Currently, 250 emergency doctors are joining the CHRS.

The Austrian Red Cross operates internationally and covers 5,600 employees and 51,000 volunteers. On behalf of its mandate, based on the Geneva Convention, it is concerned with the humanitarian aid, disaster relief and, among others, with search-services. As one of the biggest NGOs, it is experienced with cross-border missions. Primary a part of the ARC, in the meanwhile the MHDA has established itself in the field of ambulance service.

The Federal Police Forces will be mainly involved in search and rescue operations, because it is the competence of the police to search for missing persons. In that purpose, the executive body has access to data-bases, where missing persons may be registered.

In order to fulfil their duties in emergency cases, the Austrian Armed Forces are built upon Land Forces, Air Forces and Special Operations Forces (Ministry of Defence and Sports 2014). About 12,500 members of the Austrian Armed Forces can be mobilised in the case of an emergency.

Disaster relief units of the Austrian Armed Forces are composed of volunteers on active service and militia. If needed, civil specialists, i.e. rescue dog brigade, will support them. Specialised forces, such as the CBRN-defence corps, decontamination units, drinking water purification unit or pioneers will be deployed in certain emergencies.

In Table 9, the personnel resources of the most important relief forces are listed (Multiple sources were used to develop this overview: BMASK 2009, FreiwilligenWeb 2014, Wikipedia 2014, Jachs 2011b)

Table 9: Overview on relief personnel for emergencies in Austria

Stakeholder Type	Name	Number of Personnel
Emergency Organisation	ARC	48,500
	ASBÖ	3,879
	CHRS	250
	ÖBRD	11,420
	JUH	590
	MHDA	970
	ÖRHB	724
	ÖHR	298
	ÖBFV	249,000
	Team Austria	33,000
Federal Security Authority	Federal Police Forces	27,000
Governmental unit	Austrian Armed Forces	12,500

5.2 Materiel (non-financial) resources

Especially for radiological emergencies, the federal state established prevention measures by storing potassium iodide tablets, livestock and some useful items. A total of 5 million packages of potassium iodide tablets are available at schools, hospitals, pharmacies and occupational doctors.

PHAGO pharmaceutical wholesalers maintain a stockpile of over 50,000 pharmaceutical products to guarantee Austria's full supply of pharmaceutical products even during emergencies.²⁵⁷

Furthermore, about 300,000 tablet packages are stored at the Federal Ministry of the Interior. By an order by the Ministry of Health the tablets will be distributed for free²⁵⁸. For an emergency case, the "Lebensmittelbewirtschaftungsgesetz" regulates the structure and the distribution of food reserves in Austria (AMA 2014). The Federal Minister of Agriculture, Forestry, Environment and Water Management is authorised to set all necessary measures to avoid supply problems. This may include

²⁵⁷ Information is available at: <http://www.phago.at/en/services/stockpiling/>; accessed: 12th October, 2014.

²⁵⁸ Information is available at: <https://www.kommunalnet.at/news/artikel/article/atमारर-super-gau-was-muessen-gemeinden-im-notfall-tun.html?cHash=f21f743b5bf6c5f422e0ad98b9c1e636>; accessed: 11th March, 2014.

the seizure of goods, the expropriation of goods as well as prohibitions and requirements regarding the use of foodstuffs. Furthermore, the Federal Minister of Agriculture, Forestry, Environment and Water Management can instruct and authorise the governors of the provinces with extensive powers. He or she can also assign the public body of the Agrarmarkt Austria with the handling of food reserves. Appropriate prevention measures have been also defined in the “Lebensmittelbewirtschaftungsgesetz”. Municipalities will have the right to make use of registration data according to the Reporting Act. According to IAEA (2014), the Austrian Central Stockholding Entity (ELG) held an emergency oil stock of about 3.0 Mt (99 days of net imports).

In Austria, emergency stocks are not held separately from commercial stocks – all oil products held by ELG are commingled stocks. The legal framework for Austrian emergency management is the Energy Intervention Powers Act (Energielenkungsgesetz 2012) and the Stockholding Act (Erdölbevorratungsgesetz 2012). Within the review it was stated, that in 2011, a total storage capacity in Austria stood at 6.6 mcm, or around 42 mb of crude oil and oil products. The storage capacity is almost evenly distributed between crude - 53 percent (3.5 mcm) and 47 percent oil products. As identified by IAEA (2014), Austria does not have government stocks on gas, nor does it place an obligation on its suppliers to hold natural gas reserves. In the case of disasters, the Military exhibits a rapid response capacity by mobilising a high amount of personnel. Apart from their availability, their special skills concerning technical know-how, i.e. water purification, CBRN defence capacities and the provision of specialised assets, i.e. the Landesbrückengerät (bridge building devices).

5.3 Training

Training is not organised centrally but authorities and response organisations at each level offer specialised education programs according to their specific focus (2014). Austria for instance has nine fire-fighting schools in the provinces. The qualification of fire fighters is regulated by specific curricula. The qualification of personnel in emergency medical services is regulated by a national law, i.e. the paramedic law, which also provides for certification. Governmental authorities also have their internal training system. The Ministry of the Interior furthermore offers specific leadership training in its security academy. In this frame the Ministry organizes different training courses for high-level decision makers. Voluntary participants will be acquainted with theoretical basics as well as with practical principles of leadership. Within the SKKM Strategy 2020, a four-part module-based training programme has been defined (Federal Ministry of the Interior 2009). Officials of an authority and the top-level managers of an emergency service will be provided with an introduction to the legal framework of the disaster management. These insights should build the basis for the second module – leadership in disaster missions. Targeting staff members, as a high-sensitive issue, crisis managers will be trained in a module about the risk and crisis communication. Finally, the module “Risk analysis and Disaster Protection Planning” is dedicated to provide an initiation into risk analysis, focusing on natural hazards. Furthermore, the Federal Ministry of the Interior coordinates the participation at European training programmes and delegates also national experts.

Until now, Austria has completed eight modules of the European Union Modules.

5.4 Procurement

5.4.1 Procurement regulation

Procurement of crisis and disaster management assets is not centralized but the relevant actors on different administrative levels do it. Austria does not acquire specialised equipment for international disaster management but uses available resources (Expert Interview 2014). After a formal request for assistance the Federal Ministry of the Interior usually coordinates the provision of relief goods. Given this fact there is currently no explicit national position on this issue which could be mentioned in this context. Procurement is generally done in accordance with existing national and supranational legislation depending on the deliverables needed.

At the moment, the provision of assistance after the request of a foreign country frequently includes the availability of personnel and material resources. In any case, a strict statutory regulation will be required to regulate such legal aspects.

In Austria, procurements of the MoD is in compliance with the Public Procurement Law and the Federal Defence and Security Procurement Act. The first one implements Directives 2004/17/EC, 2004/18/EC and 2007/66/EC and “therefore covers the legal framework for the award of both public contracts from public entities and entities operating in the water, energy, transport and postal sectors (“sectoral entities”)” (EDA 2014). In addition, procurement of specific defence products and services is regulated by the Federal Defence and Security Procurement Act, which implemented Directive 2009/81/EC. Both federal laws are applicable for purchases above certain thresholds and for those below such thresholds.

Several types of procedures were identified by Stalzer (2014):

- Open procedures
- Restricted procedures (with and without prior notice)
- Negotiated procedures (with and without prior notice)
- Direct Award
- Direct Award with prior notice
- Competitive dialogue
- Dynamic purchasing systems
- Electronic Auction
- Design and Realisation contests
- Framework Agreement

In general, the procurement procedure undergoes three phases:

- Prior information notice (information about planned purchase)
- Announcement of request for tenders
- Announcement of awarding of contract (Announcement have to be published in the media)

As stated by Liebmann (2014), “restricted procedure and negotiated procedure, both with prior notice, are the standard in terms of the upper threshold. Contracting authorities can freely choose between the two procedures. In certain cases, for example negotiated procedure without prior notice, competitive dialogue and direct award are also available.” There was a critical note concerning the limiting measures for EU purchasing markets, which could cause retaliatory measures of third states. In 2011 it was emphasised, that new laws should not limit the contracting body’s

freedom of decision-making or the national procurement law. Currently, only few applicants from third states have been taking part in Austrian procurement process is only. An implementation in the case of an imminent danger might be difficult (Statement from the Federal Republic of Austria on the access of third states to public procurement 2011).

5.4.2 Procurement procedures

It was stated within the report of the OECD (2007) that Austria has a semi-centralised structure of Public Procurement, consisting of the national and the sub-national level. The Austrian Federal Procurement Act (Federal Act Governing the Award of Contracts, 2006) and the public procurement laws of the Federal Provinces regulate the public procurement.²⁵⁹

Figure 40 illustrates the Structure of the Austrian public procurement system.

Structure of the Austrian public procurement system

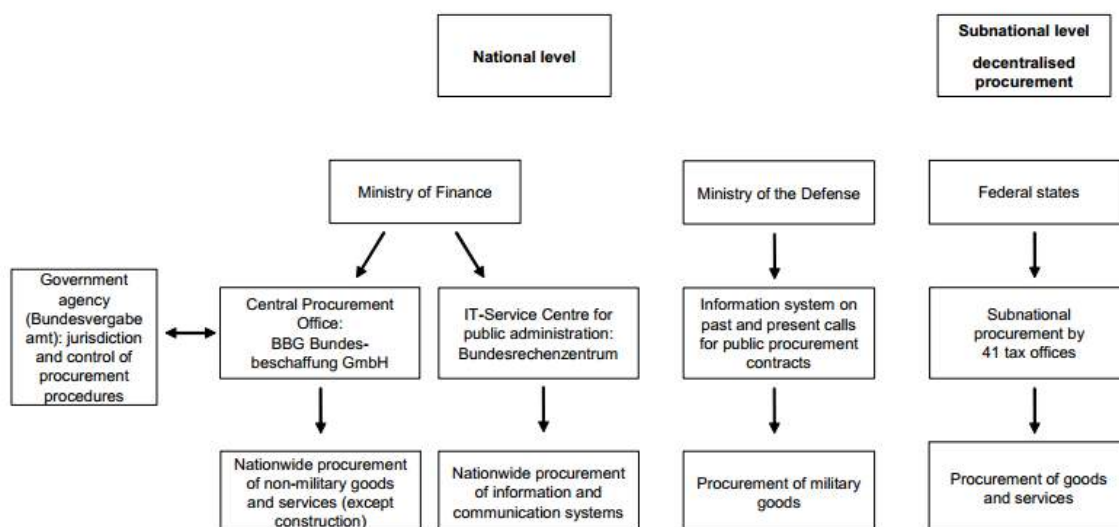

Figure 40: Structure of the Austrian Public Procurement System

Available at: ftp://ftp.cordis.europa.eu/pub/innovation-policy/studies/2_austria.pdf; accessed: 30th November, 2014.

At the national level, the Ministry of Finance, the Ministry of Defence and Sports and the Government Agency for Public Procurement are the responsible bodies for procurement. The Ministry of Finance is responsible for preparing public procurement rules, regulations and legislation. As sub-ordinated bodies of the Ministry of Finance, the Public Procurement Agency as the Central Procurement Office and the IT-Service Centre for public administration are fulfilling the tasks of nationwide procurement of non-military goods/services and information/communication systems. By establishing the Public Procurement Agency on the basis of the Law to establish the National Public Procurement Agency in 2001, the structure became more centralised. The Government agency for public procurement is dedicated to control and to rule upon public procurement procedures at the federal level. It is the competent authority “to rule upon publish procurement procedures conducted by public entities which fall within the competence of the provinces, cities and municipalities (Structure of the Austrian public procurement system n.d.). The Ministry of Defence is responsible for

²⁵⁹ An overview on laws concerning public procurement is provided at: <http://www.bundestkanzleramt.at/site/5100/Default.aspx> (only in German); accessed: 29th November, 2014.

the procurement of military equipment (goods). An information system on past and present calls for public procurement contracts was established at the MoD. Finally, at the sub-national level, the provinces are the competent bodies for the procurement of goods and services. Additionally, the Austrian Register of Tenderers (AKNO) acts as an information interface between contractors and contracting bodies. The contract award portal of the Austrian Register of Tenderers contains all Austrian disclosures made by the Federal Government, the provinces and municipalities, all invitations for tenders from the supplement of the Official Journal of the European Union and selected invitations for tenders from Eastern Europe. From a strategic viewpoint interoperability is important to differentiate between relevant areas of interoperability. Interoperability can be related to technical standards but also to rules of procedure and management aspects (Expert Interview 2014). Of course there is a need for Austria to collaborate towards organisational and national borders on all levels like the strategic, operational and tactical level and therefore systems and procedures need to be compatible to a certain degree. Nevertheless it should not be disregarded that an efficient disaster management across borders has to rely on self-sufficient resources as foreseen on European and international level (Expert Interview 2014).

5.5 Niche capabilities

Austria possesses a considerable knowledge in the area of prevention and preparedness for natural, specifically alpine hazards, which might be exemplarily. The same applies to the capacity of volunteer work and the self-initiative of the civil society, which are very well established. About 431,000 volunteers, who are in some cases specially trained, contributes very well to the resilience of the Austrian society in cases of emergency. In particular, the involvement of convergent or spontaneous volunteers within the project “Team Austria” of the Austrian Red Cross and the Ö3 radio broadcasting might be considered to be a best practice model. Current figures estimate the personnel resources of Team Austria with about 30,000 individuals. The Mol emphasised, that from a technical perspective, knowhow in drinking water purification also outlines a special skill of Austria which has been proven in several international operations (2014). Furthermore, similar to Germany, highly regarded experiments in mountain rescue have been performed in Austria. Bossong and Hegemann (2013) have indicated, that the “strong but contested domestic role of the military,” as well as the well-established national security research, should be acknowledged as important capabilities. Apart from that, the already mentioned well-functioning early warning system and the well-developed warning infrastructure with over 8,000 sirens should not be disregarded. Due to the fact, that not the whole society is as technophile, by sirens the alerting in emergencies can be ensured.

Driving Innovation in Crisis Management for **E**uropean **R**esilience

BELGIUM

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: ECORYS (Laura Birkman, Linette de Swart, Rachel Beerman)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by AIT and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

In Belgium, a distinction is made between emergency situations that arise as a result of a local/provincial/national crisis and those that arise as a result of an international crisis. A national crisis has its origins and effects on the Belgian national territory, and thus will be managed nationally. Crisis management in Belgium is organised at three levels, the mobilisation of which depends on the magnitude of the incident: These are the (i) municipal level, under the responsibility of the mayor; (ii) provincial level, under the responsibility of the provincial governor; and (iii) federal level, under the responsibility of the Ministry of the Interior.

A Belgian national crisis is first tackled at a local municipal or provincial level, before it is coordinated at the national level. If the magnitude exceeds the provinces' abilities, the national crisis organisations step in and act as crisis coordinator (operationally managed via numerous departments and operational units, falling under control of the Minister of Interior Affairs). Fire services and the civil protection services of the DG Civil Security together form the emergency intervention services on the operational response side, organised into 32 emergency rescue zones as per 1 January 2015. Civil protection forces are organised on the Federal level and act on federal, provincial and municipal requests.

Key stakeholders are the municipal level (Mayors), the Provincial level (Governors) and the Federal level (Minister of Interior Affairs and supporting DGs, namely DG Crisis Centre, DG Civil Security, DG Security and Prevention; Federal Knowledge Centre; Red Cross; B-FAST, etc).

International crises in Belgium are generally managed within the framework of multilateral organisations. The Belgian civil protection agency has a unique structure for international emergency assistance in the interdepartmental B-FAST teams, comprised of civil protection services from the Federal Public Services (FPS) Interior Ministry, as well as FPS Public Health, FPS Foreign Affairs and the Ministry of Defense. B-FAST is also deployed in the case of emergencies originating in Belgium but having effects outside its borders.

1 Policy

Belgium operates under a federal parliamentary democracy under a constitutional monarch. The key actors in the federal government are the Prime Minister and the Ministers. Through a series of constitutional revisions from 1970 to 1993, Belgium devolved into a federal state comprised of federal, regional and community institutions, entailing a complex division of responsibilities.²⁶⁰

Belgium has three region (i.e., Walloon, Flanders and Brussels, the capital) and three linguistic communities (i.e. French, Flemish and German). The regional areas are administrated on, e.g. economic, industrial and environmental issues, while the linguistic communities administer in areas mainly related to their respective language, e.g. education and media.

Belgium has 10 provinces, each of which is led by a governor that presides over a provincial council. The local government level is made up of 589 municipalities, each of which is led by a mayor presiding over a municipal council.²⁶¹

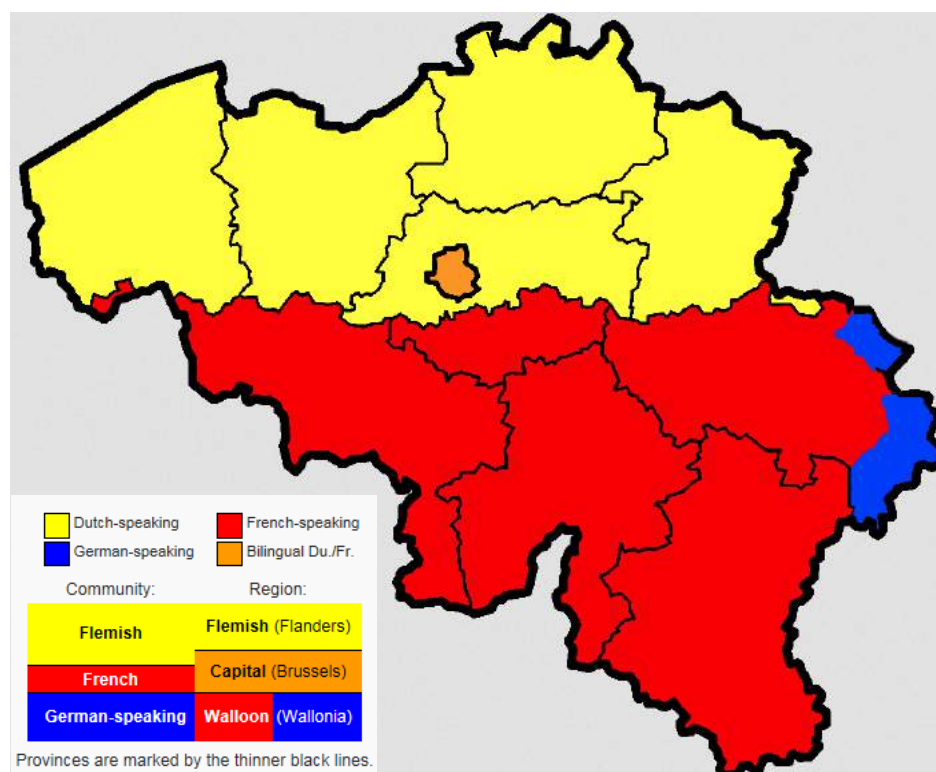

Figure 41: Map of communities and regions of Belgium²⁶²

²⁶¹ Swedish Civil Contingencies Agency (MSB), "Belgium," in *International CEP Handbook. Civil Emergency Planning in the NATO/EAPC Countries*, ed. FN LN et al. (City: Publisher, 2009), 33-34.

1.1 Risk Assessment

Due to the geographical terrain of the country, the main natural disaster risk in Belgium is flooding, particularly along rivers and in areas of reclaimed coastal land, which are protected from the sea by concrete dikes. Nuclear risks are another important threat, given that the Belgium's energy supply depends on nuclear power for more than 50% of the country's energy resources.²⁶³ Other threats include Seveso and contagious animal diseases.²⁶⁴

The Ministry of Interior Crisis Centre of Belgium and its partners identify the following priority risks:

- Flooding
- Nuclear risks
- Seveso risks
- Contagious animal diseases
- Vital Interests of the country
- Pipelines
- Terrorist threats²⁶⁵

The relevance of the risks being designated as “priorities” is that annual planning focuses first on these risks when drawing up plans.

Table 10 summarises the record of natural disasters over the last 35 years (1980 to 2015), including their human and economic impact in Belgium.

Table 10: Summary of Natural Disasters, human impact and economic damage (1980-2015).²⁶⁶

Type of disaster	No. Events	No. Killed	Total affected (1)	Damage (000 USD)
Earthquake (ground movement)	2	2	1030	\$150,000
Extreme temperature (2)	6	2121	-	-
Flood	21	28	4975	\$1,345,146
Storm	15	15	978	\$ 764,986
(1) Refers to Sum of injured, homeless, and affected (People requiring immediate assistance during a period of emergency; it can also include displaced or evacuated people).				
(2) Includes cold waves and heat waves

²⁶⁶ EM-DAT: The OFDA/CRED International Disaster Database, www.emdat.be - Université catholique de Louvain - Brussels – Belgium.

The DG Crisis Centre under the Ministry of the Interior (described in 3.1) has developed a risk inventory through which it can continuously monitor and analyse risks as objectively as possible. This inventory is called the Federal Risk Inventory, Survey and Knowledge Building (FRISK).²⁶⁷ The data and information collected is based on inputs of different sources of information and warnings from civilians and professionals (Mayor, Governor, DG Civil Security and Police).

1.2 Policy and Governance

In Belgium, a distinction is made between emergency situations that arise as a result of a local/provincial/national crisis and those that arise from an international crisis. A national crisis has its origins and effects on the Belgian national territory, and thus will be managed nationally, whereas an international crisis tend to find their roots beyond Belgium's borders and are generally managed via a political and/or military framework, such as the Belgian First Aid and Support (B-FAST).²⁶⁸

Crisis management in Belgium is organised at three levels, the mobilisation of which depends on the magnitude of the incident: These are the (i) municipal level, under the responsibility of the mayor; (ii) provincial level, under the responsibility of the provincial governor; and (iii) federal level, under the responsibility of the Ministry of Home Affairs.

A Belgian national crisis is first tackled at a local municipal or provincial level, before it is coordinated at the national level. If the magnitude exceeds the provinces' abilities, the national crisis organisations step in and act as crisis coordinator (operationally managed via numerous departments and operational units, falling under control of the Minister of Interior Affairs).

Municipal phase

If the crisis does not exceed the municipal level, the mayor is in charge of the crisis emergency planning. He reports to the governor of the concerned province.

Provincial phase

If the crisis' magnitude exceeds the boundaries of one municipality, then the governor of the province is in charge. He reports to the Minister of Internal Affairs.

Federal/National phase

When the magnitude exceeds two or more provincial boundaries and the means available to the provincial governor within his/her competence of coordination are insufficient, the Minister becomes responsible for implementing the phase.

²⁶⁷ "Analyse du risque," Belgium Ministry of the Interior, DG Crisis Centre, accessed 20 December 2015, <http://centredecrise.be/fr/content/analyse-du-risque>.

²⁶⁸ MSB, "Belgium".

All levels are responsible for emergency planning in their respective territories.²⁶⁹

1.2.1 Strategy scope and focus

The strategic approach to crisis management in Belgium covers all necessary activities for prevention, preparedness, response (including resilience) and relief and recovery. Article 11(2) of the Law on Civil Security of 15 May 2007 states that prediction, prevention, preparedness, execution and evaluation are all integral to the tasks of the operational civil security emergency services (comprised of the Civil Protection intervention services and the fire departments).

1.2.2 Monitoring and analytical support to policy making; R&D

Analytical support is provided to the civil protection services via two institutes: (i) the Higher Institute for Emergency Planning (IPSU), which is embedded within the Coordination and Crisis Centre of the Government (CGCCR) and (ii) the Federal Centre of Expertise for Civil Protection (KCCE), a separate service within the DG Civil Security of the Ministry of the Interior.

The **Higher Institute for Emergency Planning (IPSU)** was first established in 1991 by the Royal Decree of 29 July 1991. In 2003, IPSU was integrated into the CGCCR. This institute is responsible for sharing information on the multidisciplinary and strategic aspects of crisis emergency planning and to support the evolution of the CGCCR into a “knowledge centre of emergency planning for all crisis managers,” including “at the federal and local levels, in the private and public sectors, and in the military, policing and civilian fields”.²⁷⁰ It is tasked with maintaining a close link with academic experts in crisis management.

The main activities of the Institute are:

- (i) [to spread] information via the organisation of specific trainings, brochures and participating at other initiatives;*
- (ii) [to stimulate] the exchange of ideas for internal and external emergency planning among the diverse authorities and industry;*
- (iii) [to inform] workers on necessary precautions with respect to health risks regarding interventions. This takes place in close cooperation with the Directorate General for Civil Security.²⁷¹*

Examples of research projects organised by IPSU include²⁷²:

²⁶⁹ “Disaster management structure,” DG ECHO.

²⁷⁰ “Emergency Planning,” DG ECHO.

²⁷¹ Ibid.

²⁷² “Research and Networks,” Ministry of the Interior, DG Crisis Centre, accessed 20 December 2015, <http://centredecrise.be/fr/content/recherches-et-reseaux>.

- “The role of the mayor during the Emergency Management ” (2011) to clarify the specific role of the mayor in an emergency situation. The output was a publication which contains a collection of experiences and best practices on planning and emergency situations.
- “Research on monitoring disaster victims” (2011)
- “The practice of evacuations” (2009) to analyse both legal and practical aspects of evacuation. The output included the development of practical tools to facilitate a rapid and effective response during actual events.

IPSU also participates in European research projects, such as²⁷³:

- ERGO (2009), Evacuation Responsiveness by Government Organisations
- Disaster 2.0 (2012), a research project on the use of web 2.0 and web 3.0 applications in the field of crisis management.

The Federal Centre of Expertise for Civil Protection (KCCE) was established on 28 March 2007 and is embedded within the Federal Public Service (FPS) Interior Affairs. The centre is tasked with collecting information on civil security with the aim to improve the quality of their services and to stay up to date on the latest standards. In terms of specific support to policy-making, the centre plays a key role in the development of Standard Operating Procedures (SOPs), discussed in section 4.1.²⁷⁴

1.2.3 Policy for Prevention

Prevention is institutionalised via the DG Security and Prevention falling under the Ministry of Interior Affairs. The main task of DG Safety and Prevention is to contribute to the safety of Belgian civilians, via intense cooperation with a network of partners, enforcing specific safety and security legislation including the responsibility of giving sanctions in case of non compliance and last prevention (fire and burglary for example) specifically aimed at civilians.

The DG consists of eight units²⁷⁵:

1. Fire safety²⁷⁶
2. Control of private security
3. Litigation and legal support
4. Comprehensive local safety / security
5. Police management²⁷⁷

²⁷³ Ibid.

²⁷⁴ “About Civil Security,” Ministry of the Interior, DG Civil Security, accessed 20 December 2015 <http://www.securitecivile.be/en/content/about-civil-security>.

²⁷⁵ DG Security and Prevention, accessed 20 December 2015, <https://www.besafe.be/fr/public-cible>.

²⁷⁶ The unit supports the regulatory framework development for all buildings, including structures, building materials and equipment, for all buildings except single family dwellings, and ensures its implementation.

²⁷⁷ According the DG Security and Prevention website, the Directorate Police Management “supports the management of 195 police zones. It ensures the management of different materials for the operation of areas such as legislation on finance and accounting, appointment procedures and evaluation of the commanding officer, the appointment and revocation proceedings superior officers and disciplinary procedures with regard to unit commanders and senior officers. In addition, police Management Department acts on behalf of the

6. Private security
7. Football unit
8. Radicalism unit.

The DG supports the Ministry of Interior affairs and prepares measures and plans to limit damage in case of an emergency. Therefore the Department also invests in research on preventions. The Department specifically organises prevention via three funds targeted at risk prevention (IBZ, 2014):

- Seveso Fund²⁷⁸
- Nuclear Fund
- The fund/council for protection against fire and explosions

These funds are discussed under 1.3.1.

The Royal Decree of 19 December 2014 “determining the organization of the fire prevention in the emergency rescue zones” sets out the main tasks of fire prevention, namely to sensitize, provide advice and control.

*First the zones need to inform and sensitize the citizen regarding the possible dangers. They do this amongst other things through prevention campaigns, information sessions and open days. Besides sensitizing, the zones also need to provide fire prevention advice. That advice is always without obligations. Citizens, architects, authorities, ..., can ask for specific information. Fire prevention controls only take place in the framework of a potential action of the authorities or in preparation to a decision of an authority such as granting a permit or closing down a building. The emergency rescue zones also have to draw up an action plan in which they mention their future fire prevention initiatives and determine their policy. The action plan is tuned to the framework policy document of the FPS Home Affairs.*²⁷⁹

The importance of such campaigns is evidenced by the 2010 National Fire Prevention Plan campaign of the DG Security and Prevention. This plan was identified as a best practice in prevention due to the large approach to the general public and communication via social media. (IBZ, 2014)

- Civilians were made aware of the fire risks and fire prevention measures via a website <http://www.ismijnwoningbrandveilig.be> and via social media. These prevention measures focus on installing a smoke detector, investing in fire equipment (blankets and extinguishers), avoiding the use of stand-by mode for electronic equipment etc.
- The government made available funds to train fire prevention advisors. These are equipped with a trolley to support them in giving lectures. The trolley contains smoke detectors, fire blankets, fire proof building materials etc. In November 2010, 87 advisors were active in 28 operational zones (steered via the local fire fighters).

Minister of the Interior, the specific supervision of the decisions taken by the police boards and local councils on the policy plan.”

²⁷⁸ “Seveso Funds,” accessed 20 December 2015, <http://www.seveso.be/content/seveso-funds>.

²⁷⁹ “Reform,” Ministry of the Interior, DG Civil Security, accessed 20 December 2015, <http://www.civieleveiligheid.be/en/content/reform>.

1.2.4 Policy for Preparedness

The key actor is the DG Crisis Centre of the FPS Interior Ministry. Ministers are responsible for emergency planning in their area of competence, and all levels of government (i.e. municipal, provincial, national) are responsible for emergency planning in their respective territories. The CGCCR is tasked with organising proactive emergency planning. Contingency plans for emergency protection, rescue and relief are drafted on the basis of input from IPSU. The knowledge on crisis management is also updated by the KCCE. The process for drafting emergency plans is discussed in section 4.1.

In an official statement at the Third UN World Conference on Disaster Risk Reduction (WCDRR) in Sendai, Japan (March 2014), the First Counsellor of the Permanent Mission of Belgium, Mr. Christophe de Bassompierre states, as evidence of Belgium's commitment to preparedness:

During its Presidency of the Council of the EU, Belgium has developed the principle of "Host Nation Support"(HNS), with regard to receiving assistance during a major emergency. It principally consists in preparing, on the territory of States which have experienced a disaster and asked for international assistance, the on-the-spot integration of international teams mobilized in order to support them. In the same way, Belgium is very active in the organization of large-scale European civil protection exercises.²⁸⁰

1.2.5 Policy for Response

A crisis is managed at the municipal, provincial or national level depending on a number of criteria, i.e. geographical scope, number of victims, environmental and/or economic impact, etc. At the national level, three bodies can be summoned at the DG Crisis Centre: an assessment, a management, and an information cell. Each one contributes to the overall decision process within their respective competences (described in section 3.1). The Directorate of Operations under the DG for Civil Security is responsible for national coordination in the event of an emergency. An emergency is to be coordinated at this level if:

- A minimum of two provinces are affected
- The means available to the provincial governor within his/her competence of coordination are exceeded.

In terms of operational organisation, DG Civil Security is responsible for deploying the civil protection services upon request and is also indirectly responsible for fire services. The civil protection services are comprised of 6 operational units, divided across the Belgian territory. The operational tasks of each unit are divided between 5 disciplines, which are described in section 3.1.

Mobilization of the emergency civil protection services at the provincial level occurs when:

- The scope of the emergency requires management by the government
- The immediate effects of the emergency exceed the municipality.

²⁸⁰ Christophe de Bassompierre, First Counsellor at the Permanent Mission of Belgium, "Belgium: Statement made at the Third UN World Conference on Disaster Risk Reduction (WCDRR)", Sendai, Japan, March 2015.

Mobilisation of the emergency civil protection services at the municipal level occurs when the scope of the emergency requires management at municipal level.

In international scenarios:

Belgian government has a unique mechanism called B-FAST (Belgian First Aid and Support Team) which provides emergency response capacities to other countries whose own resources are insufficient to face a disaster. These capacities include humanitarian goods, dispatching of experts in assessment or for coordination, or sending of teams (modules).²⁸¹

1.2.6 Policy for Relief and Recovery

The Belgian policy approach to relief and recovery is based around the Calamity Funds system (“Rampenfond” in Flemish; or “Fonds des Calamités” in French), which is aimed at assisting civilians when recovering from a natural disaster. The main actors and tasks are:

- the **local administration** is involved for collecting detailed information in the damage.
- the **provincial level** bundles the local information to a report, which is submitted to the Calamities Directorate of the FPS Interior;
- the **Minister of Interior Affairs** declares the damage to be falling under the fund, the report is discussed at the Federal Minister council. If approved by the council, the Calamities Directorate transfers the responsibility for covering the damages caused to civilians to the ‘National Calamities Fund’. The Ministry of Interior affairs communicates with the civilians.

²⁸¹ Ibid.

Figure 42: Flowchart on the procedure for recognizing payments under the calamity funds²⁸²

For more on the calamity funds, see section 1.3.2.

Regarding international relief and recovery efforts,

*The actions related to emergency relief are as much as possible multilaterally framed both at European (EU Civil Protection Mechanism) and global levels (United Nations OCHA Emergency Services Branch: UNDAC and INSARAG). Among the foreign disasters which have left their mark on the past decade, B-FAST was prominently present and active in the aftermath of typhoon Haiyan (Philippines, November 2013), Port-au-Prince earthquake (Haiti, January 2010), Aceh tsunami (Indonesia and Thailand, December 2004 – January 2005), and Al Hoceima earthquake (Morocco, February 2004).*²⁸³

1.3 Financing

1.3.1 Investing in preparedness and prevention

The DG Civil Security invests in preparedness for and prevention against fire and explosions, nuclear-, chemical- and biological incidents via three funds:

- Seveso Fund
- Nuclear Fund

²⁸² Adapted from the Ministry of the Interior Directorate of Calamities, “Calamités naturelles – Fonds des Calamités”, accessed 20 December 2015, <http://www.ibz.be/code/fr/loc/calamites.shtml>.

²⁸³ Bassompierre, “Statement WCDRR”.

- The fund/council for protection against fire and explosions

The Seveso Fund. The Seveso fund is financed by the companies falling under Seveso legislation. The revenues collected are gathered in two funds: One 'Fund for the risks of major accidents' and one 'For the prevention of major accidents'. The first falls under the Ministry of Home Affairs, the second falls under the Ministry of employment. The funds support related prevention like for example, the realization of information campaigns, the purchase and the maintenance of specific material of intervention, the management of the network of sirens, the provision of a databank of a dangerous goods to the fire protection organizations are financed thanks to the funds.

The Nuclear Fund. The development of Belgian CEP Nuclear plans are supported by the funding foreseen by the Belgian Nuclear sector itself. The sector contributes to the Belgian Nuclear funds. This fund supports the coordination of protection measures in case of emergencies.

The Fund/Council for Protection Against Fire and Explosions. Belgian's Federal level is responsible for the basic norms of fire protection and fire prevention. This council sets up these regulations, which can be complemented with local legislation or legislation of the regional level. The council for protection against fire and explosions has an advising and guiding role. The fund also supports professional training, funds research and is taking care of information sharing.

The department additionally supports local policy makers and police departments in developing crisis management measures, supports the process of settlements if civilians were to incur damage as a result of police actions and also evaluates the compliance of private security organisations with regulation.

Overall budget expenditures on relevant crisis management activities is shown in Table 11.

Table 11: Budget Expenditures of Mol on crisis management, 2011-2012 (in ,000€)²⁸⁴

Departments and Programmes	2011	2012
Strategic Coordination	2.164	3.853
Management	9.935	10.562
Logistics and Coordination	159.664	238.276
DG Crisis Centre	15.374	13.563
DG Civil Security	94.402	89.222
DG Security and Prevention	55.283	86.598
Provincial governments	19.404	20.613
Calltakers, 112 Emergency Centre and ASTRID	72.620	87.562

²⁸⁴ Ministry of the Interior, "Tableau d'évolution du budget par division organique et par programme (en kEUR)," accessed <http://www.ibz.be/download/RA-JV-2012/Budget-original-2013-01-17.pdf>.

OCAM	1.597	1.547
Total Crisis Management Expenditures	430.443	551.796

1.3.2 Investing in consequence management

Since 1 March 2007, the financing of recovery from most “ordinary” disaster risks, i.e. floods, earthquakes, overflows or backups at public sewers and landslides/subsidence, is organised via insurance companies, specifically fire insurance. This covers damages to houses and their contents by the aforementioned disaster risks.

When the civilian’s fire insurance does not cover the damage incurred²⁸⁵, and the Minister declares the damage to be originating from an unforeseeable natural disaster, the Calamity Funds system can be activated. According the Calamity Funds User Manual, the funds provide only for:

- Assets that do not constitute ordinary risks
- Agricultural goods in principle excluded from insurance coverage, i.e. no-harvested crops, livestock alive outside buildings, soil, crops, etc.
- Cars that are not safely parked in a garage or under a carport
- Goods that are not insured because of poverty of the household involved
- Property in the public domain of legal entities.

The ‘Calamity Funds’ also cover the costs of removal of explosives of World War II and damage to Belgian private property incurred in Congo, from the moment on the country Congo declared itself independent. Both represent a minor part of their tasks.²⁸⁶

When the “Calamity Fund” is activated, the damages are paid ad-hoc by the National Treasuries.²⁸⁷ Costs of the civil protection are paid from their assigned budget, and are seldom reclaimed from the civilians relying on the services.

In the year 2012, the most recent data retrieved, the Federal government decided on the acceptance of incurred costs as a result of unforeseeable natural disasters of 2012, € 25.144.592, of which €

²⁸⁵ Damage already insured by the voluntarily fire insurance is never covered by the fund. If the damage was not insured due to poverty of the household involved, a contribution might be paid by the fund. All other goods, not insurable, are covered by the fund (with restrictions on budgets and involving own contributions).

²⁸⁶ Belgium Ministry of the Interior, Calamities Directorate, “Guide - Calamities: Mode d’emploi, janvier 2015,” September 2014, http://www.ibz.be/download/natuurramp/vademecum_09-2014_Fr.pdf.

²⁸⁷ The mayor is responsible for collecting as much as possible information on the magnitude of the damage (all households make pictures of the damage and estimate the costs). The mayors give the gathered information to the governor of the Province, which asks the Federal Minister of Interior Affairs to declare the “Rampenfond” to be applicable.

24.642.671. A total of 20 events were recognized by the Council of Ministers under the required criteria.²⁸⁸

As of 1 January 2015, this fund has been regionalised, meaning that for all damages from events occurring since 1 July 2014, the regional department is responsible (previously FPS Interior):

- Walloon Public Services – “Service régional des Calamités”
- Flemish Government Administrative Affairs “Vlaams Rampenfonds”
- Regional Public Services of Brussels – “Direction des Investissements”²⁸⁹

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

See sections 1.4.2 – 1.4.5.

1.4.2 Departmental Lessons Learned systems

While it could not be verified for each single organisation (see chapter 3.1), in general, knowledge gained from past experiences is built at the KCCE.

1.4.3 Centralised (national) Lessons Learned system

While a specific mandate with regards to a centralised lessons learned system could not be verified, the KCCE is tasked with collecting information on civil security activities with the objective to improve the quality of services provided and to maintain the latest standards in service provision. The findings of these activities then provide inputs to the development of SOPs, a key responsibility of the KCCE. See also chapter 1.2.2 and 4.1.

1.4.4 International exchange for Lessons Learned

Belgium participates in international trainings and exercises, however no specific information on international exchanges for lessons learned could be identified in the frame of the study. Knowledge is built at the Federal Knowledge Centre Civil Security and the Higher Institute of Emergency Planning.

²⁸⁸ Belgium Ministry of the Interior, “Rapport d’activités 2012,” accessed 20 December 2015, http://www.ibz.be/download/RA-JV-2012/jaarverslag%202012%20FR_intranet.pdf.

²⁸⁹ “Fonds des Calamités,” Ministry of the Interior.

1.4.5 Regular policy reviews

Belgium conducts reviews for its civil protection policy and system, it could not be verified if these reviews take place regularly or if they occur ad-hoc. The latest review was conducted as part of the preparation of the New Framework Law of 15 May 2007 (i.e. Law on Civil Protection) (discussed in Chapter 2).

1.5 Resilience

Belgium's approach to the concept of resilience is based on increasing disaster awareness through education, trainings and awareness campaigns. For example, an awareness campaign was launched to inform citizens of the procedures applied when one finds him/herself in a Seveso crisis situation. The brochures were distributed to 400.000 Belgians civilians living in Seveso risk areas and via municipalities. The budget for the campaign was 1 million EUR.

In 2012, the Seveso campaign was complemented with an online campaign targeted at young Belgians. The website was shaped as a game: Seveso The Game: Be The Ultimate Survivor. In the game the young people experience the Seveso risks and procedures in a less formal way.²⁹⁰

Figure 43: Example of a recent campaign targeted at young Belgians. Financed by the Seveso fund²⁹¹

The trainings organised by the federal and provincial training institutes are discussed in section 5.3.

²⁹⁰ "Seveso: Campaign 2012," Belgium Ministry of the Interior, DG Crisis Centre, accessed 20 December 2015, <http://www.seveso.be/content/campaign-2012>.

²⁹¹ "Seveso The Game: Be the Ultimate Survivor," Belgium Ministry of the Interior, DG Civil Security.

1.6 Information sharing and data protection

The Royal Decree of 2 June 2015 creating the Strategic Intelligence Committee and the Coordination Committee outlines the responsibilities of these two bodies in the area of intelligence and security services, including the exchange of information between the two fields. Specifically, the Strategy Committee is responsible for reviewing each proposal in the context of the intelligence and security policy determined by the National Security Council and the proposed resolutions to be submitted to the National Security Council by the Coordination Committee. The Coordination Committee is responsible for submitting to the National Security Council proposals for the general policy of the intelligence and security services, including policy on the protection of sensitive information.

In addition, several European Directives and Regulations apply to Belgium, as all other Member States.

- Directive 95/46/EC is the legislation on the protection of personal data in Europe and it requires that one independent supervisory authority be established in each Member State to monitor its implementation.
- Directive 2002/58/EC on privacy and electronic communications, covering confidentiality, billing and traffic data, rules on spam and so forth, and establishing the EDPS as an independent supervisory authority with responsibility to monitor the processing of personal data by EC institutions and bodies.²⁹²

²⁹² European Data Protection Supervisor, “Legislation”, accessed 11 January 2016, <https://secure.edps.europa.eu/EDPSWEB/edps/EDPS/Dataprotection/Legislation>,

2 Legislation

2.1 Crisis (emergency, disaster) management concept

The Belgian crisis management concept has its roots in the inter-World War era, to the “Liga voor Passieve Luchtbescherming van de Bevolking en de Burgerlijke instellingen”, founded in 1934. At that time, Liga was made up of volunteers, whose main activities were to warn the civilians in case of air strikes, to provide first aid care and to clean rubble following air strikes. Over time, the name changed to the ‘Belgian Civil Protection’, housed within the Ministry of the Interior. In 1963 the concept was defined as

*The civil protection encompasses all civil measures and tools needed in order to guarantee the preservation of Belgian population, guarding the country’s patrimonial in times of armed conflicts. The civil service also has to goal to intervene in crisis situations, catastrophes and damages of all kind and should then at all times aid civilians and protect goods.*²⁹³

The concept of Civil protection has continued to evolve overtime, no longer focused on warning against air strikes but rather organising to support fire fighters and civilian in case of larger crisis situations where expertise, technical aid and specific equipment is needed.

2.2 General crisis (emergency, disaster) management law

Key provisions of the legal framework for crisis (emergency, disaster) management in Belgium are identified below.

Legal framework for Civil Security (the fire departments and the Civil Protection services)

The Law of 15 May 2007 on the Civil Security determines the principles governing the organisation and functioning of the fire departments and the Civil Protection. According the DG Civil Security website, the basic principles underlying the execution of the reform of the civil security structure are the following:

- *a uniform method of working, by means of which all fire brigades (emergency rescue zones) intervene in the same efficient and safe manner during interventions,*
- *a thorough cooperation and more efficient division of tasks between emergency rescue zones, and between zones and units of the Civil Protection,*
- *innovation, with the examination of the best means, trainings, procedures and regulations, and with the exchange of best practices,*

²⁹³ Law of 31 December 1963 on Civil Protection, available (in French) <http://www.securitecivile.be/fr/regulation/loi-du-31-decembre-1963-sur-la-protection-civile>.

- *a uniformization and revaluation of the administrative and pecuniary statute of the professional and voluntary firemen,*
- *increase in scale, with a more efficient spending of the budget as a consequence.*²⁹⁴

Art 11. Of the second chapter defines clearly the tasks and organisation of the Belgian civil protection services' operations. First, their tasks are officially:

- To rescue and assist civilians in case of treat and also to protect their belongings
- To provide emergency medical assistance according to Art. 1 of the law of 8 July 1964
- The fight fire and explosions and their consequences
- To fight pollution and dangerous goods; including radioactive and ionised goods
- To provide logistical support,

Secondly, they have the task to:

- Preparedness: Proactively analyse and map the risks
- Prevention: All measures to prevent an minimise occurrence of risks and to minimise the likely effects
- Preparation: All measures to prepare the services on the likely threads
- Execution: To take the measures in case of emergency
- Evaluation: All measures to improve the preparedness, prevention, preparation and execution after incidents have took place.

Art. 153 defines that, for the civil emergency tasks mentioned in Art. 11, the Belgian Civil service is the only competent institute. Following Art. 48 of the law of 12 January 1989, mayors and governors can call on the Civil service' services when needed. Art. 154 defines the Minister of Interior affairs to be in charge of the Civil service. Art. 155 defines that the teams can consist of professional and voluntary staff.

The Civil Security Law additionally reforms the organisation of roles and responsibilities between the emergency services (see chapter 2.4) and the arrangements pertaining to local and provincial authorities (see chapter 2.5). The new organisation is operationalised on the 1 January 2015.²⁹⁵

Legal framework for managing crises at the national level

The Royal Decree (RD) of 31 January 2003 shapes the legal framework for crisis management at the national level (i.e. the federal phase of emergency planning). The European Commission *Civil Protection Vademecum* states,

This piece of legislation enables activation of immediate coordination at the national level. The RD confirms the role of the CGCCR in events that demand coordination at the federal level.

²⁹⁴ "Reform," DG Civil Security.

²⁹⁵ Law of 15 May 2007 on Civil Security <http://www.securitecivile.be/fr/regulation/loi-du-15-mai-2007-relative-la-securite-civile>.

Thus, it meets the overall goal of protecting the population against all types of risk that might affect it, and the lack of a general emergency plan on a national level.²⁹⁶

Legal arrangements concerning emergency planning and response

A **Circular of 11 July 1990** states that the obligation of all public administrators, municipalities, provinces, hospitals and enterprises is to develop individual emergency plans in relation to their own particular risk possibilities. The **Royal Decree of 16 February 2006** on emergency planning and response updates the 1990 Decree, assigning to Civil Protection the role of supporting the plans and executing/coordinating the operational tasks. This RD effectively established the current, three-levelled approach to crisis management planning and response in Belgium, which is undertaken at the municipal, provincial and federal/national levels (see section 1.2).

2.3 Emergency rule

Legal provisions concerning emergency rule in the event of disaster or emergency situation could not be identified.

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

Building on the Reforms to the civil security structure outlined in 2.2, a **draft Royal Decree of 14 October 2013** “modifying the RD of 25 April 2007 determining the missions of the emergency services that can be recovered and the missions that are free” sets out the division of tasks between the fire departments and the Civil Protection Services, taking into account their respective complementarities. The division of roles is discussed in section 3.1.²⁹⁷

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

The current legal arrangements and regulations specific to regional and local authorities are set out in the following:

- RD of 28 March 2003 on municipal and provincial emergency planning
- RD of 16 February 2006 on emergency planning and response
- Law of 15 May 2007 on Civil Protection

The **Royal Decree of 28 March 2003** assigns emergency tasks to the municipal and provincial level and develops general and specific emergency plans, while the **Royal Decree of 16 February 2006**

²⁹⁶ “Disaster management structure,” European Commission DG ECHO.

²⁹⁷ “Reforms”, DG Civil Security.

updates the plans and terminology. This RD is followed by 4 explanatory circulars which further outline the procedures and roles for emergency planning.²⁹⁸

Art. 11 of the Law on Civil Protection defines explicitly the need of the Civil protection service to cooperate with the local emergency services (Fire fighters). To improve the cooperation, the federal level is obliged to sign cooperative agreements. The new organisation was officially operationalised on 1 January 2015. The major change of this law, however, is the integration of the municipal fire services into a structure of zones. The **Royal Decree of 2 February 2009** regarding the territorial delineation of the emergency rescue zones groups the former 250 local firefighters into 34 rescue zones. As of the 1 January 2016, the organization of the fire departments entirely passes from a municipal organization system to a zonal system.²⁹⁹

Figure 44 shows the new configuration of the 34 emergency rescue zones for the whole of Belgium.

²⁹⁸ NPU-1, explains more details; NPU-2 defines emergency plans for the provincial governor; NPU-3 defines the procedure for adopting provincial emergency plans and NPU-4 details the 5 operational disciplines for the emergency services.

²⁹⁹ "Reform." DG Civil Security.

Figure 44: Map of new emergency rescue zones in Belgium³⁰⁰

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

The legislation (RD 15 May 2007) allows volunteers in both the organizations of fire fighters and the operational civil protection services. Art. 67 defines the financing structure for all 34 zones, all with a mixed staff of professional fire fighters, voluntary fire fighters, professional ambulance non-fire fighter staff and/or voluntary ambulance non-fire fighter staff (Art. 103). Art. 155 of the same RD defines that the civil protection staff can exist out of professional members or volunteers.

Regarding their accountability, detailed rules are applied via Art. 159 till 166 of the former mentioned RD. The volunteer or professional is only accountable personally in case s/he committed a serious failure or failure on purpose. Also small failures can be incurred by the member of staff, if these occur more than average. Other damages are incurred by the organisation of civil protection. The services as well take up the costs of legal advice for staff members, or the relatives in case the staff member passes away, except when committed a failure on purpose or an serious failure.

³⁰⁰ "Maps of the 34 Emergency Rescue Zones," Belgium Ministry of the Interior, DG Civil Security, accessed http://www.civieleveiligheid.be/sites/5043.stg.fedimbo.be/files/explorer/34hulpverleningszones_34zonesdese_cours.pdf.

2.7 Legal regulations for international engagements of first responders and crisis managers

The **Royal Decree of 28 February 2003** established B-F.A.S.T (Belgian First Aid and Support Team), an emergency relief structure for the purpose of providing assistance to a country or countries affected by natural and man-made disasters. The Decree defines the underlying strategic framework of BFAST and its supporting structures, as well as the criteria for their use. These are described below:

Before a B-FAST operation can be deployed by the Belgian government, the following **intervention conditions** must be met:

- (i) The size of the disaster, natural or man-made, must exceed the capabilities of the country hit by the disaster to such extent that it poses a threat to the health or the lives of the population in the disaster zone.*
- (ii) The country hit by the disaster must launch a request for relief to the international community.³⁰¹*
- (iii) In case of an armed conflict in the disaster zone, an intervention by B-FAST is excluded.³⁰²*

Once deployed, a B-FAST operation must comply with the following **application criteria**:

- (i) B-FAST operations cannot exceed 10 days*
- (ii) B-FAST operations solely include immediate emergency relief.³⁰³*

Regarding the “**intervention radius**” of B-FAST operations, “[f]or practical and logistic reasons and according to the proportionality principle concerning the use of the available means, an intervention radius of maximum 6,000 km from Belgium is the limit for B-FAST operations abroad.”³⁰⁴ This criteria is not, however considered to be an absolute standard.

Finally, B-FAST operations abroad should be executed in coordination with the various international partners (UN, EU, NATO) and should be deployed on the basis of the **added value** of B-FAST. That is, the participation of B-FAST should be limited to the domains in which it can provide expertise based on Belgian capacities.

³⁰¹ These are usually coordinated at the European level, i.e. via the EU Civil Protection Mechanism. Once the EU CPM receives a request for assistance, it passes on the request to its Member State organisations, which then mobilized in coordination with the EU CPM.

³⁰² “History,” B-FAST, accessed <http://b-fast.be/en/content/history>.

³⁰⁴ Ibid.

3 Organisation

Figure 45 shows the Belgian disaster management structure, including government bodies, emergency services and warning dissemination structures.

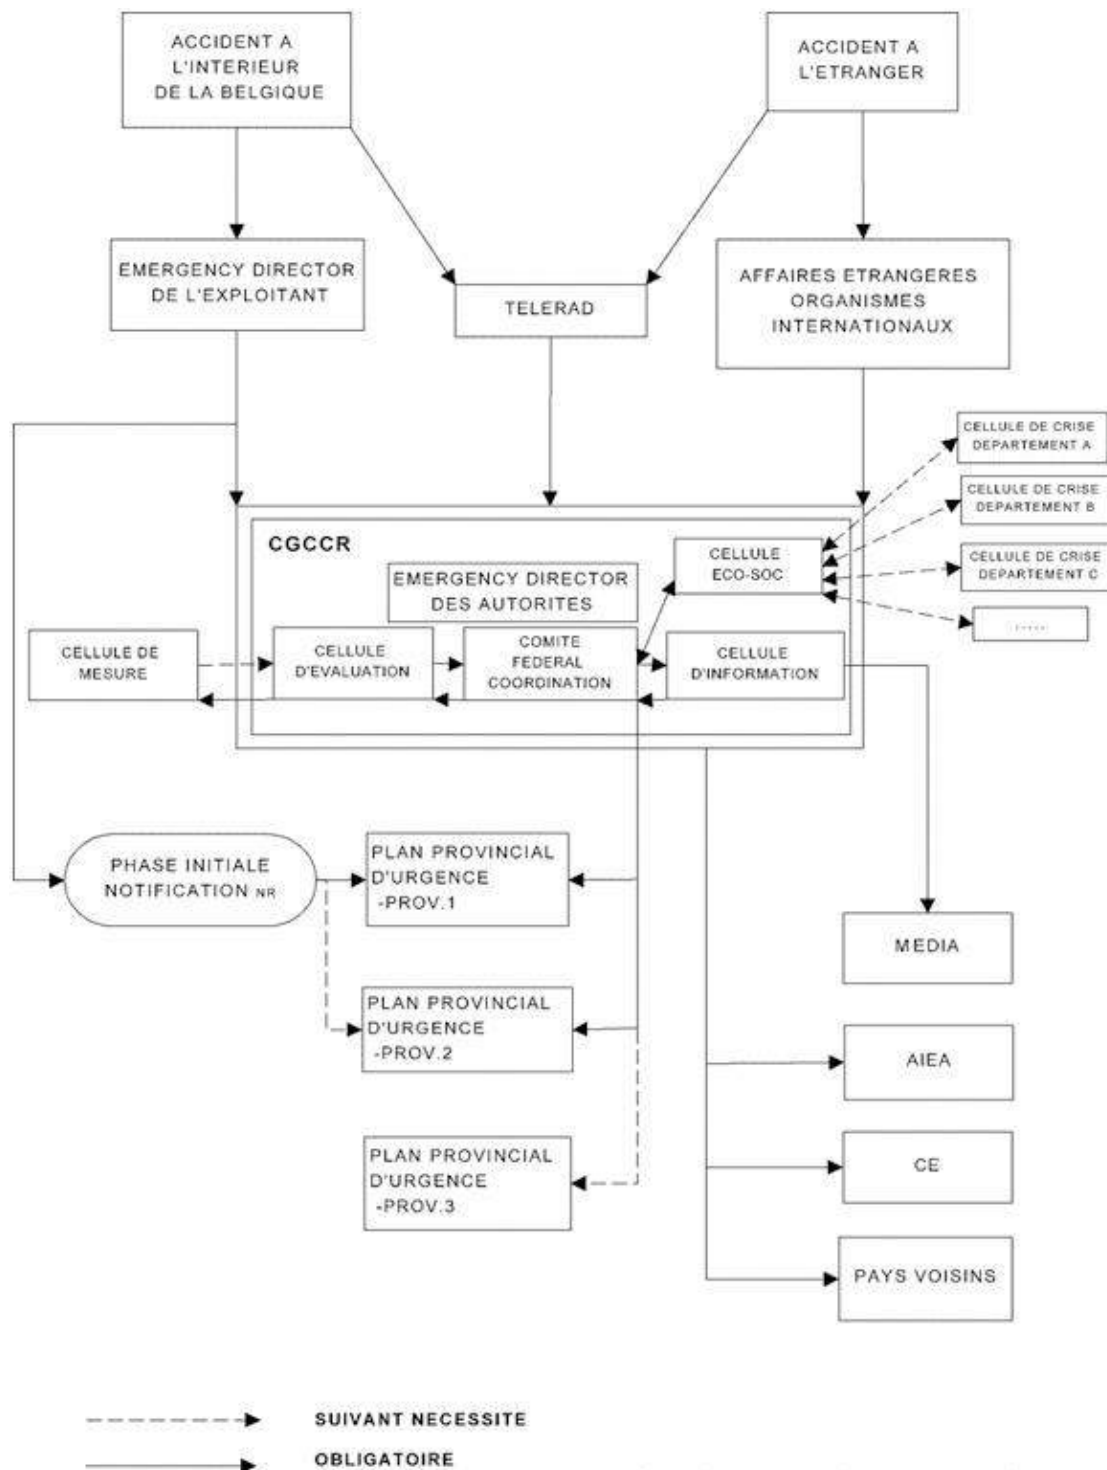

Figure 45: Belgium's Federal crisis coordination³⁰⁵

3.1 Organisational chart

The following organisations have a crucial role in the Belgian disaster and crisis management:

- Government ministries, in particular
 - Interior Affairs

³⁰⁵ "Disaster Management Structure," European Commission DG ECHO.

- Ministry of Public Health
- Foreign Affairs
- Defense
- Public security bodies
 - Police and rescue
 - Fire services
 - Civil protection services (part of the DG Civil Security)
- Coordination and Crisis Center of the Government (CGCCR)
- CNPD
- B-FAST
- Ministerial Council / Prime Minister
- Institute of Higher.. (IPSU)
- KCCE

The range of actors that may be involved in a disaster or crisis situation in Belgium are many and wide-ranging, and may include institutions not dedicated to crisis management services, e.g. DG Employment, Labour and Social Dialogue in the execution of a related Seveso Fund (see 1.3.1).

The institutes are largely based at the Federal level, rather than at the provincial or municipal level, and the overall responsibility for crisis management in Belgium rests with the federal government and the ministries.

In the event of a disaster or emergency, the Minister of Interior Affairs is the highest executive agent. The Minister is supported by several DGs, all under his or her control. Figure 46 shows the key DGs involved in crisis and emergency management.

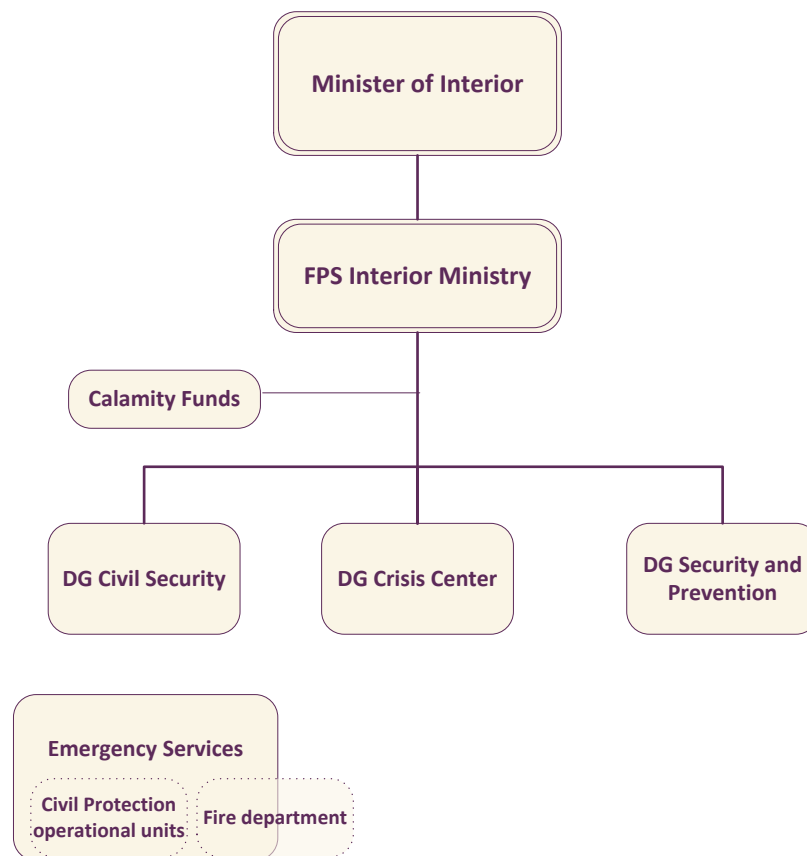

Figure 46: Main Belgian federal civil protection organizations³⁰⁶

DG Coordination and Crisis Centre of the Government (CGCCR), is responsible for overall coordination at the national level under the supervision of the Minister of Interior Affairs. It is through the CGCCR that the Minister manages national emergencies and engages the integrated police and rescue services. The DG for Civil Security is directly responsible for the civil protection services, which are federal services, comprised of six permanent operational units distributed across the Belgium territory. DG Civil Security is also indirectly responsible for fire services, which are operationally organised by emergency zones (34 in total). In a national level crisis, the CGCCR is responsible for coordination, while the Operations Directorate under DG Civil Security is responsible for managing the intervention. In the event of an international crisis, B-FAST is activated.³⁰⁷

In terms of preparedness and prevention, the CGCCR is tasked with initiating and organising proactive emergency planning, supported by the ISPU, while the responsibility for developing and implementing disaster preparedness plans in Belgium lies at all levels of government (i.e. municipal, provincial, national are responsible for emergency planning in their respective territories).

In the following sub-sections, the tasks and responsibilities of the Ministry of Interior Affairs (via DG Civil Security, DG Safety and Prevention, DG Crisis Centre), civil protection services of DG Civil Security, the fire brigade, police and rescue teams will be described in detail.

³⁰⁶ Ecorys Nederland.

³⁰⁷ "Disaster management structure," Commission DG ECHO.

DG CGCCR

The CGCCR (also known as DG Crisis Centre) is responsible for steering crisis management at the national level under the supervision of the Minister of Interior Affairs. The Crisis Centre has the assignment to organise the pro-active emergency planning. The centre is supported in this task by the IPSU (described in section 1.2.2.).

The main tasks of the Crisis Centre include:

- Collects and analyses on a permanent base relevant information for policy making and for operational organisations
- The centre offers expertise for crisis management at the Federal level
- The centre acts as the contact point for international crises
- After office hours, the centre acts as steering organisation for several federal institutions
- The crisis centre also is involved in public order management. The planning coordination and follow up of large events are tasks of the centre.
- The centre is actively involved in the security of high ranked officials visiting the country (kings etc.)
- Emergency plans on federal level are assigned to the centre
- The centre has a state of the art infrastructure for meeting and coordinating in times of crisis³⁰⁸

In the event of a national crisis, three bodies can be summoned at the Crisis Centre, each one contributing to the decision process within their respective competences: (i) an assessment cell, (ii) a management, and (iii) an information cell.

*The **assessment cell** evaluates the situation. It comprises experts and scientists from different competent authorities or services. It is presided by the department, which is most involved in the crisis, which is designated by the management cell.*

*The **management cell** (alias the Federal Coordinating Committee) takes the necessary measures and is the policymaking organ. It comprises the competent (federal) ministers or their representatives, and it is presided, in principle, by the Minister of Home Affairs or his/her representative.*

*The **information cell** communicates regularly about the measures taken to inform the population about the latest state of affairs and decisions taken by the management cell. The information cell comprises those responsible for communication or spokespersons from the departments concerned.*³⁰⁹

DG Civil Security

DG Civil Security is the hub for the non-police emergency services in Belgium, covering the 6 federal civil protection intervention service units (directly) and the municipal (now zonally organized) fire

³⁰⁸ "Sur le Centre de Crise," Ministry of the Interior, DG Crisis Center, accessed 20 December 2015, <http://centredecrise.be/fr/content/sur-le-centre-de-crise>.

³⁰⁹ "Disaster Management Structure," Commission DG ECHO.

services (indirectly). It is responsible for operational coordination in the event of an emergency, directly managing and controlling the Civil Protection Intervention Services (discussed below). The DG is comprised of 4 operational directorates, 3 staff services and five supporting cells. The operational directorates are:

- **Directorate 112**, a separate service coordinating the communication between the civilians in need of assistance in crisis situations and the professionally organised emergency services (police, medical aid, civil security etc.);
- **Centre of Expertise for the Civil Security (KCCE)**, responsible for training fire services and operational civil protection intervention services (see section 1.2.2.);
- **Directorate of Operations**, responsible for managing the interventions;
- **Directorate Equipment and New Technologies**, which supports the procurement of materials and equipment for the fire service and the operational civil protection intervention services (discussed under 5.4)

The DG is additionally charged with legal issues, prevention and public relations. The following figure shows the structure of the DG Civil Security. The purple dots are the main units within the department.

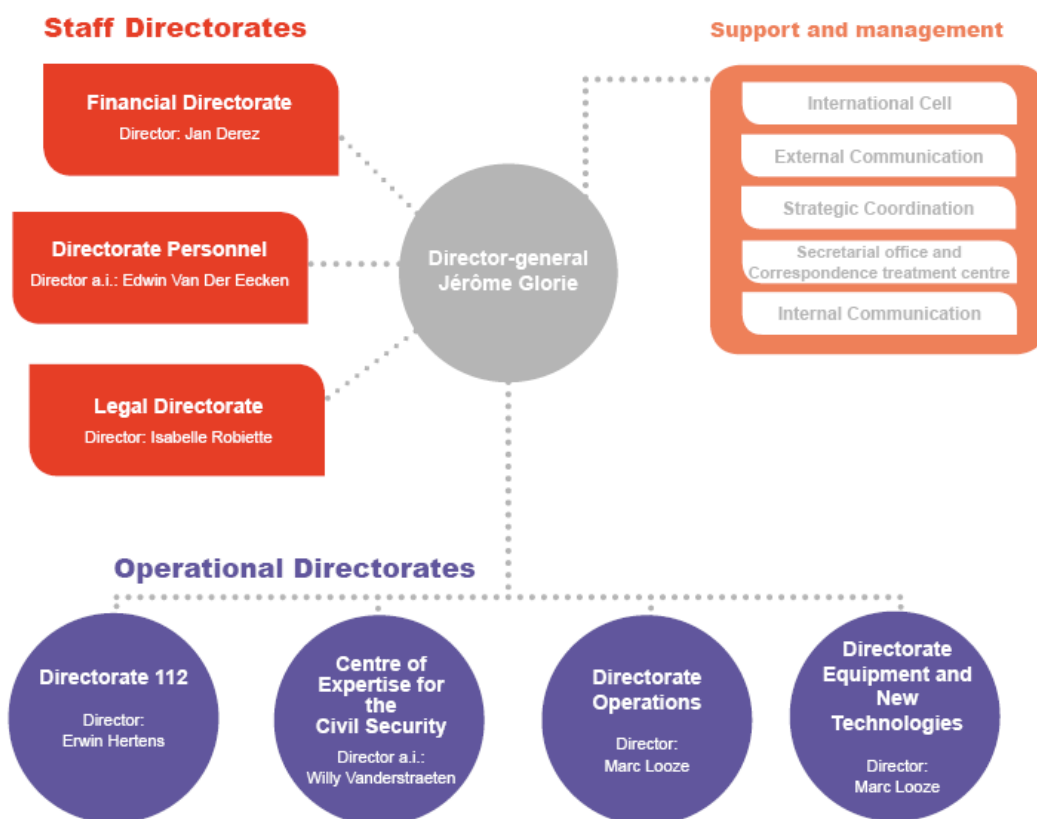

Figure 47: DG Civil security of the Federal Public Service of the Interior Affairs³¹⁰

³¹⁰ "Organisation Chart," Belgium Ministry of the Interior, DG Civil Security, accessed 20 December 2015, <http://www.securitecivile.be/en/content/organization-chart>.

Each emergency is handled by **civil protection intervention services**, which are managed and controlled by the DG Civil Security, providing the population with assistance in the event of both small or big disasters. Figure 48 shows the organizational structure in which the civil protection services operate.

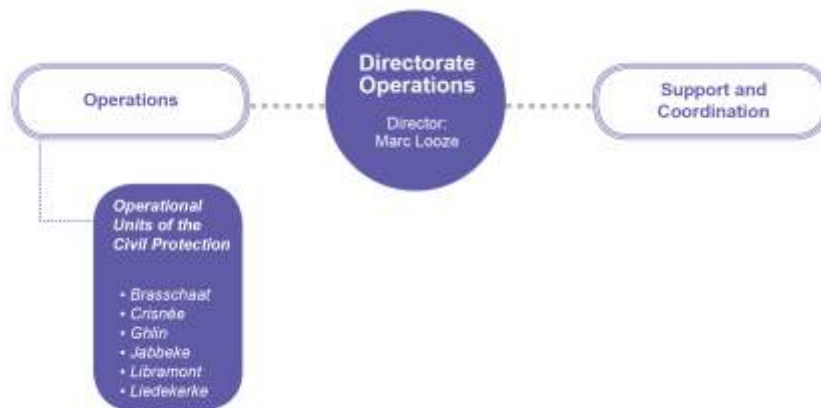

Figure 48: Organisation of the Directorate of Operations under DG Civil Security ³¹¹

There are six operational units, distributed across the Belgian territory:

- Brasschaat (near Antwerp)
- Crisnée (near Liège)
- Ghlin (near Mons)
- Jabbeke (near Brugge)
- Libramont (province of Luxembourg)
- Liedekerke (near Brussels).

Figure 49: Map of operational civil protection services units ³¹²

³¹¹ "Organisation Chart," DG Civil Security.

The operational tasks of the civil protection services are divided into five disciplines, each of which must draw up an intervention plan that outlines operating procedures.

Table 12: Five disciplines operational crisis management³¹³

³¹² “What does Civil Protection Do?”, Ministry of the Interior, DG Civil Security, accessed 20 December 2015, <http://www.securitecivile.be/en/content/what-does-civil-protection-do>.

³¹³ “Disaster Management Structure,” DG ECHO.

Discipline 1: Assistance operations
<ul style="list-style-type: none"> Controlling the emergency and eliminating associated risks, tracking persons, setting them free, rescuing and placing them in safety, protecting their goods. Claiming goods and persons.
Discipline 2: Medical, sanitary and psychosocial assistance
<ul style="list-style-type: none"> Starting the medical chain Applying medical and psychosocial care to victims and persons involved in the emergency Organising transport of victims Taking measures to protect public health.
Discipline 3: Police local to the area of the emergency situation
<ul style="list-style-type: none"> Restoring and maintaining public order Clearing entry and evacuation roads (if need be, escorting intervening services and means to the area of occurrence) Setting up the perimeter, physical demarcation, signalling and guarding, ensuring entry control to the operational theatre Executing public evacuation and supervising shelter Identifying victims Supporting judicial inquiry.
Discipline 4: Logistical support
<ul style="list-style-type: none"> Ensuring reinforcements of personnel and materials, as well as specialised rescue and assistance means Organising technical means for communication between disciplines, the operational command post and the coordinating committee(s) Organising foodstuffs and drinking water for the intervening services and stricken population.
Discipline 5: Information
<ul style="list-style-type: none"> Providing information and guidelines to the population (e.g. through the media) Providing information about measures for returning to normal conditions.

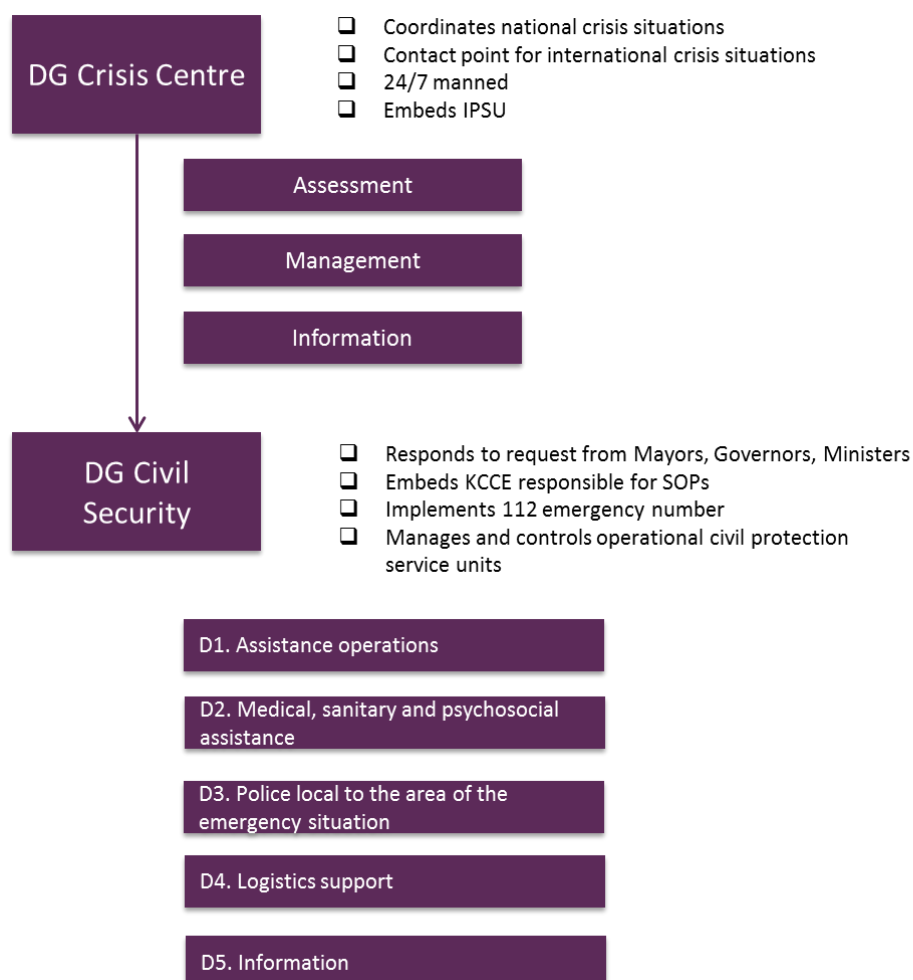

A few examples of the interventions of the Civil Protection are:

- Reinforcement of the water and foam supply, or heavy, specialized equipment in case of fire
- Shore up, apply canvasses, track and rescue victims of disasters or major accidents

- Deployment of specialized teams such as diving teams or dog teams during interventions or judicial missions of long duration
- Cleaning and transport of large-scale pollution such as petrol, asphalt, ...
- Decontamination and reception of the population in case of chemical or nuclear pollution
- Sealing of dikes and pumping in case of large-scale floods
- Distribution of potable water
- Support with means of telecommunication³¹⁴

National coordination

The CGCCR (DG Crisis Centre) is the hub in crisis management, and steers the cooperation with the operational civil protection forces under DG Civil Security. This DG intervenes at the request of the minister of Internal Affairs, the governors, the mayors, the fire departments or the police and provides reinforcement to emergency services with heavy and specialized equipment. The DG additionally coordinates with the Belgian fire fighters (operationally organised via emergency zones. The national approach for managing crises at national level, and the organisational cooperation between the relevant bodies, is sketched below.

³¹⁴ DG Civil Security, “What does Civil Protection Do?” accessed 20 December 2015, <http://www.securitecivile.be/en/content/what-does-civil-protection-do>.

Figure 50: Federal crisis management bodies³¹⁵

Fire services

The **Royal Decree of 2 February 2009** sets out a new system for organizing fire services in the Belgium. With the Decree, the 250 fire services were replaced by 34 zones. The website of the DG Civil Security states that, as of 1 January 2015, “The organization of the fire departments entirely passes [...] from a municipal organization to a zonal system. The royal decree regarding the emergency rescue zones divides Belgium into 34 emergency rescue zones.”³¹⁶ A map of the new zonal structure is shown in section 2.5.

Regarding the division of tasks and missions of the emergency services:

*A draft of royal decree modifies the division of tasks between the fire departments and the Civil Protection. It optimally takes into account the complementarity of these two emergency services. The fire departments take care of the basic missions regarding civil security, while the Civil Protection takes charge of the lengthy and specialized interventions. The possibility is given to the emergency rescue zones, by means of a cooperation agreement, to also appeal to another emergency rescue zone or to the operational units of the Civil Protection for certain basic missions when other means than the minimal means mentioned in attachment 1 of the royal decree regarding the determination of the minimal conditions of the fastest adequate assistance and the adequate means, are needed.*³¹⁷

Fire services are mobilized based on the principle of fastest adequate assistance:

This principle means that the fire department that can get to the place of a loss fastest will intervene. Before, it was the territorially competent fire department that intervened, regardless of whether another fire department actually could get to the place of the incident faster. The principle of the fastest adequate assistance is applied in practice since 2007.

*In 2012 a royal decree regarding the determination of the minimal conditions of the fastest adequate help and the adequate means, was passed. The prezones and the emergency rescue zones now have time until 31 December 2017 to take the necessary measures to meet the conditions provided in this decree.*³¹⁸

³¹⁵ Based on DG Civil Security.

³¹⁶ “Reform,” DG Civil Security.

³¹⁷ Ibid.

³¹⁸ Ibid.

Specialised teams

In addition to the roles that have been described relating to the various actors so far, the civil protection and fire departments have organized a number of specialized Civil Protection teams. These teams consist of personnel of the fire departments and the Civil Protection:

- Assistance teams with dogs
- B-FAST (discussed below)
- Dangerous goods safety advisors
- Divers of the civil protection
- High capacity pumping
- IBIS, specialized in tracking diseased persons, mainly in cooperation with the Disaster Victim Identification team (DVI) of the federal police
- Rescue with ropes
- Speleo
- USAR.³¹⁹

Civil military-cooperation

In the event of a national emergency, the following arrangement applies in accordance with the Ministerial Circular NPU-1: “Whenever civilian means are exhausted, military support can be considered and requested through the competent authority. In case of a municipal phase, agreement by the governor is compulsory.”³²⁰

Regarding international assistance, “the Ministry of Defense is part of the B-FAST structure, and it will provide available means and expertise to such missions, in accordance with international practices, e.g. the Oslo Guidelines”.³²¹

International assistance

The interdepartmental B-FAST is the framework for Belgian international assistance, comprised of civil protection services from Federal Public Service (FPS) Interior Ministry as well as FPS Public Health, Ministry of Defence and FPS Foreign Affairs. It was created by the Royal Decree of 28 February 2003 as a permanent emergency relief structure that could be mobilized at any time to assist a country or countries affected by a man-made or natural disaster. B-FAST consists of three committees and a permanent secretariat:

*The **B-FAST Secretariat** is the competent body for coordinating, preparing decisions, possible execution of and follow-up on all measures in the framework of emergency assistance.*

*The **coordination council** is presided by the Minister of Foreign Affairs or his/her representative. It consists of the representatives of the ministers involved and the director of*

³¹⁹ “Specialised Civil Protection Teams,” Belgium Ministry of the Interior, DG Civil Security, accessed 20 December 2015, <http://www.securitecivile.be/en/content/specialized-civil-protection-teams>.

³²⁰ “Emergency Planning,” Commission DG ECHO.

³²¹ Ibid.

the B-FAST Secretariat. In case of a request for assistance, the coordination council president submits a proposal for possible assistance to the Council of Ministers.

*The **planning committee** ensures strategic support and prepares files for treatment in the coordination council. It consists of administration representatives from the above-mentioned departments and focuses on technical- strategic aspects, e.g. investments, training, exercises and operations.*

*An **advisory committee** can be consulted consisting of representatives from NGOs and experts, designated by the coordination council³²².*

The decision process regarding the deployment of B-FAST services is discussed in the next section. Regarding operational activities of B-FAST, including the deployment of relief actions abroad, the organisation of exercises and trainings,

B-FAST has at its disposal the Contingent for Relief Operations Abroad (DICA-DIR), which is comprised of about 150 professionals and volunteers of the public emergency services (Fire Brigade and Civil Protection) from the FPS of the Interior, “supplemented if necessary with staff from Defence (logistics, communication, commando) and with volunteers (paramedical staff and doctors) from the FPS Public Health.” The detachment also engages in the aforementioned organisation of trainings abroad.³²³

3.2 Organisational cooperation

As has been described already in chapter 1, in terms of internal organizational cooperation of among the relevant crisis management organisations, three levels of government are central depending on the magnitude and scope of the incident.

The strategic framework of B-FAST (see Chapter 2.7) states that B-FAST should participate in the international coordination mechanisms for dealing with disasters. To that end, operations should be deployed in coordination with the various international partners (ie. EU, UN, NATO).

Regarding the mobilisation of B-FAST forces for international assistance,

As soon as a request for assistance reaches B-FAST, the Secretariat summons the planning committee and, if necessary, the advisory committee, to be able to submit a proposal to the coordination council. In practice, however, both the planning committee and coordination council will be summoned at the same time. At the moment of the convocation, so as to gain time, all relevant departments will start operational preparations.

³²² Ibid.

³²³ “FPS Interior and B-FAST,” B-FAST, accessed 20 December 2015, <http://b-fast.be/en/content/fps-home-affairs>.

As for the acceptance of international assistance, there is no specific national plan.³²⁴

³²⁴ "Emergency Planning," Commission DG ECHO.

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

The Belgian KCCE is assigned to collect, analyse, develop and spread knowhow and expertise on civil security. The development of Standing Operating Procedures (SOP) is part of their tasks. The SOP's are designed in order to have a prewritten procedure in case of a certain crisis, however given that each incident is different SOPs are to be considered as a best practice against which commanders can deviate following a proper assessment of the individual incident.

On its website, the DG Civil Security outlines the different phases of development of SOPs:

1. Development

The existing Standard Operation Procedures are developed by fire experts who work for the Centre of Expertise for the Civil Security. These fire experts act as the pilot and draw up an action plan in this framework, they appoint a working group of minimum six experts in this theme and they develop certain SOPs in co-operation and consensus with this working group.

2. Test phase

After a temporary approval of a Standard Operation Procedure by the Validation Committee, it passes through a test phase. After all, the most important thing is that a SOP corresponds to the reality of the field, that is meets the most recent intervention techniques and that it is sufficiently flexible for the application of the SOP in both a rural and an urban environment in the entire country.

After the publication of a SOP on this website, it is tested by different emergency rescue zones in Belgium. Testing and assessing a SOP in a realistic situation by at least two emergency rescue zones is the strict minimum. They can transfer their remarks on the basis of their findings to the Centre of Expertise for the Civil Security after which the pilot of the project can adapt the SOP with the help of his working group.

3. Best practice

After a test phase in at least two emergency rescue zones, a Standard Operation Procedure can be "definitively" validated by the Validation Committee and then the SOP is considered to be a best practice. Emergency rescue zones can use it if they want to. Nonetheless, SOPs are not a regulation and therefore don't need to be applied obligatory.

When it proves, after acquiring new insights on the subject or evolutions in the domain, that the SOP can still be improved after the test phase, this can off course be done by contacting the Centre of Expertise for the Civil Security.

4. Training, practice and exercise

As soon as a Standard Operation Procedure has become a best practice, trainings and exercise cards can be linked to it to prepare the relief workers even better for certain interventions. If needed, the necessary specialized equipment can be bought as well, to be able to optimally execute certain interventions.

*In case of emergency, the Belgian Directorate-General Civil Security is responsible for executing the SOP. The Directorate is part of the Federal Public Service Home Affairs.*³²⁵

4.2 Operations planning

The approach to dealing with emergencies by the authorities are set out by the numerous emergency plans for handling incidents at the different governing levels. At the first level, there are the multidisciplinary emergency and intervention plans (PUI in French, NIP in Flemish). These are developed by local authorities and cover (i) the General Emergency and Intervention Plans (PGUI in French, ANIP in Flemish), which are supported by the specific emergency and intervention plans (PPUI in French, BNIP in Flemish). The latter pertain to specific risk types and magnitude, allowing case specific planning (e.g. for airplane crashes).

The second level covers the Mono-disciplinary Intervention Plans, which are linked to are linked to the specific intervention plans of the different emergency services, detailing their functions and duties during incidents. For instance, a medical intervention plan or a psychosocial intervention plan. The third level covers the internal emergency plans of private companies.³²⁶

Thus, a “phased approach” to emergency planning exists in that, depending on the nature of the incident, assistance is structured for the local, provincial and national levels. This is show in Figure 51.

³²⁵ “How comes a Standard Operation Procedure about?” DG Civil Security, <http://www.securitecivile.be/en/content/how-comes-standard-operation-procedure-about>.

³²⁶ “Emergency planning,” DG ECHO.

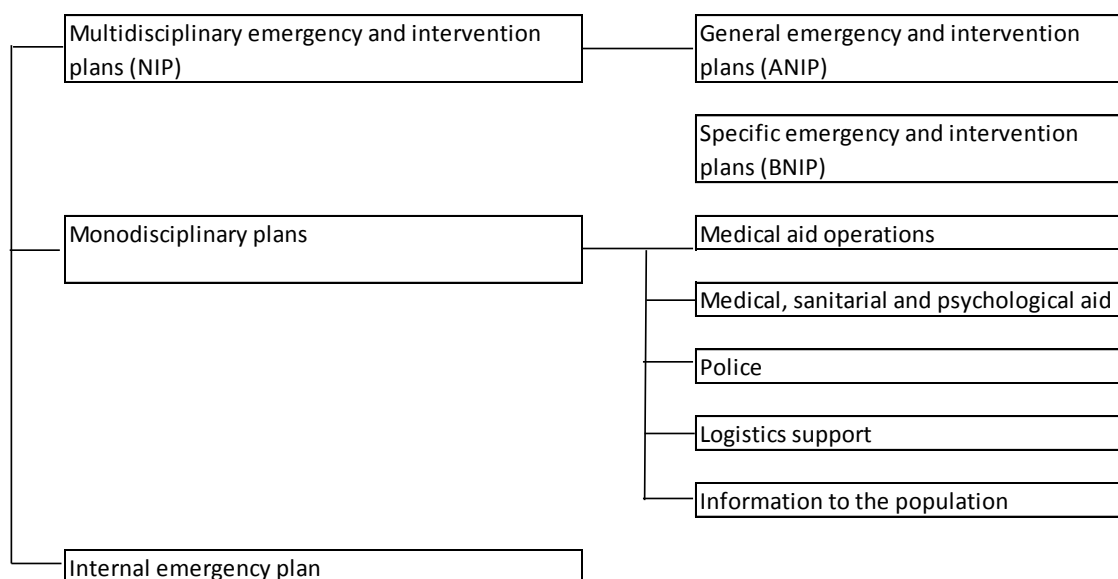

Figure 51: Crisis management plans³²⁷

4.3 Logistics support in crises

Within the DG for Civil Security, the Directorate Logistics is in charge of organizing logistics support. A full reference of logistical support intervention modules is available in the catalogue of intervention modules.³²⁸ Directorate Logistics (Dir-log) of the civil protection agency is in charge.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

The coordination of the Civil Security is organised twofold. The first type of communication is organised for supporting the operational activities. The second coordinates and communicates externally.

4.4.1 Internal communication

There are several communication systems in place for supporting operational activities among Belgian authorities and/or crisis management actors. The Regetel network (Réseau gouvernemental de Télécommunications, or Governmental Telecommunications Network) is an independent network of the government, “with own servers, 410 telephone nodes, 90 fax nodes, own technical support

³²⁷ “Planification d'urgence et gestion de crise en Belgique,” Belgium Ministry of the Interior, DG Crisis Center, 21 January 2013, accessed 20 December 2015, https://5052.fedimbo.belgium.be/sites/5052.fedimbo.belgium.be/files/planification_durgence_et_gestion_de_crise_fr_def.pdf.

³²⁸ The full catalogue of intervention support modules is available at http://www.protectioncivile.be/sites/5043.fedimbo.belgium.be/files/explorer/catalogue_modules/Catalogus_interventiemodules_CB_03-2014_NL.pdf.

and an own network in the centre of Brussels. It ensures that all partners of the DG Crisis Centre of the FPS Interior are reachable in the event of a disaster. The network is split into a part dedicated to crisis situations (Crisis Network) and a second part dedicated to federal services (Federal Network).

The Crisis network allows contact between:

- Provincial crisis centres
- Permanent units of the Civil Protection intervention services
- 112/100 Emergency Centres (EC112/100)
- Communication and information centres (CIC-C101)
- Federal organisation responsible for the analysis of threats (OCAM, in FR or OCAD in NL)
- Crisis centers at Fluxys and Eandis, gas and electricity infrastructure providers
- Dispatch centres of the Belgian Red Cross
- Maritime Safety and Coordination centre (MRCC) in Ostend and the Maritime Information Node (MIC).

The Federal Network connects higher level government actors, e.g. federal ministers and their chiefs of staff; DGs of the FPS's; the Royal Palaces; and the Speakers of the House of Representatives and the Senate.³²⁹

In addition, Belgium is equipped with a TETRA communication network, operated by ASTRID. TETRA, or "TErrestrial TRunked RAdio", is a European-developed standard for digital voice and data communications (i.e. national radio communications, paging and dispatching network) designed for emergency and security services.³³⁰

4.4.2 External communication

DG Crisis Centre is responsible for informing the media and general public in the event of an emergency. The services are day and night available to give support in crisis situations with GIS tools, videoconferences, electric generators, sirens etc. The Crisis Centre manages the network of around 570 sirens to rapidly warn the population in the event of an incident near nuclear sites and factories with significant industrial risks (i.e. Seveso high threshold risks) and nuclear areas.³³¹

³²⁹ "Regetel," Belgium Ministry of the Interior, DG Crisis Centre, accessed 20 December 2015, <http://crisiscentrum.be/fr/content/regetel>.

³³⁰ "The TETRA Standard," ASTRID, accessed 20 December 2015, <http://www.astrid.be/templates/content.aspx?id=3866&LangType=1033>.

³³¹ "Alerte à la population," Belgium Ministry of the Interior, DG Crisis Center, accessed 20 December 2015, <https://5052.fedimbo.belgium.be/fr/content/alerte-la-population>.

The use of alternative means of early warning (e.g. SMS warnings) are currently being tested as part of the BE-Alert project. Civilians can register their mobile phone number to be alerted in case of emergency. Civilians need to register and can be informed via³³²:

- Spoken messages on fixed and mobile phones
- SMS alerts on mobile phones
- Text messages via email
- Text messages via fax.

Civilians may contact the government via the common European emergency number: 112. The line is operated by the 112 Directorate of the DG Civil Security of the FPS Interior and the Ministry of Public Health. – Minister of Home Affairs & Minister Public Health. A federal multi-linguistic project is planned in the near future.

Other emergency numbers include

- Police: 101
- Emergency Medical Services: 100
- Fire Brigade: 100
- Child focus: 116.³³³

³³² "Be-Alert: soyez alerté en situation d'urgence," Ministry of the Interior, DG Crisis Centre, <http://centredecrise.be/fr/content/be-alert-soyez-alerte-en-situation-durgence>.

³³³ "Emergency Planning," Commission, DG ECHO.

5 Capabilities

5.1 Human resources

The number of staff employed at the main crisis management organisations of the federal government amounts to around 3.024 persons. The Federal level also has on its payroll 373 persons working in the provinces. It is unclear, however, the proportion of the federal staff located in the provinces that are working in the area of crisis management. The staff statistics as per 1 September 2014 are shown in Table 13.

Table 13: Staff of most relevant crisis institutes (as per 1 September 2014)³³⁴

Institute	Number of staff
DG Civil Security	1366
- Central directorate in Brussels	131
- Knowledge Centre	12
- Operational units	571
- Call takers 112/100 and Operators 101	652
DG Security and Prevention	195
DG Crisis Centre	80
Direction des calamates	17
Fire fighters	18.000 (2/3th is volunteer)

Additional resources are available from other civil protection service providers, e.g. fire services (amounting to approximately 18.000 in 2014, of which around two-thirds are volunteers), emergency medical services and from NGOs such as the Belgian Red Cross.

Private sector stakeholders include:

- Belintra for chemical transport incidents
- SCK – The Belgian Nuclear Research Centre
- IRE – The National Institute for Radioelements
- Belgoproces for nuclear incidents.³³⁵

³³⁴ Isabelle Mazzara, "Plan de management de la président du comité de direction du SPF Intérieur 2014-2020," accessed <http://www.ibz.be/download/plandemanagement-2014.pdf>.

³³⁵ "Disaster management structure," Commission DG ECHO.

5.2 Materiel (non-financial) resources

The Civil Protection has access to heavy, specialized equipment that can be deployed for her own interventions, as well as for the reinforcement of the interventions of other emergency services. A few example of this equipment are:

- super cannon: to extinguish heavy fires in chemical companies.
- goliath pump: can pump away very large amounts of water with a speed of 66,000 litres per minute, for instance in case of floods.
- decontamination units: to decontaminate people that became contaminated during a nuclear or chemical accident.
- vacuum tank: to quickly drain off and transport dangerous substances after for instance oil pollution in a river or ditch.
- waterline: can create up to 600 water bags per hour.³³⁶

The protection agency can additionally rely on the equipment of the fire protection agencies, the specialized private protection services and the army. Fire fighters from the Industrial Chemical plants can be called for support in crisis situations. The new Turbo-Lösch fire truck of the Antwerp plant of the Chemical company BASF is even co-financed by the Belgian Civil protection agency. The Ministry of Interior Affairs pays BASF a fee of 110.000 EUR per year for the next 10 years. The highly powerful fire hoses can spray a distance of up to 100 to 150 meters and up to 70 m high and 45 m in width; it can spray up to 25.000 liters of water per min. The Turbo can be used for Belgian interventions, and regional cross border interventions. When in operation, the fire truck is supplied with water via equipment of the Belgian Civil protection forces.³³⁷

Figure 52: BASF's new fire truck, co-financed by the Ministry of Interior affairs³³⁸

³³⁶ "What does Civil Protection Do?", DG Civil Security.

³³⁷ Steamexfire, "De turbo-jet van BASF Antwerpen," *Een-een-twee*, <http://www.steamexfire.nl/image/109.112turbopdf.pdf>.

³³⁸ Ibid.

The civil protection organisation has a catalogue of 120 pages detailing their material resources, ranging from equipment to reinforce the fire departments and emergency rescue zones in case of big fires to equipment for logistics support to resources to support the police services.³³⁹

5.3 Training

Within the Civil Protection structure, advisory boards are installed. These advise the operational zones, units, operators and call takers. The structure knows three advisory boards: personnel, material and training.

Within the training advisory board, four units exist.

- The trainings for public fire fighters is organised and continuously reviewed at the '*Hoge Raad voor de opleiding voor de openbare brandweerdiensten*'. The council advises the Minister of Interior Affairs directly on the trainings, reglementation and reports on the quality of the trainings organised at the local/provincial training centres.
- The *programming commission* is active in the needs mapping for trainings, advising on the syllabi, making proposals to the Minister on courses and exams and controlling the redaction committee.
- The third unit '*Commission on Equalisation and exemption*' advises the Minister on the levelling of diploma standards, courses and brevets and the exemption of courses and exams.
- In 2003, a '*supra-provincial training council*' for the French speaking and German speaking public fire fighters and a '*supra-provincial training council*' for the Dutch speaking public fire man were founded. The councils are grouping the presidents of the regional federations, technical and operational representatives of the General Council. An official of the Brussels department of fire fighters is added. These councils coordinate and level provincial trainings.

340

The training locations are spread around the provinces.

- The Federal Training centre is located in Archennes.
- The training centre for the province of Antwerp is located in Emblem.
- The training centre for Brussels is located in Brussel centre.
- The training centre for the province of Henegouwen is located in Jurbise.
- The training centre for the province Limburg is located in Genk.
- The training centre for the province Liege is located in Seraign.
- The training centre for the province Luxemburg is located in Bastogne.
- The training centre for the province Namen is located in Namen.

³³⁹ The full catalogue of intervention support modules is available at http://www.protectioncivile.be/sites/5043.fedimbo.belgium.be/files/explorer/catalogue_modules/Catalogus_interventiemodules_CB_03-2014_NL.pdf

³⁴⁰ "About Civil Security," DG Civil Security.

- The training centre for the province East-Flanders is located in Gent.
- The training centre for the province West-Flanders is located in Bruges.
- The training centre for the province Flemish-Brabant is located in Asse.
- The training centre for the province Wallonian-Brabant is located in Wavre.³⁴¹

The training centres organise mono-disciplinary and multi-disciplinary trainings at location as well. A recent multidisciplinary training was organised in a new railway tunnel under Brussels Airport. The team tested the new SOP, under guidance of the Federal Expertise Centre.

Figure 53: Training in the new Diabolo tunnel under Brussels Airport³⁴²

Certification

The trainings are organised at the provincial level. The trainings consist out of a bachelor type of training structure, split also in modules which can be followed separately. As of 1 January 2016, trainings follow the regulation of the RD of 18 November 2015 “Concerning the training of members of public emergency services and amending various Royal Decrees.”³⁴³

The trainings consist of separate courses for :

- Adjudant
- Fire man
- Unit chef
- Korporal
- Officier
- Sergeant
- Technical expert fire prevention
- Trainings outside Belgium

³⁴¹ “Belgium – Prevention and Preparedness,” European Commission Civil Protection Vademecum, accessed http://ec.europa.eu/echo/files/civil_protection/vademecum/be/2-be-3.html.

³⁴² Activiteitenverslag Binnenlandse Zaken 2012 (2013)

³⁴³ Royal Decree of 18 November 2015 Concerning the training of members of public emergency services and amending various Royal Decrees, accessed <http://www.securitecivile.be/fr/regulation/arrete-royal-du-18-novembre-2015-relatif-la-formation-des-membres-des-services-publics-de>.

A separate training *crisis management* is organised at the provincial centres. This training is structured in 4 disciplines and totals to 50 hours of training.

- Regulation
- Severe accidents: risk analysis and risk management
- Emergency planning
- Telecommunication and procedures, information management in collective emergencies

Also short courses are added. For example on gas protecting suits and diving.

After a successful participation in the courses, the students receive a certificate useful to promote within the civil protection or fire fighters organisations.

Annex I to the RD of 18 November 2015 on training defines that staff, meeting the requirements to participate in the training, are supported by subsidies covering the registration costs. The total subsidies allotted per training are listed in this Annex.

³⁴⁴

Exercises

Belgium participates in the European Civil Protection Modules Exercises (EU Modex) to prepare for international operations in the framework of the EU CPM. In March 2015, Belgium took part in the European exercise EUBelmodex held in Antwerp. The scenario of the exercise stated: “impressive floods have had an enormous impact on Belgium, the Netherlands and the north of France, bringing about dangerous situations in the surroundings of certain companies in the Port of Antwerp and in a hospital. To be able to face this large-scale situation, the Belgian authorities have requested the European assistance as reinforcement.”³⁴⁵

Intervention teams and coordination experts from multiple countries participated to the event, including from During the exercise, intervention teams and coordination experts from multiple countries came into action: Belgium, Austria, Portugal, Germany, Italy, Latvia, Lithuania, Sweden, Bulgaria and Slovakia. In total, 300 individuals participated, spread across 5 sites in Antwerp. On the Belgian side, the following are said to have participated: DG for Civil Protection and DG Crisis Centre (FPS Home Affairs), the operational units of the Civil Protection, the Emergency Planning Service of the federal services of the governor of Antwerp, the Emergency Planning Service of the city of Antwerp, the emergency rescue zone Antwerp, the emergency rescue zone ‘Rand’, the municipality of Edegem, Defence, the Havenbedrijf Antwerpen, the FPS Public Health, the (local and federal) police, different communication specialists and the university of Antwerp.³⁴⁶

5.4 Procurement

5.4.1 Procurement regulation

European regulations

The procurement of public contracts needs to be in line with the principles of European treaties and especially with the free movement of goods services, capital and people. Furthermore the procurement needs to comply with the principles of equality, proportionality etc. For some types of procurement additional regulations are codified in directives. Within the European legislation, three different procurement directives apply. These directives are mutually exclusive meaning only one of the directives applies to the public procurement. Directive 2014/25/EU (on procurement of utilities) and directive 2009/81/EC (on procurement in the defence and security industry) are topic specific. If these specific directives do not apply, public sector directive 2014/24/EU is applicable, which is the replacement of directive 2004/18/EC. The aim of the new directive is to simplify the rules on public procurement; improve the participation of SMEs and stimulate cross border joint procurement.

Stimulation of cross border joint procurement is helpful in case of a major internal crisis or a cross border crisis. The directive states in the preamble that contracting authorities should be able to choose to jointly provide their public services in cooperation with other authorities, without being obliged to use any legal form. These services don't have to be identical. The cooperation does not require all participating authorities to fulfil the obligations of the contract, as long as there is a commitment to contribute to the cooperative performance. The preamble points out that there are difficulties in cross border joint procurement. Therefore new rules have to be made. In these rules, the conditions for cross border procurement have to be clarified, as well as the applicable regulations. In addition, contracting authorities should be able to set up joint entities established under national or EU law. The new rules are specified in article 39 of the regulations.

If the procurement is executed by a centralised purchasing body located in another Member State (MS), the procurement shall be conducted in accordance with the national regulations of the MS where the purchasing body is located. In addition, several contracting authorities from different MS may jointly award a public contract, conclude a framework agreement or operate a dynamic purchasing system. Participating contracting authorities will then conclude an agreement that determines all responsibilities of the parties and the internal organisation of the procedure. As said before, the contracting authorities can set up a joint entity. The parties shall decide on the applicable rules on procurement. They can choose the rules of the MS where the entity has its registered office or where the entity carries out its activities.

This project evolves around the procurement related to crisis management, for example the procurement of ambulances, emergency packs or trainings. The utilities directive applies to gas and heat, electricity, water, transport services, ports and airports and postal services (article 8-13). The directive on defence and security applies to supply of military equipment and sensitive supplies. The majority of procurement in crisis management will be procured by normal NCCs and local authorities like the fire department or police and will not be secret. So in most cases the public sector directive

(2014/24/EU) is applicable. This chapter will therefore focus on this directive. Keep in mind that the other directives can also be applicable, for example if the army is used to solve a major crisis. The directive is addressed to Member States and has no direct effect on the national regulations. The directive needs to be implemented first.

5.4.1.1 Scope of the public sector directive

The public sector directive applies to procurement by contracting authorities with respect to public contracts as well as design contests whose value is estimated to be not less than (article 4):

- € 5.186.000 for public works contracts;
- € 134.000 for public supply and service contracts and design contests, awarded by central government;
- € 207.000 for public supply and service contracts or design contests awarded by sub-central contracting authorities.
- € 750.000 for public service contracts for social and other specific services listed in Annex XIV.

This directive should not apply to certain emergency services where they are performed by non-profit organisations or associations, since the particular nature of those organisations would be difficult to preserve if the service providers had to be chosen in accordance with the procedures of the directive. Furthermore the directive does not apply to public contracts with the purpose of providing public communication networks or electronic communication services; public contracts organised pursuant to international rules; several types of service contracts, e.g. rental, legal services and employment contracts and service contracts based on exclusive rights; and last, public contracts between entities within the public sector (articles 8-12).

5.4.1.2 Award procedures

On a European level, procurement is executed by the European Commission. The public sector directive contains several award procedures:

- open procedure,
- restricted procedure,
- competitive procedure with negotiation,
- competitive dialogue,
- negotiated procedure without prior publication.

The *open procedure* applies when no other procedure is chosen. In the open procedure, the contracting authority submits a call for tenders. Interested companies may submit a tender. The best offer is chosen, based on the selected award criteria (article 27).

The *restricted procedure* consist of two phases. In the first phase a call for expression of interests is set out. Interest candidates may submit an invitation to tender. The contracting authority will then

invite the most suitable candidates to submit a tender. The contracting authority will award the contract to the best tender, based on the selected award criteria (article 28).

In the *competitive procedure with negotiation* any interested candidate may submit a request to participate in the negotiations, in response to a call for competition. In this call for competition, the contracting authority has provided a description of their needs and the characteristics of the works or services to be procured. Only the interested candidates that are invited may submit an initial tender, which will be the basis of the negotiations (article 29). In several cases the negotiation procedure can be used without prior publication, for example when the public contract contains a creative achievement; when there is no competition; when intellectual property rights need to be protected, or when there are reasons for extreme urgency (article 32).

In the *competitive dialogue* any interested candidate can submit a request to participate in response to a contract notice given by the contracting authority. The contract notice provides the information on and the needs and requirements of the contracting authority, as well as the chosen award criteria. The selected interested candidates will join the competitive dialogue, in which the means best suited for satisfying the contract will be defined (article 30).

A new procedure within this directive is the *innovation partnership*. In this procedure, any economic operator may submit a request to participate in response to a contract notice, by providing information for qualitative selection that is requested by the contracting authority. The innovation partnership can be set up with one partner or several partners. Only the economic operators invited by the contracting authority participate in the procedure. After each phase, the contracting authority may decide after each phase to terminate the partnership or reduce the number of partners within the partnership, based on the targets.

According to article 26, the open procedure and restricted procedure are the standard procedures to apply in case of procurement. The other procedures can be used in a limited number of situations, for example when the service is innovative, or when the technical specifications can't be determined (art. 26, sub 4.).

Contracting authorities can use framework agreements, provided that they apply the procedures in this directive. The agreement cannot exceed four years. Contracts within the agreement will be awarded according to the rules in article 33.

In most procedures the candidates are chosen with the use of selection criteria. The selection criteria may relate to suitability to pursue the professional activity; economic and financial standing and technical and professional ability. All criteria need to be related and proportionate to the matter of the contract (article 58).

National regulations

Member States need to implement directive 2014/24/EU before 18 April 2016. In Belgium, procurement is codified in the Law on procurement and orders on works, services and supplies (In Flemish: De wet overheidsopdrachten en bepaalde opdrachten voor werken, leveringen en diensten).

5.4.1.3 Scope

The law on procurement applies to public contracts between a public contracting authority and one or more suppliers with respect to carrying out works, supplies or services on the market. The contracting authorities can be the Federal State, territorial agencies, and public institutions (article 2). The value of the contract is not a factor in the definition of the scope.

Some types of public contracts are excluded from the scope from the law. For example, when other rules apply according to international law, or if the procurement takes place between to public entities (article 17).

5.4.1.4 Procedures

In all types of procurement, the contracting authorities need to make sure that candidates are treated equally, without discrimination and that the procedures are transparent. The Belgium law has the same procedures as the European directive, with the open and restricted procedures as the standard and the procedure with negotiation and the competitive dialogue in a limited number of situations (article 26 and 27). One difference is that Belgium has a distinction between a tender procedure and the procurement. In a call for tenders, the candidates will be evaluated according to more criteria, while the procurement is only evaluated according to one criteria, in most cases the price.

5.4.1.5 Award criteria

The award criteria are stated in article 25 of the procurement law. According to the law, the criteria have to be line with the subject of the public contract and have to make sure that tenders can be compared objectively. The law provides some examples like price, quality, technical value and functional characteristics. These criteria are comparable to the criteria in the EU directive.

5.5 Niche capabilities

The B-FAST structure (described in chapter 2.7 and 3.1) enables Belgium to send a range of intervention services in the case of large-scale disaster abroad. What makes the B-FAST teams unique is the combination of experts from Public Health, Defense, fire departments and the Civil Protection emergency services. Specific intervention modules that can be deployed abroad in the framework of B-FAST are:

- Urban Search And Rescue (USAR), amongst which relief teams with dogs
- High Capacity Pumping (HCP)
- Advanced Medical Post
- Field Hospital
- CBRN Detection and Sampling
- Emergency Temporary Shelter
- Water Purification³⁴⁷

One of Belgium's particular niche capabilities pertains to flood disasters. As mentioned in the list above, BFAST can provide High Capacity Pumping in the event of extensive flood disasters.

The staff has received a specific training for that purpose, which will be completed by the generic functions and means required for the modules to be deployable fully autonomously in foreign countries (in particular concerning accommodation, food supply, etc.).

These flood disaster modules meet the European standards with regard to capacity (e.g. at least 1000 m³/hour), interoperability with other European intervention teams – e.g. where coupling devices are concerned – availability and autonomy.³⁴⁸

More information on all of the intervention module capabilities can be found on DG Civil Security website.

Civil Protection
of the Republic of Bulgaria

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The authors of this study are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by ECORYS and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

The number of natural disasters in Bulgaria has been increasing in recent years. For just four months—from June to October 2014—heavy floods affected half of Bulgaria’s regions and took 18 casualties on five different occasions. By the end of October, the total number of disasters since the start of the year exceeded 600, including train crashes and explosions in ammunition factories, the most recent one killing 15 people.

The types of challenges faced come in sharp contrast with the traditional concerns and the approach to protection of the population prior to WWII and during the Cold war. After several waves of reorganisation of the former militarised system for *civil defence*, the civil protection units and their management bodies are now part of General Directorate “Fire Safety and Civil Protection” (FSCP) within the Ministry of the Interior (MOI).

The main legal act regulating their activities is the *Disaster Protection Act*. A separate concept does not exist currently. The Disaster Protection Act reflects currently prevailing conceptual views on crisis management and disaster response.³⁴⁹ A number of strategies and executive regulations complement the law in regard to disaster prevention, the functioning of volunteers and volunteer organisations, consultative bodies, mid-term programmes, annual implementation plans, etc. Crisis preparedness and response need to adhere to a number of other laws, e.g. on the Ministry of the Interior, on the environmental protection, on the waters, on the regulation of territories, etc.

The central executive power continues to play the key role, primarily via the MOI General Directorate “Fire Safety and Civil Protection.” The regional and municipal authorities have their own disaster protection plans, and each region has a local FSCP directorate. Along with other ministries and central executive agencies, critical infrastructure operators, other trade companies, volunteers, health services, and the armed forces, they perform their crisis management duties in a *Unified Rescue System*.

FSCP is a point of contact for international co-operation, including humanitarian aid, engagement for disaster response and relief, protection of European critical infrastructures, etc.

FSCP has about 8 500 personnel and is sustained through the budget of the Ministry of the Interior. Elements of the monitoring and early warning system are maintained through the budget of respective ministries, agencies, and institutes. Some equipment, infrastructure and training programmes are financed as part of international projects, including EU structural funds. In addition, the Inter-agency Commission for Recovery and Assistance (ICRA) to the Council of Ministers has an annual budget of 70-90 mln. BGN, approximately 0.1 percent of the GDP, to finance “the prevention, containment, and overcoming the consequence of disasters.”³⁵⁰

Bulgaria has some crisis management capabilities of potential interest to the EU and other MSs, such as medium search and rescue units for urban environments, medium CBRN units, and land units for fighting forest fires, as well as the FSCP training range in the town of Montana. Mobile medical teams

³⁴⁹ A separate Crisis Management Law enacted in 2005 treated issues of interest to DRIVER. It was cancelled in 2009 and is not examined in detail here.

³⁵⁰ See for example the Law on the State Budget of the Republic of Bulgaria for 2014, *State Gazette* 109, 20 December 2013, article 1(2), item 4.1.1.

of the Military Medical Academy are regularly deployed abroad in disaster response operations. In 2015, a Sofia-based Centre of Excellence in Crisis Management and Disaster Response has been accredited by the North-Atlantic Council.

1 Policy

Bulgaria is a parliamentary republic. The People's Assembly (Bulgaria's single chamber Parliament) elects and discharges the Prime Minister and, on his or her proposal, all other Ministers. The formulation of policies, including the policy for disaster preparedness and response, is in the realm of this most senior body of the Executive branch power.

Head of state is generally elected President, who is also Supreme Commander of the Armed Forces. The President chairs the Consultative Council on National Security, composed of the leaders of the political parties represented in parliament. The executive powers of the President are largely limited to appointment of heads of diplomatic delegations/embassies, highest ranking military personnel and, when this is required by law, civil servants,³⁵¹ and signing international treaties.³⁵² In all these cases, the President acts on the proposal by the Council of Ministers.

When the Parliament is not in session, the President declares war, given an armed aggression against the country or the need for urgent implementation of international obligations, military or *another extraordinary situation*. In such cases the Parliament convenes immediately to decide on the President's declaration.³⁵³

Bulgaria is a unitary state with local self-governance.³⁵⁴ Currently, the country has 28 regions, each consisting of municipalities. Chapter 7 of the Constitution provides the grounds for local self-governance and administration. Each municipality has a Municipal Council, a Mayor, and its own budget. The Constitution also stipulates obligations of the citizens "to assist the state and society in the case of a natural or another disaster following legally defined regulations."³⁵⁵

Bulgaria does not have a crisis management policy document *per se*. In addition to the constitutional provisions, the foundations of CM policy are set in the Disaster Protection Act, while details emerge in the examination of a number of strategies, regulations, mid-term programmes, short-term implementation plans, organisational acts and resource allocation decisions.

Chapter 1 of the Disaster Protection Act defines 'disaster' as

*considerable disruption of the normal functioning of the society caused by natural phenomena and/or human activities, and leading to negative consequences for the life and the health of the population, property, economy and the environment, the prevention, containment and overcoming of which exceeds the capacity of the system for serving the common activities for societal protection.*³⁵⁶

The law defines the main principles of disaster protection:

1. Each person has the right to protection;
2. Saving human life has a priority over other protection activities;

³⁵¹ Mostly, the highest ranking professionals in the security ministries and agencies.

³⁵² Constitution of the Republic of Bulgaria, Articles 98, 99, 100.

³⁵³ Ibid., Article 100(5).

³⁵⁴ Ibid., Article 2(1).

³⁵⁵ Ibid., Article 61

³⁵⁶ Disaster Protection Act, article 2.

3. Provision of public information on disaster risks and the activities of the executive bodies for disaster protection;
4. Priority of the preventive measures in disaster protection;
5. Accountability for the implementation of the protective measures;
6. Gradual provision of forces and resources for protection.

The law—and respectively, the policy—treat the protection of life or health of the population, the environment and the property. Disaster protection involves executive bodies, legal entities and physical trade persons, coordinated in a Unified Rescue System, acting on a national, regional, and municipal level through:

- conducting preventive activities;
- conducting activities for protection during disasters;
- assistance and recovery;
- allocating resources;
- providing and accepting aid.

Thus, Bulgaria's crisis management policy aims to provide effective coordination and use of national and local, public and private resources, as well as assistance provided through international co-operation, to prevent crises and, when prevention fails, protect life and property during and immediately following a crisis triggered by natural disasters or man-made catastrophes. The respective crisis response is triggered whenever a disaster affecting the country, regions or local communities cannot be controlled through routine, daily and normal channels and procedures.

1.1 Risk Assessment

Data on recent disasters and other crisis event

Information on disasters is regularly reported by relevant Bulgarian ministries and agencies and is available to the public and international organizations and initiatives.

The website of General Directorate "Fire Safety and Civil Protection" (FSCP) provides annual statistical reports, available online for 2008 and the following years.³⁵⁷ While providing some information on natural disasters and industrial catastrophes, it is heavily focused on preventing fires and firefighting. The statistics provided by FSCP is detailed by region. For aggregated information for 2011-2014 see Table 14.

The Ministry of Environment and Water, through its own website or the websites of the four Basin Directorates, provides partial information on past floods. For example, the Basin Directorate for the Danube region provides an Excel file with information on 745 floods in that basin for the last century. 602 of those floods are assessed as being of significance for the respective town or village.

According to Regulation # 8 on the conditions and procedures for protecting forest territories from fires, the Executive Director of the Executive Agency "Forestry"³⁵⁸ "creates and maintains an information system with a database on fires for all forest territories with the aim to have the necessary statistical information."³⁵⁹

³⁵⁷ See www.nspbzn.mvr.bg/Sprav_informacia/Statistika/default.htm.

³⁵⁸ The name is translated into English on its official website as "Executive Forest Agency." See www.nug.bg/lang/2/index.

³⁵⁹ Article 12 /3/ of Regulation # 8 on the conditions and procedures for protecting forest territories from fires.

Table 14. FSPB statistics on disasters, incidents, and rescue mission, 2011-2014.³⁶⁰

	2011	2012	2013	2014
Natural disasters	154	700	70	703
Accidents	10	170	218	206
Home and industrial incidents	556	415	419	469
Incidents with dangerous substances and materials	681	643	487	465
Incidents with radiation sources	0	18	11	16
Total:	3412	3958	3218	3873
Assistance, search and/or rescue missions	n/a	456	376	586

The Nuclear Regulatory Agency publishes daily bulletins on the gamma background on the territory of the country (see an illustration on Figure 54), information on events in nuclear facilities³⁶¹ and reports on incidents with radiation sources, with a short description, lessons learned and recommendations.³⁶²

Academic publications by the Agency's experts add to the statistics and the analysis of individual cases. See for example Figure 55 for earlier statistics on incidents with radiation sources and brief description of key incidents in the article cited.³⁶³

**Figure 54: Gamma-background Bulletin.**

³⁶⁰ Based on the annual statistical reports at www.nspbzn.mvr.bg/Sprav_informacia/Statistika/default.htm.

³⁶¹ See www.bnra.bg/en/emergency/nuclear-facilitie/npp-events, listing three events in the Kozloduy Nuclear Power Plant, respectively in 21 December 2013, 14 April 2014 and 23 April 2014 (accessed 09 December 2014).

³⁶² See for example "Incident with a gamma - irradiation facility in the town of Stamboliyski," Nuclear Regulatory Agency, available in English at http://www.bnra.bg/en/emergency/20110729-en?set_language=en (accessed 28 October 2014).

³⁶³ Nizamska, Marina. "Analysis of the Reasons for Incidents with Radioactive Sources in Bulgaria and Preventive Measures." *Information & Security: An International Journal* 24 (2009): 115-124, <http://dx.doi.org/10.11610/isij.2411>.

Figure 55: Radiation Emergencies (events per year) for the period 1998-2006.

The National Institute of Geophysics, Geodesy and Geography (NIGGG) at the Bulgarian Academy of Sciences provides real time information of seismic activity in Bulgaria and adjacent areas (see Figure 56 for the status as of 10 December 2014³⁶⁴). NIGGG provides feeds to international networks that track and provide statistics on earthquakes.

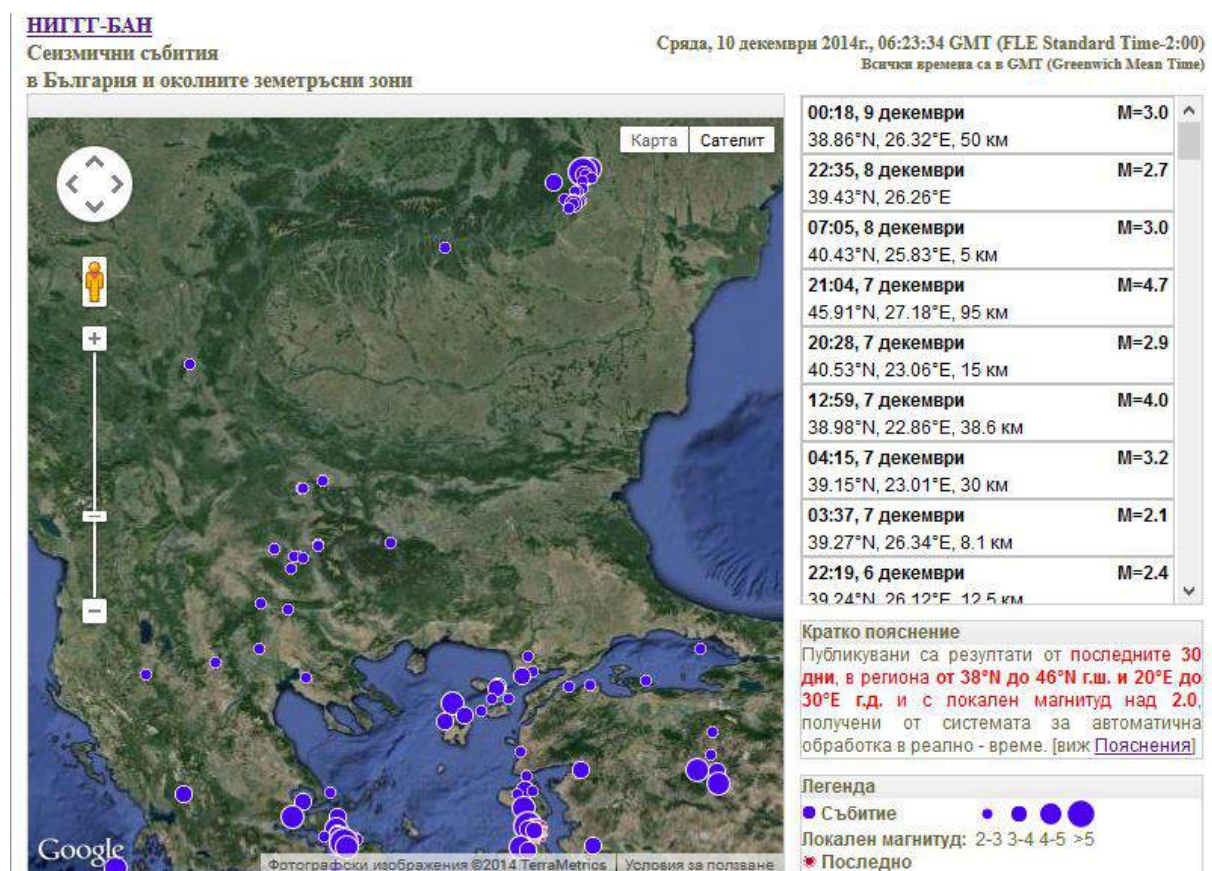

Figure 56: Seismic events in Bulgaria and adjacent earthquake zones.

³⁶⁴ For current information see <http://ndc.niggg.bas.bg>.

NIGGG researchers regularly publish related data and their data- and evidence-based findings. See for example Table 15 for the strongest earthquakes in Bulgaria since the beginning of the 20th Century.³⁶⁵ A common conclusion in these studies is that—within Europe—Bulgaria is among the countries most vulnerable to earthquakes.³⁶⁶

Table 15. Earthquakes in Bulgaria and adjacent areas since the beginning of the 20th Century with a magnitude over 5.

Date	Location	Magnitude on the Richter scale
31 March 1901	b/n Shabla and cape Kaliakra	7,2
4 April 1904	in the Struma river valley	7,8
8 October 1905	along the Struma river	6,4

7 December 1986	Popovo	5,7
27 October 2004	230 km NE of Sofia, on the territory of Romania	5,5
22 May 2012	Pernik	5,6

The National Statistical Institute publishes statistical studies on disasters, their causes and consequences, including assessment of material losses and their monetary value, assistance provided by the Interagency Commission for Recovery and Assistance, insurance premiums and paid compensations from insurers.³⁶⁷ Aggregated data for years 2010-2013 is presented on Table 16.

³⁶⁵ See Alexander N. Sadovski, "Spatial Analysis of Earthquakes in Bulgaria and Neighboring Areas," *Ecological Engineering and Environment Protection* 14, no. 2 (2014): 13-21 (in Bulgarian) and references therein. For older events, as well as earthquakes with magnitude between 4 and 5, see http://bg.wikipedia.org/wiki/Земетресения_в_България.

International organisations and initiatives can serve as additional sources for statistics on crises and disasters in Bulgaria, as well as their impact. Although based on information provided by Bulgarian authorities, these sources may be more useful for research purposes due to the common language, data structure, user-friendly online interface, etc. One such source is the UN Hyogo Framework for Action (HFA) – a 10-year plan to build resilience of nations and communities to disasters.³⁶⁸ The *PreventionWeb* site provides respective disaster statistics for the 30-year period from 1980 till 2010. An overview of the number of events and their consequences is presented in Table 17.³⁶⁹ The top events of significance and the respective statistics on their occurrence are presented on Figure 57.³⁷⁰ The same source provides data on the top 10 natural disasters, the numbers of people killed and affected, and the estimated economic damages.³⁷¹

Table 17. Overview of natural Disasters in Bulgaria from 1980 - 2010.

Number of events:	34
Number of people killed:	111
Average killed per year:	4
Number of people affected:	23,566
Average affected per year:	760
Economic Damage (US\$ X 1,000):	478,104
Economic Damage per year (US\$ X 1,000):	15,42

The United Nations Office for Disaster Risk Reduction (UNISDR) maintains a database with visualisation tools of exposures to risks. A sample of the Global Risk Update 2013, featuring human and economic exposure to earthquakes, is presented on Figure 58.³⁷²

The global assessment reports on disaster risk reduction are built on the information in DesInventar – disaster information management system maintained by UNISDR. UNISDR provides software that allows to construct databases capturing information on damage, loss and general effects of disasters. Bulgaria is interested in this opportunity to better understand disaster trends and their impacts, and achieve better prevention, mitigation and preparedness,³⁷³ but data on Bulgaria is not available on the DesInventar website at the time of preparing this report.

³⁶⁸ See www.unisdr.org/we/coordinate/hfa.

³⁶⁹ See www.preventionweb.net/english/countries/statistics/?cid=26.

Conducting Risk Assessments and Examples

There is a growing understanding that a systematic approach to disaster data collection and analysis can facilitate better policy-making and thus to the reduction of disaster risks and enhanced response to disasters.³⁷⁴ For example, the *Strategy for Mitigating Disaster Risks 2014-2020* includes a 15-page annex with overview of key disaster risks, supported by aggregated data, and their likely impact given our prediction ability, prevention and mitigation measures.³⁷⁵

Currently, the analysis, assessment and mapping of disaster risks are seen in Bulgaria as key preventive activities.³⁷⁶ They are implemented in accordance with the *Regulation of the conditions, procedures, and bodies for conducting analysis, assessment and mapping of disaster risks*.³⁷⁷ This normative document, approved by the Council of Ministers in October 2012, designates the following risks as subject of analysis, assessment and mapping:³⁷⁸

- seismic risk;
- risk of flooding;
- risk of nuclear or radiation accident;
- geological risk (landslides, landslips, active faults, and other geological processes);
- risk of forest fires.

Risks are analysed and assessed every six years, unless a specific law defines another term for reassessment. They can be re-examined given a change with potentially significant impact on the risk, if the data and information on which assessment has been made invalid or inadequate, if the negative consequences of actual disasters are higher or of different type than the ones forecasted, or based on lessons learned from past disasters.

The responsible bodies for analysis and assessment are as follows:³⁷⁹

- the Minister for Regional Development – for the seismic and geological risks;
- the Chairman of the Nuclear Regulatory Agency – for the risk of nuclear and radiation accidents;
- the Minister of Environment and Water, through the directors of Basin Directorates – for the risk of flooding;
- the Minister of Agriculture and Food – for the risk of forest fires.

The risk mapping follows the requirements of the EU Directive 2007/2/EC (INSPIRE) and other relevant requirements and standards.

The risk maps need to indicate the threatened territories and the likely negative consequences expressed through the following indicators:³⁸⁰

³⁷⁴ Interview with a FSCP expert.

³⁷⁵ *Strategy for Mitigating Disaster Risks 2014-2020*, available at <http://www.strategy.bg/StrategicDocuments/View.aspx?lang=bg-BG&Id=894> (in Bulgarian).

³⁷⁶ Disaster Protection Act, article 6(1), items 1 and 2.

³⁷⁷ Regulation of the conditions, procedures, and bodies for conducting analysis, assessment and mapping of disaster risks, *State Gazette* 84 (2 November 2012), as amended in *State Gazette* 9 (31 January 2014).

³⁷⁸ Ibid., article 1(2).

³⁷⁹ Ibid., article 2.

³⁸⁰ Ibid., article 5(3).

1. the approximate number of potentially endangered citizens (casualties, injured, or with their health under threat);
2. material losses;
3. affected technical infrastructure
4. affected economic activities in the respective area;
5. affected industrial installations (defined in Annex 4 to the Environmental Protection Law);
6. areas for water protection (identified in Article 119a(1) of the Law on Waters);
7. potentially affected areas under Article 6 of the Law on Biological Diversity;
8. the level of disruption of the normal functioning of society;
9. sites with the stature of immovable cultural values;
10. other information considered useful by the relevant bodies.

Article 6(8) of the Regulation declares that the disaster risk maps are public and are announced on the MOI website, while adhering to the requirements of the Law on Protection of Classified Information.³⁸¹ By the beginning of 2015, it was possible to find publically available information on just a few actual risk maps. In January 2014 the Regulation on mapping disaster risks was amended, extending the deadline for analysis and assessment of disaster risks till the end of 2015.

Partial results are nevertheless useful and being used in informing policy decisions. For example, Figure 59 provides an indication of seismic risks on the territory of Bulgaria³⁸² (understanding also that earthquakes in the Vrancea region of Romania, northern Greece or western Turkey may also have destructive effects on Bulgarian territory). Governmental assessments of earthquake and other seismic hazards and risks are complemented by rigorous academic studies on Bulgaria, such as those of Tzenov and Botev (2009) and Bayliss and Burton (2013).

Figure 59: Map of seismic hazards showing maximum values of acceleration of the ground in (g) with a period of repeatability 475 years.

³⁸¹ Translated also as *Classified Information Protection Act*.

³⁸² See the annex on p. 13 in Bulgarian State Standard EN 1998-1/NA, available in Bulgarian at http://www.bds-bg.org/images/upload/Nacionalni_prilozenia/BDS_EN_1998-1_NA.pdf (accessed 8 December 2014). The same map is included in Annex 64 to the National Plan for Disaster Protection (2010), p. 371.

Most advanced is the process of mapping the risk of flooding. Risk mapping is performed by the four regional Basin Directorates (part of the Ministry of Environment and Water) and partially financed by the European Union. Two maps are included below for illustrative purposes. Colours on Figure 60 indicate threshold depths for a medium probability flooding of the city of Plovdiv (the second biggest Bulgarian city, built on the banks of river Maritsa). The blue colours on the map on Figure 61 show the depth of flooding under the same assumptions.

Researchers contribute to the assessment and mapping of the risk of flooding both in terms of methods and their specific implementation, e.g. assessing risks of flooding for the population along the Black Sea coast,³⁸³ estimating flood prone territories along river basins,³⁸⁴ etc.

On this background, the analysis, assessment and mapping of the risk of forest fires lag behind. A report of the National Audit Office, covering the period 2011-2103 makes such a statement with the addition that “There is no approved methodology and the risks of forest fires have not been analysed. No organisational unit within the Ministry of Agriculture and Forests and/or Executive Agency “Forestry” has been tasked to analyse and assess the risks of forest fires and their consequent mapping.”³⁸⁵

1.2 Policy and Governance

The national disaster prevention and response framework envisions distributed crisis management within a Unified Rescue System, emphasising local preparedness and response by public bodies and the capabilities of the executive (providing also for engagement of companies and nongovernmental, including volunteer organisations).

The country's policy on disaster protection is formulated by the Council of Ministers.³⁸⁶ This most senior executive body adopts a strategy for mitigating disaster risks, the national programme for disaster protection and annual plans for its implementation, as well as a National Plan for Disaster Protection.

Disaster protection is performed on national, regional and municipal levels³⁸⁷ and includes prevention, protection measures when a disaster occurs, assistance and recovery.³⁸⁸ Each region and each municipality have their own disaster protection plans.

The response to disasters is organised through the Unified Rescue System (URS), which includes structures of ministries and agencies, municipalities, trade companies, non-governmental organisations, including organisations of volunteers, and the armed forces. All these structures preserve their institutional and organisational affiliation, as well as their assigned mission and functions.³⁸⁹

When a disaster occurs, the authority at the respective level and place (mayor, regional governor, Council of Ministers) enacts the relevant disaster protection plan. The expectation is that the local authority and locally present organisations react first. The disaster protection plans arrange for the cooperation among the components of the Unified Rescue System (URS) and provide opportunities for gradual involvement of additional forces and means with the evolution of the crisis situation.³⁹⁰

The framework for managing the response is as follows:

- Leader³⁹¹ on the site of the disaster is the Head of the respective territorial unit of the FSCP General Directorate or another officer³⁹² assigned by him or her.³⁹³
- The coordination of the URS components is assigned to the operational centres of General Directorate "Fire Safety and Civil Protection" (see Figure 66 in section 3.1 below).
- On the request³⁹⁴ by the leader (commander) on the site of the disaster, the mayor of the municipality or the regional governor, the operations centres organise the engagement of

³⁸⁶ Disaster Protection Act, article 62(1).

³⁸⁷ Bulgaria is a unitary state with 28 regions (region = 'oblast/ област') and 256 municipalities.

³⁸⁸ Disaster Protection Act, article 5. Disaster protection includes also "resource allocation" and "provision and acceptance of aid."

³⁸⁹ Disaster Protection Act, article 20.

³⁹⁰ Disaster Protection Act, article 26.

³⁹¹ Or "manager." The word used in Bulgarian is "rakovoditel/ ръководител." ISO 22320 uses the term "Incident Commander."

³⁹² Or "official." The term used in Bulgarian is "dlajnostno litse/ длъжностно лице."

³⁹³ Disaster Protection Act, article 31(2). The exception is in cases of epidemics or epizootics, when the leader on the site is the head of the regional health inspection or of the "Food Safety" Regional Directorate. See Disaster Protection Act, article 31(3).

URS components, designated in the disaster response plans, as well as additional forces and means.³⁹⁵

- The leader on the site is responsible for the cooperation and coordination of URS components, participating in rescue and urgent recovery activities in the area of the disaster.³⁹⁶

The following sub-sections provide details on this policy framework.

1.2.1 Strategy scope and focus

A Crisis Management Concept was developed by an interagency working group at the turn of this century. It was discussed among ministries and agencies involved, but never formally endorsed. The experience was useful in clarifying strategic issues and drafting the *Crisis Management Law* (adopted in early 2005; repealed in May 2009).

Currently, there is no document presenting an explicit strategy for crisis management of Bulgaria. Nevertheless, the strategy can be glimpsed by analysing other documents, in particular the Disaster Protection Act and the strategy for mitigating disaster risks.

The Disaster Protection Act treats the activities of prevention (Chapter 2), the response via the Unified Rescue System (Chapter 3), assistance and recovery (Chapter 6).

Resilience is a new concept, not yet fully implemented. One visible gap, for example, is in addressing *community resilience*.³⁹⁷ Nevertheless, some conceptual elements have been addressed over the years, e.g. the planning of the territory, consideration of the risk of flooding in managing water and related infrastructure,³⁹⁸ maintaining collective and individual protection kits, etc. Furthermore, a number of goals, in line of the Hyogo Framework for Action that aims to build resilience of nations and communities to disasters, have been reflected in the national risk mitigation strategy. One example is the stated objective to develop a national strategy for adaptation to climate change.³⁹⁹

The strategy for mitigation of disaster risks declares as a strategic goal “the prevention and/or reduction of the negative consequences for human health, socio-economic activity, environment and cultural heritage in Bulgaria as a result of disasters of natural or technogenic origin.”⁴⁰⁰ Four priorities are declared in the same document:

1. Developing a sustainable national policy and provision of a stable legal and institutional framework for disaster risk reduction;
2. Identification, assessment and monitoring of disaster risks. Enhancing and maintaining effective national systems for prediction, monitoring, early warning, and disaster alerts;

³⁹⁴ It is expected that such request is made when locally available capabilities are not sufficient to cope with the disaster.

³⁹⁵ Disaster Protection Act, article 29(2)4.

³⁹⁶ Disaster Protection Act, article 31(1).

³⁹⁷ RAND defines ‘community resilience’ as “a measure of the sustained ability of a community to utilize available resources to respond to, withstand, and recover from adverse situations.” See featured topic “Community resilience,” Available at www.rand.org/topics/community-resilience.html (accessed 27 November 2014).

³⁹⁸ Law on Waters, Article 10(3).

³⁹⁹ *Strategy for Mitigating Disaster Risks 2014-2020*, p. 19.

⁴⁰⁰ *Strategy for Mitigating Disaster Risks 2014-2020*, quote on p. 18, in Bulgarian.

3. Building a culture of disaster protection at all management levels and in society by utilising the experience, education, scientific research and innovation;
4. Reducing the key risk factors and increasing the readiness for effective response to disasters at all management levels.

Based on the declared priorities one could infer that risk assessment and prevention are in the focus of Bulgaria's disaster response strategy.⁴⁰¹

1.2.2 Policy for Response

The guiding principle is that the response is initiated and led locally, and involves locally present actors, including local authorities, public organisations, companies and non-governmental organizations. Additional capabilities and resources are provided if and when necessary. The armed forces provide support to rescue and urgent emergency recovery with the permission of the Minister of Defence on the request of the respective state body in accordance with the disaster protection plans. The main response framework is through the Unified Rescue System (URS), described in Chapter 3 of the Disaster Protection Act.

The activities under a threat or the occurrence of a disaster are:⁴⁰²

1. Warning;
2. Implementation of urgent measures to reduce disaster's impact;
3. Alert;
4. Rescue operations;
5. Delivery of urgent medical assistance;
6. Delivery of urgent psychological assistance to injured people and the rescue teams;
7. Containment and elimination of ecological incidents;
8. Protection against explosives and ammunition;
9. Search and rescue operations;
10. Radiation, chemical and biological protection in incidents and accidents with dangerous substances;
11. Containing and extinguishing fires;
12. Temporary evacuation, sheltering and delivery of means of protection;
13. Conducting urgent emergency recovery works;
14. Containing and eliminating occurring outbreaks, epidemics, and epizootics of contagious and parasitic diseases;
15. Other operations related to disaster protection.

1.2.3 Monitoring and analytical support to policy making; R&D

In practice, Bulgarian authorities implement an approach to policy making, based on regular reviews of risks, planning, and implementation. The reviews are focused exclusively on "disaster protection"

⁴⁰¹ An inference that was confirmed in an interview with an expert from the FSCP General Directorate.

⁴⁰² Ibid., Article 19. The law states also that in times of war, military or emergency situation the protection measures need to abide to the Geneva Conventions and the respective Additional Protocols.

and lead to consequent five-year programmes, e.g. National Programme for Disaster Protection 2009-2013, followed by the National Programme for Disaster Protection 2014-2018. Annual reviews and updates lead to the adoption of (and are usually included in) annual plans, e.g. the *Annual Plan for 2014 for the Implementation of the National Programme for Disaster Protection 2014-2018*.

As an established practice, non-governmental organisations, e.g. volunteer organisations and research institutes are involved in the annual reviews and drafting the national programmes and the annual plans for their implementation.

Notwithstanding available good practice and experience, Bulgaria's Caretaker Government (6 August-6 November 2014) assessed the policies made as inadequate and requested a peer-review of the system for disaster prevention and response and assessment of the country's crisis management capabilities through the EU civil protection mechanism.⁴⁰³

Scientific Support

In the period of 2004-2007, through the Interagency Commission on Protection of the Population in Disasters, Accidents, and Catastrophes (ICPPDAC), Bulgaria implemented a rigorous research programme with the aim to identify suitable crisis management strategies, legal and organisational arrangements, and enhance its prevention and early warning capabilities.⁴⁰⁴ One example is the study on alternative emergency management architectures, resulting in a set of recommendations on further development of the country's crisis management system.⁴⁰⁵

Since then, however, there is no dedicated research programme to support crisis management and disaster response.⁴⁰⁶ Occasionally, relevant projects initiated by the research community are financed by Bulgaria's National Science Fund, or Bulgarian scientists contribute to international research programmes and projects.

For scientific expertise, the MOI General Directorate FSCP relies on its contacts with the following research organizations:

- Centre for National Security and Defence Research, Bulgarian Academy of Sciences (BAS), for policy studies;
- National Institute for Meteorology and Hydrology, BAS, for meteorological and hydrological studies, current information and forecasts;
- National Institute for Geophysics, Geodesy and Geography, BAS, for monitoring seismic activity and related studies;
- Institute of Information and Communication Technologies, BAS, for operational analysis, computer assisted exercises, and modelling of complex phenomena;

⁴⁰³ https://press.mvr.bg/news/news150209_03.htm. The review is scheduled for mid-2015 and will be conducted in the framework of the EU Civil Protection mechanism.

⁴⁰⁶ The FSCP website has a section on "Applied scientific and expert activity," representing the in-house capacity to define fire safety requirements and support control and certification.

- Institute of Mathematics and Informatics, BAS, for mathematical modelling and decision support;
- Institute for Space and Solar-Terrestrial Research, BAS, for aerospace monitoring;
- The group of chemistry institutes of the Bulgarian Academy of Sciences, for issues of CBRN protection;
- Faculty of Geology and Geography of Sofia University “St. Kliment Ohridski,” for seismic studies, remote sensing expertise, etc.

1.2.4 Policy for Prevention

According to article 6(1) of the Disaster Protection Act the goal of prevention is to reduce the risk of disasters. The prevention includes:

1. Analysis and assessment of disaster risks;
2. Mapping disaster risks;
3. Categorisation of towns and villages depending on the number of people potentially affected;
4. Identification of critical infrastructures and sites and assessing respective risks;
5. Measures for protection of critical infrastructures;
6. Planning of disaster protection;
7. Adhering to the requirements of territory planning, investments design, construction and exploitation of building sites;
8. Development and maintenance of the systems for monitoring, early warning and alerts;
9. Provision of collective and individual protection means;
10. Training and practical preparedness of central and territorial bodies of the executive, response forces, volunteer formations and the population;
11. Adopting and implementing a National programme for disaster protection.

Policy for Prevention: Analysis, Assessment, Mapping of Disaster Risks

The responsible authorities for items 1 and 2 are as follows:

- for seismic and geological risks – the Minister for Regional Development;
- for the risk of nuclear and radiation accidents – the Chairman of the Nuclear Regulatory Agency;
- for the risk of forest fires – the Minister of Agriculture and Food;
- for the risk of flooding – the Minister of Environment and Water, through the directors of Basin Directorates.

The same institutions approve the methodologies for analysing and assessing the respective risk. In addition, the analysis and assessment of the risk of nuclear and radiation accidents needs to adhere to the *Law on the Safe Use of Nuclear Energy* and related norms, while the analysis and assessment of the flooding risk need to be in line with the *Law on Waters* and the relevant norms of its implementation.

Annex 1 to the National Disaster Protection Plan (NDPP), issued in 2012, is dedicated to the protection of earthquakes. It provides analysis of the risk of earthquakes, highlighting the risk of shallow quakes (depth at less than 60 km) in three main seismic areas:

- Northeastern, including the zones of Gorna Orahovitsa, Shabla and Dulovo;
- The area of Sredna Gora, including the zones of Sofia, the Maritsa river, the Tundja river, and the sub-Balkan zone;
- The area of the Rila and Rodopi mountains, including the zones of the Struma and Mesta rivers, and the zone in the Western Rodopi mountain around the town of Velingrad.

These seismic areas, with indication of plausible scenarios of maximum intensity according to the Medvedev–Sponheuer–Karnik-64 scale, is provided on Figure 62 below.

Annex 1 to NDPP details the obligations in earthquake protection of 12 ministers, the heads of the state reserves and nuclear regulation agencies, the Chairperson of the Bulgarian organization of Red Cross, two academic institutes, governors, mayors, trade companies, non-government organisations and individual citizens.

Landslides are also common, but statistically not on a scale that may cause a significant crisis. They are also subject of assessment and risk management studies.⁴⁰⁷ The National Programme for Disaster Protection 2014-2018 provides an overview of landslides per region and municipality. See the map on Figure 63 for the territorial distribution of landslides by municipality.⁴⁰⁸

Figure 62: Map of main seismic areas in Bulgaria.

⁴⁰⁷ See for example to project *RISK management of natural and anthropogenic landslides in the Greek-Bulgarian cross-border area*, RISKSLIDES, within the “European Territorial Cooperation” Operational Programme Greece - Bulgaria 2007-2013. Available at www.clmc.bas.bg/risklides (accessed 3 December 2014).

⁴⁰⁸ National Programme for Disaster Protection 2014-2018, p. 29.

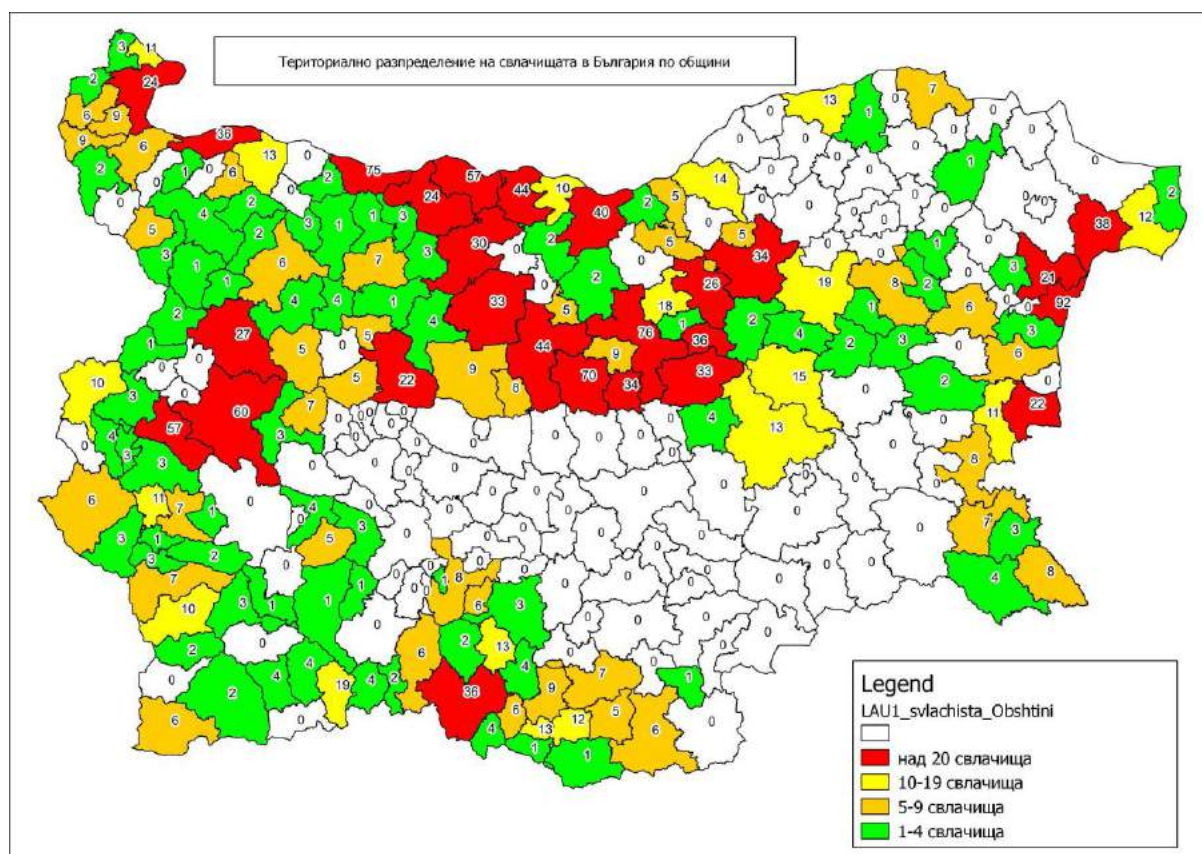

Figure 63: Territorial distribution of landslides by municipality.

The largest potential nuclear and radiation risk, originating on the territory of Bulgaria, relates to scenarios for Nuclear Power Plant (NPP) Kozloduy. Plausible scenarios, their potential impact and the response are described in great detail in Supplement 3 “External plan for accidents in Kozloduy NPP” (a 231 page document) of the standing National Disaster Protection plan. In addition, the nuclear power plant has its own plan to respond to various accidents.⁴⁰⁹

The risk of fires is addressed in NDPP, that examines large fires in industrial enterprises, sites of the critical infrastructure, forests and agricultural lands (in particular at the time of harvesting). The mountainous forests in Strandja-Sakar, Rila and Rodopi mountains, Sredna Gora and the southern slopes of the Balkan mountain are listed as particularly vulnerable, along with the regions of Haskovo, Stara Zagora, Blagoevgrad, Sofia, Pazardjik, Plovdiv, Yambol, and Burgas.

The risk of flooding is assessed as high along the rivers Danube, Maritsa, Tundja, Mesta, Iskar, Arda, Kamchia and others. The most recent experience shows, that under certain conditions, e.g. in heavy rainfalls in the summer and the fall, even small rivers can cause significant damage and human casualties. Technogenic floods, e.g. as a result of destruction of the dams Iskar, Batak, Trakiets, Ogosta, and Toplnitsa, can also have catastrophic consequences, since they could flood areas of 910 km² with 650 thousand inhabitants.⁴¹⁰

The four regional Basin Directorates (part of the Ministry of Environment and Water) are in the process of finalizing the mapping of risks of flooding and transition to the development of respective risk

⁴⁰⁹ See www.kznpp.org/index.php?lang=en&p=safety&p1=emergency.

⁴¹⁰ National Disaster Protection plan (2010), p. 6.

management plans. One example is project BG161PO005/12/1.20/02/29 “Developing plans for management of the risk of flooding” of the basin directorate for the Danube region.⁴¹¹

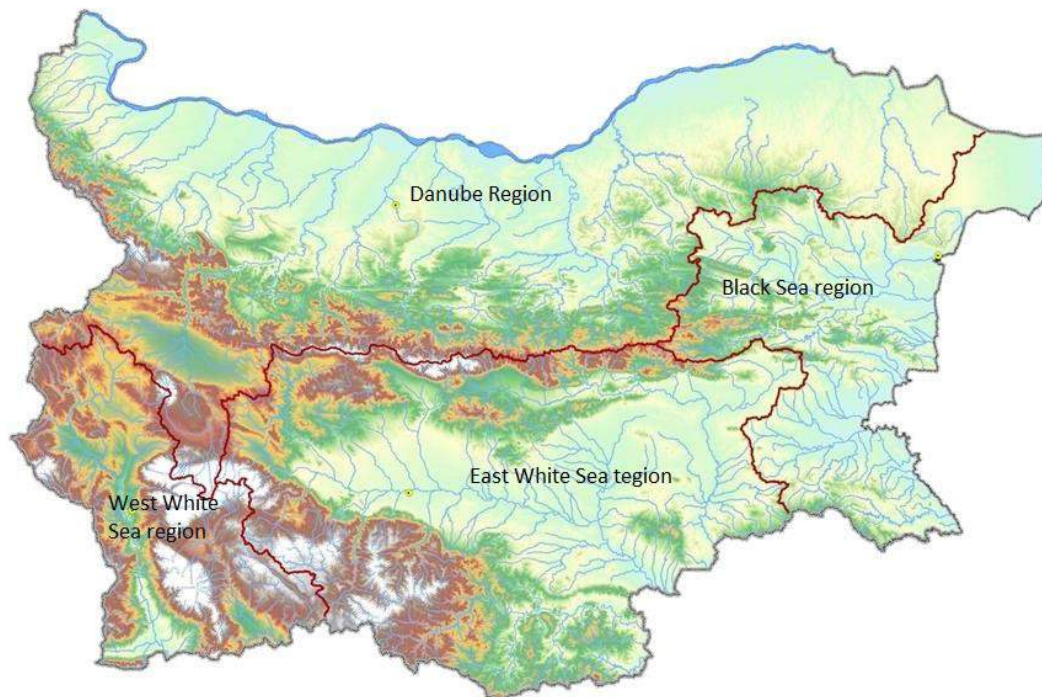

Figure 64: Coverage of the four Basin Directorates.

In addition to these risks, NDPP treats also the risks of trans-border radiation (e.g. in case of an accident in the Cernavodă NPP in Romania), incidents with vehicle transporting radioactive materials, industrial accidents followed by dissemination of dangerous substance, draught, strong winds and whirlwinds, heavy snowfalls, snowstorms and icing, accidents with maritime, vessels, trains and vehicles, terrorist acts and unexploded ordnance.⁴¹²

Policy for Prevention: Categorisation of Towns

Item # 3 on the list of legally required prevention activities—categorisation of towns and villages depending on the number of people potentially affected—is defined in the Disaster Protection Act. In the same Act, the population centres are categorised in six groups:

- the cities of Sofia, Plovdiv, Varna, Russe, and Burgass;
- other cities with population above 80 thousand;
- cities with population between 30 and 80 thousand
- cities and conurbations with population between 10 and 30 thousand
- conurbations with population below 10 thousand.

According to the Disaster Protection Act, the identification of critical infrastructures and sites and the assessment of respective risks is also a preventive measure. The *Regulation on the procedures, ways and competent bodies on identification of critical infrastructures and sites and the assessment of the*

⁴¹¹ See www.bd-dunav.org/content/proekti-i-programi (in Bulgarian) for details.

⁴¹² NDPP, pp. 8-17.

risk for them assigns the task of identification to the respective ministers and agency heads, who create standing working groups, while local authorities (governors, mayors) also collect and present relevant information.

The following set of criteria is used to assess the criticality of infrastructures and their elements:

- potential number of people killed and/or injured;
- potential economic consequences – losses, lower quality of products and services, environmental impact;
- potential societal consequences – impact on public confidence, physical suffering, disruption of everyday life, including the loss of main services.

The assessment of the risk for designated critical infrastructures⁴¹³ and assets is conducted by their owners or operators based on a methodology, developed by the standing working groups following the guidance of the Minister of the Interior. Every owner/operator of critical infrastructures or their elements must take measures to reduce their vulnerability to natural and technogenic dangers.⁴¹⁴

The remaining disaster protection activities will be examined below in this section of the report.

1.2.5 Policy for Preparedness

The policy for preparedness focuses on planning, as mandated in section II of Chapter 3 of the Disaster Protection Act, and training with regard to the Unified Rescue System (URS). Other texts in the law define requirements for disaster protection education in schools and universities, planning by companies, non-governmental and volunteer organizations, and training of their personnel.

The preparedness of URS components is assured by training and exercises. According to the Act, trainings are aimed at assessing the status of the communication and information system and the readiness of teams to react to disasters. The planning and conducting exercises serve to improve the cooperation and coordination among the URS components and with the executive bodies in their reaction to disasters. Trainings and exercises can be organised by the order of the Minister of the Interior, a regional governor, or the mayor of a municipality.⁴¹⁵

Preparedness, along with resilience, is enhanced by including volunteer formations and the population in training central and territorial bodies of the executive and response forces, the development and maintenance of the systems for monitoring, early warning and alerts, as well as legal obligations for adhering to the requirements of territory planning, investments design, construction and exploitation of building sites.

⁴¹³ Annex 2 to the Regulation on the procedures, ways and competent bodies on identification of critical infrastructures and sites and the assessment of the risk for them defines 19 sectors of critical infrastructure: energy; transport; information and communication technologies; postal and courier services; environment; agriculture and foods; health services; finance; economy; sports sites and installations; education, science and technologies; natural resources; tourism; regional development and infrastructure; defence; justice, home affairs and security; state and social governance; disaster protection; cultural heritage. The same designates a responsible ministry for each sector and sub-sector.

⁴¹⁴ Regulation on the procedures, ways and competent bodies on identification of critical infrastructures and sites and the assessment of the risk for them, article 13(3).

⁴¹⁵ Disaster Protection Act, Article 28.

1.2.6 Policy for Relief and Recovery

Relief and recovery include delivery of urgent and recovery assistance to the distressed people and urgent recovery works after the disaster.

The urgent assistance is organised and delivered by the mayors and includes:⁴¹⁶

- Feeding and providing temporary shelter to the distressed people, pets and livestock;
- Distributing clothing and household ware to the distressed people;
- Undertaking other necessary measures.

The recovery assistance involves primarily construction measures and repairs of damaged homes. They may include also destruction of buildings that, as a result of the disaster, have become unusable and dangerous.

The Disaster Protection Act authorises the Interagency Commission for Recovery and Assistance to make decisions and oversee the provision of state funding for recovery (as well as for prevention and urgent assistance necessary to contain a disaster).

1.3 Financing

1.3.1 Investing in preparedness

The main assets for crisis management and disaster response are part of the executive branch, provided for through the state budget. The FSCP General Directorate in MOI is the organisation with primary crisis/disaster management responsibilities. It is financed within the MOI budget by the programme “Fire safety and population protection in fires, disasters and emergency situations.”⁴¹⁷ The approximate amounts for this programme are:⁴¹⁸ 161.5 mln. BGN for 2013; 144 mln. for 2014; and 143 mln. BGN for 2015.⁴¹⁹

A number of agencies with key disaster management capabilities are also financed through the state budget. Among them are the Nuclear Regulatory Agency, the Basin Directorates in the Ministry of Environment and Water, Executive Agency “Forestry,” Executive Environment Agency, the National Centre of Radiobiology and Radiation Protection (Ministry of Health) and others.⁴²⁰

Several research institutes of the Bulgarian Academy of Sciences, most notably the National Institute for Meteorology and Hydrology and the National Institute for Geophysics, Geodesy and Geography, perform operational activities such as 24/7 monitoring, early warning, and forecasting. These types of activities are financed by the state budget through the budget of the Bulgarian Academy of Sciences.

⁴¹⁶ Disaster Protection Act, Article 55(2).

⁴¹⁷ For 2013 the name of the programme is “Provision of state fire control, fire safety and rescue, disaster protection and early alert.”

⁴¹⁸ Draft budget for 2014 of the Ministry of the Interior and updated budget forecast for 2015 and 2016 in programme format (in Bulgarian), available at www.mvr.bg/NR/rdonlyres/92521007-BCE9-44BB-8FBB-352156486003/0/Programen_format_budjet_MVR_2014.pdf (accessed 20 October 2014).

⁴¹⁹ The exchange rate to the Euro is fixed at 1.9558 BGN for 1 Euro.

⁴²⁰ These agencies perform other functions as well, and it is not possible to estimate precisely the portion of their budget that supports their crisis management and disaster response capabilities.

The country allocates a budget for the creation and maintenance of “crisis stocks” of materiel and petroleum, oil, and lubricants (POL) to provide for population protection in disasters.⁴²¹

Investments in disaster preparedness and response capabilities are regularly financed by EU funds through the operational programmes, with partial national contribution from the state budget. A sample of such projects includes:

- “Technical provision of the operational units on the FSCP General Directorate of the MOI for containing and extinguishing fires,” with approximately 49 mln. Euro (15 percent national co-financing) in the Operational Programme “Environment”⁴²²;
- “Enhancing the capacity of the operational units on the FSCP General Directorate of the MOI for reaction to flooding,” project DIR 51214001-2-193 with approximately 49 mln. Euro (15 percent national co-financing) in the Operational Programme “Environment.”⁴²³

Other projects with partial support from the European Union facilitate the transfer of good practices from the EU, development of the digital communications and information system, training (including training in project management and other aspects of good governance), testing, experimentation and certification, risk assessment and mapping. A number of projects are implemented in bi-lateral frameworks and aim to establish and/or strengthen trans-border cooperation in disaster preparedness and response.

Similar investments are included in the plans for the new EU programming period 2014-2020 through the instruments addressing agriculture (in view of the forest fires), environment (e.g. for risk mitigation), territorial development (e.g. for mapping disaster risks, preparedness, etc.).

The total project-based financing of this type over the last three years is estimated at 150 mln. Euro.⁴²⁴ The agencies and institutes with crisis management responsibilities, listed above, also implement research, capacity building and infrastructure development projects with international funding.

The Ministry of Defence occasionally invests in specific disaster management capabilities, e.g. equipping helicopters for firefighting, through the defence budget. In case of a need, MOD is expected to provide some of its ‘dual use’ capabilities, e.g. deactivation and de-contamination capabilities.

Local authorities at municipal level are expected to finance disaster prevention, preparedness and response through the municipal budget, while trade companies should finance the sites and assets they are responsible for.⁴²⁵ Currently, however, the level of local investments is estimated as rather low compared to the financing from the state budget. Possible exceptions are the municipalities of Sofia and some of the other biggest cities, but no aggregated data is available.

Finally, in the beginning of each year, the Interagency Commission for Recovery and Assistance (ICRA) decides to allocate a certain portion of the contingency budget (see the next section). For 2010 and 2011 ICRA decided to dedicate 15 percent of that budget to prevention activities, and increased it to 20 percent in 2012.⁴²⁶ However, no explicit decisions have been made for 2013 and 2014, mostly due to the numerous requests for recovery assistance after the 2012 earthquake in Pernik.

⁴²¹ Disaster Protection Act, Article 59, para 8.

⁴²² See www.nspbzn.mvr.bg/Proekti/Info+pojari.htm (in Bulgarian).

⁴²³ See www.nspbzn.mvr.bg/Proekti/Proekt-navodnenia.htm (in Bulgarian).

⁴²⁴ Interview with a senior expert from the FSCP General Directorate.

⁴²⁵ Disaster Protection Act, Article 61.

⁴²⁶ ICRA’s Protocols and decisions, available in Bulgarian at www.nspbzn.mvr.bg/Sprav_informacia/Mejduvedomstvena_komisija/default.htm.

1.3.2 Investing in consequence management

Typically, the Law on the State Budget, in its section on “Reserves for unforeseen and/or urgent expenditure” includes a separate line “for prevention, containment and overcoming the consequences of disasters.”⁴²⁷ In recent years, as well as in the 2015 state budget, the dedicated amount for that purpose is 70 mln. BGN.

This budget is managed by the Interagency Commission for Recovery and Assistance, which decides on requests by line ministries (mainly for recovery of unforeseen expenses for activities in actual disasters) and local authorities (for the actual recovery of buildings and infrastructures damaged as result of a disaster or for the destruction of facilities that have become unusable and dangerous due to a disaster). There is no formally prescribed rationale for deciding on how to distribute the available funding, or which of the numerous requests for recovery assistance to authorise. ICRA’s decisions in that regard are made largely in an *ad-hoc* manner.

When the losses as a consequence of a disaster are significant, the EU also provides recovery assistance. For example, after the floods in the summer and the autumn of 2014 the European Commission has agreed to compensate Bulgaria’s losses.⁴²⁸ The expected assistance amounts to no less than 10.5 mln. Euro.⁴²⁹

Insurance companies do not play such a significant role in the recovery, since insuring property and critical assets is not legally mandatory. To address this issue, a roundtable with insurers was organised recently.⁴³⁰

By law, the Bulgarian Red Cross is subsidised by the state⁴³¹ and is authorised to use some exceptions regarding taxes and payments, as a whole and for its employees.⁴³² The subsidy for 2014 is 3.1 mln. BGN.⁴³³

To remedy the consequences for people who suffer as a result of disasters, many organizations and individuals donate money, food, bottled water, clothing and other items either directly, or through the Bulgarian Red Cross and other organisations and campaigns. The monetary value of these donations easily exceeds several million levs.⁴³⁴

* * *

In total, a rough estimate of the annual expenditures of public actors on prevention, preparedness and response points to 400 mln. BGN (based on the figures in this Chapter), or about 0.5 % of the GDP of the country. This amount does not include the costs of preparedness of the armed forces and

⁴²⁷ Line 4.1.1 of the Law on the State Budget 2014.

⁴²⁸ The agreed compensation formula is “2.5 % of the direct losses under ‘the large disaster threshold’ + 6 % of the losses above the threshold.” The threshold for Bulgaria in 2014 is 232.5 mln. Euro. See “The European Commission recognised all compensations for the floods in Bulgaria,” *Trud*, 1 December 2014, available at www.trud.bg/Article.asp?ArticleId=4454903 (in Bulgarian).

⁴²⁹ CROSS News Agency, 17 December 2014.

⁴³² *Ibid.*, Article 7.

⁴³³ Law on the State Budget of the Republic of Bulgaria for 2014, Annex 4 to Article 49, item # 1.

⁴³⁴ Till mid-November 2014 the Bulgarian Red Cross received donations of 2 million BGN to provide assistance to people suffering from the floods. See www.redcross.bg/floods_bulgaria2014.html (in Bulgarian).

sustainment costs of the “security” departments and officers in all line ministries, regional and municipal administrations, nor the financing needed to create and maintain crisis reserves of materials, food, fuel, etc.

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

As an established practice, each individual emergency or a disaster is followed by an analysis and a formal report on reasons, consequences and recommendations. One example is the report of a working group, tasked by the Municipal Council of Varna to study the flood on 19 June 2014 that led to 13 casualties and considerable damages of the infrastructure.⁴³⁵ The report itself is 13 pages long, while the official website of the Varna municipality provides access to 218 pages in total with the report, annexes, photos, maps and the official statements by concerned stakeholders as a reaction to the report.⁴³⁶

1.4.2 Departmental Lessons Learned systems

There are no formal departmental Lessons Learned systems in place in ministries and other key stakeholder organisations, with partial exception of the Ministry of Defence.

1.4.3 Centralised (national) Lessons Learned system

There is no formal centralised (national) Lessons Learned system. Nevertheless, the analysis and assessment of disaster risks—key input information for the development of the national programme for disaster protection and the annual plans for its implementation—are based on past emergencies and disasters.

In the process of developing the national programme for disaster protection and the annual implementation plans stakeholders, represented in the respective working groups, exchange information on past experience—both negative and experience considered as good practice—and critical issues of common concern. FSCP General Directorate coordinates at working level the development of plans and programmes and thus facilitates the exchange of information.

1.4.4 International exchange for Lessons Learned

Bulgaria participates in international activities aiming to evaluate the experience of crisis management and disaster response and learn from it. The main forums of exchange of lessons learned information are:

⁴³⁵ Report of the Working group, created with the objective to clarify the reasons for the tragedy on 19 June 2014 and define measures to prevent future disasters, 18 July 2014, Available in Bulgarian at the official website of Varna municipality, www.varna.bg/bg/getfile.html/id/75a7c30fc0063c4952d7eb044a3c0897 (accessed 2 December 2014).

⁴³⁶ Ibid.

- The European Union Civil Protection mechanism via DG ECHO;
- The NATO Civil Emergency Planning mechanism and the Euro-Atlantic Disaster Response Coordination Centre.

Through FSCP, Bulgaria provides information in the Hyogo Framework for action,⁴³⁷ but does not exchange information through DesInventar – the disaster information management system maintained by UNISDR.

Bulgaria is active in a number of regional and bi-lateral formats of information exchange, such as:

- Strategic project RISK – Joint monitoring of the risk in emergency situations in the trans-border region of the Danube river, www.nspbzn.mvr.bg/Proekti/RISK+info.htm;
- SEERISK – Joint assessment of risk of disasters and readiness in the Danube micro-region, www.nspbzn.mvr.bg/Proekti/SEERISK.htm;
- The Disaster Preparedness and Prevention Initiative for South Eastern Europe, www.dppi.info;
- The Black Sea Earthquake Safety Net(work) – ESNET, <http://esnet.infp.ro/en>;
- CBCAID – Bulgaria-Turkey trans-border cooperation in industrial accidents, www.nspbzn.mvr.bg/Proekti/CBCAID.htm;
- Enhancing fire safety along the border between Bulgaria and Greece, www.nspbzn.mvr.bg/Proekti/Proekt_BG2003_005-630-04.htm, etc.

All these projects involve exchange of information, including lessons learned.

1.4.5 Regular policy reviews

There is no legally mandated requirement to conduct rigorous, comprehensive reviews of the national crisis management and disaster response policy.⁴³⁸ Nevertheless, the country implements a cyclic review, leading to the adoption of five-year national programmes for disaster protection (e.g. for the periods 2009-2013, and then for 2014-2018), and annual plans for implementation of the current programme. All concerned ministries, regional authorities, key non-governmental organisations and research institutes are involved in the development of the programme and the implementation plans.

Local communities, through their representatives in Municipal Councils, have the opportunity to contribute to the development of the respective standing disaster protection plans.

However, there are no aggregated reports on the implementation of these plans and programmes (thus, missing an opportunity for rigorous parliamentary and societal scrutiny).

⁴³⁷ See www.preventionweb.net/english/countries/statistics/?cid=26.

⁴³⁸ Unlike, for example, the field of defence, where every few years Bulgaria conducts a “Strategic Defence Review” (the titles may differ), followed by the adoption of White paper of defence and the armed forces, and accompanied by annual reports of the Executive to Parliament on the status of defence and the armed forces.

1.5 Resilience

The term ‘resilience’ is not translated directly to Bulgarian,⁴³⁹ and the concept of resilience is not well known.

Nevertheless, there are a number of activities and legal requirements in line with the concept of resilience.

First, the *Strategy for Mitigating Disaster Risks 2014-2020* follows the Hyogo Framework for Action with its 10-year plan to build resilience of nations and communities to disasters.⁴⁴⁰ The strategy focuses on identifying, assessing, prioritizing, monitoring and mitigating disaster risks. It calls for moral responsibility and responsibility to the society of all leadership levels for mitigating disaster risks, strengthening the culture of prevention, openness, transparency, and cooperation, as well as to increase awareness and participation of the population in disaster risk reduction activities.⁴⁴¹

Secondly, a number of regulations call for preparation and obligations of citizens and companies during disasters (to be examined in Chapter 2 of this report). Educational programmes are in place to prepare school and university students for a disaster response.

Third, key items are kept in stock to be used in case of a disaster. That includes foodstuff, tents and blankets, iodine, vaccines, etc. Also, collective and individual protection means are maintained for such cases.

Finally, ISO 22301:2012 “Business Continuity Management – Requirements” has been translated and introduced as a national standard. A number of training events took place, and several consultancy companies provide training on ISO 22301:2012 in combination with the British Standard PAS 200:2011 “Crisis management – Guidance and good practice” and ISO 27001 “Information Security Management.”

1.6 Information sharing and data protection

Data protection and information sharing

Municipal social services and humanitarian organisations maintain registries on people with particular disabilities, but this information is not centralised.⁴⁴² Hence, any requests to share personal data during crises or for crisis management purposes need to be addressed to the respective social services or humanitarian organisations.

The derogation of the legislation with regard to data protection is not included among the rights that can be constraint temporarily in a disaster situation.⁴⁴³

However, the Law on Protection of Personal Data stipulates that personal data can be processed when “this is necessary to protect the life and health of a physical person about whom is the data.”⁴⁴⁴ The same Law states that the processing can be performed by an “Administrator of personal data” —

⁴³⁹ It is often translated as “stability / устойчивост.”

⁴⁴⁰ www.unisdr.org/we/coordinate/hfa.

⁴⁴¹ *Strategy for Mitigating Disaster Risks 2014-2020*, p. 7, p. 21.

⁴⁴² To the extent the authors are aware.

⁴⁴³ Enumerated in Article 52 of the Disaster Protection Act.

⁴⁴⁴ Law on Protection of Personal Data, Article 4(1), para 4.

a physical or legal entity, a body of the state power or local self-governance—which, alone or jointly with another entity, defines the purposes and means of processing personal data, when these purposes and means are constraint by law.⁴⁴⁵

The sharing of classified information—internally, within the European Union and with third states/ organisations—follows the requirements of the Classified Information Protection Act and respective sub-legal norms. The legislation related to classified information has been adapted first to NATO requirements, and is generally considered to be in line with corresponding EU norms.

Registry of volunteers

The legal provisions for the use of volunteers and volunteer formations are fairly recent. In the short period of about three years in which they are in force, 162 formations were created, and FSCP provides public access to the respective registry.⁴⁴⁶ The registry provides data on the authorised⁴⁴⁷ and the actual strength of each formation by municipality. No aggregated data on particular capabilities, level of readiness and contact information is publically available.

The Registry has to contain information on groups within the volunteer formation along types of activity,⁴⁴⁸ and that information should be public, but this requirement is not yet implemented.

The work with the Registry shall abide to the requirements of the Law on Personal Data Protection. Hence, while the Registry contains the names and the Unified Identification Number of each volunteer, this information is not public.

Use of social media

Currently, Bulgaria has no plans to use data gathered from social media during crises. It nevertheless envisions a role for a citizen in providing information and data, via the National System for Emergency Calls 112 or otherwise, as a basis for monitoring, early warning, and alerts.⁴⁴⁹ Hence, there are no legal obstacles to use other technical venues, including social networks, as a way to provide disaster related information.

⁴⁴⁵ Ibid., Article 3(1) and (2).

⁴⁴⁶ See www.nspbzn.mvr.bg/Sprav_informacia/Registri/default.htm. As of 19 December 2014 the registry can be downloaded at www.nspbzn.mvr.bg/NR/rdonlyres/63B788EC-2181-4A3F-871D-142803766A07/0/Registar_DF_Publichen_19122014g.pdf.

⁴⁴⁷ As explained in the footnote to the Registry, the authorised strength is based on statistical data on the population in the municipality, as related to its distance from the component parts of the Unified Rescue System. The authorised strength is defined by Decision # 327 of the Council of Ministers of 25 April 2012.

⁴⁴⁸ Regulation Iz-1669 of 17 August 2012 on the order of creating and maintaining a registry on the volunteer formations for overcoming or containing disasters, fires, and emergency situations and elimination of their consequences, Article 9(1), para 8.

⁴⁴⁹ Disaster Protection Act, Article 11(1), para 1.

2 Legislation

The *Constitution of the Republic of Bulgaria* is the founding Act defining, *inter alia*, main rights and responsibilities of the citizens, authorities and cases in which they can declare war or another emergency ('extraordinary') situation, as well as the citizens' rights that cannot be derogated in such cases.

2.1 Crisis (emergency, disaster) management concept

There is no formally approved crisis management concept. A draft document outlining such a concept was discussed at the turn of the century. Those discussions informed the drafting of the *Crisis Management Law*. Many of the stipulations in that law (repealed in 2009) are now included in the *Disaster Protection Act*.

2.2 General crisis (emergency, disaster) management law

In 2005 a *Crisis Management Law* was introduced. However, it was repealed in 2009 without much debate in Parliament or within the expert community. In the authors' opinion, there were two main reasons for that decision. Firstly, it contained a rather broad legal definition of a 'crisis,' potentially subject to various interpretations,⁴⁵⁰ and secondly, the new party in power⁴⁵¹ intended to close down then existing *Ministry on Crisis Management*⁴⁵² and to transfer its functions, along with the Civil Protection Agency, to the Ministry of the Interior.

The main law currently regulating crisis management is the *Disaster Protection Act*.

The Act regulates the protection of life and health of the population, the preservation of the environment and property during disasters.⁴⁵³

This Act provides definition of a disaster,⁴⁵⁴ outlines the responsible authorities and actors, and the coordination of their activities through the Unified Rescue System, the main principles and activities of disaster management (prevention, protection, recovery and assistance, resource allocation, providing and receiving aid), the contribution of citizens, volunteers and legal entities (companies), administrative measures and penalties, and legal definitions of the main terms.

The Disaster Protection Act envisions implementation of certain norms introduced by other laws:

⁴⁵⁰ The Crisis Management Law existed in parallel to the Disaster Protection Act, but was cancelled in 2009 through amendments to the Law on Defence and Armed Forces.

⁴⁵¹ Prior to and after the regular parliamentary elections in the early summer of 2009, the leaders of the party coming to power declared publicly, on several occasions, this intention.

⁴⁵² Earlier, Ministry on Disasters and Catastrophes.

⁴⁵³ Disaster Management Act, Article 1.

⁴⁵⁴ See the opening section of Chapter 1 above.

- According to Article 9(12), the part on “Flooding” of the disaster protection plans is drafted taking into account the plans for managing the risk of flooding, developed according to the requirements of the *Law on Waters*.⁴⁵⁵
- According to Article 9(14), in the initiation or approval of the detailed plans for the territory, required by the Law on Territory Planning,⁴⁵⁶ the bodies responsible for the elaboration of disaster protection plans provide information on foreseen disasters, endangering the territories in the scope of the disaster protection plans, and for the necessary measures for their protection, included in the disaster protection plans.
- Owners and operators of sites and assets in the scope of Article 137, categories 1, 2, or 3 of the Law on Territory Planning (roads and other infrastructure and construction sites of significant importance and involving high complexity and risk) are obliged to develop, maintain and prepare for the implementation of an emergency plan for the respective site/ asset.
- According to Article 18a(2), the information on designating certain infrastructure as European Critical Infrastructure is in accordance with the respective level of classification, defined by the Law on Protecting Classified Information.⁴⁵⁷ According to the same Law and Article 18b(6) of the Disaster Protection Act, the operator’s plan for security of European Critical Infrastructure is considered classified information.

Additional requirements are introduced by other laws and regulations, including the Law on the Forests and Regulation # 8 on the conditions and procedures for protecting forest territories from fires, the Law on Waters and Regulation # 13 maintenance of dams and relevant facilities, the Law on the Safe Use of Nuclear Energy and Regulation on emergency planning and emergency preparedness in case of nuclear and radiation accident, and the Regulation on critical infrastructures. Among the relevant sector-specific laws are also the Law on the Ministry of the Interior, the Law on Defence and Armed Forces, and the Law on State Agency “National Security.” For details refer to section 2.4 below.

2.3 Emergency rule

Declaration of war, military situation or emergency (‘extraordinary’) situation is treated in the Constitution of the Republic of Bulgaria (see above). According to Article 122(1) of the Law of Defence and Armed Forces “emergency (extraordinary) situation” is introduced on the whole or part of the territory of the country “under a danger of involving the Republic of Bulgaria in a military-political crisis or a military conflict.”⁴⁵⁸

The Disaster Protection Act stipulates that in all three cases—war, military situation or emergency (extraordinary) situation—the protection of the population is exercised in accordance with the Geneva Conventions.⁴⁵⁹

The declaration of a disaster [situation] is treated in Chapter 5 of the Disaster Protection Act.

⁴⁵⁵ Law on Waters, *State Gazette* 67 (27 July 1999), last amendment 28 November 2014.

⁴⁵⁶ Law on Territory Planning, *State Gazette* 87 (29 September 1995), last amendment 14 October 2011).

⁴⁵⁷ Classified Information Protection Act, *State Gazette* 45 (30 April 2002), last amendment 28 June 2014.

⁴⁵⁸ Thus clearly distinguishing *emergency (extraordinary)* from a *disaster* situation as a result of a natural or technogenic nature.

⁴⁵⁹ Disaster Protection Act, Article 19(2).

Disaster situation is a mode (regime), introduced in the area of the disaster by the authorities, authorised by law, that involves application of temporary measures aimed to contain the disaster and conduct rescue and urgent recovery works.⁴⁶⁰ A disaster regime is declared after the implementation of the measures of the respective disaster protection plan has been initiated.

The mayor of the municipality with his or her order declares a disaster situation on the territory of the municipality or part of it, and sends a copy of the order to the regional governor and the Minister of the Interior.⁴⁶¹ Likewise, the governor declares a disaster situation on the territory of the region or part of it, and immediately sends a copy of the order to the Minister of the Interior.

The Council of Ministers, on the proposal of the Minister of the Interior, takes and announces a decision to declare a disaster situation on the territory of more than one region or on the territory of the whole country.⁴⁶²

The order (respectively, the decision) declaring a disaster outlines:

- the conditions serving as a basis for declaring a disaster situation;
- the rationale behind the declaration of a disaster situation;
- the borders of the territory on which the disaster situation is declared;
- the measures for containing the disaster, including the measures, temporarily undertaken, on constraining the rights of the citizens;
- the bodies and persons responsible for the implementation of these measures;
- the initial moment of introducing the disaster situation and its duration (which cannot exceed 30 days).⁴⁶³

The Act further defines the conditions under which the disaster situation can be extended or terminated.

Article 52 of the Disaster Protection Act defines rights that can be temporarily limited, in the “inevitably necessary scale” during a disaster:

1. the right of inviolability of persons and homes when people are temporary taken away from areas where their life and health are under immediate danger;
2. the right to use property when it is necessary to protect persons’ life, health and property, or the environment;
3. the freedom of movement or staying in a designated part of the territory, endangered or affected by the disaster;
4. the right to conduct an activity that could hamper or prevent the implementation of rescue works.

When a disaster situation is declared, the necessary measures may include:

1. temporarily moving away persons, pets, and farm animals and removal of property from a designated territory;
2. prohibition of entering, staying or moving in certain sites or territory;
3. immediate construction, engineering works, terrain restructuring, or removal of constructions aimed to mitigate or prevent a threat as a result of the disaster;

⁴⁶⁰ Disaster Protection Act, Article 48(1).

⁴⁶¹ Disaster Protection Act, Article 49.

⁴⁶² Ibid., Articles 49 and 50.

⁴⁶³ Ibid., Article 51(1).

4. care for children and disadvantaged people, if in the disaster situation such care cannot be exercised by the people who usually provide it;
5. supplying with priority kindergartens, social, health and medical institutions and the rescue teams;
6. evacuation and/or de-concentration.

According to Article 52(3) of the Disaster Protection Act, the conditions and procedures for conducting evacuation and de-concentration are defined in a Regulation, approved by the Council of Ministers.⁴⁶⁴

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

A number of laws and regulations treat the disaster protection responsibilities of individual departments and agencies. The key ones among them are the following:

- The Law on Waters and Regulation # 13 of 29 January 2004 on the conditions and procedures for technical maintenance of dams and relevant facilities describe duties and obligations of the Ministry of Environment and Waters, its subordinated executive agencies and basin directorates, as well as owners and operators of dams and related infrastructure.
- The *Law on the Forests* defines requirements towards planning and inspections in order to prevent and protect forests from fires. In addition, Regulation # 8 on the conditions and procedures for protecting forest territories from fires tasks the Executive Director of the Executive Agency “Forestry” to collect the necessary statistical information on fires for all forest territories (and, thus, facilitate risk management).⁴⁶⁵
- The *Law on the Safe Use of Nuclear Energy* defines key conditions for safe exploitation of nuclear power stations and other radiation sources, and the respective obligations of the Nuclear Regulation Agency.
- The *Regulation on the procedures, ways and competent bodies on identification of critical infrastructures and sites and the assessment of the risk for them* stipulates responsibilities of owners and operators of critical infrastructures and assets. It also identifies the Minister of the Interior as the point of contact for exchange of information on European Critical Infrastructure.
- The *Law on Health* defines the disaster protection responsibilities of medical and other health institutions (including national and regional health inspections, the Head State Health Inspector and regional health inspectors).⁴⁶⁶
- The *Law on the Ministry of the Interior* defines the provision of fire safety and protection in fires, disasters and emergency situations as one of the seven main activities of the ministry.⁴⁶⁷ This activity is further detailed in Article 17 of the Law. In regard to crisis management, this law refers to the Disaster Protection Act.

⁴⁶⁴ Ordinance on the conditions and procedures for conducting evacuation and de-concentration, State Gazette 103 of 28 December 2012.

⁴⁶⁵ Article 12 /3/ of Regulation # 8 on the conditions and procedures for protecting forest territories from fires.

⁴⁶⁶ Law on Health, section V, Articles 114, 115.

⁴⁶⁷ Law on the Ministry of the Interior, Article 6(1).

- The *Law on Defence and Armed Forces* stipulates that in peacetime the armed forces maintain readiness and provide humanitarian assistance and rescue on the territory of the country and its maritime space, as well as outside the country in accordance with the national legislation and the international treaties. Units of the armed forces are trained to provide rescue and emergency recovery works to contain disasters and overcome their consequences. The armed forces contribute to prevention, protection, rescue and urgent recovery works in accordance with the Disaster Protection Act.⁴⁶⁸
- According to the *Law on State Agency "National Security,"* the Agency conducts activities aimed to protect national strategic sites and activities.⁴⁶⁹

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

Each municipality/ region has a disaster protection plan, tailored to its specific circumstances. The first response is local, and it is up to the mayor/ the regional governor to initiate the implementation of the respective disaster protection plan and, if necessary, to declare a disaster situation.

When the locally available capacity is (or deemed to become) overwhelmed, the mayor/ the regional governor request the activation of additional components of the Unified Rescue System and other forces and means.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

Chapter 4, section III of the Disaster Protection Act is dedicated to volunteer formations. It defines "volunteer" as a "person participating in a volunteer formation for preventing or containing disasters, fires, and emergency situations and elimination of their consequences"⁴⁷⁰ and the requirements to volunteers in terms of age, health, etc.⁴⁷¹

Volunteer formations are created by the mayor based on a decision of the Municipal Council. The mayor sends a request to the Ministry of the Interior so that the volunteer formation is listed in a central registry.⁴⁷²

As of January 8, 2016, the register lists 170 volunteer formations with 2 474 volunteers in total.⁴⁷³

The mayor is responsible to:

1. sign a contract with the volunteer;⁴⁷⁴
2. provide training and equipment to the volunteer;

⁴⁶⁸ Law on Defence and Armed Forces, Article 56, para 4, 5 and 6.

⁴⁶⁹ Law on State Agency "National Security," Article 4(1)9.

⁴⁷⁰ Disaster Protection Act, Article 39.

⁴⁷¹ Ibid., Article 40.

⁴⁷² Registries of the FSCP General Directorate, www.nspbzn.mvr.bg/Sprav_informacia/Registri/default.htm.

⁴⁷³ Register of the volunteer formations for disaster protection on the territory of the Republic of Bulgaria and number of volunteers by municipality, 8 January 2016, available at http://www.nspbzn.mvr.bg/NR/rdonlyres/63B788EC-2181-4A3F-871D-142803766A07/0/Registar_DF_Publichen_08012016g.pdf.

⁴⁷⁴ When the person meets established training requirements.

3. insure the volunteer against accidents as a result of or in connection with his or her contract obligations;
4. insure the volunteer against all relevant social risks.

The respective expenditures are covered by the state through the delegated budget.⁴⁷⁵

2.7 Legal regulations for international engagements of first responders and crisis managers

The Disaster Protection Act envisions delivering and receiving aid during disasters, as well as certain forms of international cooperation, but does not treat Bulgaria's contribution to international rescue and/or humanitarian operations.

The Regulation on the structure and the activity of the Ministry of the Interior adds the participation in international humanitarian and/or rescue operations to the rescue activities performed according to the Law on the MOI.⁴⁷⁶ Other articles in this document refer to participation in international fire-fighting operations, operational cooperation with the EU, NATO and other international organisations in the fields of fire safety, protection of the population, humanitarian assistance and civil-military emergency planning.⁴⁷⁷

Roles, command arrangement, and rules of engagement are not explicitly treated in laws and regulations. Most likely, the working assumption is that Bulgaria will contribute to international operations, for example organised within the EU civil protection mechanism or led by NATO, with relatively small units and teams.

Often, Bulgaria contributes to first response of humanitarian relief operations with military units or personnel. Armed forces' personnel and equipment sent to missions abroad are insured against several types of risks.⁴⁷⁸

⁴⁷⁵ Disaster Protection Act, Article 42(2).

⁴⁷⁶ The Regulation on the structure and the activity of the Ministry of the Interior, Article 66, para 8.

⁴⁷⁷ Ibid. articles 65 and 69.

⁴⁷⁸ For details see the tender announcement by the MOD for insuring personnel equipment outside the territory of Bulgaria at http://www.aop.bg/case2.php?mode=show_doc&doc_id=606574&newver=2 (in Bulgarian).

3 Organisation

3.1 Organisational chart

Brief overview of the evolving organisational arrangements

Natural disasters in Bulgaria are on the increase. From June to October 2014, on five different occasions heavy floods affected half of Bulgaria's regions and took 18 casualties. By the end of October, the total number of disasters since the start of the year exceeded 600, including train crashes and explosions in ammunition factories, the most recent one killing 15 people.

These types of challenges faced come in sharp contrast with the traditional concerns and the approach to civil protection. In 1936, Decree no. 310 of Tsar Boris III introduced the *Regulation for air defence and chemical protection of the population*, with respective tasks for the armed forces and other governmental agencies. The focus on protecting the population in times of military conflict against WMD was reaffirmed in the time of the Cold war, 1946-1989. Renamed to "Central Directorate of Civil Defence" in 1962, the organisation was directly subordinated to the Council of Ministers. In 1971, the "Civil Defence" organisation became part of the Ministry of Defence (MOD), with the additional tasks of *preventing and limiting the consequences of natural disasters and major industrial catastrophes*. With Governmental Ordinance no. 419 of 4 December 1991 the organisation was renamed to "Civil Protection," but retained its military nature as part of the MOD. It was demilitarised in 2000, and in 2001 became *State Agency for Civil Protection* under the Council of Ministers. In 2007 it became part of the newly established Ministry for Disasters and Catastrophes (later renamed as "Ministry of the Emergency Situations," or MES). In 2009 it was included in the Ministry of the Interior (MOI; MES was closed down) as a separate General Directorate, and since 2010 it is part of the MOI General Directorate "Fire Safety and Civil Protection" (FSCP).

FSCP is the focal point of a multi-agency, multi-stakeholder, territorially distributed system aiming to provide disaster prevention and response.

National authority for disaster management; Chain of command and high-level decision-making

Figure 65 aims to clarify the responsibilities of various executive and consultative bodies with "crisis" management responsibilities.

As a Head of State and a Supreme Commander of the Armed Forces, the President leads the Supreme Command and chairs the Consultative Council on National Security.⁴⁷⁹ According to the Law on the Consultative Council on National Security, it consists of the Chair of the National Assembly (Speaker of the Parliament), the Prime Minister, the ministers of defence, foreign affairs, interior, and finance, the Head of the State Agency "National Security," the Chief of Defence, and one representative of each parliamentary group. Others may be invited to take part in the meetings of the Council depending on the issues to be discussed.⁴⁸⁰

⁴⁷⁹ Constitution of the Republic of Bulgaria, Article 100.

⁴⁸⁰ Law on the Consultative Council on National Security, Article 2.

The Security Council is another consultative body, supporting the Council of Ministers on issues of national security. It is chaired by the Prime Minister, and Deputy Chair is the Vice Prime minister with the relevant portfolio. Permanent members are the ministers of foreign affairs, defence, and interior, the deputy minister of finance, the MOI Main Secretary and the Chief of Defence.⁴⁸¹ The President may participate personally in the meetings of the Security Council and to designate one or more persons to represent him/her.⁴⁸² In practice, the focus of the Security Council is on external threats and the threat of terrorism like and, respectively, on coordinating the work of defence, security and intelligence services.

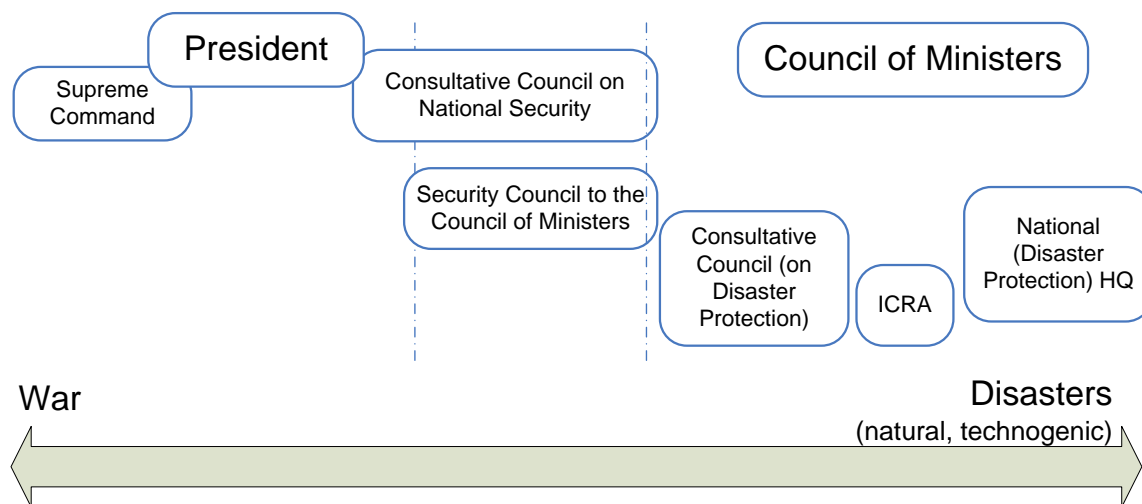

Figure 65: High-level crisis management arrangements.

The lead authority depends on the type of crisis (see Figure 65). In the case of a crisis of natural or technogenic nature, the responsibility is clearly assigned to the Council of Ministers,⁴⁸³ with the Minister of Interior in the lead of main operational preparedness and response activities.

The Council of Minister elaborates the state disaster protection *policy*.⁴⁸⁴ On policy issues, including resource allocation, it is supported by a number of multi-stakeholder formats, as outlined below:

- Policy making is supported by a *Consultative Council*, that includes representatives of ministries, agencies, the Bulgarian Academy of Sciences, universities, research institutes, the National Association of Municipalities, and other legal entities with disaster protection responsibilities⁴⁸⁵ (The MOI FSCP General Directorate has invited the Bulgarian Academy of Sciences (an organisation with 42 research institutes) and 20 universities to nominate their representatives as members of this Consultative Council⁴⁸⁶).

⁴⁸¹ Regulation on the functions, tasks and organization of the work of the Security Council to the Council of Ministers, Article 3.

⁴⁸² Ibid., Article 4.

⁴⁸³ Disaster Protection Act, Article 62.

⁴⁸⁴ Disaster Protection Act, Article 62(1).

⁴⁸⁵ Disaster Protection Act, Article 62(3) and (4).

⁴⁸⁶ Interview with a senior leader from the Bulgarian Academy of Sciences.

- The National Programme for Disaster Protection is developed by the Minister of the Interior, jointly with other ministries and agencies, the National Association of Municipalities, and the Bulgarian Red Cross.⁴⁸⁷
- The Interagency Commission for Recovery and Assistance (ICRA) to the Council of Ministers is led by the Minister of the Interior and includes respective minister or deputy ministers and agency heads, and provides for contributions of the National Association of Municipalities and regional governors.⁴⁸⁸ ICRA decides, among others, on financing or reimbursing urgent rescue and recovery activities and the investments from the central state budget in preventive measures.

The operational disaster response is coordinated through the Unified Response System, with a National Headquarters (HQ), described in the following section.

National permanent disaster management units

The main executive disaster management organisation is “Fire Safety and Civil Protection” (FSCP), constituted as a General Directorate in the Ministry of the Interior (the FSCP structure is presented on Figure 66).

⁴⁸⁷ Disaster Protection Act, Article 18(5).

⁴⁸⁸ Disaster Protection Act, Article 54.

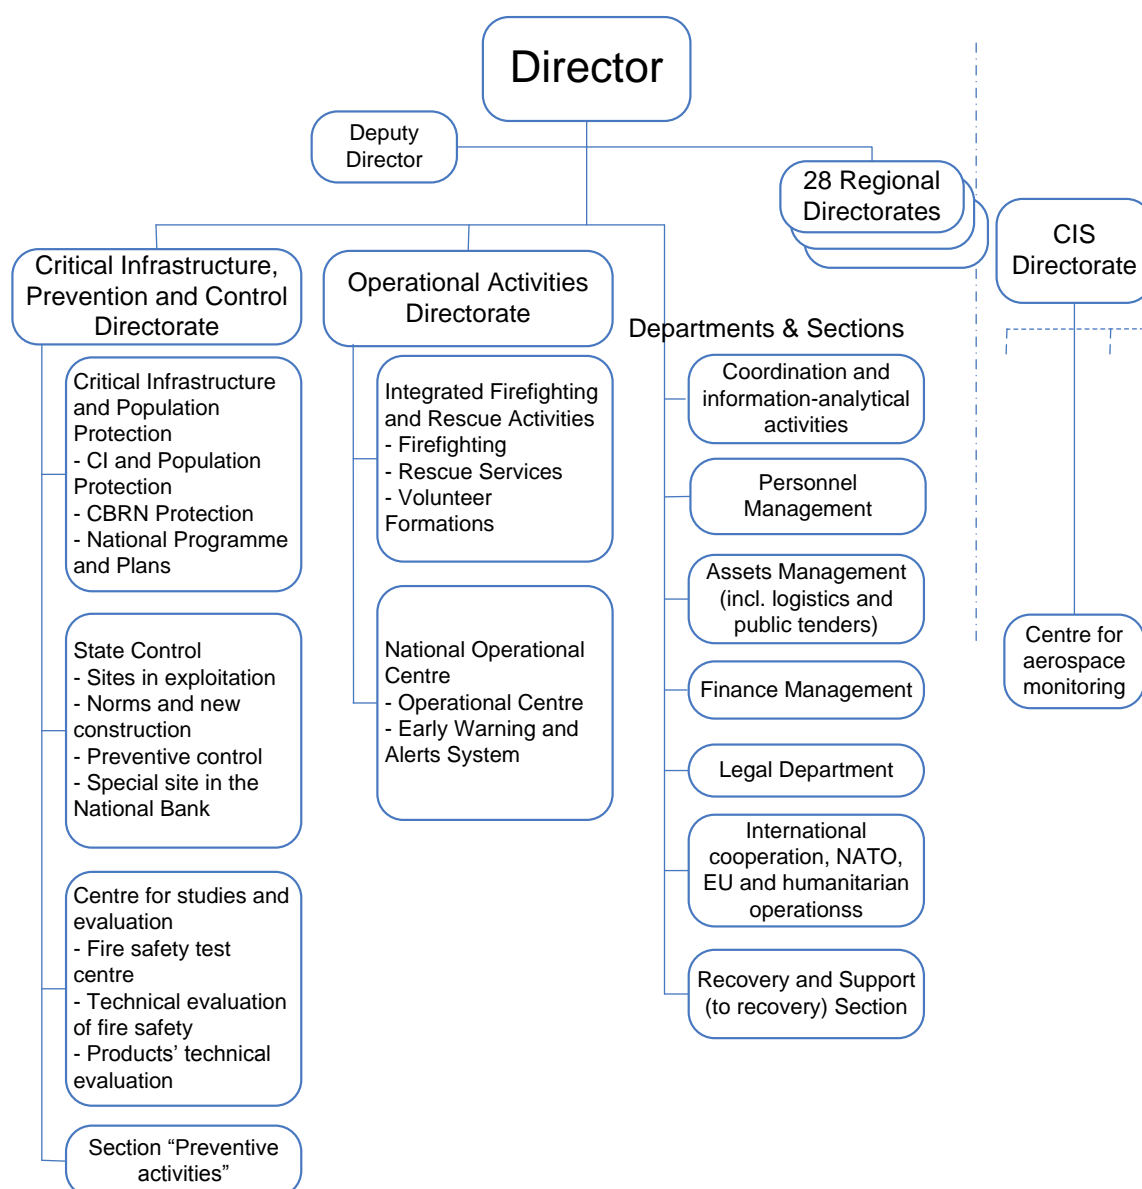

Figure 66: MOI General Directorate “Fire Safety and Civil Protection.”

FSCP includes two directorates, several stand-alone departments and sections, including the national operational centre and the early warning and alert system. Closely related to the FSCP is the Centre for Aerospace Monitoring, supported by the MOI Communications and Information Systems (CIS) directorate.⁴⁸⁹

The FSCP General Directorate includes 28 regional FSCP directorates – one in each region of the country. They have some common administrative elements, but the first responder units are tailored to the disasters typical for the respective regions.

The maximum authorised personnel strength of FSCP is 8 848; it currently employs around 8 000.⁴⁹⁰

According to the 2012 FSCP Modernisation Programme,⁴⁹¹ the FSCP Table of Organisation and Equipment (TOE) calls for 201 rescue vehicles (183 available, including 119 rescue, 41 chemical, 14 alpine,

⁴⁸⁹ The 112 system is supported by another directorate of the Ministry of the Interior.

⁴⁹⁰ Reference on the personnel positions and unfilled positions in the Ministry of the Interior as of 31 May 2014.

9 for divers), 17 lifting gear, 17 medical vehicles, 399 support vehicles, 49 engineering vehicles, 43 armoured vehicles, and 489 transport vehicles. The document itself states that a significant number of this equipment is not in a functional state.

Anticipated use of specialised military assets

The involvement of military capabilities and assets is formally seen as a last resort, envisaged only in cases when the available civilian capacity is overwhelmed. In practice, however, the military are called to support disaster response fairly often, e.g. for aerial surveillance and reconnaissance, search and rescue from the air (see for example Figure 67⁴⁹²), firefighting with specially equipped helicopters and land units, provision of heavy transport vehicles in snow storms and heavy icing, etc.

Figure 67: Military aerial search and rescue during the floods in September 2014.

Annual national plans provide further details. For example, the 2013 plan provides information on the financing necessary to fully equip units and formations of the armed forces for:⁴⁹³

- management of the consequences of an accident at Kozloduy NPP;
- response to industrial accidents;
- response to fires;
- response to floods;
- response to earthquakes;
- activities in heavy winter conditions;
- identifying and destroying unexploded ordnance;
- a rapid reaction military medical team of the Military Medical Academy.

⁴⁹¹ Programme for modernisation and provision of technical resources of the territorial units for fire safety and protection of the population in the Republic of Bulgaria, 2012.

⁴⁹² Servicemen from the Bulgarian Army provide help in areas affected by floods, *MOD News section*, Available at www.mod.bg/bg/news_archive.php?fn_month=9&fn_year=2014#!pP (accessed 12 December 2014).

⁴⁹³ The 2013 Plan for Implementation of National Disaster Protection Programme, p. 32.

The Ministry of Defence, as well as other ministries maintain operational centres and specific crisis response capabilities.

The 2013 National Disaster Protection Plan provides details on the capabilities maintained by the Ministry of Defence and the Armed Forces:⁴⁹⁴

- The “Operations and Training” Directorate is the MOD structure organising the activities of the defence establishment aimed at protecting the population in disasters;
- The Military Medical Academy and its subordinate military hospitals maintain specialised teams, transport vehicles and consulting rooms as follows:
 - a Rapid Reaction Military Medical Team (RRMMT) – Sofia with 15 specialised teams (4 – surgery; 2 – resuscitation; 2 – therapeutic; 1 – toxicological; 1 – obstetrics-gynaecological; 1 – epidemiological; 2 – for infectious diseases; 2 – resuscitation teams for aerial medical evacuation⁴⁹⁵); the respective specialised transport vehicles (4 ambulances; 1 mobile treatment cabinet /therapeutic room/; 1 mobile paediatric room; 1 mobile obstetrics-gynaecological room; 1 mobile surgery room; 1 mobile resuscitation room; 1 mobile dressing vehicle; 1 bus for sanitary evacuation);
 - RRMMT-Plovdiv, Varna, and Pleven each maintain 3 teams (surgery; resuscitation; therapeutic) with the respective specialised vehicles;
- “Military Police” maintains a team of 76 military staff and 28 vehicles in readiness to perform protection, traffic management, and escort;
- With a staff of 355, Executive Agency “Military Clubs and Recreation” maintain 2 800 beds and can host affected groups of the population;
- The Bulgarian Army maintains 95 formations available for containing and overcoming the consequences of disasters, as follows:
 - for managing the consequences of an accident at Kozloduy NPP – 6;
 - for managing the consequences of industrial accidents – 7;
 - for extinguishing fires – 20;
 - for managing the consequences of earthquakes – 9;
 - for activities in heavy winter conditions – 23;
 - for identifying and destroying unexploded ordnance – 16.

Other national organisations with crisis management responsibilities

Numerous executive, research, and non-governmental organisations, in addition to the Ministry of the Interior, have disaster protection responsibilities. The National Disaster Protection Programme 2014-2018 lists in particular the responsibilities of:

- The Ministry of Foreign Affairs
- The Ministry of Regional Development
- The Ministry of Health
- The Ministry of Defence
- The Ministry of Transport, Information Technologies, and Communications
- The Ministry of Economy and Energy
- The Ministry of Environment and Waters

⁴⁹⁴ The 2013 Plan for Implementation of National Disaster Protection Programme, pp. 6-7.

⁴⁹⁵ When air transport is provided by other military units or companies.

- The Ministry of Labour and Social Policy
- The Ministry of Agriculture and Foods
- The Ministry of Culture
- The Ministry of Education and Science
- State Agency “State Reserves and Wartime Stocks”
- The Bulgarian Red Cross
- The Nuclear Regulation Agency
- The Research Institute on Geophysics, Geodesy and Geography at the Bulgarian Academy of Sciences
- National Institute of Meteorology and Hydrology at the Bulgarian Academy of Sciences.

Most of these ministries and agencies maintain general purpose or specialised disaster protection units, described in respective annexes to the National Disaster Protection Plan.

Local emergency management arrangements

The regional governor and the mayor are the lead authorities respectively at regional and municipal level, supported by the head of the local FSCP unit.

Regional administrations, as well as the administration of big municipalities, have “Security Directorates” with the functions, *inter alia*, to protect the population in “disasters, accidents, incidents, and other emergency situations,” planning and coordination of disaster protection, budgeting the creation of stocks of individual protection means, PR activities related to disaster protection, creating and equipping one or more volunteer formations, etc.⁴⁹⁶

Smaller municipalities maintain sections or individual employees with disaster protection responsibilities.

Volunteers and volunteer organisations; specialised NGOs

Since 2011, the Disaster Protection Act regulates the contribution of volunteers and the functioning of volunteer formations.⁴⁹⁷ The amendment to the Act was followed by the adoption of a *Strategy for developing volunteer formations for protection in disasters, fires, and other emergency situations in Republic of Bulgaria 2012-2020*.⁴⁹⁸

According to Article 47 of the Disaster Protection Act, the FSCP General Directorate maintains a registry of such volunteer formations. By October 2015 the registry lists 169 units at municipal level, with 2470 volunteers, is available at the FSCP page on the MOI website⁴⁹⁹ (compared to 162 units with 2311 volunteers in December 2014).

⁴⁹⁶ See, for example, “Security Directorate,” General Administration, Mayor of the Sofia Municipality, available in Bulgarian at www.sofia.bg/tu1.asp?napr=1574 (accessed 5 December 2014).

⁴⁹⁷ Disaster Protection Act, Articles 39-47.

⁴⁹⁸ Available at http://www.nspbzn.mvr.bg/NR/ronlyres/07BFA9E-CBA4-4C10-91F0-ACC720FFAE57/0/01_STRATEGIYA_DF_15_10_2012.pdf, in Bulgarian.

⁴⁹⁹ Available in Bulgarian at http://www.nspbzn.mvr.bg/NR/ronlyres/63B788EC-2181-4A3F-871D-142803766A07/0/Registar_DF_Publichen_23102015g.pdf.

The Bulgarian Red Cross⁵⁰⁰ is the foremost non-governmental organisation with disaster protection capabilities and key node in a network of specialised organisations:

- Bulgarian Red Cross Youth, <http://youth.redcross.bg>
- Mountain Rescue Service, www.pss.bg
- Water Life Saving Service, <http://en.redcross.bg/activities/activities3.html>
- Refugee-Migrant Service, <http://en.redcross.bg/activities/activities8.html>.

The list of relevant NGOs and associations includes also:

- National Association of the Volunteers in the Republic of Bulgaria⁵⁰¹
- National Syndicate of Firefighters and Rescue Workers “Firefighter.” The syndicate has 92 sections at city/municipal level
- Association “Club Active Security,” www.aktivnasigurnost.org/en/home
- Humanitarian NGOs, such as Caritas, <http://caritas.bg>
- NGOs dedicated to environmental protection, such as WWF, www.wwf.bg.

Private businesses and public-private partnerships

The Disaster Protection Act provides for the involvement in legal entities, including private commercial companies, in disaster prevention, preparedness and response activities. Three types of companies are treated explicitly in the law:

- owners/ operators of critical infrastructure, especially of assets designated as European critical infrastructure;
- operators of radio and television programmes;
- providers of electronic communications.

In addition, according to a general clause in the Disaster Protection Act, all legal entities and trade companies registered as physical persons, that are included in a disaster protection plans, are obliged to provide the planned assistance upon request.⁵⁰²

During the floods of 2014, private enthusiasts demonstrated the aerial surveillance capabilities of both ultralight piloted aircraft and remotely piloted aerial vehicles.

Attempts have been made to establish public-private partnerships aiming to provide helicopters for rescue and transportation of injured and other people in need to major hospitals.⁵⁰³

3.2 Organisational cooperation

Operational cooperation

Although FSCP is the organisation with most responsibilities for disaster management and protection of the population, it is not expected to provide disaster protection all by itself. All activities for protection of the population in a disaster (or a pending disaster) are performed by the Unified Rescue

⁵⁰⁰ Bulgarian Red Cross, <http://en.redcross.bg>.

⁵⁰¹ Established at the end of August 2014; the official registration is still pending.

⁵⁰² Disaster Protection Act, Article 37.

⁵⁰³ See for example “The Ministry of Health will pursue a public-private partnership for the sanitary aviation,” available in Bulgarian at www.investor.bg/ikonomika-i-politika/332/a/mz-shte-tyrsi-publichno-chastno-partniorstvo-za-sanitarnata-aviaciia-166328 (accessed 5 December 2014).

System, which incorporates structures of ministries and agencies, municipalities, trade companies, hospitals and other health centres.⁵⁰⁴

The underlying principle is that the response is local and, when necessary, it is enhanced by provision of additional capabilities and assets. The request for assistance is processed through the URS.

The main URS components are:

- General Directorate “Fire Safety and Civil Protection” of the Ministry of the Interior;
- The MOI regional Directorates;
- The Centres for Emergency Medical Care.⁵⁰⁵

Figure 68 presents the information flows in operational coordination in crisis management and disaster response. With slight variations, such visualisation is included in annexes to the 2010 National Disaster Protection Plan⁵⁰⁶ describing the coordination of the URS components in the following scenarios:⁵⁰⁷

- Annex # 67 – in case of an earthquake;
- Annex # 68 – in cases of floods;
- Annex # 69 – in cases of industrial accidents involving release of dangerous substances;
- Annex # 70 – in large and complex forest fires;
- Annex # 71 – in cases of heavy snowfalls, snowstorms, and icing;
- Annex # 72 – in the case of road, railroad, and aviation catastrophes;
- Annex # 73 – disasters and accidents as results of a terrorist act.

There is a National HQ for cases of disasters. The National HQ is created by an order of the Prime Minister along with the introduction of the National Plan for Disaster Protection. This order lists the names of the members of the National HQ – ministers, deputy ministers, agency heads and their deputies, and other representatives of organisations with responsibilities envisioned in the National Plan for Disaster Protection.⁵⁰⁸

The activity of the National HQ is supported in terms of logistics, communications and administrative matters by the FSCP General Directorate and, depending on the type of disaster, by other competent ministries, agencies, or institutions. It is supported also by thematic working groups and an “infor-

⁵⁰⁴ Disaster Protection Act, Article 20. All these structure preserve their institutional or organisational affiliation, roles and functions.

⁵⁰⁵ Disaster Protection Act, Article 22(1).

⁵⁰⁶ The currently standing plan.

⁵⁰⁷ Operational coordination in radiation accidents, epidemics, and epizootics is organised in specific ways.

⁵⁰⁸ Disaster Protection Act, Article 62a(2).

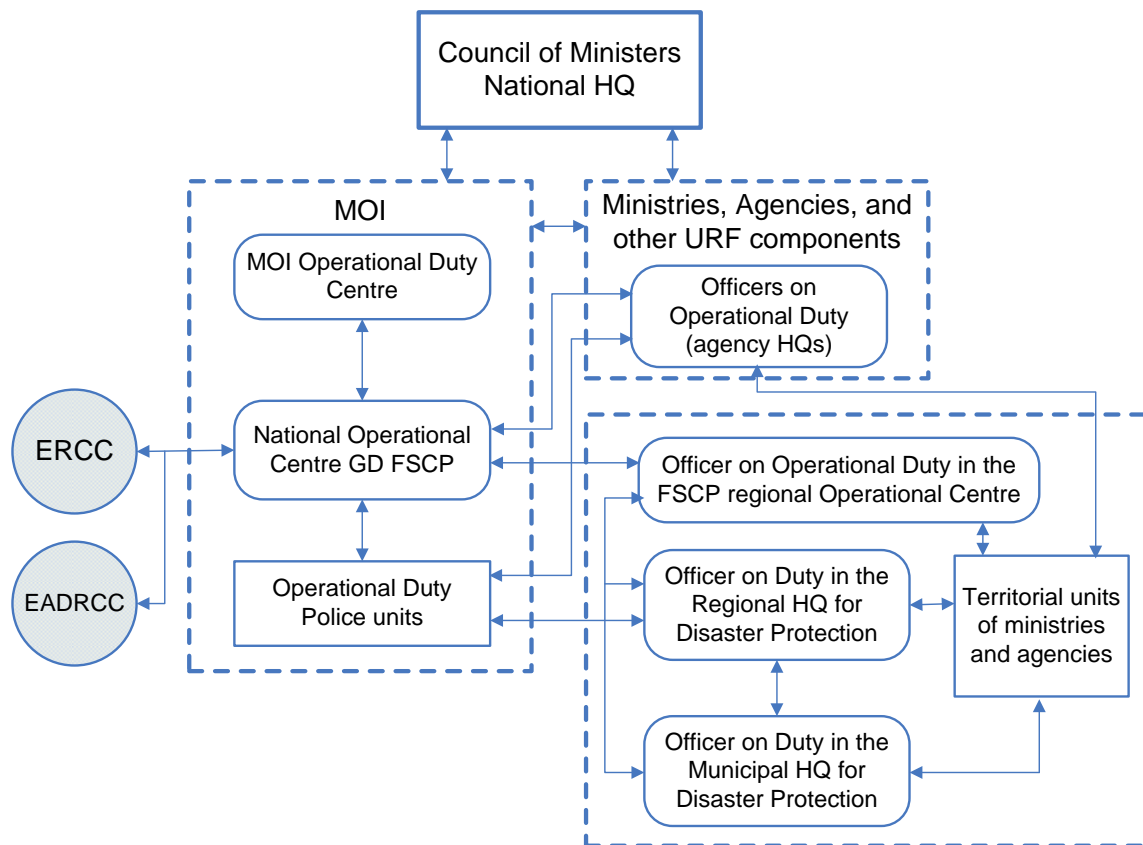

Figure 68: Operational Coordination in Crisis Management and Disaster Response.

mation working group.” All respective members are included on “alert lists,” maintained within the national early warning and alert system.

The National HQ conducts the following activities:⁵⁰⁹

1. Analysis and assessment of the disaster situation;
2. Decision making on the necessary quantities and resource allocation to rescue and urgent recovery works for prevention, containment and overcoming the consequences and assisting the affected population;
3. Organisation and coordination of the actions of ministers, agency heads, regional governors, mayor of municipalities, and legal entities (companies) with responsibilities for disaster protection;
4. Exercises control of the implementation of the tasks and the measures for containing the disaster;
5. Through the media, informs the population for the evolution of the disaster, for the measures for its mitigation and containment, and for the necessary precautions;
6. Reports to the Prime Minister, the President of the Republic of Bulgaria, and the speaker of Parliament for the ways in which protective activities are conducted.

There is no formal mechanism for assigning priorities in case of two or more events occurring simultaneously. It could be inferred that the guiding principles are:

⁵⁰⁹ Disaster Protection Act, article 62a(6).

1. to provide protection of the life and health of the population, the environment and the property (as Article 1 of the Disaster Protection Act defines its purpose); and
2. giving a priority (advantage) to saving human life among all protection activities.

Hence, the expectation is that, in case of simultaneous disasters, the available resources and capabilities will be managed in a way that minimises human casualties.

International cooperation in responding to a disaster is managed via the National Operational Centre at FSCP (the national point of contact in disasters with the EU, NATO and other international organisations⁵¹⁰; see Figure 68). That includes:

- cross-border collaboration on a bi-lateral or another regional basis;
- cooperation with the EU via the Emergency Response Coordination Centre (ERCC);
- cooperation with NATO via the Euro-Atlantic Disaster Response Coordination Centre (EADRCC).

In national disaster situations, the FSCP Operational Centre notifies DG ECHO and EADRCC according to approved standard operating procedures and using approved notification forms.⁵¹¹ The request briefly describes the situation and the impact of the disaster.

In a nuclear or radiation accident, the Nuclear Regulatory Agency notifies the International Atomic Energy Agency (IAEA) and the European Union through the system ECURIE, as well as the regulatory bodies of the countries with which Bulgaria has signed bi-lateral notification agreement. The regulatory bodies of other countries that could be affected by the accident are also notified.

A request for assistance to the EU is sent by the FSCP Operational Centre to ERCC via the CECIS network. Approved forms are used to describe both a request and a proposal to provide assistance.⁵¹²

A particularly detailed procedure is in place for requesting from the EU (within its Civil Protection mechanisms) or another state a module for fighting forest fires through aerial means.⁵¹³

In the framework of NATO, requests for assistance are sent to EADRCC via Internet, fax and/or phone. Approved forms are used to describe both a request and a proposal to provide assistance.⁵¹⁴

In a nuclear or radiation accident the request for or the provision of assistance follow the procedures described in the *External Plan for Accidents in Kozloduy NPP*.

During the disaster, the FSCP Operational Centre regularly sends brief situational reports to ERCC and EADRCC, describing the status and the evolution of the situation, using approved forms.⁵¹⁵

Requests for disaster assistance from countries that are not members of the European Union or NATO are sent through Bulgaria's Ministry of Foreign Affairs, by verbal notes through Bulgaria's embassies in the respective countries, or through their diplomatic missions in Bulgaria.

Cooperation and coordination in CM capability development

The coordinated use of resources within an individual ministry or agency towards crisis preparedness and response is usually guaranteed. The requirements of the EU civil protection mechanism and the

⁵¹⁰ National Disaster Protection Plan 2010, section 6.2, pp. 24-25.

⁵¹¹ Annexes 13 and 14 of the National Disaster Protection Plan 2010.

⁵¹² Annexes 15 and 16 of the National Disaster Protection Plan 2010.

⁵¹³ Annex 12 of the National Disaster Protection Plan 2010, pp. 142-159.

⁵¹⁴ Annexes 17 and 18 of the National Disaster Protection Plan 2010.

⁵¹⁵ Annexes 19 and 20 of the National Disaster Protection Plan 2010.

development of a European Emergency Response Capacity (EERC) are of particular importance,⁵¹⁶ and thus facilitate the coordinated use of resources.

Also, section 7 of the National Disaster Protection Plan details the responsibilities of officials (i.e. ministers, agency heads, regional governors, mayors) in terms of disaster protection, including their coordination roles.⁵¹⁷

There are some legally defined priorities. Among the protection measures, the Disaster Protection Act declares that prevention has a priority.⁵¹⁸ However, the examination of the distribution of the budget managed by the Interagency Commission on Recovery and Assistance (ICRA) shows that in the last two years, i.e. since the earthquake in Pernik, practically no funding has been provided by ICRA for preventive activities. The Law defines the measures for protection of critical infrastructures also as a priority.⁵¹⁹

The five-year national disaster protection programme defines other priorities for the development and resource allocation to the Unified Rescue System.⁵²⁰

However, crisis management capability planning has not been introduced, with the possible exception of the planning within the defence ministry.

There is no nationally centralized process of capability planning. There is a process of centralised planning in place for the development of the national disaster protection programme and the annual plans for its implementation, but it lacks major features of the planning for capabilities.⁵²¹ For example, it does not seek most efficient national solutions, while the planning of the state budget strictly follows organisational boundaries and tends to preserve institutional stovepipes.

Nevertheless, Bulgaria's executive authorities are gaining some knowledge on the planning principles and processes, primarily through the participation in multi-national, EU-funded projects. Examples of international cooperation in the development of capabilities, related to crisis management, are provided in Chapter 5 of this report.

⁵¹⁶ Decision No 1313/2013/EU of the European Parliament and of the Council of 17 December 2013 on a Union Civil Protection Mechanism.

⁵¹⁷ National Disaster Protection Plan 2010, pp. 26-40.

⁵¹⁹ Disaster Protection Act, Article 8a(3).

⁵²⁰ Disaster Protection Act, Article 18(2), para 5.

⁵²¹ See, for example, Todor Tagarev, "Capabilities-Based Planning for Security Sector Transformation," *Information & Security: An International Journal* 24 (2009): 27-35, <http://dx.doi.org/10.11610/isij.2404>.

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

The publicly available National Disaster Protection Plan (NDPP) includes descriptions of standard operating procedures (SOPs) for a number of disaster scenarios. The SOPs, which are listed below, prescribe the way the activities of URS components are coordinated:

- SOP # 01, in case of earthquakes (Annex # 67 to NDPP);
- SOP # 02, in case of flooding (Annex # 68 to NDPP)
- SOP # 03, in case of nuclear and radiation accidents (Annex # 51 to Complement 3 to NDPP)
- SOP # 04, in large and complex forest fires (Annex # 70 to NDPP)
- SOP # 05, in case of heavy snowfalls, snowstorms, and icing (Annex # 71 to NDPP)
- SOP # 06, in case of industrial accidents involving release of dangerous substances (Annex # 69 to NDPP)
- SOP # 07, in the case of road, railroad, and aviation catastrophes (Annex # 72 to NDPP)
- SOP # 08, in disasters and accidents as a result of a terrorist act (Annex # 73 to NDPP).

As part of the National Disaster Protection Plan, each SOP is publicly available, and typically includes:

1. Purpose and normative basis;
2. Area of application of the procedure;
3. Alerting by the URS and the management bodies;
4. Organisation of the interaction among the operational duty centres of the Unified Rescue System (see as an example the information flows on Figure 68);
5. Designation of the coordinating authority on the site of the disaster and its responsibilities;
6. Responsibilities of the URS components involved in disaster management (in terms of alerting, implementation of urgent measures, rescue operations, evacuation /if applicable/, urgent recovery works, other operations);
7. Points of 24/7 contacts for implementation of the procedure;
8. Conditions for terminating the application of the procedure.

All stakeholders are aware of the SOPs. Procedures are considered to be understood and accepted by contributing parties.⁵²² Disaster management exercises are used to test, among others, the standard operating procedures.

4.2 Operations planning

As it is mentioned above, Bulgaria has in place a standing National Disaster Protection Plan. The current version was approved in 2010, and has three major supplements:

- Supplement 1, issued in 2012, is dedicated to the protection during earthquakes;
- Supplement 2, also issued in 2012, treats the protection during floods;

⁵²² Interview with a senior leader from FSCP.

- Supplement 3 is the External plan for accidents in Kozloduy NPP, issued in 2012 and amended in July 2014.

The minister of the interior develops the National Disaster Protection Plan (NDPP) jointly with representatives of other ministries, agencies, the Bulgarian Red Cross, and local authorities.⁵²³ The NDPP is adopted by the Council of Ministers.⁵²⁴

Ministers and agency heads develop disaster protection plans aimed at implementing their obligations in accordance with the National Disaster Protection Plan. These plans are authorised by the respective minister or agency head, after being countersigned by the Minister of the Interior.⁵²⁵

The regional governor organises the development of a disaster protection plan for the region, jointly with the local structures of the central executive power and the mayors of municipalities. The regional disaster protection plan is authorised by the governor, after being countersigned by the Minister of the Interior.⁵²⁶

The mayor develops a disaster protection plan for the municipality, jointly with representatives of agencies and legal entities (e.g. companies) relevant for disaster protection on the territory of the municipality. The municipal disaster protection plan is adopted by the Municipal Council.⁵²⁷

The operational planning process follows a practically established procedure. It is not clear to what extent it follows international best practice and standards.

In the last two years a number of relevant international standards have been adopted as national standards, including:

- ISO 22320:2011 "Societal security -- Emergency management -- Requirements for incident response";
- ISO 22301:2012 "Societal security -- Business continuity management systems -- Requirements";
- ISO 22313:2012 "Societal security -- Business continuity management systems -- Guidance."

In the future, these standards may be implemented by first responders and other organisations with crisis management responsibilities.

4.3 Logistics support in crises

According to the Disaster Protection Act, legal entities, including commercial companies "are obliged to deliver upon request the planned assistance"⁵²⁸ and to plan and protect the personnel and the facilities they own or operate.⁵²⁹ In practice, private companies are requested to provide logistics services, which they do on an ad-hoc basis, and are reimbursed at a later stage.

The Ministry of Defence plans to provide accommodation to people, affected by a disaster, through the Executive Agency "Military Clubs and Recreation." There have been cases with the floods in 2014

⁵²³ Disaster Protection Act, Article 9(4).

⁵²⁴ Ibid., Article 9(5).

⁵²⁵ Ibid., Article 9 (6) and (7).

⁵²⁶ Ibid., Article 9 (8) and (9).

⁵²⁷ Ibid., Article 9 (10) and (11).

⁵²⁸ Disaster Protection Act, Article 37.

⁵²⁹ Ibid., Articles 35 and 36.

when the armed forces were providing hot food to affected population in the field. The MOD can provide also transportation and other logistics services on an ad-hoc basis.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

Establishing and maintaining systems for monitoring, early warning and alerts is seen as one of the main disaster prevention measures.⁵³⁰ Monitoring, early warning and alerts are based on information provided by citizens, organisations and institutions, including information provided through the 112 National system for emergency calls, as well as on information and data provided by technical monitoring systems (meteorological, hydrological, seismological, chemical, biological, radiological, nuclear, ecological, etc.) and the international exchange of information and data.⁵³¹

Each disaster protection plan describes the procedure for early warning and alerts to the executive bodies, the component parts of the Unified Rescue System, and the population.⁵³²

Alerting the relevant officials, organisations, and the population is the core activity of the Unified Rescue System, performed through the operational centres of the FSCP General Directorate.⁵³³ The owners or operators of critical infrastructure establish and maintain local alert systems.

The law mandates also the establishment of a National System for Early Warning and Alerts (NSEWA) of the executive bodies and the population in disasters.⁵³⁴ The conditions and procedures for the functioning of the NSEWA in disasters and air threats are regulated by the Council of Ministers.⁵³⁵

NSEWA has two component parts for early warning and alerting respectively:

- the executive bodies and the URS components;
- the population.

NSEWA provides information and coordination at national, regional and municipal levels through two national control nodes (main and alternative ones) of the national operational centre of FSCP, regional control nodes and municipal control boards, as well as integrated local alert systems in critical sites and facilities.

NSEWA uses the Unified Communications System of the state administration, the communications networks and services of the MOI (MOI-owned or outsourced) and the frequency spectrum allotted to the Ministry of the Interior.

Early warnings and alerts are issued upon the decision of:

- the Prime Minister, the Minister of the Interior or the MOI Main Secretary – at national level;
- the regional governor and/or the mayor, on the proposal of the director of the FSCP General Directorate of the director of the FSCP regional directorate – at regional and municipal level.⁵³⁶

⁵³⁰ Disaster Protection Act, Article 6(1), para 8.

⁵³¹ Ibid., Article 11. For the technical systems in use see section 5 below.

⁵³² Ibid., Article 9(3), para 7.

⁵³³ Ibid., Article 29(2), para 3.

⁵³⁴ Ibid., Article 62(2), para 5.

⁵³⁵ Regulations of the conditions and procedures for the functioning of the National System for Early Warning and Alerts to the executive bodies and the population in disasters and air threats.

⁵³⁶ Ibid., Article 7(1).

In addition to warnings and alerts, NSEWA provides opportunities for urgent or planned conference calls with executive bodies and URS components.

The Regulation on NSEWA defines also the conditions for issuing alerts, the groups of officials to be alerted and the order of priority for alerting them, etc.

Acoustic signals and preliminary recorded voice messages are used to warn or alert the population on a pending or occurring disaster. Follow-up live voice messages provide information on the nature and parameters of the disaster and guidance on the behaviour and actions of the population.

In a pending or occurring disaster encompassing the whole or part of the territory of a region, early warning and alerts are issued upon the decision of the governor or the director of the FSCP regional directorate, while the mayor or the officer on duty may trigger the alerts for the municipality.

A distinct acoustic signal and voice messages are issued to note the end of the threat of a disaster.

The FSCP webpage at the MOD website provides detailed description of the signals and what they mean.⁵³⁷

Different NSEWA signals and voice messages are tested once or twice a year, and the population is informed by popular media on the forthcoming tests.

Media is also used to disseminate warning and alerts. The officials who have decided on issuing early warning and alerts provide written information to the electronic media on the danger of or the occurring disaster. The media air this information immediately, free of charge, and without alteration with as many repetitions as necessary.

Currently, it is not envisioned to use commercial GSM communications of social networks to issue warnings or alerts to the population.

⁵³⁷ See www.nspbzn.mvr.bg/Pravila_povedenie/signalni.htm/

5 Capabilities

5.1 Human resources

Permanent emergency and disaster management personnel

The main executive disaster management organisation—the MOI General Directorate “Fire Safety and Civil Protection” (FSCP)—has an authorised personnel strength of 8 848, of which about 90 percent, or 8 000 are currently employed.

The FSCP General Directorate includes 28 regional FSCP directorates – one in each region of the country. They have some common administrative elements, while the first responder units are structured with account of disasters typical for the respective regions.

Other ministries, agencies, regional and some city administrations have “Crisis Management” directorates or departments, all with disaster protection responsibilities (among others).

A number of ministries and agencies (e.g. the ministries of defence; environment and waters; agriculture and health; transport, information technologies, and communications; energy; the Nuclear regulatory Agency), as well as the Bulgarian Red Cross maintain specific disaster protection formations/teams, described in respective annexes to the National Disaster Protection Plan.

There is no publicly available information on a capacity to mobilise additional personnel. It could be assumed that, when the locally available capacity is overwhelmed, the assistance will be provided by activating additional components of the Unified Rescue System, including formations of the armed forces, volunteer formations, trade companies and, if necessary, international assistance.

Involvement of volunteers, volunteer organisations, and specialised NGO personnel

Since 2011 the Disaster Protection Act regulates the involvement of volunteers in disaster protection through the creation of municipality-based volunteer formations. As of October 2015 the Registry of volunteer formations, maintained by the FSCP General Directorate, lists 169 formations with an authorised strength of approximately 4 000 positions of which volunteers have been assigned to 2 470 positions.

The main non-governmental organisation with disaster protection capabilities is the Bulgarian Red Cross, including a number of specialised organisations:

- Bulgarian Red Cross Youth;
- Mountain Rescue Service;
- Water Life Saving Service;
- Refugee-Migrant Service.

Over 19 000 volunteers are involved in the activities of the Bulgarian Red Cross. In 2013, 4 917 of them had basic volunteer training and 5 602 – specialised training in volunteer programmes.⁵³⁸

Involvement of private businesses

Several groups of private actors play important roles in in specific aspects of disaster protection:

⁵³⁸ Facts and figures for the activity of the Bulgarian Red Cross 2013, available in Bulgarian at www.redcross.bg/uploads/19794.file/Facts%26Figures_2013_bul.pdf (accessed 19 December 2014).

- Owners/operators of critical infrastructures, including transport and energy infrastructure, dams, chemical plants, etc.;
- Owners/operators of electronic communications networks, e.g. GSM operators;
- Media, in particular electronic media;
- Private hospitals and providers of other health services;
- Companies, providing general transport and construction services.

National educational programmes

The education is considered an important component of disaster prevention, readiness and adequate response. The Disaster Protection Act stipulates that students at interim school (5th to 7th grade, i.e. 11 to 14 years old students) need to get the basic knowledge on disaster risks and the respective ways of behaviour and action, while high-school and university students need to have knowledge on disaster protection corresponding to their educational profile and specialty.⁵³⁹ In addition, the Minister of Education and Science, in coordination with the Minister of the Interior, approves educational programmes, materials and tools for kindergartens and schools, as well as plans for disaster protection training of the teachers.⁵⁴⁰

In October and November 2014, the “G.S. Rakovski” Defence Academy in Sofia conducted a pilot course on disaster prevention for teachers.⁵⁴¹

Relevant educational programmes are provided by several universities, including:

- The “G.S. Rakovski” Defence Academy in Sofia has a masters’ programme in “Protecting the population and the critical infrastructure”;⁵⁴²
- The National Military University, Veliko Tarnovo, has a masters’ programme in “Protecting the population in disasters, accidents and catastrophes”;⁵⁴³
- The Technical University of Varna provides a bachelor’s degree in “Protecting the population in disasters and accidents”;⁵⁴⁴
- The Agriculture University in Plovdiv provides a masters’ degree for environmental experts in “Protecting the population and the environment in natural disasters and accidents”;⁵⁴⁵
- The University of Shumen provides a masters’ programme for pedagogues in “Competences and skills in disasters and accidents.”⁵⁴⁶

5.2 Materiel (non-financial) resources

The material component of the first response, provided by FSCP, and the planned use of military assets are described in section 3.1 above. Additional, more specific military assets used in disaster response involve primarily the use of helicopters for aerial reconnaissance, search and rescue, and fire-fighting.

⁵³⁹ Disaster Protection Act, Article 16(2).

⁵⁴⁰ Disaster Protection Act, Article 16(3).

⁵⁴¹ See www.mon.bg/?go=news&p=detail&newsId=852 (in Bulgarian).

⁵⁴² See http://rnda.armf.bg/wp-content/uploads/000s/Pr_ZNKI2009_MAGspec.php.

⁵⁴³ See www.nvu.bg/node/314. The programme is coordinated with General Directorate FSCP.

⁵⁴⁵ See www.au-plovdiv.bg/cntnr/CMD/2012/anotacia/33.pdf.

⁵⁴⁶ See <http://shu-bg.net/faculties/pf/spec>.

The State Agency “State Reserve and Wartime Stocks” maintains stocks of fuel, chemicals, food, metals, spare parts, wooden materials and paper, hospital and sanitary materials, medicines, tents, blankets, etc. Ministries and agencies, as well as companies also maintain a certain level of general and specific reserve stocks.

Bulgaria maintains a number of organisational and technical systems in place to monitor various hazards and risks and, when necessary, issue warnings and alerts. The key systems and services are briefly presented below.

The National Seismological Service has a network of 14 stations and observatories and two local networks – “Provadia” and “Kozloduy” (see Figure 69⁵⁴⁷). The Seismic Centre in Sofia collects, processes, analyses and interprets the information. This allows real time determination of the parameters of earthquakes in the country and the neighbouring areas.

A computing centre at the National Institute of Geophysics, Geodesy and Geography (NIGGG) facilitates the collection, processing and analysis of data from national and local accelerometric networks. That allows to evaluate and identify the dynamic characteristics of the seismic influences in environment, building and equipment for the needs of the earthquake engineering, prevention and mitigation of the seismic risk.⁵⁴⁸ A number of collaborative arrangements are in place to support these aims. Currently, NIGGG represent Bulgaria in a project to establish “Black Sea Earthquake Safety Net(work) – ESNET” with partner institutes from Romania, Moldova, and Turkey.⁵⁴⁹

Figure 69: The network of seismic stations of the national seismological service.

⁵⁴⁷ “Operational Research Activity,” presentation of the National Institute of Geophysics, Geodesy and Geography, Bulgarian Academy of Sciences, available at www.niggg.bas.bg/wp-content/uploads/2014/02/operat_en.ppt (accessed 3 November 2014).

⁵⁴⁸ Ibid., slide # 16.

⁵⁴⁹ Black Sea Earthquake Safety Net(work) – ESNET, available at www.niggg.bas.bg/projects_bg/esnet (accesses 3 November 2014).

Among the other technical systems, briefly presented above, are:

- The system for radiological monitoring;
- The radio-communication system TETRA⁵⁵⁰
- The Unified Communications System of the state administration, etc.

5.3 Training

FSCP conducts regular training and exercises for its own personnel, as well as representatives of other components of the Unified Rescue System, volunteer formations and NGO personnel.

Specialists are usually trained “on-the-job.” Training requirements depend on the specific position of an individual in the organisation.

The regular tests of the early warning and alert system are used also for training of the personnel involved.

Field and, in particular, computer assisted exercises serve (among others) as a tool to increase the awareness and enhance the decision-making capacity of high-level decision makers.

FSCP maintains and regularly uses its training range in the town of Montana for training first responders (both regular and volunteers), as well as to train decision-makers, e.g. mayors, for rapid reaction in disasters. It is used for international exercises as well, in particular within NATO’s CBRN training programme.⁵⁵¹

5.4 Procurement

5.4.1 Procurement regulations

The Bulgarian Law on Public Tenders incorporates the guidelines of the main European directives, regulating respectively:

- procurement of goods and services, including energy, water, transport and postal goods and services;
- procurement in the field of defence and security.

For the former, the Law on Public Tenders defines thresholds for conducting a public tender, small public tender or just soliciting three from independent contractors. Table 18 presents these thresholds that further distinguish construction and project design from other types of services, as well as the place for delivering the goods or services – on or outside the territory of Bulgaria.

Procurement for the General Directorate “Fire Safety and Civil Protection” (FSCP)—the organization with widest spectrum of crisis management capabilities—is managed by the FSCP directorate through its section on “Public Tenders” and in accordance with the Law on Public Tenders.

FSCP procures goods and services, including construction, maintenance and training services.

⁵⁵⁰ See project PHARE BG 2006/018 – 343.07.08, http://www.nspbzn.mvr.bg/Proekti/proekt_tetra.htm.

⁵⁵¹ See for example <http://bnr.bg/radiobulgaria/post/100231264/mejdunaroden-ucheben-centyr-v-montana-podgotvya-spasiteli>.

Table 18. Procurement of goods and services, thresholds and types of tenders

Type of procurement	The service is provided in or outside the country	Thresholds in thousand BGN ⁵⁵² (excluding VAT)	Tender
Goods and services	in the country	below 15	no tender is necessary
		b/n 15 and 50	3 offers
		b/n 50 and 180 (for goods) or 110 (for services)	'small' public tender
		above 180 (for goods) or 110 (for services)	public tender
	outside the country	below 50	no tender is necessary
		b/n 50 and 100	3 offers
		b/n 100 and 250	'small' public tender
		above 250	public tender
Project design		b/n 30 and 110	'small' public tender
Construction	in the country	below 45	no tender is necessary
		b/n 45 and 200	3 offers
		b/n 200 and 2 150	'small' public tender
		above 2 150	public tender
	outside the country	below 500	no tender is necessary
		b/n 500 and 1 500	3 offers
		b/n 1 500 and 6 000	'small' public tender
		above 6 000	public tender

Procurement cases are announced on the webpage of the FSCP General Directorate.⁵⁵³ The administration of the Council of Ministers maintains an electronic database – a Registry of Public Tenders.⁵⁵⁴ Tenders are announced publicly on the e-Procurement portal of the Public Procurement Agency.⁵⁵⁵

As a rule, multinational procurement is part of bi-lateral or regional projects with financing from the European Union, and the respective procurement rules apply.

⁵⁵² The exchange rate of the BGN to the Euro is fixed at 1 Euro = 1.9558 BGN.

⁵⁵³ For the two main types of procedures see www.nspbzn.mvr.bg/Obst_porachki/ZOP/default.htm and www.nspbzn.mvr.bg/Obst_porachki/Pokani/default.htm, both in Bulgarian.

⁵⁵⁴ Regulation on managing the Registry of Public Tenders, Article 7.

⁵⁵⁵ See http://rop3-app1.aop.bg:7778/portal/page?_pageid=173,1&_dad=portal&_schema=PORTAL for the English language version of the portal.

5.4.2 Procurement procedures

Bulgaria's legislation on public procurement is generally considered to be in line with respective norms of the European Union.

The FSCP General Directorate utilises the common procedures of:

- “public tenders”
- “public invitations”⁵⁵⁶
- limited procedure or procedure for negotiation with announcement, in cases of procurement of special (military or dual use) equipment and services, including construction.⁵⁵⁷

All these procedures are described in detail in the Law on the Public Tenders.

The same norms and procedures apply when a tender is part of a procurement within the operational programmes, partially financed by the European Union.

5.5 Niche capabilities

Bulgaria has some crisis management capabilities of potential interest to the EU and individual Member States, such as:

- medium search and rescue units for urban environments;
- medium CBRN units;
- land units for fighting forest fires.

Possibly of interest is also the training range of the FSCP General Directorate, located in the town of Montana.

Disaster protection capabilities of the defence ministry are also of value for international partners, in particular mobile medical teams of the Military Medical Academy, which are regularly deployed abroad in disaster response operations.

Finally, Bulgaria hosts the NATO Centre of Excellence for Crisis Management and Disaster Response,⁵⁵⁸ accredited by the North-Atlantic Council in 2015. The Centre provides analyses, recommendations, training and exercises in multinational formats of interest to the DRIVER community of users, EU and Member States.

⁵⁵⁶ Law on Public Tenders, Chapter 8a.

⁵⁵⁷ Law on Public Tenders, Article 3(2) and those refereeing to it.

CROATIA

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: AIT (Bettina Jager)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by CSDM and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

With a risk factor of 4.28 percent, Croatia ranks on the 120th position of the World Risk Index. Croatia shows a high exposure to floods, earthquakes, wildfires and droughts. Due to its past experiences of the Croatian War also accidents with leftover mines are a realistic threat in Croatia. In Croatia, the crisis and disaster management is built upon a civilian-based approach (Samardžija et al. 2014), which is conceived with the focus on protection and rescue. As the main source of law, the Protection and Rescue Act, adopted in 2004, defines the institutional structure, the rights and responsibilities and procedures and management to ensure the protection and rescue of human lives. After reforms in the period between 2000 and 2012, the civil protection, fire-fighting and a 112 system was included in the Croatian civil security system. The civil protection system in Croatia involves all levels – from the community level to the state level, but the National Protection and Rescue Directorate (NPRD) has been considered “as a single administrative organisation regulating norms and standards in the protection and rescue area”. The heads of local and regional self-government units as well as the director of the NPRD at national level are concerned with the establishment, development and the functioning of civil protection (IPA CP Cooperation Programme II 2014). The National Protection and Rescue Directorate, which is affiliated to the Ministry of Interior is the leading national authority for civil protection in Croatia. As a strategic actor at the national level, the NPRD is concerned with the administrative organisation by drafting plans, the assessment of risks and the coordination of the involved actors in the area of protection and rescue (Swedish Civil Contingencies Agency 2009). Furthermore, it assumes also a tactical-operative role by activating operational units, i.e. the police etc. At the operational level, the local and regional authorities are mainly responsible to organise the response in the case of an event. Since a disaster has been declared, the coordination and command competences will be transferred to the NPRD, which is activating the operational units. Thereby the NPRD can resort to the Croatian Fire-fighting Association, Croatian Mine Action Centre, Croatian Mountain Rescue Service, Volunteer Fire Brigades, Radio amateurs and other organizations, Croatian Red Cross, Croatian Rescue Dog Association and, if divers are needed, the Croatian Divers Association (European Commission 2014). The participation of the private sector in protection and rescue measures is based on a public-private-partnership. Despite the coordination competence of the NPRD, if assistance from the Croatian Armed Forces or police forces is required, a reconciliation between the Ministry of Defence, Ministry of Interior and the National Protection and Rescue Directorate may be necessitating. Apart from this, in mine accidents, CROMAC will take over the coordination function.

It is estimated that, the total protection and rescue expenditures, including fire-fighting, civil protection and other regular operational forces average approximately 0.45% of the GDP (for the year 2006). Amongst other, Croatia’s know how in demining represent one of the most exemplarily capabilities of Croatia. Furthermore, it has been emphasised, that Croatia features a professional protection and rescue system as well as a remarkable commitment of the citizens to engage voluntarily. As one of the new Member States of the European Union, Croatia assumes an important role in regional initiatives and benefits from its wide cooperation network with regional partners as well as with international organisations.

1 Policy

Pursuant to Art. 1 of the Constitutional Act, (NN 56/90) and amendments, Croatia is a unitary state including three levels of governance, the central level, the regional level and the local level. The regional level of Croatia is divided into 20 Counties and the City of Zagreb. At the local level, the regional administration is sub-divided into 127 towns and 429 municipalities. In the course of the decentralisation process, which began in 2001, the local governments gained more right of self-determination related with more duties, i.e. by the transfer from the national budget to the budgets of the local governments (EIPA and ECR 2014). In Art. 133-138 the Constitution of the Republic of Croatia (NN 85/10) determines the hierarchy and the distribution of rights and responsibilities of the community-level as well as the local and regional self-government.

The main competences of the state include overall legislation and execution, security and defence, foreign and domestic policy, direction and control over the civil service operation and economic development. Whereas the regional level is responsible for tasks of regional importance, education, healthcare, regional and urban planning, economic development, environmental protection, transport and traffic infrastructure, establishment and development of the network of educational, medical, social and cultural institutions, maintenance of public roads and issuing location and construction permits (except in territories of large towns). Municipalities are assuming tasks of local importance which directly address the needs of the citizens, and which are not assigned to state bodies by constitution or act, organisation of settlement and “housing, spatial and urban planning, utility services, primary health protection, social welfare, elementary education, culture, physical culture and sports, consumer protection, environment (protection and improvement of natural environment), fire protection and civil protection and traffic management” ⁵⁵⁹. Additionally, large towns have duties in the maintenance of public roads and the construction and renting permits.

As defined by Samardžija et al. (2014), the Croatian civil security system is characterised by a civilian-based rather than a military-based approach. Originally based on civil defence led by the Ministry of Defence, a shift toward civil protection under the direction of the Ministry of the Interior was made in 1994 (Austrian Red Cross 2014). Regarding the distribution of responsibilities, the civil protection concept of Croatia combines a bottom-up and a top-down approach and envisages the engagement of various stakeholders at all spatial and administrative levels. The Civil protection sector has been identified as the main framework for the provision of prevention, preparedness and response. It covers a wide range of tasks, beginning with risk assessment and the preparation of rescue plans to the monitoring of recent disasters (European Commission 2014).

On the basis of the existing legal framework, an all-hazard approach, including natural disasters as well as major accidents, can be identified. The Protection and Rescue Act, adopted in 2004, has been identified as the main source of law, which defines the institutional structure, the rights and responsibilities and procedures and management to ensure the protection and rescue of human lives. Based on the provisions of the Constitution of the Republic of Croatia, the Croatian Parliament adopted the Strategy of National Security in 2002.

⁵⁵⁹ <http://extranet.cor.europa.eu/divisionpowers/countries/MembersNLP/Croatia/Pages/default.aspx>

1.1 Risk Assessment

The Republic of Croatia covers about 87,609 square kilometres, of which 56,542 square kilometres is mainland. It is home to approximately 4,500,000 inhabitants with an urbanization rate of 59% of the population (United Nations, Department of Economic and Social Affairs 2014).

It is bordering on Slovenia in the northwest, Hungary in the North, Serbia in the East, in the southeast to Bosnia and Herzegovina and southward on Montenegro. Westwards, Croatia has a maritime boundary to Italy (IPA CP Cooperation Programme II 2014). Croatia extends from the furthest eastern edges of the Alps in the northwest to the Pannonia plain and the banks of the Danube in the East (DUSZ 2014). As illustrated in the map (see Figure 70), the central area is surrounded by the Dinaric Alps and its southern parts extend to the coast of the Adriatic Sea.

Figure 70: Geographic map of Croatia

Available at: <http://en.18dao.net/images/3/33/Map-Croatia.jpg>; accessed: 22th September, 2014.

Since Croatia has been a member of the UN International Strategy for Disaster Reduction Hyogo Framework for Action 2005-2015 and the Regional Cooperation Council, risk assessment is an important issue at the Government of Croatia and became even more important since Croatia have joined the European Union in 2013. In particular, in the area of wild fires, monitoring and forecasting concepts of meteorological hazards has been established. Amongst others, it lies within the responsibility of the NPRD to ensure the implementation of the Disaster Risk Reduction capabilities (World Bank 2009). As stated within the National Security Strategy of the Republic of Croatia (2002), a whole range of risk will be considered, which may threaten the survival of the population. The focus covers – apart from military issues – natural and technological catastrophes.

As regulated by the Protection and Rescue Act, the National Protection and Rescue Directorate (NPRD) is responsible for developing the National Disaster Preparedness Plan for Croatia. The NPRD carries out this task on the basis of the National Vulnerability Assessment and the Ordinance on the Methodology for Development of Risk Assessments, and Rescue and Protection Plans. The NMHS is

in charge for the improvement of the quality and the amount of meteorological and hydrological information, as well as for raising awareness and involving the public in this process.

The World Meteorological Organization (2012), indicated, that also other ministries have the duty to conduct risk assessment in their specific area. As an example, the Ministry of Finance performs administrative and other tasks related to collecting and processing data on damages occurred as a result of natural disasters.

According to IPA CP Cooperation Programme II (2014), chemical and/or industrial accidents, transportation of chemicals, nuclear accidents and natural hazards have been regarded as major source of threats. As indicated by Perešin (2013), due to the fact that Croatia is a post-conflict country, which is situated near instable countries, there is a vital threat to become a victim of a terrorist attack. Inter alia triggered by programs of the European Union, vulnerability of Critical Infrastructures has already been addressed from different viewpoints. Radovic et al. (2012) indicated, that a considerable number of Croatian hospitals exhibit a high vulnerability to seismic hazards, because about 30 percent of hospitals were built in the mid of the 19th century and a large proportion is older than 40 years. Moreover, floods and raised level of underground water represent a threat to the critical health infrastructure.

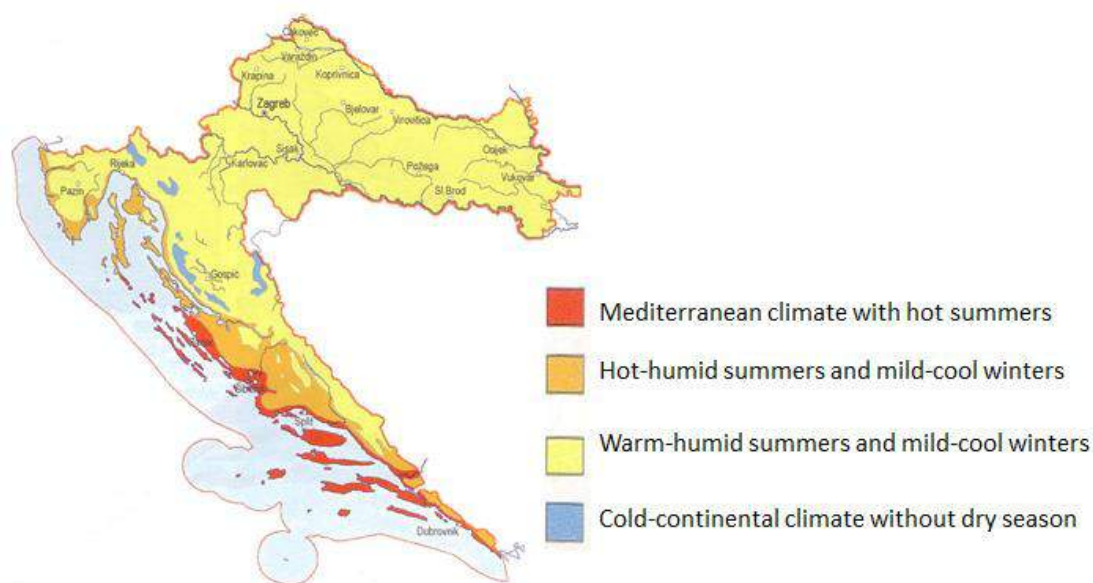

Figure 71: Climate zones in Croatia

Available at: http://www.preventionweb.net/files/22169_20efdr12oct2011wg1croatianastasaho.pdf; accessed: 11th September, 2014.

Croatia is influenced by a Mediterranean and a Continental climate. The Adriatic coast and its surrounding area in the South are characterised by a Mediterranean climate with very warm regions, while the north-west region is the cold part of Croatia. Hot, dry summers and rainy winters with temperatures from 15 to 30°C characterise the coastal area (IPA CP Cooperation Programme II 2014). In general, heavy rainfall is typically for the Dinaric mountain region and the region of Gorski Kotar.

The Croatian weather is mainly influenced by two spheres. On the one hand, the coastal zone of Croatia is – equivalent to the whole eastern rim of the Adriatic, ravaged by Adriatic storms, cyclones

and intense bora winds. These Adriatic wind patterns are strongly correlated to very large scale global weather patterns, the Iceland cyclone and the Azores anticyclone (World Bank 2009). On the other hand, Croatia has a part of the typically European weather risks in the plain, which is characterised by storms, hail and heavy precipitation. In line with other countries in the South Eastern and Central Europe, Croatia is highly exposed to natural hazards, especially to floods, wildfires, earthquakes, heat waves, strong winds, and droughts (World Bank 2009), but Samardžija et al. (2014) indicated, that also technological accidents have to be considered in Croatia.

An overview on the major disasters in Croatia since 2000 is provided in Table 1.

Table 19: Major disasters in Croatia since 2000 (PreventionWeb 2014, EuropeanCommission 2014)

Date	Crisis Description	# of persons killed	consequences
May 2014	Flood	2	Hundreds of evacuees, damages to infrastructure and thousands homeless
February 2014	Flood		No fatal casualties
June 2012	Transport accident	8	-
November 2012	Flood	-	No fatal casualties
January 2010	Flood	-	No fatal casualties
May 2010	Flood		
July 2009	Transport accident	6	55 casualties
September 2008	Transport accident	14	-
August 2007	Fire Accident "Kornati Island Accident"	12	One Badly injured fire fighter
July 2007	Central/Eastern Europe Heat Wave		-
March 2006	Central Europe Floods		-
December 2005	Extreme temperature/Cold Spell	5	-
February 2005	Storm	2	-
July 2003	Extreme temperature/Heat Wave	788	-
May 2002	Transport accident	11	-
2001	Flood	-	1,200 people affected, no fatal casualties
August 2000	Wildfire	1	-
June 2000	Extreme temperature/Heat Wave	40	-
2000	Flood	-	600 people affected, no fatal casualties

1.1.1 Natural Hazards

With an exposition of 11.53% in the World Risk Matrix (UNU-EHS and Alliance Development Works 2014), natural hazards account in sum the majority of hazards in Croatia. In comparison with the other ten countries covered in the report of SEEDRMAI (2008)⁵⁶⁰, Croatia is relative highly exposed to

⁵⁶⁰ In the frame of the desk study the focus is on the region of South East Europe (SEE) and provides risk profiles of the following countries: Albania, Bosnia and Herzegovina, Bulgaria, Croatia, Macedonia, Moldova, Montenegro, Romania, Serbia, Slovenia and Turkey.

extreme temperature, floods and windstorms. Regarding the occurrence of natural events, floods clearly lead the ranking of natural disasters, followed by wildfires and extreme temperatures, as illustrated in Figure 72.

As summarised by Samardžija et al. (2014), the strongest potential losses for Croatian inhabitants are expected from floods, droughts, landslides and earthquakes. The most of the population is exposed to droughts (298,949 citizens exposed) followed by earthquake (57,890).

Figure 72: Ranking of natural disasters in Croatia by occurrence in the period from 1989 to 2006 (SEEDRMAI 2008)

In the frame of a comparative study of the regulations regarding major risk management, earthquakes, forest fires, floods, storms, landslides and drought has been identified as main natural hazards (Higher Institute for Emergency planning 2003). In the reference period of 2003 to 2012, seven major natural events have been observed by the World Bank (2013). They caused a total damage of USD 410 million, which correspond to a share of 0.6 % of the GDP. Although, floods rank first on the list of observed events in the last 30 years (see Figure 72), droughts, extreme temperatures and wildfires caused the most economic damage (PreventionWeb 2014).

The World Meteorological Organization (2012) explained, that forest fires mainly occur during dry periods throughout Croatia and especially during summer in the coastal areas when fire-fighting interventions require the engagement of substantial material, technical and personnel resources. As a big problem, the organisation emphasised that an evacuation of large numbers of tourists might be needed. Furthermore, the most people had been killed by heat waves in 2000 and 2003. Until now, the earthquake in 1996 and the floods have affected most people in Croatia.

The South Eastern Europe Disaster Risk Mitigation and Adaptation Initiative (2008) indicates that, until the year of publication, technological hazards, such as transport accidents caused the highest amount of deaths, followed by extreme temperature. Due to its potential extent floods and earthquakes may affected a wide area and thereby a big part of the population.

1.1.1.1 Flood

The rivers Sava, Drava, Mura, Danube, Zrmanja, Krka, Cetina and Neretva are the eight major rivers in Croatia that have been included in the Sava River Project for Flood Management (2014), (SEERDRMP, UNDP Croatia, and UNDP 2011).

SEE RDRMP et al. (2011) stated, that Croatia is suffering heavily from meteorological hazards:

River flooding occurs frequently. Croatia is located within the Danube basin and is under the influence of the Danube and Sava rivers and their tributaries. Around 15% of the territory of Croatia territory is prone to flooding on major rivers. This area contains 57 settlements and 87,000 residents. Between 1925 and 2000 23 destructive floods struck in seven different river basins. Flash floods affect 85 settlements containing 160,000 residents.

In the mountain area, flash floods and snowstorms during the winter season frequently occur. Especially Zagreb is threaten by flash floods. Effects of climate change, in particular an increase of the soil moisture and the warming trend will sharpen Croatia's vulnerability to several hazards.

Flood protection systems are extremely complex and comprise a large number of structures that regulate and protect water (Samardžija et al. 2014). As a governmental organisation, Croatian Waters is responsible for the flood risk management, floods risk assessment and for floods defence planning. CW conducts integrated management of Croatian water resources on four river basin districts comprising one or more river basins of the major watercourses or parts thereof, which constitute a natural hydrographic unit (World Meteorological Organization 2012).

According to ICPDR (2012), the flood events in 2010 on the Croatian rivers were caused not only by an extreme precipitation in the territory of Croatia but also due to a large inflow from the upstream parts of the river basin in the neighbouring countries.

As mentioned by Radovic, damages to hospitals in Varaždin, Gospić, Osijek, Šibenik as results of heavy rain and/or poor maintenance were recorded in the past. In the meantime the Ministry of Health and Social Welfare has become aware of the risk for critical health facilities and has made reasonable endeavours in the field of crisis preparedness, i.e. risk assessment on the basis of WHO standards. According to the World Risk Report (2014)⁵⁶¹, Croatia ranks on the 120th global position with a relatively low risk profile of 4.28%. Regarding the exposure to natural hazards, the climatic diversity of Croatia can be identified as a relevant factor. The National Human Development Report noted that there are "large spatial differences in Croatia" – especially between the continental lowland, the transitional mountain area and the Adriatic coast (for comparison – see Figure 71).

1.1.1.2 Earthquake

As found out by the IPA Beneficiary Country Needs Assessment (2011), similar to other Balkan areas, seismic hazards must be taken into account in Croatia. About 36% of the state territory can be threatened by seismic hazards (magnitude from 8-10 It has been indicated that the earthquakes

⁵⁶¹ The World Risk Report (UNU-EHS and Alliance Development Works 2014) expresses the risk "of becoming a victim of a disaster as a result of vulnerability and natural hazards such as earthquakes, storms, floods, droughts and sea level rise" on the basis of multiplying the exposure towards natural hazards, susceptibility depending on infrastructure, etc., coping capacities depending on the governmental structure, etc. and adaptive capacities related to future natural hazards and the impacts of climate change.

caused an economic loss of USD 5 million during the last 33 years. Figure 73 shows the epicentre of about 30,000 earthquakes in Croatia. Every year, earthquakes, which have a magnitude higher than 6 on the Richter scale, occur. The population shall anticipate about 65 earthquakes per year.

It has been explained by SEEDRMAI (2008), that the Pannonian Basin is characterised by a typical intraplate activity with a less frequency of occurrence, but an intensive impact. The highest amount of seismic activity has been observed in the coast area. The latest seismic event was the Jabuka Island Earthquake, occurred in 2003 in the middle of the Adriatic Sea. It has been labelled as one of the heaviest quakes within the Adriatic microplate (South Eastern Europe Disaster Risk Mitigation and Adaptation Initiative (SEEDRMAI) 2008). As critically noted by SEEDRMP (2011), spatial plans concerning the seismic risk are available at the national and the municipal level. A closer look at risk areas has been given to the typical tourist zones at the coast.

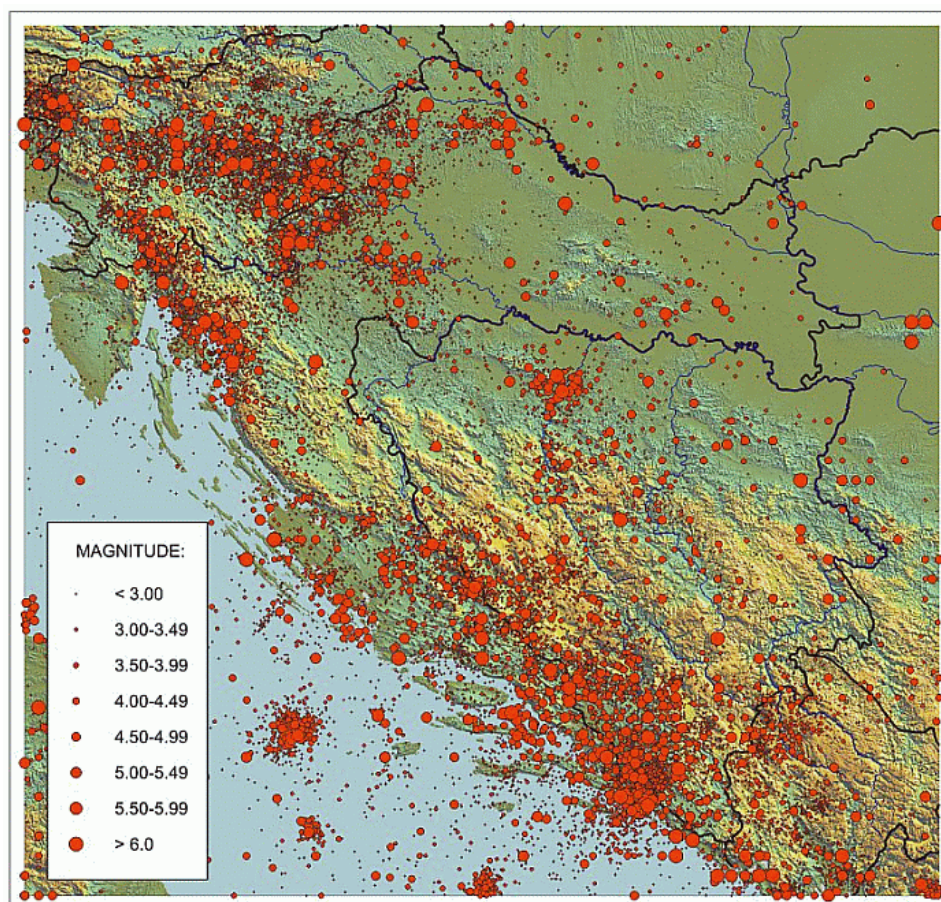

Figure 73: Map of Croatian seismic activity

Available at: <http://seekms.dppi.info/data/map-of-croatian-seismicity>; accessed: 21st September, 2014.

1.1.1.3 Extreme Temperature and related hazards

As emphasised by SEEDRMAI (2008), Croatia is very susceptible to extreme temperatures. An upward trend of warming in summer, a decrease of soil moisture in spring and an uncertainty of surface snow in Northern Croatia have been identified within the United Nations Development Programme. 2009. Furthermore, as a consequence of the climate change, heat waves will become more likely, which represents an increased probability of wildfires in a broader area (Holcinger 2011). Long periods of extremely hot temperatures have already claimed many deaths per year and caused an

average of annual costs of EUR 176 million between 2000 and 2007. Exemplarily, the heat wave in June 2000 affected the four big cities Zagreb, Split, Osijek and Rijeka – in sum, 200 people and claimed about 40 deaths. The drought has been considered responsible for a huge amount of economic loss, as an example drought in 2003 caused a damage of USD 330 million. Particularly badly affected was the city Dubrovnik in the end of July 2003. Within only a few days, wildfires caused a damage of USD 177.5 million (United Nations Development Programme. 2009).

In that context, it has been explained by the World Meteorological Organization (2012) that a long and dry seasons without rainfall, accompanied by high temperatures are in general likely to lead to severe drought.

The Kornati Island Accident in August 2007 was considered as the largest fire accident in the history of Croatia, which prompted the Office for National Security of Croatian Parliament and the Ministry of Interior to order an in-depth exploration by a voluntary research team composed of researchers from various Croatian Universities and Institutions (Stipanicev and Viegas 2009). In the frame of a post-disaster assessment, it has been ascertained that a natural phenomenon known as “burning of non-homogenous gas mixture,” i.e. a high temperature burning, with fast expansion of hot gasses caused the accident (Samardžija, Tišma, and Skazlić 2014), whereby a total area of 99,887 square kilometres was burned (Stipanicev and Viegas 2009).

The Mediterranean region, as well as the eastern area of Croatia, suffers the most from heat waves. Thereby, the risk for wildfires will be increased and crops will be devastated.

1.1.2 Technological Hazards

The Higher Institute for Emergency Planning (2003) regarded chemical/industrial, traffic and transport-related risks as well as marine pollution and nuclear accidents as relevant technological risks. Although, Croatia does not operate a nuclear power plant, there are two nuclear power plants in the neighbouring countries. Located in a distance of 30 kilometres to Zagreb, the nuclear power plant in Krško (Slovenia) poses a realistic hazard for Croatia. Another nuclear power plant is bordering on the north-eastern area of Croatia (Paks in Hungary) (Republic of Croatia 2012).

1.2 Policy and Governance

There are several levels of civil protection related to emergency situations: international, national, ministerial, regional and local level as well as private sector, volunteers and NGOs.

As explained at the Website of the European Commission (2014):

The bodies responsible for harmonising operations of protection and rescue operational forces at all levels of responsibilities ranging from local to national ones and depending on the type and other specifics of the emergency consider the structure and size of protection and rescue operational forces that are to be engaged.

At the central level, the focus mainly lies on risk assessment, preparation of the policy and legal framework, ensuring the efficient functioning of the protection and rescue system as well as the funding of fire brigades and administrative supervision over fire-fighting organisations (EIPA and ECR 2014).

The Government of Croatia is the responsible body for coordinating activities of national agencies, including several ministries, in particular the Ministry of Defence, the Ministry of the Interior, the Ministry of the Sea, Transport and Infrastructure, the Ministry of Agriculture, Forestry and Water Management, the Ministry of Environmental Protection, Physical Planning and Construction and the Ministry of Health and Social Care (Government of the Republic of Croatia 2005). Based on the Act on the Structure and Scope of Activity of the Central State Administration Authorities, an emphasis lies on the National Protection and Rescue Directorate, which is affiliated to the Ministry of the Interior and integrates a wide range of competencies – beginning with the preparation of plans, over the management of operational forces to an overall coordination of various actors of the protection and rescue system. In the current policy, the Ministry of the Interior with the assigned inspectorate for fires and explosions and the Ministry of Defence with the capacity of special fire-fighting forces and the anti-fire escadrille play an important role in the crisis management of Croatia.

If a disaster occurs, the Crisis Management of the Government will be activated, including the Prime Minister and responsible ministers. In general, the civil protection sector is in direct command of the NPRD and local civil protection forces, which provides material assets and equipment during a disaster or major accident.

With a strong emphasis on the self-sufficient principle, the local self-governments are important bodies of the crisis management in Croatia. Due to the fact, that counties are responsible for local issues (Swedish Civil Contingencies Agency 2009), the heads of the local and regional self-government units are mainly in charge to ensure the establishment of civil protection by recruiting, mobilising and equipping appropriate protection and rescue organisations.

At the regional level, the duties include an annual assessment of the status of protection and rescue, if necessary, an adoption of threat assessments and drafting of protection and rescue plans, preparing guidelines for the organisation and development of a protection and rescue system, funding of services, performing protection and rescue measures and activities, establishing a Committee for the protection and rescuing at local level, coordination of all bodies in civil protection and fire protection at the county level and in the case of an immediate disaster at the county level, the mobilisation and coordination of all resources needed by the Head of County.

Local authorities are assuming quite similar tasks as the regional authorities, i.e. the obligation to assess the status of protection and rescue annually, preparing guidelines for the organisation and development of a protection and rescue system, take care of the funding etc.

In addition, they are responsible for fire protection plans, the establishment of a public fire-fighting brigade and the encouragement of several activities in the area of voluntary fire-fighting associations. In times of emergencies, the coordination of involved bodies at local level rests on local authorities and the Mayor ensures the mobilisation and coordination of available resources (EIPA and ECR 2014).

The Act on Protection and Rescue encourages the development of self-protection and self-help capabilities of the citizens to be able to “implement measures of personal and mutual protection against threats and the consequences of disasters” (KMS 2014). In consequence, a clear statement has been made, that “each citizen has the right and obligation to be trained in protection and rescue and has the right to receive full and timely information about all threats of disasters, as well as possibilities, measures and activities for protection” (United Nations Office for Disaster Risk Reduction 2009).

1.2.1 Strategy scope and focus

On the basis of a legislation analysis it has been concluded by SEEDRMAI (2008), that a clear scope of the Croatian strategy can be identified. Disaster laws are rather addressing response and preparedness than prevention or mitigation measures. The World Meteorological Organisation recognised the Protection and Rescue Act as the most relevant document concerning the management of disasters.

As mentioned in the frame of the IPA Beneficiary Disaster Risk Reduction Needs Assessment (2011), Disaster Risk Reduction is recommended to become a national as well as a local priority. While the Strategic Development Framework 2006-2013 focuses on measures like flood control, the Strategy of Government Programmes for 2010-2012 refers mainly to response-oriented measures, which are dedicated to improving the protection and rescue and fire-protection systems and the development of an integrated 112 emergency number. Solely, within the Spatial Planning Strategy structural measures have been partly addressed. Limitations exist in the area of risk reduction. In contrast to the well-defined risk assessment approaches to the natural hazards, the risk of technological hazards have been failed to take into account (United Nations Office for Disaster Risk Reduction 2009). The adoption of SEVESO II Directive has drawn more attention on risks posed by technology/industry.

1.2.2 Monitoring and analytical support to policy making; R&D

As a central contact point for appropriate sciences in the area of protection and rescue, a close cooperation of the NPRD and national academia and research institutions has been established. Mandated to monitor and analyse the protection and rescue situation as well as to undertake efforts to continue the improvement of these skills, the NPRD is responsible for promotions and publications concerning the protection and rescue (Swedish Civil Contingencies Agency 2009). Furthermore, cooperation exists in the area of environmental monitoring. As emphasised by Rademaekers et al. (2013), Croatia has thematic databases, which includes interfaces of various systems measuring parameters, e.g. radiological value, weather, seismologic, air quality etc. as well as procedures for providing data to relevant services.

Due to the fact, that early warning, prevention, preparedness and response is centralised at the NPRD, it can prepare coordinated measures based on the existing governmental services, including the Croatian Waters, the NMHS, the Croatian Seismological Survey, the State Service for Public Health and the State Service for Nuclear and Radiological Safety. It has to be mentioned in this context that early warning systems maintenance and operation as well as warning belongs to the duties of authorities on municipal level, too (Swedish Civil Contingencies Agency. 2009).

It was emphasised by SEEDRMP et al. (2011) that the NMHS maintains a database of historical and recent meteorological and hydrological events, including extreme events, in line with WMO-standards. It acts as a provider of value-added services in support of hydro-meteorological risk assessment activities and services based on a real-time monitoring of hazards. Referring to SEEDRMAP (2007), the membership of NMHS in several organisations entails access to comprehensive weather data, which is essential for the national performance of forecasting and early warning. Further memberships exist at MEDiterranean Experiment (MEDEX) of the WMO and ECMWF (European Centre for Medium-Range Weather Forecasts). On the basis of the Standard Operating Procedures (SOP) for the utilization of the NMHS weather forecasts, a demanded linkage was made between the operational data utilization and information exchange between NMHS and

System 112. Improvements in early warning mechanisms can be expected especially by the membership at the ECMWF. As a 24h/365 days per year service for weather and climate-related satellite data, images and products, EUMETSAT (European Organisation for the Exploitation of Meteorological Satellites) provides relevant data to the NMHS.

In Croatia, a multitude of systems has been implemented to forecast weather situation, such as 40 manned weather stations, 30 automated weather stations, 2 weather radars and other systems (SEEDRMAP 2011). Weather data are also available through the membership at the network of 24 European National Meteorological Services (EUMETNET), which offer also many training exercises. Pursuant to the Act on Radiological and Nuclear Safety, 2010 (OG 28/10), the State Office for Radiological and Nuclear Safety monitors environmental radioactivity using online and offline systems (Republic of Croatia 2013). In Croatia, the Main Flood Defence Centre was established in the Croatian Waters (CW) as a central organisational unit for the purpose of management, coordination and information on flood defence status. According to the ICPDR (2012), a close cooperation exists between CW, the NMHS and NPRD. In the Danube river basin, water level status is monitored on more than 140 automatic water stations and other water stations relevant for immediate flood defence with data collected in real time. Furthermore, the hydro-meteorological conditions and forecasts of basins in the neighbouring countries are monitored.

1.2.3 Policy for Prevention

The NPRD acts in the field of monitoring while the small-scale planning falls within the competences of the local and regional authorities (European Commission 2014). A general threat assessment and the preparation of appropriate plans are situated at the NPRD. Especially, its subordinated units, namely the Operations & Analysis Department of the Civil Protection Sector and the Firefighting, Protection and Rescue School are concerned with the development of prevention strategies, e.g. risk assessment, hazard monitoring and drafting SOPs (Swedish Civil Contingencies Agency 2009). The Firefighting, Protection and Rescue School is one of the leading agencies, which takes considerable efforts in standardisation of protection and rescue procedures. At the NPRD, a comprehensive data collection has been established, which provides information on all events, accidents and disasters in the country, as well as on big accidents and disasters abroad, disaggregates their consequences and protection and rescue intervention modalities (World Meteorological Organization 2012). The WHO (2012) indicated that health-related DRR activities, like mitigation, preparedness planning and recovery activities have been transferred to the county and municipal levels and are implemented on the basis of the specific hazard profiles.

1.2.4 Policy for Preparedness

The Civil Protection Sector and the Firefighting, Protection and Rescue School are also strongly involved in preparedness measures. While the Prevention, Planning and Inspection Department at the first sector assumes mainly the role of monitoring current disasters, the Firefighting, Protection and Rescue School is the central institution, which is organising the training of professional staff. It also offers training sessions for citizens to enhance the self-help capacities and mutual assistance during disasters and major accidents (Swedish Civil Contingencies Agency 2009). The county level is involved in forwarding information to the population and maintains appropriate infrastructure for the public service sector (WHO 2012).

In order to contribute to disaster management, preparedness and response, the Croatian Red Cross implemented activities by, which prepares disaster response units on local and national level and informs citizens of all ages about correct procedures and behaviour in emergencies.⁵⁶²

1.2.5 Policy for Response

As stated by Samardžija et al. (2014), the authority and responsibility for crisis preparedness and response in Croatia is primarily located at the local level. If the crisis exceeds the capacities at the local level, the NPRD (National Protection and Rescue Directorate) takes over the responsibility at the state level. In case of an event, the Civil Defence Headquarters of the national, the county and the city level are responsible for the coordination of disaster response preparedness. Chaired by the Deputy Prime Minister, the Crisis Management Headquarter of the Government coordinates the main activities to cope with the disaster (Government of the Republic of Croatia 2005).

The Firefighting Sector is focusing on the protection against fires by performing an assessment of the situation as well of the needs of the field staff. As a main coordination body for the fight against fires, especially if they cross county borders, the civil protection sector is concerned with the monitoring of situations and is conducting needs assessment, encompassing record of the status of shelters and the manner in which they are used. Whenever it is necessary, the sector “harmonises joint activities with the Ministry of Defence and the Ministry of the Interior related to the engagement of the armed forces and law enforcement forces, respectively, as well as with other state administration bodies and legal entities in the area of protection and rescue”(IPA CP Cooperation Programme II 2014).

As operational actors, the NGOs and voluntary organisations play an important role in the response to disasters. In particular, the contribution of the Croatian Firefighting Association has been considered as the most important one because it very often participates in response operations and its equipment is very well developed (Samardžija et al. 2014).

A GIS featured database supports the NPRD in the monitoring of the protection and rescue situation, the collecting and analysis of data on hazards and disaster consequences. Moreover, the location of operational rescue forces, as well as equipment and material needs, can be traced.

1.2.6 Policy for Relief and Recovery

No clear responsibilities have been defined for relief and recovery measures in Croatia. Mainly, NGOs carry out recovery measures.

The central authorities or the local governments will arrange the reconstruction of damaged state infrastructure. Due to the fact, that counties and municipalities are responsible for the infrastructure and other public services, they may be held liable for arranging and financing reconstruction efforts (WHO 2012). Also, private companies contribute to relief and reconstruction efforts in the aftermath of disasters. Exemplary was the commitment of Coca-Cola HBC to the Central Europe Flood in 2014. As the state of emergency was declared in Croatia, Serbia and Bosnia and Herzegovina after severe floods, Coca-Cole supports relief agencies at the local level as well as the Red Cross.

The company prompted the assistance of around 3,000 employees and provided water and food. Solely, Croatia received 140,000 litres of bottled water.⁵⁶³

⁵⁶² Information is available at: <http://www.hck.hr/en/category/-disaster-preparedness-and-response-63>; accessed: 21st October 2014.

1.3 Financing

1.3.1 Investing in preparedness

“At the national level funding for disaster management and DRR is a combination of a budget allocations for the National Protection and Rescue Directorate, other respective Governmental entities (HMS, RSS, Croatian Waters, Croatian Forests)”⁵⁶⁴ and funds allocated for the implementation of specific disaster protection plans, i.e. the National Flood Protection Plan, Intervention Plan during Wild and Forest Fires on the territory of the Republic of Croatia etc. Local DRR activities have been supported mainly from national entities. Thus, local governments do not have adequate resources to fulfil their legal mandate regarding DRR (SEERDRMP, UNDP Croatia, and UNDP 2011). Samardžija et al. stated (2014) that the national budget for protection and rescue annually ranges between EUR 60 and 68 million which is some 0.4 percent of the state budget. A major part consists of the cost of NPRD (90 percent), CRC (0.1 percent), CMRS (3.9 percent) and partly of CFA (6 percent). These costs have an annual share of 0.2 percent of the state budget. It was indicated that these organisations also have other funding sources. There is a plan to distribute the financing sources at the national level also to other ministries, in particular to the MoD, MoI, etc.

According to the estimations of the United Nations Office for Disaster Risk Reduction (2009), the annual cost for the Civil Protection System amounted to around EUR 50 million, which is 0.98 percent of GDP. This includes salaries of the public servants involved in Civil Protection, salaries of professional fire-fighters as well as costs for equipment, technologies and emergency assets. At the county level, the allocations for protection and rescue ranged from 0.46 percent to 1.5 percent of the annual budget (1.5 percent allocated by the City of Zagreb). In 2011, the counties have allocated about EUR 15.7 million for protection and rescue.

According to Pollner et al. (2010), Croatia has a budget reserve of USD 5.5 million of annual allocations from the municipal budget fund. 60 percent of the total costs for demining measures were financed by the state budget and Croatia’s public enterprises and 40 percent by donors, EU-funds and the loans of the World Bank.

1.3.2 Investing in consequence management

In Croatia, there are no specific relief funds for preparing the damage of reducing the impact of disasters. The Government of the Republic of Croatia finances the compensation for disaster damage and for alleviating the effects of natural disasters by a reserve of the national budget (Government of the Republic of Croatia 2005). National budget funds are allocated to the National Protection and Rescue Directorate according to the national planning and budget plan. The budget for recovery and investment is covered by the funds of the Ministry of Health and Social Welfare. The WHO (2012) explained, that counties receive lump sums from the national budget and their relevant administrations allocate them according to their annual plans.

⁵⁶³ The article is available at: <http://www.coca-colahellenic.com/sustainability/community/emergencyrelief>; accessed: 12th October, 2014.

⁵⁶⁴ <http://www.gripweb.org/gripweb/sites/default/files/Croatia%20Needs%20Assessment%20-%202011-10-26.doc>

As determined in Art. 40 of the Act on Protection from Natural Disasters, 97 (NN 73/97) and explained in the Criteria for Assessing Disaster Damage, 1998 (NN 96/98), local or regional bodies can reduce the receivables (taxes) or provide financial relief. Insurances play an important role in financing the consequences of disasters. Insurance to reduce the impact of disasters is considering liability issues and covers damages to property caused by natural disasters and personal injuries caused by human-induced risks, i.e. spreading hazardous substances in the environment. The EU Solidarity Fund (EUSF) serves as an effective instrument to provide aid. After the ice storm in January and February 2014, Croatia received EUR 8.6 million to reimburse rescue costs in the affected regions.⁵⁶⁵ In comparison, Croatia was granted aid of EUR 4 million by the EUSF after the heavy rainfall in 2010 to reimburse the cost of alleviation in affected areas (Radovic, Vitale, and Tchounwou 2012).

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

A comprehensive framework for post-disaster assessment has been established at the NPRD, which monitors the protection and rescue situation, collects and analyses data on hazards and disaster consequences and keeps the records on operational protection and rescue forces, their location, equipment and material needs, in a single GIS database (SEERDRMP, UNDP Croatia, and UNDP 2011). Due to the fact, that the NMHS has a focus on analysing previous and current disasters, conducting trend analysis and maintains several memberships in appropriate international organisations, post-disaster assessment belongs inter alia to the tasks of NMHS.

As mentioned in chapter 1.1.1.3, the fire accident at the Kornati Island gave rise to a comprehensive post-disaster assessment at the Office for National Security of Croatian Parliament and the Ministry of Interior. The appointed researchers identified some shortfalls within the response to the disaster and defined 37 recommendations for improvements on that basis (Stipanicev and Viegas 2009).

Table 20 provides an overview on some of the most impressive mistakes in the response to the Kornati Fire. As indicated by the authors of the report, despite the list of mistakes, it should be noted that the accident presents a major challenge for the fire-fighting forces due to its unknown nature.

Table 20: Summary of mistakes within the response to the Kornati Island Fire based on the findings of Stipanicev & Viegas (2009)

Subject of mistake	Short description
Equipment	Radio communication of the fire-fighters was not working well
	Only one airplane was in operation in Croatia
	Only 4 Canadair airplanes for fighting forest fires were available in Croatia
Preparedness	The fire protection of the National Park Kornati was not appropriately organized according to existing plans
	Fire fighters were not wearing the complete working uniform resistant to fire

⁵⁶⁵ Press release is available at: http://europa.eu/rapid/press-release_IP-14-948_en.htm; accessed: 21st September 2014.

Response	False assessment of the situation – because two other large fires were active in the region, the airplane was sent from Kornati Island to another location The rescue of the victims was not organized appropriately
-----------------	---

1.4.2 Departmental Lessons Learned systems

Departmental lessons learned systems could be supposed for the NMHS, the NPRD and the Fire-fighting Protection and Rescue School. Ministries have to provide annual reports on threat assessment of their area of responsibility to the NPRD (European Commission 2014). Annually, the State Office for Radiological and Nuclear Safety provides a report about the “National Implementation of the Obligations under the Convention on Nuclear Safety”. Also, public agencies, which have been established by the government of the Republic of Croatia, have to deliver annual reports. As an example, the Croatian Environment Agency (CEA), which is dedicated to collect, integrates, and process environmental data, provides annual updates⁵⁶⁶ about the environmental information system, a summary of international efforts in the environmental community and reports about progress in the area of projects and cooperation.

1.4.3 Centralised (national) Lessons Learned system

In order to promote disaster risk reduction beyond departmental borders, the Ministry for Science, Education and Sport established a Curriculum Revision Working Group, which involves the Ministry for Science, Education and Sport, the NPRD, NMHS, the Republic Seismological Survey, the Croatian Red Cross as well as other ministries and experts (SEERDRMP, UNDP Croatia, and UNDP 2011). As an example, a close cooperation between the NPRD and the NMHS was stipulated by joint training and improvements to the standard operating procedures across agencies linked to the different threat levels and lessons learnt from each disaster event.

1.4.4 International exchange for Lessons Learnt

Croatia joined the Euro-Atlantic Partnership Council (EAPC), which provides a framework for Planning and Review Process (PARP) in which framework Croatia and NATO define and achieve partner goals. Furthermore, NATO Committee meetings serve as a platform for sharing knowledge and experience between the heads of their national civil emergency planning organisations and members of national delegations at NATO at least twice a year (The Croatian Parliament 2002). In November 2014, Croatia joined the conference entitled, “Sharing information and solutions to reduce flood risk, and enhancing cross-border cooperation in mitigating risk and flood protection” in Sarajevo. It addressed civil protection professionals, water management experts and decision-makers from Albania, Croatia, Republic of Macedonia, Montenegro, Slovenia, Serbia, Bosnia and Hercegovina as well as professional OSCE staff. The RACVIAC-Centre for Security Co-operation of Croatia participated the event to discuss approaches for reducing potential risks from disasters and respond mechanisms with representatives from other countries.⁵⁶⁷ Training programmes in the frame of the Civil Protection

⁵⁶⁶ Publications of CEA are available at: <http://www.azo.hr/Default.aspx?sec=683>; accessed: 12th September, 2014.

⁵⁶⁷ Information is available at: <http://www.oscebih.org/News.aspx?newsid=2034&lang=EN>, accessed: November 8th, 2014.

Module provide a good opportunity for exchange of experience with other representatives and discuss lessons learned by training courses, joint exercises and an experts' exchange system.

1.4.5 Regular policy reviews

Regional authorities, as well as local authorities, have the obligation to draft a report about the assessment of the status of protection and rescue once a year or upon passing their budget (European Commission 2014). This implicates the adoption of outcomes from the threat assessment and draft protection and rescue plans. At ministerial level, administrative authorities have to draft and forward a threat assessment to the NPRD in the segment applying to the region of their competency.

1.5 Resilience

At all levels (state, county, city and municipality) the Republic of Croatia is providing an estimation of the vulnerability of the population,, material and cultural resources, and the environment to natural and man-made disasters and major accidents. Based on these estimations, plans for protection and rescue in the response to potential threats have been prepared at all levels. Therein, a determination of available capacities, as well as equipment, which is on the disposal of each authority level, is provided. One of the sectors of the NPRD is responsible for civil protection managing civil protection forces in case of disasters. For each county departments for civil protection are established (Swedish Civil Contingencies Agency 2009). As an example, an expert of the County Department for Civil Protection from Split Dalmatia (2014) has illustrated the principle of preparing plans on the basis of the Plan for Accidental Marine Pollution in the Republic of Croatia. Each county makes own plans and basically, the County Operational Centre (COC) is responsible for the implementation of procedures and measures for predicting, preventing, restricting, preparedness for and response to disasters by the county contingency plan. COC is also responsible for operational participation in the implementation of the plan and sub-regional plans. A COC always has his commander, and, in this case, it is the harbourmaster.

According to the National Plan for Interventions, the COC of Split-Dalmatia County may take over the operational actions in the areas of operations of neighbouring COC (i.e. COC from both Šibenik-Knin County and Dubrovnik-Neretva County), in case the quantity of the pollution exceeds the capacities of a single COC, or if more than one county might be threatened and if marine pollution can endanger the marine environment, human health and economic use of the sea. In such cases processes are performed in cooperation with the neighbouring COC and under coordination of National Headquarters for Coordinating Search and Rescue in Rijeka (MRCC).

1.6 Information sharing and data protection

The NPRD is responsible for the maintenance of a database on operational forces, assets and measures (Swedish Civil Contingencies Agency 2009). However, in the event of a crisis, public media may become a relevant information source for the population and trigger public pressure, sometimes even dictate the answers to certain types of threats. Despite this fact, at the moment, there is no strategy to promote social media for that purpose (Expert Interview 2014). Governmental entities like the NHMS, the Republic Seismological Survey, Croatian Forests, and Croatian Waters collect,

store and analyse risk information from their areas of responsibility (Samardžija, Tišma, and Skazlić 2014). All of them are linked to the Operation and Communications Centre (Centre 112), which merges and forwards information from different sources (SEERDRMP, UNDP Croatia, and UNDP 2011).

According to Article 14 of the Information Security Act (NN 79/07), the Office of the National Security Council is the central government body for the coordination of information security measures and standards within the Republic of Croatia and the exchange of classified and unclassified information between the Republic of Croatia and foreign countries and organisations.

“Information security measures and standards include organising special data bases for classified information within the Republic of Croatia, as well as for classified information which is transmitted from other countries, international organisations or institutions with which the Republic of Croatia co-operates.”

Public access to environmental data is based on the Act on the Right of Access to Information (OG 25/13). This Act contains provisions that are in accordance with the following acts of the European Union:

- Directive 2003/98/EC of the European Parliament and of the Council of 17 November 2003 on the re-use of public sector information,
- Regulation 1049/2001 of the European Parliament and of the Council of 30 May 2001 regarding public access to European Parliament, Council and Commission.

Pursuant to Article 18a of the Act on Personal Data Protection (NN 103/03, 118/06, 41/08 and 130/11), the NPRD has appointed clerk for the protection of personal data which:⁵⁶⁸

- Takes care of the legality of the processing of personal data;
- The realisation of the right to protection of personal data;
- Cooperating with the agency for protection of personal data in connection with the implementation of control of personal data;
- Perform other tasks stipulated by the law on personal data protection and subordinate regulations adopted thereunder.

Within the Aarhus Convention, an implementation report indicated that the Water Act determines the procedure for ensuring the flow of information between the National Protection and Rescue Directorate, the State Water Inspectorate and Croatian Waters (Republic of Croatia 2013). Based on the Ordinance on the Content, Form and Manner of Keeping Water Documents (OG 120/10), Croatian Waters collects and processes water-related data. Based on the Act on Radiological and Nuclear Safety, 2010 (OG 28/10), the State Office for Radiological and Nuclear Safety monitors environmental radioactivity and publishes the results on the website of the State Office.

Furthermore, information related to nuclear safety and the system of preparedness in case of a nuclear or radiological disaster and other information related to radiological and nuclear safety are available at the website. The Croatian Institute for Toxicology and Anti-doping maintains an extra web page to inform the public about hazards of dangerous chemicals and protection measures. In Croatia, the Act on the Right of Access to Information (OG 25/13) extends to all public authorities.

Cooperation for the purpose of data sharing and information exchange has been established with the following organisation:

⁵⁶⁸ Information is available at: <http://www.duzs.hr/page.aspx?PageID=566>; accessed: 21st September 2014.

- IAEA - International Atomic Energy Agency.
- ICPDR - International Commission for the Protection of the Danube River.
- UN/ECE – IAN System (United Nations Economic Commission for Europe).
- NATO – EADRCC (North Atlantic Treaty Organization – Euro-Atlantic Disaster Response Coordination Centre).
- ECURIE (European Community Urgent Radiological Information Exchange).
- UNESCO IOC (Intergovernmental Oceanographic Commission).
- TWFP (Tsunami Warning focal Point).
- Neighbouring countries (Protocols with Slovenia, Bosnia and Herzegovina, etc.).

In the frame of the Community Civil Protection Mechanism, several tools have been developed to facilitate adequate preparedness and effective response to disasters at the EU level:

- MIC (Monitoring Information Centre) European Union.

MIC is located at the European Commission in Brussels. It provides 24 hours/365 days per year information about pending requests for assistance. Dedicated to seek for international assistance if the event exceeds the capacities of the affected country, it monitors the situation in the case of emergencies and major accident within the EU, neighbouring countries and the rest of the world. By a formal request of the affected country, the mechanism can be activated.

- Common Emergency Communication and Information System (CECIS)

In order to provide a rapid response by facilitating the communication between the MIC and national authorities, CECIS is designed as a reliable web-based alert and notification system.

According to the representative of the County Department for Civil Protection (2014), data on volunteers are primarily located at the level of services like NPRD, fire-fighters, CMRS and RC, and have not been united in one single registry of volunteers.

Moreover, on the basis of treaties, the mutual exchange of information is regulated with the following parties⁵⁶⁹:

- The Act of ratification of the North Atlantic Treaty (NN, MU 3 2009).
- Security Agreement between the Republic of Croatia and the North Atlantic Treaty Organization (NN, International Agreement 14/03).
- Agreement between the Republic of Croatia and the European Union on security procedures for the exchange of classified information (NN, International Agreement 9/06).
- Security Arrangements between the Office of the National Security Council (UVNS) of the Republic of Croatia, the EU Council general Secretariat Security Office (GSCSO) and the European Commission Security Directorate (ECSD) for the protection of classified information exchanged between the Republic of Croatia and the EU (October 2007).
- Agreement between the Government of the Republic of Croatia and the Government of the Republic of Bulgaria on mutual protection and exchange of Classified Information.
- Agreement between the Government of the Republic of Croatia and the Council of ministers of the Republic of Albania on mutual protection of Classified Information.
- Agreement between the Government of the Republic of Croatia and the Government of the Republic of Macedonia on exchange and mutual protection of Classified Information.

⁵⁶⁹ Information is available at: <http://www.uvns.hr/default.aspx?id=167>; accessed: 17th September, 2014.

- Agreement between the Government of the Republic of Croatia and the Government of the Republic of Estonia on mutual protection of Classified Information.
- Agreement between the Parties to the North Atlantic Treaty for the Security of Information.
- Agreement between the Government of the Republic of Croatia and the Government of the Czech Republic on mutual protection of classified information.
- Agreement between the Government of the Republic of Croatia and the Government of the Slovak Republic on mutual protection of classified information.
- Notification on coming into effect of the Agreement between the Government of the Republic of Croatia and the Government of the Slovak Republic on mutual protection of classified information (NN, International Agreements 6/10).
- Agreement between the Parties to the North Atlantic Treaty for Co-operation regarding Atomic Information with Secret Technical Annex to the Agreement between the Parties to the North Atlantic Treaty for Co-operation regarding Atomic Information and Confidential Security Annex to the Agreement.
- Notification on coming into effect of the Agreement between the Government of the Republic of Croatia and the Government of the Czech Republic on mutual protection of classified information (NN, International Agreements 8/10).
- Agreement between the Government of the Republic of Croatia and the Government of the French Republic on mutual protection of classified information (NN, International Agreements 7/11)
- Notification on coming into effect of the Agreement between the Government of the Republic of Croatia and the Government of the French Republic on mutual protection of classified information (NN, International Agreements 12/11)
- Agreement between the Government of the Republic of Croatia and the Government of the Republic of Slovenia on mutual protection of classified information (NN, International Agreements 15/11)
- Notification on coming into effect of the Agreement between the Government of the Republic of Croatia and the Government of the Republic of Slovenia on mutual protection of classified information (NN, International Agreements 1/12)

2 Legislation

2.1 Crisis (emergency, disaster) management concept

In sum, there are several strategic papers, which are relevant for civil protection. Two key documents are cited below:

Important milestones to promote national security, have been achieved by the “National Security Strategy”, 2002 (NN 79/07) and the “National Strategy for the Prevention and Suppression of Terrorism”, 2008 (NN 139/08).

National Security Strategy

The National Security Strategy of the Republic of Croatia, adopted in March 2002 (NN 32/02) and amended in 2004, expresses the political views on national security of the Croatian Parliament as the highest political and legislative institution of the Republic of Croatia.

Within the document, security was defined as “a functional area of operation of security institutions and society in general in achieving the security goals and interests of the Republic of Croatia” (Government of the Republic of Croatia 2005). The strategy builds the basis for institutional targets, guidelines and programs to react to “general security challenges and concrete forms of endangering the Republic of Croatia”.

Within the strategy the following principles have been taken into account (The Croatian Parliament 2002):

- Croatia’s present geo-political position is characterized by its determined effort to advance towards and enter Euro-Atlantic and European security organisations.
- State of the security challenges and risks area for the Republic of Croatia.
- State of the system and successfulness of national security operations.
- Available resources.

As described in the National Security Strategy (2002), possible results of natural and technological disasters in the country or a specific region pose a constant security threat for its citizens and material goods.

In detail, the National Security Strategy addresses the following threats (The Croatian Parliament 2002):

- Terrorism;
- Proliferation of weapons;
- Leftover mines and explosive devices;
- Instability of neighbouring countries;
- Natural Disasters;
- Technological Disasters;
- Infectious disease;
- Threats to information systems and the private domain.

Against the background of a prospected EU membership, an interdepartmental Commission, chaired by the MoD, presented a new National Security Strategy in 2010, which was oriented on existing EU-

standards. Aiming at strengthening of the national security and the NATO collective defence, therein an involvement of “professionals, the scientific and the general public in the process of developing the strategy”⁵⁷⁰ was declared.

Based on the comprehensive risk approach, cooperation on the local, regional and state level has been defined as vital for the achievement of national interests (Samardžija et al. 2014).

Mahečić (2010) indicates that the National Security Strategy offers different tools for providing and building the necessary level of the security to Croatia, which are inter alia, an understanding of the necessity to establish cooperation within the state institutions and administrative levels as well as with international and regional counterparts, a comprehensive list of the National Security Objectives that should serve as a security policy framework for all the state institutions involved as well as the conceptualisation of pursuing the security policy.

Strategic Defence Review

The Strategic Defence Review built the basis for the practical realisation of Croatia’s National Security Strategy and Defence Strategy (NN 33/02). It provides the direction for developing the defence system and the Croatian Armed Forces to ensure the protection of vital interests of the Republic of Croatia and its citizens. Multiple risks associated with natural and man-made disasters require the contribution of defence capabilities to support civil authorities in the more serious national crisis situations. As stated in the Strategic Defence Review in 2005, the Ministry of Defence focuses mainly on four key scenarios for which effective response capabilities must be developed; these are:

- Regional Crisis with a complex threat to Croatia’s security;
- Attack on a NATO Member;
- Crisis response operation abroad under the auspices of UN, NATO or the EU;
- Natural or man-made disaster in the Republic of Croatia.

While the first two of the enumerations above were classified as low-risk and the scenario of natural and man-made disaster as medium-risk, crisis response abroad was assessed with a high-risk potential. In order to promote Croatia’s national security, the MoD participates in emergency and civil-military crisis planning, coast guard responsibilities, host nation support and multi-faceted security-related issues by inter-agency cooperation (MINISTRY OF DEFENCE 2005).

Additional National Plans of Action

Planning activities of the NPRD in the area of protection and rescue are guided by the Strategic Development Plan of the State intervention units of civil protection for the period from 2014 to 2016.

As another important policy, the National Plan of Action concerning Environmental Impacts, 2002 (NN 46/02) was adopted to determine the measures for the protection of the environment. Specific responsibilities, e.g. from the Croatian Meteorological and Hydrological service (NMHS) were defined within the chapter “Environmental protection and effective environmental management”. In a more detailed way, the roles and responsibilities at different administrative levels and of various actors were covered by the Activity Programme for the Implementation of the Special Fire Protection Measures in Republic of Croatia in 2010. Within the intervention plan during Wild and Forest Fires on the territory of the Republic of Croatia, the structure, roles, and responsibilities of relevant agencies,

⁵⁷⁰ Press release is available at: <http://www.morh.hr/en/news/press-releases/6610-national-security-strategy-draft-presented.html>; accessed: October 21, 2014.

coordination and management systems, capacity building, public information procedures, and the financial support for implementation were determined (SEERDRMP, UNDP Croatia, and UNDP 2011).

Within the Strategy of Government Programs for the period 2011-2013, an assessment of the current protection and rescue systems conclude, that cooperation shall be improved. Therein, the further development of the GIS system by an integration of the 112 system was set on the agenda.

A quite important framework was defined within the Strategy of Government Programmes for 2010-2012, wherein the disaster management was considered as a part of a general concern and a definition of the organisational principle of the protection and rescue system over all involved actors was provided (World Meteorological Organization 2012).

As identified by Perešin (2013), the “Strategic Plan of the Ministry of the Interior and Other Institutions in Function of the Protection and Rescue for the Period of 2012-2014” is a relevant document, which is based on an overarching comprehension of public security. It implicates strategic measures to deal with criminal acts, accidents as well as with natural disasters – all types of hazards, which may threaten the human life, the personal integrity, the public safety, etc.

In the frame of the Strategy of Government Programmes and State Budget for the period 2010-2012, the overall budget for the protection and rescue system was laid down. Furthermore, it determines the budgetary sources of the different administrative levels and ministerial departments (Samardžija et al. 2014). The direction of the rescue and protection system in the Republic of Croatia based on the Program for Equipping and Technical Development of the National Protection and Rescue Directorate until 2009.

2.2 General crisis (emergency, disaster) management law

According to IPA CivilProtection 2014 the following acts are of major relevance for the protection against disasters in Croatia:

- Protection and Rescue Act.
- Fire-Fighting Act.
- Act on Protection against Natural Disasters.

The Protection and Rescue Act (Protection and Rescue Act, 2004) is the primary legal source for regulating civil protection. The Protection and Rescue Act provides a definition of the protection and rescue system, including, amongst others, the tasks of the command and coordination bodies, the activities of the operational communication centre – 112 and provisions for international cooperation (IPA CP Cooperation Programme II 2012). Within the Protection and Rescue Act, various threats have been addressed and the distribution of competences in the management of threats suggests an individual focus on specific hazards by each responsible body. “The Act on Protection Against Natural Disasters defines the term natural disaster and provides the basis for protective measures, the rights and duties of protection officers, evaluates damage and details how to assist affected areas” (Swedish Civil Contingencies Agency 2009). It is supplemented by other laws related to the certain areas of critical infrastructure protection, the mountain rescue (Borić 2014), protection against natural disasters, the organizing element of the fire brigades and fire protection. As described in KMS (2014), the law regulates the following issues:

- System of protection and rescue of citizens, goods and property in disasters and major accidents;

- Management and coordination of protection and rescue activities;
- Rights, obligations, specific training and general education of participants in protection and rescue activities;
- Tasks and the structure of protection and rescue authorities;
- The way to alert and warn;
- Guidelines for mobilisation of protection and rescue.

In 2007, the Act on Protection and Rescue was harmonized in order to address the SEVESO II Directive. Additionally, more specific legal acts and plans, focusing on specific threats like floods, major fires, transport accidents and ionizing radiation, etc., have been developed to regulate the protection procedure in specific cases, e.g. firefighting, protecting humans in mountain areas, protection and rescue measures in accidents and transportation with dangerous substances. At the community level, extra plans for protection and rescue measures in municipalities, cities and the state are available (Swedish Civil Contingencies Agency 2009). Within the Act of Protection and Rescue, the principles of solidarity and self-responsibility encourage citizens to carry out measures of personal and mutual protection against threats and the consequences of disasters.

Furthermore, the planning and financing of the system of protection and rescue is regulated by Articles 40 and 41 of the Protection and Rescue Act (NN 174/04, 79/07, 38/09). Protection and rescue plans at the national level are part of the Croatian Defence Plan, and they incorporate all existing national plans for different types of threats. Plans also establish material, technical resources and sources of funding proposed activities (Samardžija et al. 2014).

- Ordinance on the methodology for making threat assessments and protection and rescue plans (NN 30/14 and 67/14)

As general rules for protection and rescue, the “Regulations on the mobilization and action of operational and rescue forces” (NN 40/08, 44/08) regulate the deployment of operational and rescue forces for protection and rescue activities.

The list of important laws regarding Civil Protection can be extended by the following ones:

- Act on Critical Infrastructures (NN 56/13);
- Act on Radiological and Nuclear Safety, 2010 (NN 28/10);
- Decision on determining the sector from which the central administrative authorities identify national critical infrastructure and lists the order of the sectors of critical infrastructure (NN 108/13).

Regarding the level of the European Union, the following regulations have an effect on Croatia’s disaster management (World Meteorological Organization 2012):

- European Flood Directive on the Assessment and Management of Flood Risks, 2007 (2007/60/EC);
- Council Directive on the freedom of access to information on the environment, 1990 (90/313/EEC).

At the international level, Croatia signed the following relevant treaties:

- Law on Ratification of the United Nations Framework Convention on Climate Change, 1992
- Kyoto Protocol to the Convention on Climate Change, 1999
- Law on Ratification of the United Nations Convention to Combat Desertification in Countries Experiencing Serious Drought and/or Desertification, Particularly in Africa – Convention to

- Combat Desertification (Paris 1994);
- Cooperation Agreement with WMO, International Civil Aviation Organization (ICAO), and EUMETSAT
- Cooperation Agreement with ECMWF, EUMETNET and Economic Interest Grouping of the National Meteorological Services of the European Economic Area (ECOMET)

2.3 Emergency rule

“The President, as the supreme commander of the armed forces, declares a state of emergency. He is responsible for the defence of the country's independence and territorial integrity” (Inter-Parliamentary Union 2013).

As declared within the Constitution of the Republic of Croatia (NN 85/10):

The President of the Republic shall pass decrees with the force of law and take emergency measures in the event of a state of war or an immediate danger to the independence and unity of the Republic, or when government bodies are prevented from regularly performing constitutional duties. During the time the President of the Republic is making use of such powers, the House of Representatives may not be dissolved. The President of the Republic shall submit decrees with the force of law for approval to the Chamber of Representatives as soon as the Parliament is in a position to meet.

From a practical view, the NPRD can propose a declaration of a state of emergency to the Croatian Government. Samardžija et al. (2014) indicated, that Act on Protection and Rescue (Art. 53) envisages the mobilisation of citizens, temporary detraction vehicles, temporary restriction of property rights, etc. by a competent civil servant of the NPRD. The constitution determines the deployment of the Croatian Armed Forces to assist firefighting and rescue operations, surveillance and protection at sea.

As laid down in Art. 17 of the Constitution, the Parliament decides by a two-thirds majority of all its members or, if it is unable to meet, at the proposal of the government with the counter-signature of the Prime Minister, by the President, that during a state of war or an immediate threat to the independence and unity of the state, or in the event of severe natural disasters “fundamental freedoms and human rights can be restricted to the extent strictly required by the exigencies of the situation and cannot result in the inequality of persons due to race, colour, sex, language, religion, national or social origin” (European Commission for Democracy through Law 1995). Despite the state of emergency, fundamental human rights, such as the right to life, the right not to be subjected to torture, etc. will not be restricted or derogated from. As clarified by the Inter-Parliamentary Union (2013), “the extent of these restrictions must be proportional to the nature of the emergency and cannot lead to unequal treatment of individuals. The work of the parliament is continued under these circumstances, in accordance with the regulations laid down by the Constitution.”

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

The establishment of National Protection and Rescue Directorate is based on the Act on the Amendments to the Act on the Organization and Scope of Responsibilities of Ministries and National Administrative Organizations (NN 30/04).

The involvement of the staff of the NPRD is regulated by the “Regulations on uniform members of operational and rescue forces of the National Protection and Rescue Directorate (NN 81/09, 115/10) and in general, the “Regulation on the internal organization of the National Protection and Rescue Directorate” (NN 43/12 and 125/14) determines the working principle of the NPRD. Cooperation between specific agencies is regulated by the “Ordinance on the method of cooperation authorized persons Coast Guard and the National Protection and Rescue and the method of exchange of information necessary for their effective and concerted action (NN 40/09).

As stated by the Swedish Civil Contingencies Agency (2009), aside from the MoI, also the MoD, the Ministry of the Sea, Transport and Infrastructure, the Ministry of Agriculture, Forestry and Water Management, the Ministry of Environmental Protection, Physical Planning and Construction as well as the Ministry of Health and Social Care take part in Civil emergency planning. Exemplary, the Strategy of National Security and the Strategy of Defence have been mentioned as inter-ministerial cross-cutting issues (IPA CP Cooperation Programme II 2014). Due to the fact, that security issues are interconnected, at least coordination between the MoI and the MoD is required.

The following laws mainly regulate the military-related cooperation in protection and rescue activities:

- The Defence Law (NN 33/02);
- Ordinance on the organization, manning, and equipping forces and civil defence units for alerting (NN 111/07).

The Constitution of the Republic of Croatia specifies in Art. 7, that armed forces can be deployed to support the police and other state bodies in the face of a threat posed by nature, in fire-fighting as well as in rescue operations.

Moreover, coordination is necessary with the Ministry of Health and Social Welfare, which is responsible for health issues in national disasters. The Health Care Act, aiming on the protection of health of the population, regulates inter alia the provision of health care services in the MoD and the CAF (WHO 2012).

The participation of state intervention units of Civil Protection is regulated as follows:

- Decision on the Establishment of the State intervention units of civil protection;
- Strategic Development Plan of the State intervention units of civil protection for the period from 2014 to 2016;
- Law on Participation of the Croatian Armed Forces, police, civil defence, civil servants and employees in peacekeeping operations and other activities abroad (NN 33/02, 92/02);
- Police Act (NN 129/00, NN 41/08).

Additionally, the “Ordinance on the organization, equipping, training, start-up and mode of action of the intervention of fire brigades and reimburse the costs of their activities (NN 31/11)” specifies the principles of deployment of the fire brigades in Croatia. As explained at the Vademecum-Website

(2014), the envisaged participation of the private sector in protection and rescue measures and related rights and obligations of individual protection, as well as threat assessment and Protection & Rescue Plans are defined by the Protection and Rescue Act and supporting legislation.

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

The Constitution of the Republic of Croatia determines three levels of responsibilities for Protection and Rescue (KMS 2014). Apart from the state level, measures aiming at emergency and disaster management are located at the local and regional level.

The Act on Community Level, Local and Regional Self-Government defines the responsibility of the county prefects at the county level as well as the competencies of the mayors of the towns or municipalities at the local level. Article 135 emphasises the duties of local self-governments (municipalities) in the area of fire protection and civil defence. It was emphasised by the Croatian Fire-fighting Association (2011) that professional and volunteer fire-fighters are equal regarding the fulfilling their duties. However, the professional fire-fighting units work on basis of the Law of Public Institutions while the volunteer fire-fighting units operate on the basis of the Law of Associations of Citizens. Additional 4 fire-fighting intervention-units work in four coastal counties in Dalmatia, and all fire-fighting units are commanded during the summer by the Centre in Divulje near Split, which are part of the National Directorate for protection and safety.

In addition, the decisions below provide guidelines of protection and rescue for the regional and local level.

- The decision on the appointment of the Mayor, Deputy Mayor and members of the Headquarters of protection and rescue the Croatian (NN 53/12);
- The decision on dismissal of a deputy mayor and a part of the Headquarters of protection and rescue the Croatian (NN 99/12);
- The decision on the appointment of Deputy Chief and part of the Headquarters of protection and rescue the Croatian (NN 99/12);
- The decision on the appointment of members of the Headquarters of protection and rescue the Croatian (NN 67/14);
- The decision on the appointment of a member of the Headquarters of protection and rescue the Croatian (NN 143/14);
- The decision on dismissal of members of the Headquarters of protection and rescue the Croatian (NN 143/14).

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

There are several regulations concerning the organisation, attendance, recruitment and the use of units, services and bodies for managing and organising civil protection in Croatia (Swedish Civil Contingencies Agency 2009). In general, the Protection and Rescue Act regulates the involvement of volunteers and NGOs, regarding the rights and obligations of volunteers in the area of protection and rescue and agreements on protection and rescue cooperation between the NPRD and the voluntary associations (Tomin and Barbera 2011).

The legislative framework for the deployment of complementary protection and rescue services is regulated by the following acts:

- Law on the Croatian Mountain Rescue Service (NN 79/06).

The Protection and Rescue Act also regulate the deployment of the Croatian Mountain Rescue Service operations.

- Law on the Croatian Red Cross (NN 71/10).

The European Volunteer Centre (2012) indicated that due to a research lack, the percentage of people declaring engagement in volunteering activities varies from 5 percent to more than 40 percent. Despite the inconsistencies, a positive trend towards volunteering can be stated.

In 2007, the Parliament of the Republic of Croatia adopted the Law on Volunteering (NN 58/07), which facilitates the involvement of volunteers at the local and national level by providing “a definition of volunteering, principles and conditions for volunteering, the rights and obligations of volunteers and volunteer implementing organisations, the conditions for conclusion of volunteering contracts, the adoption of a Code of Ethics for volunteers, the issuing of a volunteering certificate, a national volunteer award as well as means for supervising the implementation of this law.”

Within the report of the European Volunteer Centre (2012), the following framework was identified:

- Volunteering legislation and a regulatory framework;
- Government policies on volunteering;
- Organisers of volunteering activities: organisations and networks at local, regional and national level; local/regional/national institutions;
- Volunteering centres and the Croatian network of volunteer centres;
- Volunteering opportunities and brokering mechanisms between (potential) volunteers and volunteering opportunities, including on-line placement databases;
- Volunteering promotion and raising public awareness of the value of volunteering;
- Funding to ensure volunteering programs sustainability;
- Academic and civil society organisations (CSO) research projects.

The Ministry of Social Policy and Youth is responsible for the implementation of the law. Its implementation will be ensured by monitoring the implementation of the law and collecting feedback from the implementing organisations about the consequences of its implementation. The ministry provides an annual budget of around EUR 128,500 for volunteering.

Furthermore, within the National Strategy for the Creation of an Enabling Environment for Civil Society Development 2006-2011 and its Operational Implementation Plan, basic guidelines for the volunteer development were defined to improve the existing legal, financial and institutional mechanisms, to support civil society development and to achieve the enabling environment for civil society development in Croatia.

Regarding the liability of first responders in an emergency, it was determined in Art. 1047 of the Civil Obligations Act (NN 35/05, 41/08 and 125/11), “if damage is a result of performing an act of public interest for which an approval has been obtained from the competent authority, only a compensation for damage exceeding the usual limits may be required (excessive damage). In that case, however, socially justifiable measures with the aim of preventing the occurrence of damage or reducing the damage may be requested.”

2.7 Legal regulations for international engagements of first responders and crisis managers

As explained by the IPA CP Cooperation Programme II (2012), the status of personnel of bilateral partners is clarified in the bilateral agreements. “The Prime Minister gives the final word on behalf of the whole Government regarding the request for international assistance. He/she has the right to make the decision alone, but he is usually advised by the NPRD General Director and the national headquarters.” It is not considered for the personnel of other international relief actors. This also applies for issues concerning the liability for damage caused by relief personnel.

An international cooperation between the NPRD and equivalent authorities is built upon agreements on the bilateral, regional and international level (NPRD 2014a). International treaties on cooperation in the field of protection from disasters are signed with the following contracting parties.

- Republic of Hungary;
- Republic of Slovenia;
- Bosnia and Herzegovina;
- Slovak Republic;
- Republic of Macedonia;
- Republic of Albania;
- Republic of Montenegro;
- Republic of Poland;
- Republic of Austria;
- French Republic;
- Russian Federation.

Memorandums of Understandings have been signed with:

- European Union (Community Mechanism for Civil PROTECTION; FINANCIAL INSTRUMENT CIVIL PROTECTION);
- Memorandum of Understanding on the Institutional Framework Initiative for Preparedness and Prevention disaster for South Eastern Europe.

In detail, regional cooperation was decided in the frame of:

- DPPI (the Disaster Preparedness and Prevention Initiative);
- SEDM (the South-East Europe Defence Ministerial);
- CMEP SEE (Civil Military Emergency Preparedness South Eastern Europe).

Specific regulations exist in order to guide the engagement in mutual assistance across borders, which are listed below.

- Regulation on the amount of compensation to persons engaged in the protection and rescue outside the Croatian borders (NN 90/06);
- Regulation on the procedure of crossing the border when receiving or sending urgent assistance in protection and rescue (NN 52/06);
- Regulation on the definition of compensation for temporarily seized movable property, to implement measures for protection and rescue (NN 85/06);
- Regulations on the participation of members of operational and rescue forces in the activities of forces for immediate aid in disasters abroad (NN 73/06);

- Law on Participation of the Croatian Armed Forces, police, civil defence, civil servants and employees in peacekeeping operations and other activities abroad (NN 33/02, 92/02).

Furthermore, a SOP was prepared for the coordination between national authorities while sending/receiving international assistance in emergency situations, which determines the responsibilities of all participants, the communication and coordination lines in between them as well as the specific procedures for sending, receiving and “processing” transiting international assistance. The coordination structure in case international teams are also present in the operations is covered by these SOPs (IPA CP Cooperation Programme II 2012). Additionally, an extra SOP for the provision of cross-border assistance in extinguishing the fire of open space between Croatia and Bosnia & Herzegovina exist.

The Decree on crossing national border while sending/receiving international assistance in emergency situations (adopted in 2006) builds the basis for the deployment of forces abroad (IPA CP Cooperation Programme II 2012). As an example, it determines that

“Visas can be issued expeditiously, exceptionally even at border crossing points. Customs duties and related fees are waived for the relief items and for the equipment of international intervention teams, provided that all items are well documented. As entry is always facilitated by a representative of NPRD (or of its local office), the likelihood of any misconduct or violation of these rules are practically non - existent.”

There is no additional certification procedure for foreign disaster relief personnel. Medical personnel can provide basic healthcare, especially if they are part of a certified USAR team (IPA CP Cooperation Programme II 2012). The national headquarter is responsible for issues regarding the operations and logistics of assisting international teams. As further explained within the Analytical Study on Host Nation Support (2012), should an OSOCC eventually be established, it shall deal with the request via the liaison officer “assigned to it. To provide logistical services for national intervention teams, standard procedures are in place, whose application may be extended to international teams, too, if feasible.” “Although, there are no restrictions concerning the import of emergency equipment, the use of own radio frequencies is prohibited, because it may cause interferences with the frequencies of national authorities.”⁵⁷¹ Croatia determines free frequencies for international disaster relief teams, which can be distributed in case of need. In the responsibility of a Host Nation, Croatia takes to care for the security and safety of relief personnel, their equipment and relief consignments. In a case of security constraints, security advice is provided by the representative of the police in the national headquarter (IPA CP Cooperation Programme II 2012).

In the past, Croatia rendered assistance to several disaster-affected nations upon request. These were in the case of forest fires in Montenegro in 2002, fires in Bosnia and Herzegovina, Macedonia and Greece in 2007, forest fires in Israel and Bosnia and Herzegovina in 2010, floods in Slovakia in 2006, floods in Hungary in 2010, floods in Albania in 2011 and severe weather conditions in Montenegro in 2012 (NPRD 2014a). The provision of assistance to Hungary, Bosnia and Herzegovina, Greece was organised by the NPRD as the Croatian contact point for the EU Mechanism (Austrian Red Cross 2014).

⁵⁷¹ <http://www.gpo.gov/fdsys/pkg/CFR-2001-title7-vol1/xml/CFR-2001-title7-vol1.xml>

3 Organisation

3.1 Organisational chart

The Law on Protection and Rescue defines three levels of responsibilities for the area of Civil Protection. As illustrated in Figure 74, these are the level of the state, the counties and the municipalities or towns.

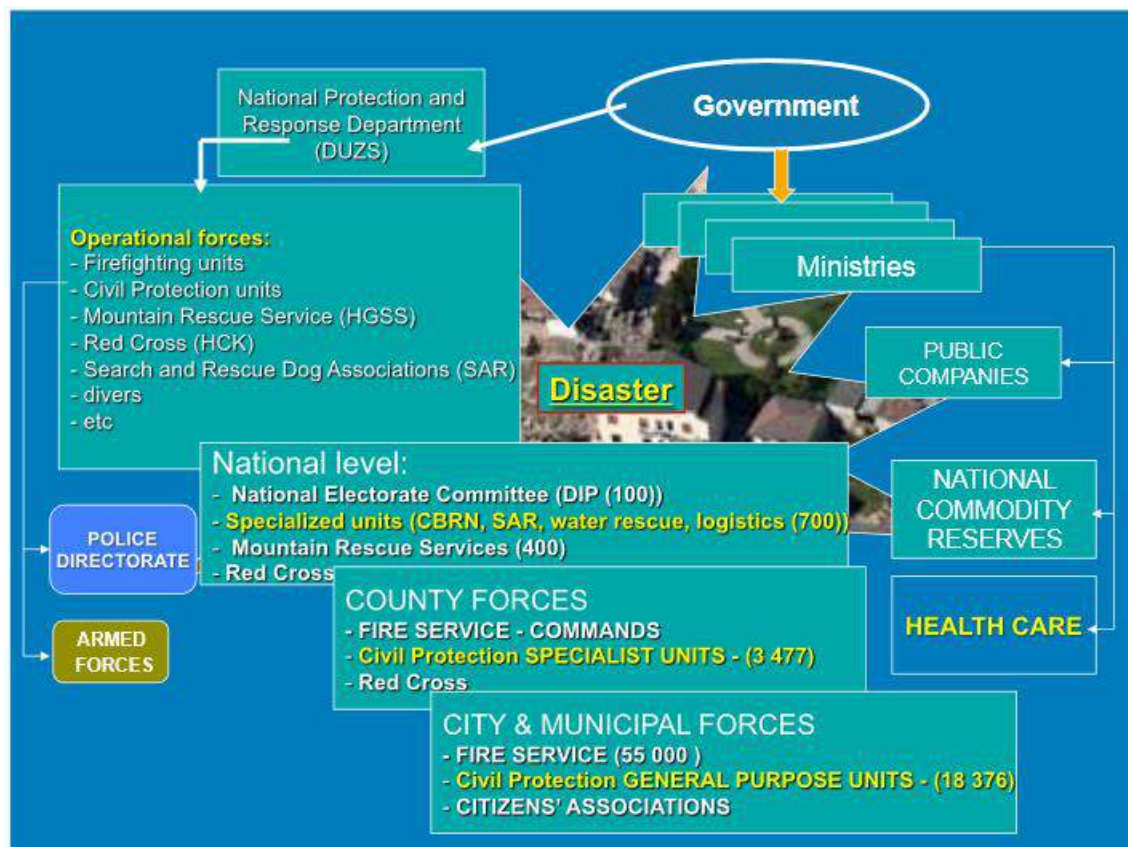

Figure 74: Organisation of emergency response in Croatia (WHO, 2012)

Authorities at the level of regional and local self-governments participate in the implementation of guidelines to ensure the functioning of the protection and rescue system in their area of competence. Furthermore, they are responsible for financing the protection and rescue system at the spatial level concerned. Additionally, regional and local authorities take part in drafting protection and rescue plans, adopt threat assessments and pass general acts for the management of operational forces (IPA CP Cooperation Programme II 2014).

Municipalities and towns are mandated to mobilise all available human and material resources in order to respond to a disaster in their territory. Since the event overwhelms the capacities at the local level, assistance from county level by contacting its prefect can be requested. The county is responsible for the mobilisation of resources within its territory until its capacities are insufficient. After a request for help at the state level, the NPRD assumes the overall coordination and organises response with support from its subordinate departments.

As defined by the NPRD (2014b), in the event of disasters, major accidents and accidents with dangerous goods on Croatian territory the provision of direct technical assistance, additional capabilities and resources will be ensured by these units. Organised as the operative force for specialist tasks of protection and rescue, they will become mainly active in the field of CBRN, Search and Rescue (SAR), water rescue and logistics. Furthermore, they take part in planning, operational and technical issues related to the preparation and achievement of full operational readiness, equipment and training. In general, a state intervention unit of Civil Protection is composed of professionals and reservists. While professionals primarily fulfil duties related to the establishment of state intervention units of Civil Protection, drafting proposals of development plans, deploying staff and material/technical resources, planning the preparation and implementation of training programs and participate in the planning, organisation and implementation of these exercise, reservist monitors the development of new technologies, equipment and resources, methods and procedures in the protection and rescue and proposes their practical introduction into operational use (NPRD 2014b).

An important agency is the National Headquarter for search and rescue at sea is under the jurisdiction of the governmental coordination. It hosts 48 vessels of the Ministry of Maritime Affairs, Transport and Infrastructure, 38 vessels of the Ministry of the Interior and the air units of the Ministry of the Interior as well as of the Ministry of Defence. However, in a case of need a conveyance, environmental units and privately owned vessels or airplanes might be included.

Additionally, the National headquarter for search and rescue at sea has the competence to organize relief operations, i.e. search and rescue at the sea. Both key players are supported by police forces and build the core structure of the Croatian disaster management. As the main legal document, the Law on Protection and Rescue regulates the disaster management, which is supplemented by other laws related to the certain areas of critical infrastructure protection, the mountain rescue (Borić 2014), protection against natural disasters, the organising element of the fire brigades and fire protection. The national coordinating body for the all-hazards approach is also the NPRD while relevant services and institutions established by the government participate in preparation and implementation of protection and rescue activities and measures. The system is on the operational level subdivided into agencies that cope with specific threat types such as floods, wildfires, mountain rescue and protection, etc. In a case of multidimensional incidents, cross-sector coordination is ensured by the NPRD (Samardžija et al. 2014).

In the case of major accidents and disasters, the NPRD has the following duties (NPRD 2014a):

- Establishing mandatory guidelines for the management guidelines for risk management and rescue;
- Implementing the mobilisation of departments and units of the board and the operational and rescue forces;
- Coordinating, managing and directing operational command of forces in disasters and major accidents;
- Directing and coordinates the activity of operational forces in the field of protection and rescue;
- Performing tasks of informing and alerting the population and coordinate unique alert system in Croatia;
- Performing inspections of operational power;

- Cooperating with the competent authorities of other countries and international organisations in the protection and rescue, in order to provide and accept international assistance and joint action;
- Providing information to the public.

The NPRD stated (2014a) that the functioning of the National Protection and Rescue System in the 20 counties of Croatia is ensured by its subordinate offices at the county level. Each county has a County 112 centre and a Prevention, Planning and Inspection Department. Protection and Rescue Departments have been established in the major cities Zagreb, Rijeka, Osijek and Split, and National Intervention Units are in place in the county offices at the coast Zadar, Šibenik, Split and Dubrovnik (Radovic, Vitale, and Tchounwou 2012). The units at the county level are dedicated to provide their service in protection and rescue operations, if special skills are required, especially in the case of forest fires.

As illustrated in Figure 75, the NPRD, which is affiliated to the Ministry of Interior, comprises three divisions of imperative relevance for crisis management, namely the International Cooperation Department, the Director's Cabinet and the Internal Revision Department (Swedish Civil Contingencies Agency 2009). The strategic forefront rests on five sectors, which are focusing on specific issues of civil protection and rescue. These sectors and their tasks will be discussed below.

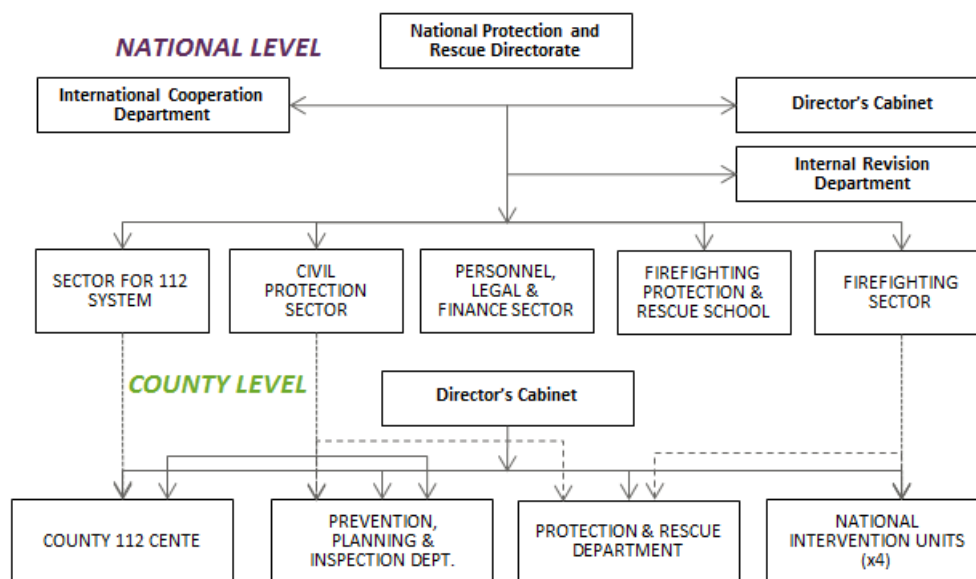

Figure 75: The Structure of the National Protection and Rescue Directorate

Available at: <http://seekms.dppi.info/national-protection-and-rescue-directorate/>; accessed: 17th September, 2014.

The Sector for the 112 System is composed of the national 112 Centre, the Prevention, Planning & Supervision Department and the Communications & IT-Department (Swedish Civil Contingencies Agency 2009). Furthermore, by acting as an operational communication service for data and information management as well as a notification service, it fulfils the duty of crisis communication and has to inform the public as well as authorities and rescue services.

The Civil Protection Sector includes two departments – the Operations & Analysis Department and the Prevention, Planning and Inspection Department. The last one directs rescue forces in the case of emergency by assuming mobilisation and coordination tasks. Furthermore, it implements prevention

measures, e.g. risk assessment, preparing SOPs, etc. and takes tactical tasks by monitoring current disasters and conducts a need assessment (Swedish Civil Contingencies Agency 2009).

In the frame of the central administration, the Firefighting, Protection and Rescue School is dedicated to prepare plans and standards, monitor training programs and provide training exercises for professional firefighters and commanders of civil protection and rescue staff. Similar to the Civil Protection Sector, the Firefighting Sector is focusing on the protection against fire by performing an assessment of the situation as well of the needs of the field staff. This Sector acts as an overarching coordination body for the fight against fires, especially if they cross county borders. In cases, which require land and air forces, the Firefighting Section works on the harmonization between the Ministry of Defence and the Ministry of the Interior to receive support of the military and/or the police (Swedish Civil Contingencies Agency 2009). Together with the MoI its tasks concerns the preparation of strategies and programs for further implementation of fire protection. Another close cooperation exists with the MoD and the Croatian Fire Fighting Association concerning the pushing forward of intervention plan for a large-scale forest fires. The National Intervention Units remain under the control of the Firefighting Sector. Additionally, a Personnel, Legal & Finance Sector has been established, which is dedicated to handle the legal, personnel and financial issues, relating to the legislation, maintain a real property database, prepare contracts, maintain books on business relations and medical insurance policies for employees (Swedish Civil Contingencies Agency 2009). There, the Legal Department, the Personnel Department, the Finance Department as well as the Department for Investments and Procurement have been integrated.

Apart from the dominating role of the independent NPRD, the protection and rescue system relies on professional firefighters, volunteers and private specialist contractors. Pursuant to the Constitution of the Republic of Croatia, professional firefighters are assigned to local authorities, which provides the financial basis for their performance (Croatian Firefighting Association 2011). If necessary, they can be deployed by the central firefighting sector.

As an important voluntary NGO, the Croatian Red Cross (CRC) is integrated in the National Protection and Rescue System at the national and local level. With its 20 branches at the level of counties and 110 branches at towns and municipalities, the CRC provides first aid, disaster preparedness and response, tracing service, health programs, water life service and humanitarian activities (NPRD and UNDP 2012).

The Croatian Rescue and Mountain Service (CRMS) is built upon twenty territorial units. As a specialized rescue service, the main areas of action are the help on rugged terrain during difficult weather conditions and in rescue scenarios, which require special equipment or know-how. A strong cooperation was established between CRMS and the police, the Croatian Armed Forces and firefighters. "Croatian Mountain Rescue Service gathers the fittest Croatian rock climbers, speleologists, mountaineers and skiers, specially trained in administering of first aid and in all mountain rescue techniques, including helicopter-aided rescuing and search parties in rugged terrain involving the use of rescue dogs. Croatian Mountain Rescue Service has around 500 members, including 25 medical doctors and 12 instructors."⁵⁷² In addition, the CMRS is providing first aid to people injured in rugged areas and fosters education and prevention, especially of mountaineering related accidents. Additionally, specialised diving associations, rescue dog services and amateur radio organisations play a role in the protection and rescue system (Samardžija et al. 2014).

⁵⁷² <http://www.hgsszd.hr/en/o-nama/>

Private specialist contractors, which are designated to perform protection and rescue activities in their everyday business as well as citizens' associations whose activities are complementary to protection and rescue measures are engaged on the basis of public-private partnership (European Commission 2014). Especially, in the area of disaster risk reduction, ICT companies contribute to the warning and disaster response system (SEERDRMP, UNDP Croatia, and UNDP 2011).

At the level of ministries and agencies, the Central State Administration Authorities contribute to the efficient functioning of protection and rescue systems by planning and allocating resources and equipment for protection and rescue needs, collaborate in threat assessment with the NPRD (in the area of their competence) and ensure an appropriate competence level of staff to undertake measures and activities necessary for efficiently carrying out the services of a central state government authority in disaster and major accident situations (European Commission 2014). The Meteorological and Hydrological Service of Croatia (NHMS) is a national centre of excellence based on high standards. Their tasks include the support to economic development, environmental protection, measures for the preservation of life and material goods from natural hazards and related mitigation measures as well as monitoring and observation of hydro-meteorological phenomena (SEERDRMAP, UNDP Croatia, and UNDP 2011).

Charged with the maintenance and deployment of the network of seismographs and other instruments and collecting, analysing and archiving of seismological data, the Croatian Seismology Survey, which is part of the Geophysical Institute of the Faculty of Science and Mathematics of the University of Zagreb. Also research on earthquake related issues are one of their key competences.

Croatian Waters is responsible for the monitoring of water flow and water level prediction, while the River Section Director for Flood Protection is the competent authority to declare the beginning and the end of the both regular and emergency protection. Strong cooperation exists between Croatian Waters and DHMZ in order to provide "high-quality controlled national and international hydrological data in near real time in agreed format" (SEERDRMP, UNDP Croatia, and UNDP 2011).

The Croatian Mine Action Centre (CROMAC) is responsible for research on and improvement of mine action techniques, technology and methods, testing of machines, mine detection dogs and handlers, testing and field evaluation of modern technologies, education and expert assistance to the countries in the region and beyond.⁵⁷³

As regulated by appropriate laws (e.g. Act on Defence), assistance from police forces and the Croatian Armed Forces can be requested in the case of major disasters.

The General Police Directorate is managed by the General Police Director and have to fulfil tasks in the area of:⁵⁷⁴

- Monitoring and analysing the state of security and developments leading to the emergence;
- Harmonisation, guidance and supervision over the work of Police Directorates and Police Administrations;
- Immediate support in particular more complex operations of Police Directorates and Police Administrations;

⁵⁷³ Information is available at: <http://www.ctro.hr/eng/menu/about-us/article/about-us-12.html>; accessed: 11th October, 2014.

⁵⁷⁴ Information is available at: <http://www.mup.hr/1259.aspx>; accessed: 17th September, 2014.

- Contribution to the implementation of the international agreements on police cooperation and other international acts under the competence of the General Police Directorate;
- Application of standards for the equipment and technical means;
- Providing the basis for the police readiness to act in the state of emergency.

3.2 Organisational cooperation

In order to establish cooperation in the field of protection and rescue issues, the NPRD is the focal point for the appropriate counterparts in neighbouring countries as well as for international organisations (Swedish Civil Contingencies Agency 2009). As explained at the Vademecum-Website (2014), a Decree on how to receive and send urgent assistance in case of a demanding emergency situation has been issued in accordance with the Protection and Rescue Law. The Decree defines the responsibilities of the NPRD, the Border Police and Customs when international assistance is crossing the Croatian state border and the coordination between these authorities. An appropriate SOP has been developed to define the obligations of the NPRD, the Border Police, Customs, the Ministry of Defence, the Ministry of Health and Social Welfare and the Ministry of Foreign Affairs and European Integration. Furthermore, it determines the communication and coordination procedures between the involved actors. Additionally, cooperation has been established with the NATO Euro-Atlantic Disaster Response Coordination Centre (NATO-EADRCC) and the European Union Community Mechanism for Civil Protection. Coordination at the international level is provided by the Government or the NPRD as a central state administration body for this kind of events. Corresponding to that, the NPRD has been incorporated as a focal point for the International Search and Rescue Advisory Group, both for political issues and for operations (INSARAG 2014).

Regarding the probability of the simultaneous occurrence of events, the County department for Civil Protection (2014) has indicated, that the Croatian system of Protection and Rescue is based on the principle of subsidiarity, meaning that the response to possible crisis at first must be provided by the local government level, then at regional level and finally at the state level – if local capacities are not sufficient. The top priority for the action of these forces are, in any case, the saving of human lives and, secondly, the mitigation of damage to material and cultural goods. As priorities, certainly, those threats will be ranked first, which are well-known that they can turn into major accidents and disasters (Expert Interview 2014).

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

The County department for Civil Protection (2014) pointed out that, in Croatia, SOPs exist, but are mainly related to firefighters, CMRS and NPRD, who have developed their SOPs and are continuing on their improvement. There it was expressively stated that the NPRD is in charge for drafting plans, preparing appropriate by-laws (Swedish Civil Contingencies Agency 2009) and the launching of standard operating procedures. Due to the fact that the main actors also provide training, according to the established plans, they permanently receive feedback from a user view. It should be noted that the existence of plans at the national, as well as at the levels of local and regional governments, are mainly addressing specific threats. This will become apparent by the title of the plans, e.g. Croatia have Fire protection plans ("Firefighting and management", Flood protection plans, etc. As mentioned by Jeraj (2014), for the case of cross-border activities, Croatia and Slovenia are developing a common Standard operating procedures for fighting open space fires.

The Website of the NPRD provides a comprehensive overview on Standard Operating Procedures, concerning Civil Protection (National Protection and Rescue Directorate 2014):

- SOP for treatment of a single operative - Communication Centre 112 at the fire in the open air;
- SOP Croatia – Bosnia & Herzegovina on the provision of cross-border assistance in extinguishing the fire of open space;
- SOP to use weather forecast Meteorological and Hydrological Service;
- SOP for the operation of a single operative - Communication Centre (centre 112) - Delivered location data of users for calls from mobile telecommunications networks – AMENDMENTS;
- SOP for the operation of the single operations and communications centre 112 in case of an accident in the tunnel;
- SOP for the operation of a single operative - Communication Centre 112 in the case of search and rescue operations on the mainland or an island;
- SOP for the operation of a single operative - Communication Centre 112 in case of an accident on the highway;
- SOP for treatment of a single operative - Communication Centre 112 in case of an accident on the state, county, local and unclassified roads;
- SOP in organizing transportation for the purpose of organ transplants;
- SOP for border crossing;
- SOP for the operation of operational and rescue forces in flood;
- SOP on call emergency numbers by which operators of public communications networks Centres 112 and 112 National Centre must allow free calls.

The rulebook, developed by National Directorate for Protection and Rescue, lays down rules and means for citizen alert system, as well as procedures for citizen alert system related to the origin of a crisis, procedures during the crisis and ending the crisis.

The protocol on standard operative procedures of the Common operative and communication centre (112 Centre) defines the way of common actions of operational troops and the Common operative and communication centre (hereinafter 112 Centre), procedures for transmission of all available information related to crisis, accidents, big accidents or catastrophes after receiving information through 112 service, procedures of information analysis and forwarding to the operational troops and other participants in protection and rescue operations, as well as obligations of participants in protection and rescue operations towards 112 Centre, aiming at organised and coordinated implementation of protection and rescue operations. It includes also actions of Common operative and communication centre 112 and other participants in protection and rescue operations during firefighting actions on open space.

The Standard Operative Procedure for action of operative troops for protection and rescue during floods launched by the National Directorate for Protection and Rescue is delivered to harmonise cooperation and action of operative troops for protection and rescue, as well as rescue operations during floods, where actions should follow Plan for protection and rescue on the territory of the Republic of Croatia and other basic legislation, particularly Law on water and National plan for flood defence. By applying SOP, a maximal integration of operative capacities and their efficient implementation within the whole protection and rescue system on the territory of the Republic of Croatia will be assured.

4.2 Operations planning

In general, disaster preparedness plans and contingency plans are in place at all levels (local, regional and national) and are reviewed, supplemented and tested in practice regularly. County and local governments are responsible for the development of draft protection and rescue plans (e.g. disaster preparedness plans) for their respective administrative units. Preparedness/contingency plans are publicly available and are posted at the county and local self-government web sites (SEERDRMP, UNDP Croatia, and UNDP 2011).

4.3 Logistics support in crises

The “Rulebook on mobilisation and action of the Operational Protection and Rescue Forces (NN 40/08, 44/08), adopted by the NPRD, regulates the deployment and management of operational forces, determining their management, command and coordination during disasters (Samardžija et al. 2014). While protection and rescue headquarters are responsible for the management and command of operational forces at the local and regional level, the NPRD is the competent authority at the national level. Furthermore, the organisation in terms of recruitment, personnel and material of those units is determined by regulations of the “Rulebook on organization, recruitment and equipping of the civil protection units and alerting units” (NN 111/07), passed by the director of the NPRD. As stated by Samardžija et al. (2014) stated, according to the Law on Protection and Rescue, logistics and equipping relies on NPRD warehouses, resources of local and regional self-government units and civil organizations whose members are recruited, depending on the type of the engaged units.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

As pointed out by the United Nations Office for Disaster Risk Reduction (2009), the system of alerting authorities is based entirely on the emergency number 112. Through this system, reports and signals regarding all levels of emergencies are collected and alerts are issued.

The early warning system is a part of the NPRD and is interconnected with warning centres, monitoring stations and alarm units. Furthermore, warning centres, which act as a communication hub in times of a disaster, operates sound alarm systems. Alarm units forward information about threats to the Warning Centre and alarm the population (Republic of Croatia 2010). As stated by the County department for Civil Protection (2014), there are many ways to warn the citizens. From the simplest such as triggering an alert by sirens to the more complex as it is the use of public media. The sirens are located in the 112 Centres of the NPRD but have also been established at the local fire departments. Not all sirens of firefighters have been linked to the system 112 of NPRD. These current circumstances have been considered as a sub-optimal, because the forwarding of information, e.g. about the type of danger or the specific threat, might be later than the impact of an event affect the population. It was stated by SEERDRMP et al. (2011), the Standard Operating Procedures of the Integrated Operational-Communicational Centre (Centre 112) defines the way of common actions of operative units and Common operative and communication centre, procedures for transmission of all available information related to crisis, accidents, big accidents or catastrophes after receiving information through 112 service, procedures of information analysis and forwarding to the operational units and other participants in protection and rescue operations.

Furthermore, as obligations of participants in protection and rescue operations towards 112 Centre, which is aiming at the organised and coordinated implementation of protection and rescue operations have been defined. It includes also actions of Common operative and communication centre 112 and other participants in protection and rescue operations during fire-fighting action on open space. The communication of threats is mainly located at the Sector for 112 System, which operates at the national and county centres as a 24 hour a day – 7 days a week service. The sector comprises the national 112 Centre, the Prevention, Planning and Supervision Department and the Communications and IT Department. The tasks of the 112 Sector include the collection and processing of information as well as the notification about events.

A central data storage for the collection of real events has been established. Equipped with a public alert system, it is responsible for informing the general public as well as the legal persons, the national administration and the emergency and rescue services. Furthermore, it is dedicated to coordinate the transfer of commands and decision between various levels (Tomin and Barbera 2011). If an approaching danger has been detected by a hydro-meteorological forecasting system, warnings will be forwarded to the flood defence centres at the counties, Croatian Waters and the Main Centre of Flood Defence. The last one is responsible for notifying the NPRD and updating information about current events permanently (ICPDR 2012). According to the Government of the Republic of Croatia (2005), databases for individual risk types are maintained by risk-specific expert groups, i.e. Technical Support Centre (nuclear risk), the National Institute for Toxicology and the Information Centre of the National Oil Company, etc., which are forwarding relevant data to warning centres, the government, Civil Defence Headquarters.

5 Capabilities

5.1 Human resources

At the state level, there are a total of 540 people ordinarily employed in Civil Protection duties, consisting of public servants employed with the NPRD and staff of the 112 system. In the case of an emergency, 900 private specialist contractors and 50 professional firemen will support employees of the NPRD. The county level comprises 180 people in the Civil Protection Sector in times of peace, which are mainly employees of the 112 system. In towns and counties of Croatia, 2,300 professional firefighters and about 60,000 volunteers can be mobilised for Civil Protection in cases of disasters. This number includes personnel from the National Protection and Rescue Directorate (plus the sector for the 112 system), private specialist-contractors, professional firefighters and volunteers; in total, about 63,970 individuals could be involved for civil protection in emergency periods. This amount corresponds to approximately 2.15 percent of the national active population (United Nations Office for Disaster Risk Reduction 2009).

According to the Croatian Firefighting Association (2011), in Croatia there are 1,835 volunteer firefighting units in municipalities and towns, 56 volunteer industrial firefighting units, 61 professional public city firefighting units, 34 professional industrial firefighting units, four intervention units of the Ministry of Interior and in addition, special firefighting forces and forces of the anti-fire escadrille of the Ministry of Defence. As presented by the Croatian Parliament (2006), in 2005, the Croatian Armed Forces had a numerical size of 18,479 active military personnel.

The state intervention units consist of teams dedicated to providing measures in the area of CBRN, Search and Rescue (SAR), water rescue and logistics (NPRD 2014b). The state intervention units for the Civil Protection have total personnel of 612, which are composed of 227 members from the Departments in Zagreb, 186 from the Department Osijek and in equal shares of 197 members from Department of Rijeka and the Unit in Split. In all departments and the Unit of Split, the major part of members takes the logistic team.

As already stated by Samardžija et al. (2014), the Croatian civil protection system strongly relies on volunteers which play an important role in all aspects. As illustrated in Table 21, without the contribution of police forces, about 90,402 personnel may participate actively in the case of an emergency. The result of this evaluation is more recent compared to the one provided by (United Nations Office for Disaster Risk Reduction 2009) at the beginning of this section. Moreover, it includes about 18,500 members of the Croatian army, therefore these numbers cannot be compared directly.

Table 21: Overview on operational forces for protection and rescue activities in Croatia

Stakeholder Type	Name	Number of Personnel
Voluntary Organisation	Croatian Mountain Search and Rescue Service	~ 750
	Croatian Red Cross	8,852
	Volunteer fire-fighting units of towns and municipalities	56,415
	Volunteer fire-fighters of industrial fire-fighting	1,621

	units	
	Professional fire-fighters in volunteer fire-fighting units	236
	Professional industrial fire-fighters	778
	Professional fire-fighters of public fire-fighting units	2,371
Agency/Department	Croatian Armed Forces	18,479
	Police	unknown
Private business	Private specialist contractors	900
Total		90,402

In Croatia, civil protection forces will be trained on the basis of a regular system of training and courses (European Commission 2014). For the needs of civil protection, the training through a regular system of education is being performed by enlisting adequate programs in the curriculum of elementary schools, and a three-year specialist training for the vocation of fireman. Even so, most of the training is maintained through specialist courses, which are being performed in combination, through centralisation or decentralisation, at the state level or at the local self-government level and administration.

5.2 Materiel (non-financial) resources

In Croatia, protection and rescue plans at each administrative level determine the appropriate material and technical means used in the event of a crisis (Expert Interview 2014). Furthermore, it has been stated that there are plans in Croatia to use some military resources when they are needed. Protection and Rescue Plans define what kind of legal and natural persons in the sphere of local and regional governments will be entrusted with tasks to conduct certain activities in the case of disasters and major accidents. The County Department for Civil Protection (2014) has named as examples the PP NOS firefighting planes in the case of large forest fires and the helicopters for emergency medical flights and rescuing victims from inaccessible areas.

As stated by the Croatian Firefighting Association (2011), the participation of special firefighting forces and forces of the anti-fire escadrille of the Ministry of Defence involves, if necessary, the provision of the following special assets:

- 6 Canadair CL 415;
- 6 Air-tractors 802 A Fire Boss;
- Helicopters of the type Mi-8 and 117-Š of the Croatian army.

In the period of 2003-2009, 210 fire-vehicles and a firefighting robot, produced by DOK-ING Company, were acquired. There are the following types of vehicles available at the firefighting units in Croatia.⁵⁷⁵

- Attack vehicles;
- Water tankers;

⁵⁷⁵ Information is available at: <http://www.firegeezzer.com/2011/05/20/the-croatian-fire-service-then-and-now-part-2/>; accessed: 19th October, 2014.

- Chemical vehicles;
- Technical vehicles;
- Turntable ladders;
- Forest vehicles;
- Command vehicles;
- Other vehicles (used for some special purpose like transport of equipment or personal, industrial fire-fighting, aero ports, tunnels etc.).

Within the National Report for the WDRC, the Croatia Government stated (2005), that at the national level, the Directorate for Strategic Commodity Stockpiles and the Ministry for Economic Affairs, Labour and Entrepreneurship are responsible for stockpiles of food, energy and equipment.

As stated by the Croatian Red Cross, the required “equipment is procured and stockpiled in the central warehouse in Zagreb and in regional warehouses.”⁵⁷⁶

The Law on Strategic Commodity Stockpiles, 2002 (NN 87/02) determines the holding of emergency stockpiles, its financing and their facilitation. As defined by the law, in the event of major natural disasters and technical/technological and ecological disasters, agricultural products, foods and non-food products, oil products, materials and raw materials for production should be available at stock.

In Croatia, companies operate storage facilities for commodity reserves. HANDA, an entity under Public Law, is responsible to form the state compulsory oil stocks at the level of a 90-day-consumption by 31st July 2012, in line with EU directives.

According to the report of the Petroleum Development Consultant Limited & Energetski Institut Hrvoje Požar (2011), in Croatia the following emergency stock was held in 2010 (see Table 22).

Table 22: Overview on current emergency stock holding in Croatia

Type	Stock (tonnes) held by HANDA, July 2010	Stock (tonnes) held by industry, July 2010
Crude oil	293,043	48,084
Motor gasoil	30,000	10,720
Diesel	25,000	23,920
Jet fuel	0	900
Gas oil	0	4,752
Fuel oil	35,000	7,725

5.3 Training

The Firefighting and Protection and Rescue School of the NPRD offers response-oriented specialist courses and trains professional firemen and protection and rescue forces (command headquarters, unit commanders, shelter managers and civil protection commissioners). Training and workshops for county and local government (for mayors, senior management and other relevant staff), as well as for volunteer associations (diving associations, mountain rescue services, volunteer fire departments) are organised by the NPRD. In 2011 on average 50-360 hours of training sessions were completed at national level and 50-80 hours at local level (SEERDRMP, UNDP Croatia, and UNDP 2011). It was

⁵⁷⁶ Information is available at: <http://www.hck.hr/en/category/-disaster-preparedness-and-response-63>; accessed: 21st October 2014.

mentioned within the IPA Needs Assessment that, “Croatia extensively uses simulation exercises to validate preparedness activities and contingency planning”.

Radovic et al. (2012) emphasised that employers have an obligation to train employees in rescue and evacuation measures for the case of emergency. There are special regulations concerning the prevention, firefighting and evacuation of employees.

In the frame of an international disaster mitigation process, Croatia offers an international training program for medical response to major incidents to educators.

NMHS is conducting internal capacity building and technical training activities related to DRR, such as evaluation of the suitability of communications, workstations, and software to support DRR; forecasting of hazards including up-to-date training of new forecasting technologies and products; training on DRR processes and similar. In addition, NMHS participates in exercises and drills, e.g. “concerning nuclear accidents, floods, major traffic accidents etc. to ensure disaster preparedness. Pamphlets, brochures, posters and recorded materials are the methods and instructional materials used by the HMS to provide education and public outreach programmes”⁵⁷⁷. The UNISDR (2009) indicated, that the Firefighting Protection and Rescue School of the National Protection and Rescue Directorate maintain many cooperation in the field of Civil Protection, i.e. the United Kingdom’s Bournemouth University (courses on international disaster management) and with the Italian training centre FORMEZ (affiliated to the Presidency of the Council of Ministers). Moreover, in the frame of the Stability Pact – DPPI Croatia has stipulated a Disaster Management Training Program, which is embedded in the cooperative network for countries of South Eastern Europe. Based on a common organisation of the Croatian National Protection and Rescue Directorate and the Slovenian Administration for Civil Protection and Disaster Relief special Risk Reduction Training Courses have been offered to professionals.⁵⁷⁸ Addressing the response to specific hazard types, training sessions for specific scenarios, i.e. cave accidents, have been established, involving 150 cave rescuers from Croatia and Slovenia.

Croatia is frequently joining international and European training exercises. The country “is enhancing its national civil emergency and disaster management capabilities in cooperation with NATO and through participation in activities, organised by the Euro-Atlantic Disaster Response Coordination Centre (EADRCC). Croatia also participates in the work of the Senior Civil Emergency Planning Committee.”⁵⁷⁹ In March 2010, the NPRD representatives participated at the international rescue dog exercise in Slovenia. Republic of “Croatia has also participated in the NATO Crisis Management Exercise CMX09.”⁵⁸⁰ Furthermore, the NPRD participate in the EU Civil Protection Mechanism training programme and in the UN CADRI and DPPI DRR oriented workshops and training (SEERDRMP, UNDP Croatia, and UNDP 2011). Training sessions and other types of educational events are regularly completed in the course of bilateral and international cooperation. In cooperation with the Civil-Military Emergency Preparedness, specific disaster management related training and workshops have been attended. Some important training exercises are provided in Table 23.

5.4 Procurement

5.4.1 Procurement regulation

Exercised by the Department of Procurement, the NPRD is the superordinate body for the planning and quantifying of the state's emergency reserves required for the protection and rescue. Regarding the focus of procurement, the County Department for Civil Protection (2014) has argued, on the basis of its experience, that one should go with the other – that means, equipment and training needs to be procured together.

⁵⁸¹ Information about EU-related training session is available at:

http://ec.europa.eu/echo/files/civil_protection/civil/prote/exercises.htm#2009 (last updated: 10th July, 2014); accessed: 10th August, 2014.

⁵⁸² An overview on training sessions in the frame of the Disaster Preparedness and Prevention Initiative for South Eastern Europe (DPPI SEE) is available at: <http://www.dppei.info/programmes-activities/dmtp>; accessed: 29th September, 2014.

⁵⁸³ Information is available at: <http://www.morh.hr/en/news/press-releases/6350-nato-crisis-management-exercise-cmx-09.html>; accessed: 10th August, 2014.

In Croatia, the goods and services have to be procured under the Law on Public Procurement, for which a compliance with EU Directives can be assumed. At the moment, in Croatia a joint/cross-border procurement is under consideration regarding equipment and training (Expert Interview 2014). It has been indicated that there have already been several meetings with an attempt to jointly apply several projects for EU funding. From the standpoint of the County Department for Civil Protection (2014), an additional legislation with regard to cross-border procurement is vitally necessary. Based on previous experiences with cross-border missions, i.e. in Bosnia & Hercegovina, some lacks, concerning differences in country-specific SOPs and deficiencies at operational fieldwork, became apparent. The unequal standard of neighbouring countries is a hindrance for an interoperable approach and thus pointed out grievances, which should be eliminated as quickly as possible. Hence, any regulation that would facilitate the procurement of goods would be more than welcome.

5.4.2 Procurement procedures

In the Republic of Croatia, the NPRD is responsible for procurement at the strategic level of the state, while at the operational level, where operational forces, i.e. Firefighters, CMRS, etc., are the main actors, each department is free to dispose their procurement on their own.

Article 1 of the REGULATION ON PUBLIC PROCUREMENT FOR DEFENCE AND SECURITY PURPOSES (NN 89/12) defined the rules, conditions and public procurement for the following issues:

- *The supply of military equipment, including any parts, components and/or subassemblies thereof,*
- *Supply of sensitive equipment, including any parts, components and/or subassemblies thereof,*
- *Works, supplies and services directly related to the equipment referred to in points 1 and 2 of this article for any and all elements of its life cycle,*
- *Works and services for specifically military purposes,*
- *Sensitive works and sensitive services.*

In the course of the procurement regulation, compliance with the Directive 2009/81/EC was given as well as with the Directives 2004/17/EC and 2004/18/EC in the fields of defence and security. The regulation refers to the Public Procurement Act and the Act on State Commission for Supervision of Public Procurement Procedure (NN 21/10).

5.5 Niche capabilities

The best performing parts of the Croatia's civil security system are well-trained and well-equipped forces, particularly in the fire-fighting (both regular and voluntary forces) and flood protection. Croatia has highly professional and operational protection and rescue capacities at the central government level (healthcare, inspections, capacities of relevant public administration bodies and crisis management related services). Their skills and knowledge are one of the crucial assets for the system. Furthermore, specialised knowledge in the area of cave rescuing was established based on

the well-established speleological science in Croatia.⁵⁸⁴ In 2013, an international conference on the issue of mountain rescuing, where more than 500 of the world's best rescuers participated, was hosted in Croatia by CRMS. The speleological expedition „Lukina jama 2010“ was the occasion for the meeting of Croatian speleologists and colleagues from Bulgaria, England, Slovakia, Czech Republic and Spain.⁵⁸⁵

Close cooperation has been established between state administration bodies, NGOs, public and private companies (Samardžija, Tišma, and Skazlić 2014). The remarkable number of volunteers (about 71,000) can be identified as an important aspect of the protection and rescue system.

Furthermore, Croatia is considered as a Centre of Excellence for the training of firefighters and coordination of response to forest fires in the countries of South Eastern Europe.

As mentioned at ReliefWeb (2009):

Croatia is widely considered as a regional leader in the South Eastern Europe, particularly, in the area of wildfires risk management and monitoring and forecasting of meteorological hazards. The Government develops multi-year plans for hazard risk management, including the Protection and Rescue Plan developed by the National Protection and Rescue Directorate (NPRD), which describe the planned activities aimed at strengthening disaster risk management functions.

Croatia is regarded as driver for research on risks and disasters in the South-East region. Due to Croatia's contribution to the harmonisation of the firefighting brigades in the countries of the region through standardisation of equipment and procedures, thus promoting the regional cooperation and collaboration in disaster risk reduction.

In the view of the County department for Civil Protection (2014), best practices and transferable elements can be found in Fire-fighting, especially airborne task forces (firefighting planes-Canadair) and rescue from hard to reach areas (CMRS).

As emphasised by Samardžija et al. (2014), based on Croatia's experience with the consequences of war, "Croatia has developed humanitarian demining capacities (physical demining, equipment, know-how, and rehabilitation of mine victims) which represent its comparative advantages in Europe and worldwide."

Driving Innovation in Crisis Management for **E**uropean **R**esilience

CYPRUS

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: ATOS (Nadia Politou, Adem Yaşar Mülayim, Alejandro Afonso Spinola, Dario Ruiz)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by AIT and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

The republic of Cyprus consists of six administrative districts: Famagusta, Kyrenia, Larnaca, Limassol, Nicosia and Paphos.⁵⁸⁶ A district administration in "exile"⁵⁸⁷ exists on the Republic of Cyprus-controlled part of the island. The north-eastern part of the island is a self-declared state controlled by the Turkish Republic of Northern Cyprus (TRNC) and recognised only by Turkey, whereas the international community considers it as part of the Republic of Cyprus.

Figure 76: The Republic of Cyprus administrative divisions⁵⁸⁸

In more detail:

-  The Famagusta district, with the main town Famagusta which is the island's most important port.
-  The Kyrenia district, with the main town Kyrenia. It is the smallest district of Cyprus and the only one controlled entirely by the TRNC.
-  The Nicosia district, with the main town Nicosia (or Lefkosia) which is also the island country's capital city. The northern part of the district is controlled by the TRNC.
-  The Larnaca district, with the main town Larnaca where the island's primary airport is located. Part of the district is controlled by the TRNC.
-  The Limassol district, with the main town Limassol.
-  The Paphos district, with the main town Paphos, which is entirely controlled by the internationally recognised government of Cyprus. It is composed by four municipalities; Paphos, Yeroskipou, Peyia and Polis Chrysochous
-  The two areas in grey colour, namely Akrotiri and Dhekelia, officially named the Sovereign Base Areas of Akrotiri and Dhekelia, is a British Overseas Territory on the island of Cyprus.⁵⁸⁹

National crisis management & disaster response concept:

In Cyprus, crisis management and all emergency situations are handled by the Civil Defence, a governmental agency under the Ministry of Interior. Its main mission is to carry out various humanitarian actions intended to deal with the consequences of disasters, resulting either from natural actions (earthquake, flooding, hurricanes etc.) or from human actions (industrial accidents, armed conflicts etc.).

The members of the Civil Defence serve either at the General Directorate of Civil Defence (GD CD) or at one of the five regional managements (RMCD): Nicosia, Limassol, Larnaca, Paphos and Famagusta.

The RMCD offices operate five departments;

- Search, Rescue and Fire Fighting,
- First Aid department,
- Welfare department,
- Neighbourhood Watch department and
- Secretarial-Communications department.

Key stakeholders: Minister of Interior, GD CD, RMCDs, civil defence units (e.g. Search and rescue teams), community councils, Cyprus Red Cross, volunteers.

Financing: Other than civil protection purposes allocated to other government agencies 0.0452% of GDP is allocated for Cyprus Civil Defence/Protection organisation.

Furthermore, crisis management for Cypriots around the world is handled by the department of Crisis Management that belongs to the Ministry of Foreign Affairs. Under a crisis situation, this department is responsible for the risk evaluation and to provide recommendations on the best management and most possible actions to the Permanent Secretary of the Ministry of Foreign Affairs, such as repatriation of Cypriot citizens.

1 Policy

1.1 Risk Assessment

In Cyprus key risks and areas of concern are natural and man-made hazards, such as earthquakes, large fires, floods and marine pollution.

The Civil Defence department is the responsible authority in Cyprus for the execution of different measures for the prevention and control and management of all consequences related to natural and manmade disasters.

Cyprus has a major earthquake about every 10 years. During the 20th century there were recorded 30 incidents and 400 injured. The Paphos district is considered as a high risk area for earthquakes, where the last three major earthquakes occurred; in 1953 with 63 dead, in 1995 with 2 dead and in 1996 with no fatalities.⁵⁹⁰ Similarly, floods and tornados are quite rare with a very small number of casualties. On the other hand, technological accidents and fires, especially in periods of extreme temperature, are more common with about ten large incidents per year.⁵⁹¹

Based on the disasters recorded for Cyprus in the OFDA/CRED - International Disaster Database⁵⁹² between 1990 and 2014, the following figures demonstrate the frequency, mortality and economic effect of the disasters.

Figure 77: Frequency of disasters in Cyprus 1990 - 2014⁵⁹³

Table 24: Major disasters in Cyprus.

Year	Disasters
2009	Tornado
2008	Forest fire
2007	Forest fire
2007	Extreme temperature, Nicosia, 4 dead
2005	Drought
2005	Transport accident, 31 dead, 8 people affected
2004	Storm, Larnaca, 10 people affected
2003	Tornado, Limassol, Larnaca, 30 people affected, estimated damage USD 10 million
2000	Wildfire, Larnaca Sud
2000	Extreme temperature, Nicosia, 5 dead, 400 people affected
2000	Drought
1998	Fire at a military base, Episkopi, 692 people affected
1998	Extreme temperature, 52 dead, 100 people affected
1996	Viral meningitis epidemic, Limassol, Larnaca, Nicosia, 280 people affected
1995	Earthquake, seismic activity and ground shaking, Paphos and Nicosia areas, 2 dead, 1865 people affected, estimated damage USD 4.34 million
1991	Drought
1983	Storm
1970	Storm
1970	Cholera epidemic
1969	Storm, Limassol, 3 dead, 3100 people affected, estimated damage USD 0.1 million
1953	Earthquake, seismic activity and ground shaking, south-west, 40 dead, 100 people affected

1.2 Policy and Governance

Cyprus has a main national plan for crisis management with the code name “Zenon”. The main objective of this basic plan is to define the framework and to provide clear instructions for the complete organisation and functioning of the state system for crises management in the peacetime, by providing detailed allocation of responsibilities and obligations of ministries and state agencies.

The basic national plan “Zenon” is the institutional framework and guide to the ministries, who use it as a bases for the design and preparation of the individual specific plans, which encode 22 different situations and scenarios, such as the case of major disasters, technological accidents, terrorist

attacks, Middle East crisis, large coastal pollution and others which fall in the responsibilities of the corresponding ministries.⁵⁹⁶

The plan considers six main threats and defines the responsibilities of the Ministries of the Government⁵⁹⁷:

- **Earthquakes** whose primary responsibility for the co-ordination of relief activities rests on the Ministry of Interior - Civil Defence Force.
- **Forest Fires** where the primary responsibility belongs to the Department of Forest of the Ministry of Agriculture, Natural Resources and Environment.
- **Rural Fires** whose responsibility lies under the Cyprus Fire Service (which belongs under the jurisdiction of the Ministry of Justice and Public Order through the Police). The Cyprus Fire Service is responsible for fighting rural fires which are up to a distance of 1km from forests boundaries. The Fire Service is also responsible for fighting urban fires and those at airports.
- **Marine Pollution** where the primary responsibility rests on the Fisheries Department of the Ministry of Agriculture, Natural Resources and Environment. An existing contingency plan establishes the necessary arrangements for the effective and timely response to a marine pollution incident. A Regional Agreement has been signed between Cyprus, Egypt, and Israel to combat major pollution accidents in the Eastern Mediterranean.
- **Radiological emergencies** where the responsibility lies to the Ministry of Labour, Social Welfare and Social Insurance.
- **War** whose responsibility lies with the Ministry of Interior - Civil Defence Force.

Some of the specific plans based on the master plan “Zenon” are listed below:

- Enceladus for earthquakes: in the first phase, a detailed analysis of all data and information is carried out so that all necessary services are mobilized. Then it is assessed whether Cyprus will need additional assistance from the EU or the UN. The second phase provides for setting up crisis and coordination centres.⁵⁹⁸
- Electra plan on preparedness and response on extraordinary Radiological or Nuclear Incidents that might affect a large population.⁵⁹⁹
- Estia plan that involves the mass evacuation and repatriation of citizens via Cyprus from the Middle East region, with the participation of thirteen more countries (Australia, Austria, Belgium, France, Germany, Denmark, Spain, Italy, Canada, UK, USA, Norway and The Netherlands).
- SEVESO plan, for the crisis management in the event of a major technological incident, based on the implementation of the European Directive “SEVESO”.⁶⁰⁰
- Ifestos plan, for the crisis management in the event of forest fires.⁶⁰¹

⁵⁹⁶ Minister of Defense: Cyprus a country standard for crisis management, Accessed February 11, 2016. <http://www.sigmalive.com/news/politics/72963/yp-amynas-i-kypros-xoraprotypo-gia-diaxeirisi-kriseon#.dpuf>

⁶⁰⁰ Fire Service Union Officers. Implementation of the European Directive “SEVESO” in Cyprus. Definition of measures and conditions to address risks of major accidents in establishments or plants due to the existence of hazardous substances. April 2015.

- National health plan, in order to ensure a health system of the country that is human-centred, emphasizing the prevention and aims at strengthening social contribution through continuous upgrading service with professionalism and respect, equal rights for all citizens.⁶⁰²

1.2.1 Strategy scope and focus

The Civil Defence in Cyprus is taking preparedness measures in response to natural or man-made disasters, the size of which can be dangerous for the life and welfare of the civilians or may cause extensive damage to the environment and the natural resources of the Republic. These measures include a series of actions for prevention, preparation, response, design, education and mitigation of disasters. As a Civil Defence force, its mission extends beyond to what is usually encompassed in civil protection priorities, so as to also include the protection and relief of non-combatant populations during military clashes, and the preservation to the maximum possible of morale and order. They cover a wide range of afflictions and continuous efforts are made in order to modernize and harmonize the policy and governance for crisis management in the country along with the developments in the European Union.⁶⁰³

1.2.2 Monitoring and analytical support to policy making; R&D

With the aim to bring all Research / Technological Development / Innovation activities under the management of appropriate entities, which will have a co-operational and complementary role in the implementation of the national strategic objectives, there was a restructure in the research policy making system in Cyprus through the National Strategic Plan for Development for the period 2007-2013⁶⁰⁴.

As mentioned in the Monitoring Policy and Research Activities on Science in Society in Europe (MASIS) National Report for Cyprus, the main actors within the Cyprus' structure for the research policy making system are⁶⁰⁵:

- The National Research and Innovation Council (NRIC). The highest and main responsible body within the new structure for the drawing of the long-term Cyprus policy in the research, technological development and innovation sectors.
- The Scientific Research Council (SRC). Its aim is to provide assistance and support to the NRIC on policy and strategic issues related to the research, technological development and innovation sectors.
- The Planning Bureau. It constitutes the administrative "arm" of the NRIC, playing mainly a coordinating role in the drawing of long-term policies in the Research, Technological Development and Innovation sectors, and the representation of Cyprus in the relevant European Union bodies.

⁶⁰⁴ Sustainable Development Strategy, 2007. Cyprus

⁶⁰⁵ Dimopoulos, Christos, Monitoring Policy and Research Activities on Science in Society in Europe. National Report, Cyprus. October 2011

- The Research Promotion Foundation. It constitutes the executive entity of the new system, realizing the long-term policies of Research, Technological Development and Innovation mainly through the implementation of the National Framework Programs.

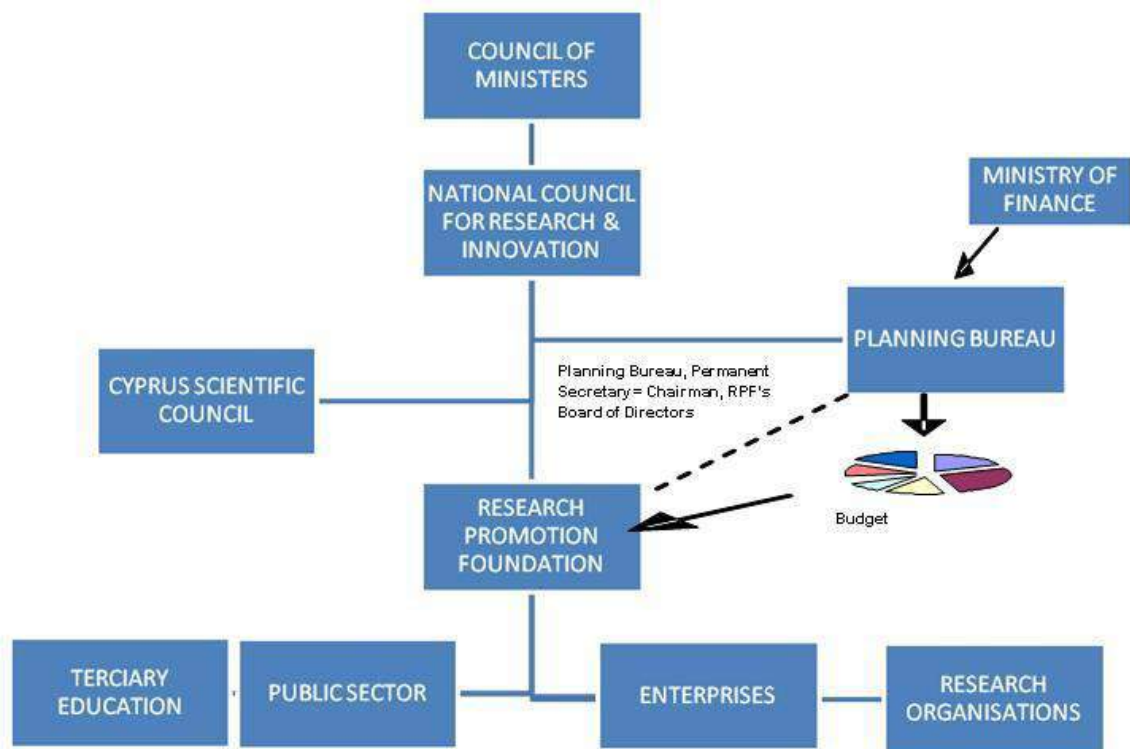

Figure 80: The R&D landscape of Cyprus⁶⁰⁶

Cyprus is also participating in numerous research and other projects in relation to crisis management, contributing to both policy making as well as any disaster risk reduction measures. Some examples of finalised projects:

- EUTAC - European Technical Assistance Cooperation (<http://www.juh-ipc.eu/eutac/>)
The project's aim was to develop a Technical Assistance and Support Team for an assistance of EU Civil Protection interventions, through the creation of Assessment Mission Kits and Technical Assistance Support Teams.
- QuestCity (<http://www.juh-ipc.eu/questcity/>)
QuestCity – a free social game (<http://www.questcity.eu/>) in which the players are confronted to a variety of emergency situations and asked to avert dangers and harms from themselves or others by providing adequate assistance while awarded with virtual incentives. In the European project consortium of this project participated also the Civil Defence department of the Ministry of Interior of the Republic of Cyprus as an associated beneficiary.

GDCD also participates in ongoing projects, such as the PACES project (<http://www.paces-project.eu/index.php/en/>) which is a 2-year project and started in 2016. It is co-funded by the EU Humanitarian Aid & Civil Protection, in the area of preparedness in Civil Protection and Marine Pollution under Grant Agreement no ECHO/ SUB/2015/713774/PREP04.

⁶⁰⁶ The R&D Landscape in Cyprus, Accessed February 11, 2016. http://www.euraxess.org.cy/services_incoming_practical_info_1.shtml

1.2.3 Policy for Prevention

GDCD takes certain prevention and preparedness measures, in co-operation with other involved services, in order to respond in the event of a disaster. Such preventative measures are the following:

- Preparing Action Plans such as the "Enceladus", for earthquakes
- Carrying out various exercises, with different possible scenarios
- Training, equipping and exercising department personnel
- Providing information to the population at regular intervals
- Constructing and designing shelters

1.2.4 Policy for Preparedness

In addition to the prevention efforts, Cyprus' efforts regarding preparedness are supported by the EU Civil Protection Mechanism training program aiming in improving the level of preparedness of the systems for civil protection systems, their personnel and the rest of the population. These projects tend to be used to develop new concepts or models.

Furthermore, GDCD has installed in Cyprus and monitors a warning system for its population, more specifically an electronic siren system, which allows GDCD to alert the public with alarms, live transmissions and pre-recorded voice messages.⁶⁰⁷

1.2.5 Policy for Response

In the case of disasters, the responsible forces for response depend on the disaster, such as the police or the fire service, according to the specific plans for each disaster. GDCD is not a direct response force, but is prepared to act and provide assistance to the other services in case of a major disaster. Moreover, the Civil Defence Rescue department under the GDCD is organised to respond immediately in case of emergencies and if the remaining authorised forces of the state services require assistance. The rescue teams of the Civil Defence Rescue department continually go through training and special exercises in equipped training grounds and also take part in firefighting conditions as well as water plumping during floods.⁶⁰⁸

1.2.6 Policy for Relief and Recovery

The Welfare Department of the Civil defence in Cyprus is in charge of the performance of different types of humanitarian tasks that aim to protect the civilian population from different dangers and to help them recover from the immediate effects of disasters or war hostilities and also provide them with the necessary conditions for their survival, such as shelters, catering and clothing for the homeless, psychological support to the victims and generally provide relief to the population in the event of a disaster.

The mission of the First Aid Department of the Civil defence in Cyprus is to provide First Aid service in the event of a disaster, until medical assistance becomes available. Also the Joint Rescue Coordination Centre organizes the search and rescue system of the Republic in order to be able to

⁶⁰⁷ QuestCity Partners, accessed February 8, 2016. <http://www.juh-ipc.eu/questcity/questcity-partners/>

⁶⁰⁸ CCD – Cyprus Civil Defence, Cyprus Civil Defense and Disaster Management Arrangements, Accessed February 11, 2016. <http://www.cyprus-storms.net/cypruscivildefense.htm>

find and rescue in the least possible time people whose lives are threatened as a result of an air or naval accident.⁶⁰⁹

For mass emergency catering purposes, there is a special Civil Defence Catering Plan, to be implemented in co-operation with other services. To implement the plan, Civil Defence has a mobile catering unit, the operation of which is undertaken by specially-trained personnel. The unit takes part in exercises to ensure readiness in the event of an emergency.

Civil Defence has implemented a programme for the construction and design of shelters, mainly in the urban areas. For this purpose, civil engineers designed additions and alterations to suitable basements, with the owners' consent, to render them safe for short periods of stay and protection of the civil population. A large number of shelters have already been completed.

Restoration of damage service, headed by the Director of Civil Defence, was introduced after the earthquake in Paphos in 1995, to house the afflicted and to repair damage. The 1996, 1998 and 1999 earthquakes followed in Limassol and Paphos. The service's activities continued during the Limassol tornado in 2003 and the flooding in Nicosia in 2004. During these disasters, the service provided grants to restore the damages. In addition to the above, it had an advisory role in the earthquake control programmes and in upgrading refugee housing estates, schools and other public buildings.⁶¹⁰

1.3 Financing

Other than civil protection purposes allocated to other government agencies 0.0452% of GDP is allocated for Cyprus Civil Defence/Protection organisation.

Furthermore, there is an ongoing support⁶¹¹ from the Participating States to the EU Civil Protection Mechanism in which participating states, like Cyprus, may find funding from 2.800.000 EUR, for both, Prevention and Preparedness projects².

1.4.2 Departmental Lessons Learned systems

Information on this subject could not be found.

1.4.3 Centralised (national) Lessons Learned system

Information on this subject could not be found.

1.4.4 International exchange for Lessons Learned

Cyprus, as a member of the European Union and ECHO, is participating to the European Experts training and exchange programme. The Civil Protection Mechanism's experts exchange system allows for the secondment of civil protection experts to participating states. This exchange of experts provides participants with knowledge and experience on all aspects of emergency intervention and the different approaches of national systems. In Cyprus, GDCC has the coordinating role of the experts exchange programme.

1.4.5 Regular policy reviews

The detailed plans for Civil Protection, based on the master plan “Zenon” are revised and updated every 6 to 12 months by the responsible bodies.⁶¹²

1.5 Resilience

Information on this subject could not be found.

1.6 Information sharing and data protection

Information on this subject could not be found.

⁶¹² Cyprus fully prepared for natural disasters, Famagusta Gazette, Accessed February 12, 2016. <http://famagusta-gazette.com/cyprus-fully-prepared-for-natural-disasters-p24959-69.htm>

2 Legislation

2.1 Crisis (emergency, disaster) management concept

The responsibility of the civil defence rests in general with the Ministry of the Interior. The Minister of the Interior, on behalf of the Council of Ministers, is responsible for the implementation of the Civil Defence Act and the relevant regulations as well as the overall supervision and control of the civil defence system. He coordinates services and organisations which are declared as essential for the civil defence purposes.⁶¹³

2.2 General crisis (emergency, disaster) management law

The Civil Defence Act was amended and consolidated in 1996, and new regulations were enacted in 1997 in order to reorganise and strengthen the whole civil defence system of the republic. These regulations were then updated as shown below:

1. In 2004 and to comply with the EC Act with the Directive 96/82/EK of the council of the 9th of December 1996 for the tackling of major accident hazards involving dangerous substances.
2. In 2006 updated in order to comply with the EC Act with title "Directive 2003/105/EK of the European Commission and the council of the 16th of December 2003 for the amendment of the Directive 96/82/EK of the Council for the tackling of major accident hazards involving dangerous substances".

2.3 Emergency rule

In case of war or disaster which requires mass mobilization of human resources or means, the Council of Ministers or the Minister of the Interior on behalf of the Council may declare a "State of Civil Defence" for 48 hours (an extension of this period requires the approval of the House of Representatives).⁶¹⁴

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

The Council of Ministers may declare the administration of any Ministry or any Governmental Department/Service or Independent Office or any Public or Private Corporation an "essential service" for civil defence purposes. Any such declaration has a legal effect on the "essential services"

⁶¹³ Cyprus Civil Defense and Disaster Management Arrangements, Accessed February 11, 2016. <http://www.cyprus-storms.net/cypruscivildefense.htm>

⁶¹⁴ Cyprus Civil Defense and Disaster Management Arrangements, Accessed February 11, 2016. <http://www.cyprus-storms.net/cypruscivildefense.htm>

concerned in terms of planning, training, preparedness and response, in order to be able to participate effectively in the civil defence system.⁶¹⁵

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

Members of Civil Defence serve either at the General Directorate of Civil Defence (GDGD) or at one of the five regional managements (RMCD): Nicosia, Limassol, Larnaca, Paphos and Famagusta.

Under every Regional Management, operate Civil Defence Stations and Substations in the towns and within the communities. This is where the volunteers and the citizens serving the Civil Defence attend for training and exercises. Attendance is on fixed days and times of the week. In communities where there are no Civil Defence units, organisation is carried out in co-operation with Community Councils⁶¹⁶.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

All citizens of the Republic of Cyprus aged over 16 years old have the duty to serve the Civil Defence force for a period that does not extend the two years. Males usually serve the Civil Defence after they have been released from the National Guard duties. Enrolment takes place once a year, following a decision of the Council of Ministers. The notification is issued by the Minister of Interior, and calls male and female citizens to serve and obliges the called citizens to attend a specified unit and enrol either in the town or in the countryside. During their service, members attend training and exercise on fixed days and time in first aid, border guard and communications.⁶¹⁷

Furthermore, anyone aged over 16 years old has the right to request to join voluntarily the Civil Defence and offer his/her services as a member.⁶¹⁸

2.7 Legal regulations for international engagements of first responders and crisis managers

Cyprus is member of various international organisations in relation to crisis management and response. Some of them are listed below:

- The EU Civil Protection Mechanism
- In 2004 Cyprus Civil Defence Rescue Team got the INSARAG⁶¹⁹ certification and became a member⁶²⁰. INSARAG is a global network of more than 80 countries and organisations under the United Nations and deals with urban search and rescue related issues.
- The Organisation for Security and Co-operation in Europe (OSCE)⁶²¹.

3 Organisation

3.1 Organisational chart

According to the study made on the Stock-taking of existing critical infrastructure protection activities for the European Commission by Booz & Company⁶²²,

“The management of emergencies in Cyprus relies on the Civil Defence organisations.

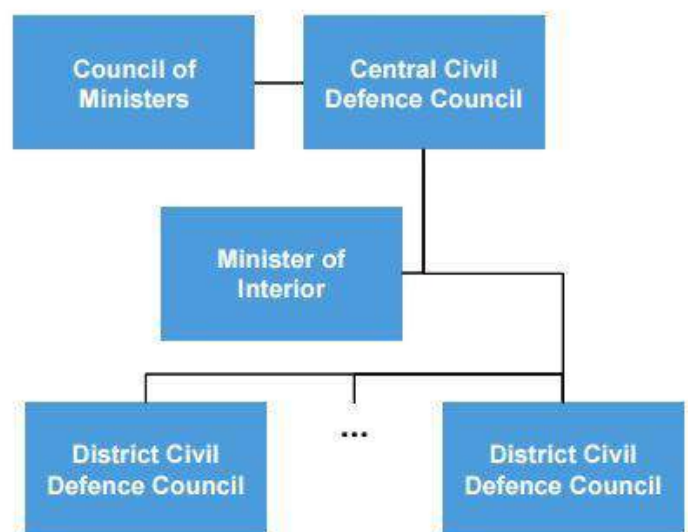

Figure 81: Organisational chart of the Civil Defence organisations in Cyprus

- The **Minister of Interior** on behalf of the Council of Ministers⁵⁵ is responsible for the implementation of the Civil Defence Law and the relevant regulations and has the overall supervision and control of the Civil Defence System. Accordingly, Civil Defence in general is under the responsibility of the Ministry of Interior.
- The **Council of Ministers** may declare the administration of any Minister, any Governmental Department/Service or Independent Office, or any public or private corporation, as an “Essential Service” for Civil Defence purposes. Any such declaration has legal implications for the services concerned. It requires them to undertake planning and training, improving their preparedness and response capabilities in order to participate effectively in the Civil Defence System. The Council of Ministers may appoint a Central Civil Defence Council.
- **Civil Defence** is a Department of the Ministry of Interior and its primary mission is the execution of measures to prevent natural or manmade disasters and to overcome their consequences.

The Council of Ministers approves the General Civil Defence Plan, which defines the role, duties and responsibilities of all bodies of the civil defence system. According to these roles, duties and responsibilities, each body (mainly the “essential services”) has to elaborate civil defence plans in

⁶²² Booz & Company, Stock-taking of existing critical infrastructure protection activities, European Commission, October 2009

order to deal with contingencies, which may arise either because of war or disaster. The plans are submitted to the Central or District Civil Defence Councils (according to their level) for checking and coordination.⁶²³

In the event of a crisis, the members of the ministerial team for crisis management consist of the Minister of Foreign Affairs, the Minister of Interior, the Minister of Transport and Public Works, the Minister of Energy, Commerce, Industry and Tourism and the Minister of Labour and Social Security, or their representatives.⁶²⁴

The figure below gives an outline of the organisational structure of the Disaster Management structure in Cyprus which is handled by the Civil Defence headquarters or GDCD, under the Ministry of Interior. Within the GDCD operate the five regional Civil Defence administrations, the RMCDs, in Nicosia, Limassol, Larnaca, Paphos and Ammochostos.

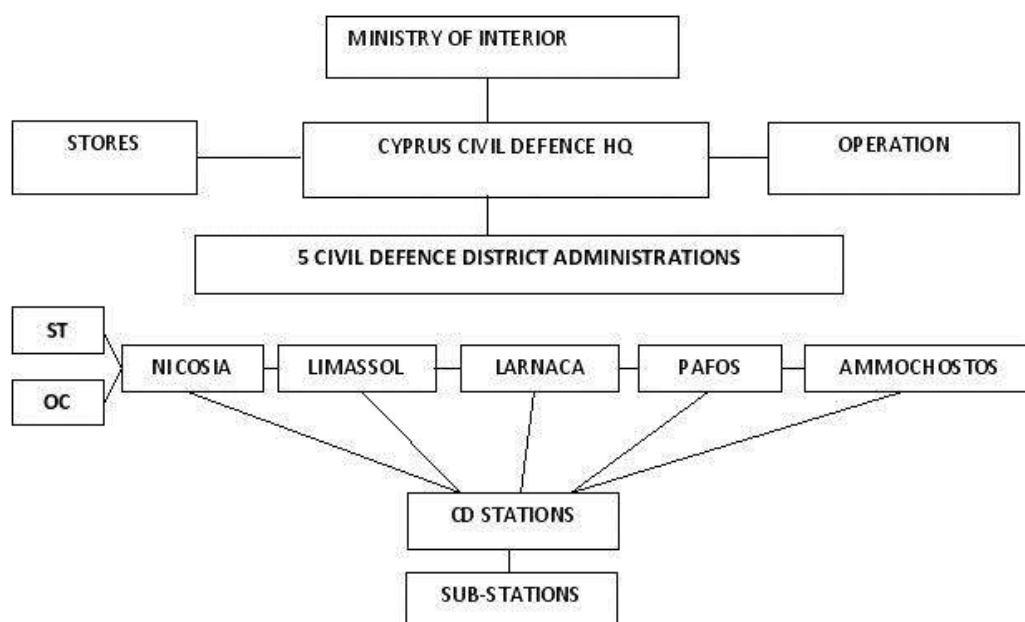

Figure 82: Cyprus civil defence organisational chart⁶²⁵

3.2 Organisational cooperation

The republic of Cyprus is a member state of the following platforms and organisations:

European and Mediterranean Major Hazards Agreement (EUR-OPA)

Created in 1987, the European and Mediterranean Major Hazards Agreement (EUR-OPA) is a platform for co-operation between European and Southern Mediterranean countries in the field of major natural and technological disasters. Its field of action covers the knowledge of hazards, risk prevention, risk management, post-crisis analysis and rehabilitation.

International Civil Defence Organisation (ICDO)

The International Civil Defence Organisation (ICDO) is an intergovernmental organisation with the objective to contribute to the development by States of structures ensuring the protection and assistance of population and safeguarding property and the environment from natural or man-made disasters.

Website: <http://www.icdo.org/>

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

Information on this subject could not be found.

4.2 Operations planning

As mentioned in Cyprus Civil Defence: Structure, capabilities, history, manpower⁶²⁶,

The Civil Defence Administrative Operations Control Centre operates with a permanent staff on a 24-hour basis, which gives great capabilities to the Republic of Cyprus.

One of these is the link with the EU Emergency Response Coordination Center (ERCC), that uses the Common Emergency Communication and Information System (CECIS system), and includes all member states and countries that have signed a Memorandum of Understanding with the Directorate Humanitarian Aid and Civil Protection. The Operations Control Centre is the National Contact Point for European Community Urgent Radiological Information Exchange (ECURIE) to monitor ionizing radiation in Europe, and transmits the information to the Ministry of Labour and Social Insurance, which is competent for applying the legislation.

The Centre is also the National Contact Point of the European Management Safety Agency (EMSA) in monitoring water pollution in Europe. The information is transmitted to the Fisheries Department, which is responsible for pollution control.

Furthermore, the Centre is responsible for monitoring the electronic sirens system, operating wireless networks, handling information systems, and for the operation of the Centre as a Command Centre in the event of mobilization.

In addition to the above, Civil Defence has at its disposal multifunctional mobile operations control centres.

4.3 Logistics support in crises

Information on this subject could not be found.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

The Civil Defence Administrative Operations Control Centre operates with a permanent staff on a 24-hour basis, which gives great capabilities to the Republic of Cyprus.

Some of the main responsibilities of this Centre are monitoring the electronic sirens system, operating wireless networks, handling information systems, and for the operation of the Centre as a

⁶²⁶ Republic of Cyprus, Cyprus Civil Defence: Structure, capabilities, history, manpower. 2014

Command Centre in the event of mobilization. In addition to the above, Civil Defence has at its disposal multifunctional mobile operations control centres.

Civil Defence has set up an electronic siren network in towns and communities to warn the population in the event of a threat of a natural disaster or hostile air activities. The siren network has the following abilities:

- to sound the alarm
- to transmit a mobilisation signal
- to transmit vocal messages

When the sirens sound, citizens are obliged to follow both Civil Defence instructions and those of other essential services. Additional analytical information on the subject is provided on the special Civil Defence leaflets, entitled "Black-out" and "Alarm".⁶²⁷

Cyprus Civil Defence has established a reliable wireless communication system within its units and other state services, municipalities and communities. This modern system has island-wide range and it is very important in case the telephone network breaks down in the event of a major disaster.

⁶²⁷ Republic of Cyprus, Cyprus Civil Defence: Structure, capabilities, history, manpower. 2014

5 Capabilities

5.1 Human resources

In order to prepare for, respond and train to disasters, the Civil Defence Force consists of:

- a permanent and well-organised staff of 33 persons
- an interchangeable staff of 45 persons
- around 600 volunteers serving under special terms island-wide
- around 7000 male and female citizens serving Civil Defence island-wide⁶²⁸

Other important resources of the civil defence in Cyprus are private and public organisations that have been declared "essential" for civil defence purposes as well as volunteers such as the Cyprus Red Cross and St John Ambulance and other local associations.⁶²⁹

5.2 Materiel (non-financial) resources

The Welfare Department is responsible for providing shelters, catering and clothing for the homeless, psychological support to the victims and generally provide relief to the population in the event of a disaster.⁶³⁰

Civil Defence has implemented a programme for the construction and design of shelters, mainly in the urban areas. For this purpose, civil engineers designed additions and alterations to suitable basements, with the owners' consent, to render them safe for short periods of stay and protection of the civil population.⁶³¹

For mass emergency catering purposes, there is a special Civil Defence Catering Plan, to be implemented in co-operation with other services. To implement the Plan, Civil Defence has a mobile catering unit, the operation of which is undertaken by specially-trained personnel. The unit takes part in exercises to ensure readiness in the event of an emergency.⁶³²

In case of war or disaster which requires mass mobilization of human resources or means, the Council of Ministers or the Minister of the Interior on behalf of the Council may declare a "State of Civil Defence" for 48 hours (an extension of this period requires the approval of the House of Representatives).⁶³³

5.3 Training

The personnel of all departments and services of the Civil Defence undergo training both in Cyprus and abroad on a constant basis⁶³⁴. The Cyprus Civil Defence members are trained as well as the staff of the essential services and departments.

The volunteers and the citizens serving the Civil Defence attend for training and exercises in the Civil Defence Stations and Substations in the towns and within the communities, under every Regional Management. Attendance is on fixed days and times of the week. In communities where there are no Civil Defence units, organisation is carried out in co-operation with Community Councils.⁶³⁵

National, regional and local exercises are run, including the following:

- Earthquake exercises, among these “Egkelados”
- Seveso II exercise
- Search and rescue exercises
- Welfare exercises.

GDCD also takes part in international exercise programmes such as the Assessment Mission Course (AMC), a specialised course for the target group of technical and assessment experts in the field of emergency management and European Commission officials. Further information can be found in <http://www.juh-ipc.eu/amc/>.

The GDCD is also a partner in the very complex training called “Exercise Unified Response – EUR15” under the EU Civil Protection Mechanism which is scheduled for the 23rd of February to the 3rd of March 2016 in London. Further details on the exercise can be found in <http://www.london-fire.gov.uk/exercise-unified-response.asp>.

Driving Innovation in Crisis Management for **E**uropean **R**esilience

CZECH REPUBLIC

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: AIT (Florian Eicher, Bettina Jager)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by ATOS and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

In the Czech Republic, the Civil Emergency Planning (CEP) includes “planning, co-ordination and management precautions to ensure preparedness of the state to prevent and manage emergencies and crisis situations threatening the population, the running of the administration, the economy, to perform international security engagements as well as supporting the armed forces in case of state emergencies.” (UNISDR Europe 2013)

As an important part of the security system, the Crisis Management in Czech Republic includes the political sphere as well as the strategy of protecting of the population, finance and economy (Swedish Civil Contingencies Agency 2009). A clear division can be identified between the Ministry of the Environment, which is in charge for coordinating activities to achieve the goals of the Hyogo Framework for Action and the Ministry of the Interior as the primarily responsible for disaster risk reduction. Undoubtedly, two ministerial departments can be identified as the predominantly. On the one hand, the department of Security and Crisis Management at the Ministry of the Environment of the Czech Republic and on the other hand, the Department of International Relations at the Ministry of the Environment of the Czech Republic, which has been labelled as the second focal point. The CEP-system does not cover solely centralised protection approaches, but also processes of prevention planning, preparedness and consequence management at the level of municipalities. The Integrated Rescue System (IRS) is a core mechanism to apply the goals, defined by the Hyogo Framework of Action for the period 2005 – 2015. By coordinating several actors in several areas, especially, rescue and security forces at the level of the state and the local governments as well as legal entities and individuals, it is a main driver to ensure an efficient response to natural disasters. Chaired by the Fire Rescue Service, experts, technical staffs as well as Public Health Authorities have been involved in the system. As indicated by Bakken and Rhinard (2013), the military as a provider of relevant resources plays an important role within the IRS. The mobilisation of rescue forces and operational resources is organised by the operations and Information Centre of the IRS.

1 Policy

According to the (European Commission 2014) the Czech Republic is a unitary state with a parliamentary system; the Parliament consisting of two houses – the Chamber of Deputies and the Senate. At the lower administrative level, the country is divided into 14 regions and the statutory City of Prague. This division has been in place since 2002, when the Reform of Territorial Administration took place and the counties were replaced by regions. The regions are further sub-divided into municipalities. The legislative and main administrative competences rest on the national level with respective ministries. The political system of the country is best described as a majoritarian democracy with some significant aspects of consensus democracy (European Commission 2014).

In line with (Bakken and Rhinard 2013) the civil security system is rather decentralized. Authority and responsibility for crisis preparation and response rest at the regional level. A state of danger can be declared by the regional council president for the whole region or its part, for a period of maximum 30 days when there is a natural disaster, ecological or industrial accident or if life, health or property of citizens is threatened. When a crisis cuts across the regions, the central government assumes responsibility.⁶³⁶ Up-scaling to a higher degree, then, is the *state of emergency* which is called by the government for a period of maximum 30 days. The reasons are the same as in the previous case, however, the scale of the disaster must be here “significant”. Typically, the state of emergency is declared when two or more regions are affected by a crisis (Bakken and Rhinard 2013).

<i>Administrative level</i>	<i>Crisis management authority</i>	<i>Consultative and advisory body</i>	<i>Crisis Management Centre</i>
Centre	Government, the prime minister	National Security Council (esp. Committee for Civil Crisis Planning)	Central crisis staff
Region	Regional president (<i>hejtman</i>)	Security council of the region	Crisis staff of the region
Municipality with extended powers	Mayor (<i>starosta</i>) of the municipality with extended powers	Security council of the municipality with extended powers	Crisis staff of the municipality with extended powers
Municipality	Mayor (<i>starosta</i>)	-	Crisis staff of the municipality

Table 25. Structure of Crisis Management in the Czech Republic. (Bakken and Rhinard 2013)

The Security Council is a permanent body.⁶³⁷ At the regional and municipal levels it consists of the representatives of the regional/ municipal office, basic bodies of the IRS, military and health bodies.

⁶³⁶ http://anvil-project.net/wp-content/uploads/2014/01/Czech-Republic_v1.0.pdf

⁶³⁷ <http://www.thefreelibrary.com/A+question+of+determinacy%3a+the+legal+status+of+anticipatory...-a0195265741>

1.1 Risk Assessment

According to Jelinek, Wood and Harvas (2007) the Czech Republic has no national multi-hazard risk assessment available to inform planning and developing decisions. Although an Agreement for national standards for multi hazard risk assessments does exist. Multi-hazard assessment has been done for some areas or cities but not at the level of the whole state. The main problem is that all measures have been developed for floods, which are a far more frequent disaster type. Much less has been done for other types of disasters which are occurring relatively rarely (Bakken and Rhinard 2013). The Council Directive 2008/114/EC establishes a procedure for the identification and designation of European critical infrastructures ("ECIs"), and a common approach to the assessment of the need to improve the protection⁶³⁸ of such infrastructures in order to contribute to the protection of people (The General Directorate of Fire Rescue Service of CR 2014).

The most frequent crises in the Czech Republic since its democratic transition in 1989 have been caused by extreme weather conditions, most notably by floods, but also through extreme temperature and storms. In the area of industrial and transportation disasters, the Czech Republic has witnessed only five such events since 1990. These were two explosions – one methane explosion in a coal mine in 1990 and one ammunition explosion in a Soviet army barracks in early 1991 (Bakken and Rhinard 2013).

Table 26 provides an overview of crises between 1990 and 2014 and the number of persons killed, injured, and affected, according to the available data from EM-DAT (2014).

⁶³⁸ <http://www.hzscr.cz/hasicien/article/implementation-of-the-council-directive-2008-114-ec-in-the-czech-republic.aspx>

Table 26. List of Crisis between 1990-2014 according to EM-DAT.

A) Natural hazards

An instructive example for Natural hazards is the flood of 2002 which were the most severe ones in the country's modern history. According to the International Federation of Red Cross and Red Crescent Societies (2012) in mid-July 2002, the meteorological situation was unfavourable, accompanied by intense torrential rains, especially in the Blansko District and the South Bohemia

Region. The IRS was used, large numbers of persons had to be evacuated (1,500 people were evacuated, approximately 100 people were rescued). Since 1998, floods have caused some 700 fatalities in Europe, the displacement of about half a million people and at least 25 billion Euros in insured economic losses. The floods in central Europe cannot be regarded as caused by climate change, but the probability of flooding is estimated to increase as a result of climate change.⁶³⁹

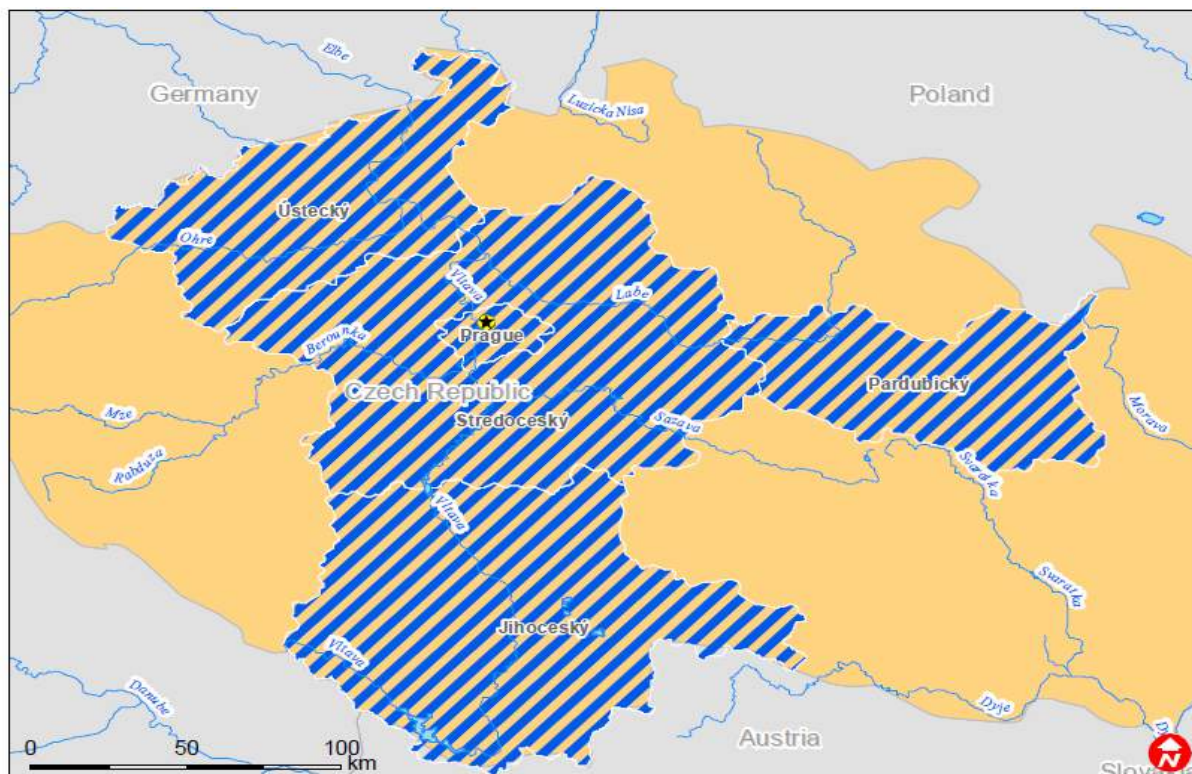

Figure 83: Risk areas of flooding in the Czech Republic according to Red Cross Czech republic (Red Cross EU Office)

Weather conditions indicate phenomena that, in accordance with present understanding, would be caused by climate change (Red Cross EU Office). Figure 1 illustrates the affected Regions the Czech Republic by Floods.

Studies on small-forested catchments showed that annual runoff is projected to decline in 2071–2100 compared to 1967–1990 by 10 to 30%.⁶⁴⁰ Impacts on the distribution of monthly flow are projected to be significant, with summer– autumn decreases of 30 to 95%, and winter increases of up to 40%. Mean daily flows are estimated to decrease by 70% from August to November. These results are based on 2 general circulation models, downscaled using 3 regional climate models under two emission scenarios, in combination with a hydrological model (Centre for Climate Adaption). According to ICPDR (2013), due to country location in the upper parts of the international river basins, as well as due to hydrological and geomorphological characteristics, people suffered in the past mainly from fluvial and flash floods caused by long and/or intense precipitation.

However, the diversity of terrain in the Czech Republic, dominated by low mountains and highlands excludes large-scale flooding.

⁶³⁹ <http://www.climateadaptation.eu/czech-republic/river-floods/>

⁶⁴⁰ <http://www.climateadaptation.eu/czech-republic/fresh-water-resources/>

According to Jelinek et al. (2007) all countries, except the Czech Republic, have national or regional coverage of flood hazard maps. In the Czech Republic are only Provincial maps with the periodicity of floods 5, 20 and 100 year available. Figure 2 shows an example of a provincial map on flood hazard.

Figure 84. Map sheet of the flood plain from the Svitanka River, Czech Republic from Jelinek et al. (2007)

B) Technological hazards

According to Bakken & Rhinard (2013), the Czech Republic has witnessed in the area of industrial and transportation disasters only five such events since 1990. These were two explosions – one methane explosion in a coal mine in 1990 and one ammunition explosion in a Soviet army barracks in early 1991. Furthermore, there were two railway accidents in 1995 and 2008 and a bus crash in 2003. (Bakken and Rhinard 2013)

Specific environmental risks are safeguarded under the jurisdiction of the Department of Environmental Risks and Ecological Damage (DERED). They include environmental risks posed by chemical substances, related serious industrial accidents, and handling of genetically modified organisms (GMOs). The DERED draws national damage prevention policies for these areas, develops systems for evaluating these risks, proposes indicators for their monitoring, and executes specialised

state administration derived from relevant legislation. At the same time, the DERED guarantees activities resulting from the country's membership in international organisations (UNEP, OECD – Chemicals Programme and Working Groups on Industrial Accident Prevention, Biotechnologies, and Nanomaterials) and from ratified international treaties (Rotterdam Treaty, Helsinki Convention on Transboundary Effects of Industrial Accidents, Cartagena Protocol on Biosafety, Stockholm Convention on Persistent Organic Pollutants) in its jurisdiction. "Contaminated sites management in the Czech Republic is mainly covered by the Ministry of the Environment and other relevant ministerial bodies. Number of contaminated sites is remediated and the risk to the human health and to the environment is reduced every year.⁶⁴¹ The Department of Environmental Risks and Ecological Damage is the competent authority in this field (Ministry of the Environment of the Czech Republic 2014).

1.2 Policy and Governance

At the beginning of 2013, the Ministry of the Environment of the Czech Republic picked up the baton of Czech National Committee for Natural Disaster Reduction (founded in 2005) and fulfils now the role of National Platform for Disaster Risk Reduction in Czech Republic.⁶⁴²

The function of national platform and also a focal point for Hyogo Framework for Action is currently provided by the Ministry of Environment of the Czech Republic. Ministry of the Environment cooperates closely with the Czech National Committee for Natural Disaster Reduction (CNC-GDR), whose members are experts from the following institutions: Ministry of Agriculture, Ministry of Interior, Ministry of Foreign Affairs, Ministry of Regional Development, Headquarters Fire Rescue Service (Ministry of Interior), Czech Hydrometeorological Institute, State Health Institute, State Office for Nuclear Safety, Red Cross, various research institutes and universities, Czech Association of Insurance Companies, private companies, individual members etc. (The United Nations Office for Disaster Risk Reduction 2013).

As reported by (Bakken and Rhinard 2013) the crisis management system is relatively simple and quite efficient.⁶⁴³ The responsibilities are clear. Crisis management works well at the regional level (crisis staffs formed by both administrative as well as operational bodies' representatives). When up-scaled (subsidiarity) to central level the crisis management works also well (Bakken and Rhinard 2013).

1.2.1 Strategy scope and focus

As stated by the international expert, in Czech Republic, *"the strategic approach is not comprehensive focusing only on limited number of prevention and recovery activities."*

The Czech Republic passed through several severe floods and Early Warning especially for floods is well organized.⁶⁴⁴ An important part of the mechanism to ensure the fulfilment of the activities and objectives of the International Strategy for Disaster Reduction and the Hyogo Framework of Action

⁶⁴¹ https://ec.europa.eu/europeaid/environment-czech-republic_en

⁶⁴² <https://www.unisdr.org/partners/countries/cze>

⁶⁴³ http://anvil-project.net/wp-content/uploads/2014/01/Czech-Republic_v1.0.pdf

⁶⁴⁴

http://www.preventionweb.net/english/hyogo/gar/2011/en/bgdocs/hfa/15505_cze_NationalHFAprogres 2009-11.pdf

framework for the period 2005 - 2015 is the Integrated Rescue System (IRS). IRS is an effective system of links, rules, cooperation and coordination of rescue and security forces, state and local governments, individuals and legal entities in the joint conduct of rescue and relief work and preparing for emergencies and natural disasters.⁶⁴⁵

The bodies of IRS are the Fire Brigade of the Czech Republic, Emergency Medical Services Providers and the Police of the Czech Republic. Other bodies include: Designated powers and resources of the Armed Forces, Municipal Police, Public Health Authorities, Emergency, Expert and Technical Services, Civil Protection Facilities, Non-profit organizations and associations of citizens, which can be used for rescue and liquidation operations. Fire Brigade is the main coordinator and backbone of the IRS. In practice, this also means that in case of intervention of multiple bodies of the IRS, in the place is usually in charge member of a Fire Brigade, which manages and coordinates the interaction of bodies rescue and disposal operations.

Operations and Information Centre of the IRS mobilizes and deploys the necessary forces and resources of IRS in specific locations. At the strategic level is then the IRS coordinated through regional crisis authorities and the Ministry of Interior.⁶⁴⁶

According to the Law on the IRS the commanding officer of the intervention has extensive powers at his disposal. The commanding officer may, among other things, prohibit or restrict the entry of persons to site, order the evacuation of people or decide on other temporary restrictions to protect life, health, property and the environment. Preparedness for flash floods remains, mainly due to its different character from common floods on rivers is still a problem.

The non-existence of a complex disaster reduction plan including all types of disaster is caused by differentiation of responsibilities for different ministries. Another reason is that the most probable kind of disaster in the Czech Republic is floods (over 90 % of all disasters). DDR principles have been included in so-called “flood protection plans” with specific responsibilities (Ministry of the Environment of the Czech Republic 2013).

The main aim of the National Platform is to support all actions leading to reduce human, social and economic losses caused by natural disasters. The following goal is to integrate Disaster Risk Reduction into decision making processes at all levels.⁶⁴⁷

The ministries, in particular of the Interior, Health, Agriculture and Environment fulfil their proper duties based in the national legislation of the crisis management and they apply the activities and objectives of the International Strategy for Disaster Reduction and the Hyogo Framework of Action for the period 2005 – 2015 (The United Nations Office for Disaster Risk Reduction 2013).

The Ministry of the Environment ensures warning and forecasting services according the information issued by the Czech Hydrometeorological Institute, established by the same Ministry.⁶⁴⁸

The National Platform for Disaster Risk Reduction in Czech Republic focuses mainly on:

- supporting of the risk-aware and resilient society able to prevent disasters and to mitigate their impact,
- strengthening legislation on issues related to disaster risk reduction,

⁶⁴⁵ <http://www.unisdr.org/partners/countries/cze>

⁶⁴⁶ <http://www.preventionweb.net/english/hyogo/national/list/v.php?id=46>

⁶⁴⁷ <http://www.unisdr.org/partners/countries/cze>

⁶⁴⁸ <http://www.unisdr.org/partners/countries/cze>

- improving crisis management and international cooperation within the frame of disaster risk reduction,
- improving coordination between governmental, non- governmental and private sector stakeholders in the field of natural hazards and disasters.⁶⁴⁹

1.2.2 Monitoring and analytical support to policy making; R&D

According to the Ministry of Environment (2013) Disaster losses and hazards are systematically reported, monitored and analyses, although a disaster loss database does not exist. Reports are generated and used in planning by finance, planning and sectorial line ministries. Hazards are consistently monitored across localities and territorial boundaries.⁶⁵⁰ Police investigations have often led “nowhere” when responsibility of larger (both state and private) companies has been undertaken after the floods.

Several national and international programs are supporting research on Disaster risk reduction, e.g. the Innovation and Support of Doctoral Study Program (INDOP) as well as other study grant initiatives such as the SGS (Student Guidance Service) projects.

1.2.3 Policy for Prevention

Disaster prevention is coordinated at the level of General Directorate of Fire Rescue Service of the Czech Republic (DG FRS CR) and the regional Fire Rescue Service (FRS). Prevention of crisis situations is mainly linked to protection of critical infrastructure (The General Directorate of Fire Rescue Service of CR 2014).

Some institutions like the Czech Hydrometeorological Institute, Institute for Atmospheric Physics or Water Research Institute of TGM and River Catchment Authorities participate in various projects devoted to flood and disaster reduction. Also some universities participate in such projects and programs (Ministry of the Environment of the Czech Republic 2013).

1.2.4 Policy for Preparedness

Crisis preparedness is provided in the organization (creation of organizational structures, emergency and crisis planning), technical (equipment and other material) and competence (training and education).⁶⁵¹

According to the Czech Government (2005), Multi-Hazard assessment has been done for some areas or cities but not at the level of the whole state. Programs or policies for disaster preparedness, contingency planning and response exist in form of (Ministry of the Environment of the Czech Republic 2013):

- Programs and policies incorporated by DRR.
- The institutional mechanisms for the rapid mobilization of resources in a disaster, utilizing civil society and the private sector in addition to public sector support.

⁶⁴⁹ <http://www.seesac.org/res/files/failovi/545.pdf>

⁶⁵⁰ <http://www.preventionweb.net/english/hyogo/hfa-monitoring/documents/2013-15-National-HFA-Monitor-Guidance-Note.pdf>

⁶⁵¹ <http://www.hzscr.cz/hasicien/article/crisis-management-in-the-czech-republic.aspx>

Many floods in the Czech Republic in the past 15 years, a good system of flood warning and flood protection including “flood plans” for each city and community has been developed, applied and progressively improved. A support from crisis management as well as water (Water Act, Crisis Management Act) legislation has been very important. However, some problems could appear with some other types of disaster which occur very rarely.

Furthermore an anti-flood system in Prague has been finished and also tested. It consists of removable barriers (dykes) together with some new standard dykes in the vicinity of Vltava River. In some communities in the country resilience especially towards flood has been improved while in others has not been improved especially because of a lack of finances. Last two years financing towards increase of resilience has been more difficult because of economic crisis.⁶⁵²

1.2.5 Policy for Response

The General Director of the Fire Rescue Service (2014) states that the Solution to the crisis is related to the implementation of rescue and relief work, the implementation of measures to protect the affected population, emergency survival measures to ensure functional public administration and critical infrastructure.

The Czech Republic has developed a very comprehensive multi-hazard system based on an integrated early warning system connected with a special rescue and response system. The system passed through several tests during real disasters especially floods occurring last 15 years. Also exercises have been organized on regular basis. The system defines clear competencies of all stakeholders and includes also duties of media in such events. These plans, procedures and resources for extraordinary events have been systematically created and could be released for the use by the proclamation of the state of emergency by the Prime Minister (at the state level) and local authorities leaders (at the regional level). Operational and communication centres create a system throughout the whole state and their functionality has been checked either by real disasters like floods or by regular exercises at various levels. Special attention has always been given to potential failures of nuclear power plans.

Exercises and trainings have been organized regularly, however sometimes only some parts of the whole crises management systems are involved in exercises (Ministry of the Environment of the Czech Republic 2013).

1.2.6 Policy for Relief and Recovery

An inclusion of post-disaster recovery especially has been placed in connection with an enhancement of resilience of newly built houses and infrastructure and has been applied only occasionally. The main problem is a lack of money for inclusion of better resilience in future as a part of post-disaster recovery programs. It is rather difficult to incorporate these measures into the programs. Moreover, it is usually very difficult to find another place (land) for building new houses at safer areas (more distance from rivers). It is caused by relatively high population density and complicated orography of the country (Ministry of the Environment of the Czech Republic 2013).

⁶⁵² http://www.preventionweb.net/files/15505_cze_NationalHFAProgress_2009-11.pdf

1.3 Financing

1.3.1 Investing in preparedness

According to the Ministry of the Environment of the Czech Republic (2013) Investments to reduce the risk of vulnerable urban settlements are realized in terms of Investment in drainage infrastructure in flood prone areas and slope stabilisation in landslide prone areas. Nevertheless Training of mason on safe construction technology, Provisions on safe land and housing for low income households and communities, Risk sensitive regulation in land zoning and private real estate developing and regulated provisions of land titling has not been established yet.

Some investments have been realized with financial support from special EU programs

Realization of such projects and programs strongly depends on current regional and local authorities. In some areas a great success can be seen while in others such projects have not been launched yet

As stated in (Bakken and Rhinard 2013) the largest threats to the Czech civil security system stem from its environment: The budgetary cuts resulted in cutting investments and in focusing on “running” the system only. The strongest link is then the functioning of the IRS (including the ability to help abroad) and of crisis management, especially at the regional and also at the state level (when up-scaled to this level) with clearly set responsibilities and procedures (Bakken and Rhinard 2013).

1.3.2 Investing in consequence management

The budget for consequence management mainly depends on state contribution and some projects are covered by the EU. National contingency fund and Catastrophe insurance facilities arrangements are in place to deal with major disasters. Catastrophe bonds are not established yet.

In the absence of adequate flood prevention measures the cost of the damages provoked by increasingly strong floods can be very high. In the Czech Republic, the EIB already financed several reconstruction projects after the catastrophic floods of 1997 (EUR 200 million) as well as the reconstruction of infrastructure (EUR 400 million) and the renewal of Prague’s metro (EUR 80 million) damaged during the 2002 floods (European Commission 2006).

The above mentioned financial arrangements have been established and can be used in declared emergency situations at various levels (state, region, community). Special state reserves of food, material, tools, bridges, fuel, etc., exist and are well maintained for the use in emergency situations (Ministry of the Environment of the Czech Republic 2013).

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

Some losses and damages have been assessed by insurance companies, others especially on the infrastructure (roads, railways, electricity lines, etc.) by companies responsible for maintaining this infrastructure and by the state and regional authorities. An agreed method and procedure have been adopted to assess damage, loss and needs when disasters occur.

Special projects analysing recent losses caused by bigger floods have been launched by the government after each such event showing some gaps, losses and also proposals for future

avoiding drawbacks encountered. The reports dealing with evaluation of these floods (Ministry of the Environment of the Czech Republic 2013).

Triggered by recent disasters, the Czech Republic has been prompted to conduct disaster assessment and identify the performance of disaster management. As an example, the floods in Bosnia and Herzegovina, which caused a damage of approximately USD 1.67 billion, have encouraged the Czech Republic to conduct a post-disaster needs assessment and identify shortcomings, e.g. in data accuracy and rapid response capacity. Together with UNEP, the Czech Republic has launched a project aiming at identified gaps in data collection and communication of natural disasters risks in the hydrology sector.⁶⁵³

1.4.2 Departmental Lessons Learned systems

The identified documents on civil security in the Czech Republic do not provide requirements or specific mechanism for learning lessons from emergencies to be established.

1.4.3 Centralised (national) Lessons Learned system

Framework or system for assessing the experience of individual emergencies and disasters is not developed. There are not integrated Lessons Learned systems in individual organisations but rather ad-hoc efforts (Expert Interview 2014).

1.4.4 International exchange for Lessons Learned

A system to exchange lessons learnt systematically is not in place (Expert Interview 2014). The Czech Republic has signed bilateral agreements on cooperation with neighbour countries. All the aforementioned agreements include provisions on mutual exchange of information and early warning in case of major disasters. In the frame of some projects, e.g. the transnational project Ceframe, a harmonised flood management strategy will be developed beyond borders.

In the Czech part of the Morava river basin 583 kilometers of river sections were identified as APSFR. In the Czech part of the Vah river basin (Vlára catchment) 34 kilometers of river sections were identified as APSFR.

1.4.5 Regular policy reviews

According to the Expert Interview (2014), Policy reviews leading to incorporation of findings in the policy process take place. Disaster losses are systematically reported, monitored and analysed, a disaster database which is regularly updated could not be identified. It can be maintained that policy are reviewed only when main disasters have happened. However, Reports are generated and used in planning by finance, planning and sectoral line ministries (Ministry of the Environment of the Czech Republic 2013).

⁶⁵³ Information is available at: <http://www.un.ba/novost/10804/the-czech-republic-and-unep-to-build-capacity-in-disaster-risk-reduction-in-bosnia-and-herzegovina->; accessed: 21st October, 2014.

1.5 Resilience

The concept of resilience in civil protection, in terms of county's capacity to withstand shocks due to natural and other disasters, to rebuild itself with efficiency and to improve on the pre-existing state wherever possible, has not been explicitly established in the Czech Republic by law or other normative act.

However, according to the European Commission (2006) the Czech Government has devised a national strategy to provide protection to the areas at risk, particularly where there are large concentrations of population. The implementation of this strategy has already started and was supported by the European Investment Bank with a first EUR 60 million loan for Flood Prevention. The EIB loan will finance flood protection investment schemes across the whole country contributing to the reduction of the potentially devastating effects of floods and safeguarding human health. The anti-floods measures will substantially improve the security of the population living in the five Czech river basins (Morava, Labe, Ohre, Odra and Vltava)⁶⁵⁴. As these territories are part of the European catchment area discharging water into the Black, North and Baltic Seas, they will also have significant cross-border effects with positive implications for people living along respective rivers in neighboring countries.

Individual actions supported by the loan will cover for example the construction or maintenance of reservoirs and dams, including dry reservoirs, the increase of the flow capacity of watercourse channels, protective dams, discharge channels and tunnels, etc. The Czech Ministry of Agriculture will be the promoter of the flood prevention measures, while local authorities involved in water management, e.g. River Boards, Regions and Municipalities as well as pond managers will be the final beneficiaries of the loan.

Additionally the experience of the Czech Republic Puncuchar, P. (2012) stated that the flood management and the flood prevention lead to the following most important activities/actions:

- *The adoption of strategic (conceptual) documents and relevant legislation for improvement of flood prevention*
- *The improvement of the advanced forecast and early warning systems using high-tech procedures and equipment (radar, ALADIN, mathematical models of run-off etc.)*
- *The implementation of a robust information systems for dissemination of data from databases of water management bodies and fire-brigades using modern communication technologies (internet, mobiles, TV, wireless)*
- *Well prepared activities of bodies responsible for flood, rescue and crisis management (flood commissions, crisis committees, mayors, municipalities), which follow from appropriate legislation for the flood prevention and flood defense*
- *Continuous upgrading of flood plans and activity of flood commissions, their training and checking the communication between the bodies responsible for flood management and flood protection activities*

⁶⁵⁴ <http://www.eib.org/infocentre/press/releases/all/2006/2006-142-czech-republic-czk-9-billion-for-flood-prevention.htm>

- *The identification of flood areas (including determination of “active zones”) and transfer these information to the inhabitants (namely in small municipalities)*
- *The realization of flood protection measures combining structural technical, non-technical (nature plausible) measures as well as improvement non-structural measures*
- *Well prepared management of flood flow rates by use of manipulation on dam-reservoirs, polders, removable walls installation etc.*
- *Development of the close collaboration with the neighboring countries on flood management and on realization of flood defense measures in integrated plans of respective watershed. Puncuchar, P. (2012)*

1.6 Information sharing and data protection

Collection and protection of personal data related to disaster management, in the Czech Republic could not be identified in the entire documents of Crisis Management in the Czech Republic. However, The Ministry of Interior fulfils the task in the area of critical infrastructure resulting from the membership of Czech Republic in the European Union, provides international exchange of information in this area, serves as the contact point of the Czech Republic in the frame of European critical infrastructure and submits the European Commission reports on tasks of implementation arising from the EU legislation in this area (Government of the Czech Republic 2010). As indicated by ICPDR (2012), public communication and information is partly provided by Flood Information System POVIS, www.povis.cz, where relevant information and documents about implementation of the Directive 2007/60/EC on the assessment and management of flood risks (2007) is provided to the public.

Therefore the Czech Republic joins the Euro Atlantic Partnership Council (EAPC), which provides a framework for Planning and Review Process (PARP) in which framework the Czech Republic and NATO define and achieve partner goals. Furthermore, NATO Committee meetings at least twice a year serve as a platform for sharing knowledge and experience between the heads of their national civil emergency planning organisations and by members of national delegations at NATO.

Beyond the above mentioned The Czech Republic has International bilateral co-operation in the flood prevention as states in the following (Puncuchar, P. 2012).

Cooperation with the Federal Republic of Germany

As stated in (Puncuchar, P. 2012) the Czech Republic shares with Germany the longest international boundary. The author mentions also that the transboundary waters are split into regional waters (Saxon boundary and Bavarian boundary). The Czech Republics' cooperation with Saxon lasts since 1955 and the cooperation with Bavaria since the 1970s. Flood protection, which is the main activity, is involved in expert groups 1 and 3 (Water Management Planning and Balancing, Hydrology) according to (Puncuchar, P. 2012).

Cooperation with the Republic of Poland

The Czech Republic has also a cooperation with the Republic of Poland (since 1958) corresponding to. Therefore the Polis Institute of Meteorology and the Czech Institute of Hydrometeorology are working together on the topics hydrology, hydrogeology and flood protection. The co-operation has

led to improvements in forecasting services, flood warning and the implementation of meteorological forecasting models. (Puncuchar, P. 2012)

Cooperation with the Republic of Austria

In 1928 the Joint Technical Commission was established and since then the cooperation with the Republic of Austria is ongoing. The actual convention was signed in 1967. The problems discussed in this cooperation are quality and quantity of water, water abstraction and the maintenance of watercourses. Assessing impacts of reservoirs on conditions in transboundary reaches was a task of the commission for a long period in the course of the cooperation. This includes the improvement flood management. (Puncuchar, P. 2012)

Cooperation with the Slovak Republic

Between the Czech Republic and the Slovak Republic there is a cooperation dealing with the managing of transboundary waters. This cooperation was preliminary agreed in 1992 before the division of the Slovak and Czech Federative Republic in 1993. The cooperation includes management of watercourses, assessment of water quality and flood protection. (Puncuchar, P. 2012)

2 Legislation

The country takes an all-hazard approach and the key functions of the civil security system are embedded in two acts: The Crisis Act and the Act on IRS. A general anchor for these is the Constitutional Act on Security. The leading institution in civil security police making is the Mol. The General Directorate of the Fire Rescue Brigade is then responsible for civil security, including research and education. The main responsibility for the implementation for dealing with crisis rests upon the regions. (Bakken and Rhinard 2013).

2.1 Crisis (emergency, disaster) management concept

The most important documents on crisis management in cases of natural and other disasters are:

- The Law on Crisis Management No. 240/2000
- The Law on Integrated Rescue System No. 239/2000.

These two laws define the responsibilities of the Government, the Central Administrative Offices and the Territorial Administrative Offices plus elements of the Integrated Rescue System. In addition, they stipulate crisis preparedness measures and the limitations that apply to individual rights during crisis. It provides also a set of common principles on how should protection, secure and relief organised throughout the civil protection system. It also stipulates operational guidance to all professional and volunteer, national and local, state and private forces that based on law or other forms of organised engagement contribute to all or each aspect of protection against natural and other disasters. The Law on Crisis Management and the Law on the Integrated Rescue System cover all levels of government, from national to local. International intervention is governed by political agreements, for example with neighbouring countries.

Besides these two laws are the law on The Law on Securing the Defence of the Czech Republic and the Law on Economic Measures for Solving Crisis Situations related to Crisis Management

- The Law on Securing the Defence of the Czech Republic.

This law, which came into force in December 1999, stipulates the tasks and responsibilities of the Central Administrative Offices, the Territorial Administrative Offices and legal bodies and citizens in order to meet the defence requirements.

- The Law on Economic Measures for Solving Crisis Situations.

This law determines the preparatory economic measures to be taken in crisis situations and adopts economic measures after a crisis situation announcement.

2.2 General crisis (emergency, disaster) management law

The principles of crisis management are codified in the Act No. 240/2000 Coll. on Crisis Management and amending certain acts (the Crisis Act), as amended.⁶⁵⁵

2.3 Emergency rule

According to Art. 5 of the Constitutional Act on the Security of the Czech Republic (No. 110/1998 Sb.; amended by No. 300/2000 Sb.), a state of emergency may be declared by the Government of the Czech Republic under the circumstances of natural catastrophe, ecological or industrial accident, or other danger which to a significant extent threatens life health, or property or domestic order or security. Art. 3 determines, that the extent of the military service obligation, the duties of the armed forces, of the armed security corps, of the rescue corps and accident services, their organizations, preparation, and supplementation, and the legal relations of their members shall be laid down by statute in such a way as to ensure civilian control of the armed forces. "If delay would present a danger, the Prime Minister may declare a state of emergency. Within 24 hours of the announcement thereof, the government shall either ratify or annul his decision."

Special legal conditions apply when a state of emergency is declared. Along with the declaration of this state, the government must strictly delineate which rights will be restricted (in accordance with the Charter of Rights and Freedoms) and to what extent. Declaration of the state of emergency is a part of functional crisis management. None of the declarations has so far provoked complaints (Bakken and Rhinard 2013).

The Constitutional Act on the Security of the Czech Republic limits the state of emergency to a duration of maximum 30 days (extension is possible only with the consent of the Assembly of Deputies). "A state of emergency ends upon the expiry of the period for which it was declared, unless the government or the Assembly of Deputies decides to annul it prior to the expiry of that period."

Art. 12 of the Constitutional Act on the Security of the Czech Republic determines, that a decision to declare a state of emergency, a condition of threat to the State, or a state of war shall be made public by means of the mass media and shall be promulgated just like a statute. It enters into effect at the moment provided for in the decision.

Based on this law, a state of danger can be declared to overcome unfavorable trends of situation development. The state of danger can be declared by the regional governor as an urgent measure, when lives, health, property, and environment are threatened, provided the intensity does not reach the danger of considerable extent, and it is not possible to avert threats by normal activities of administrative authorities, regional and municipal bodies, IRS (Integrated Rescue System) bodies or entities of critical infrastructure. The Crisis Act also processes relevant regulations of the European Union and modifies specification and protection of European critical infrastructure (Government of the Czech Republic 2010).

⁶⁵⁵ <http://www.hzscr.cz/hasicien/article/crisis-management-in-the-czech-republic.aspx>

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

Aspects on legislation in emergency and disaster management are tackled by the document (Government of the Czech Republic 2010). The report contains the following paragraph:

“The crisis legislation and particularly the Crisis Act (nr. 240/2000 Coll.) stipulates the rights and obligations of the population in the state of crisis. In this way, the right to information about prepared crisis measures to protect life, health and property is ensured. The obligations, on the other hand, are relatively generally stated and do not represent an essential part of the functioning of the civil security system. The essential obligation is to – in the state of crisis – obey the call of responsible authorities of crisis management to carry out imposed labour duty; to provide requested material means; or to accept restrictions stemming from crisis measures. A person can reject these obligations should the fulfilling of these endanger his/her life and health or the life and health of other people or if the obligations are against the law.(Government of the Czech Republic 2010)

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

Executive responsibility primarily rests at the regional level, although also at the local level; mayors of municipalities are responsible for crisis planning and crisis preparedness in their municipalities. At all levels of administration, there is a legal requirement to form a security council. When conducting rescue or disposal works, the services of the IRS are obliged to follow the orders of the commander in place (usually from the fire brigades) or of the mayor of a municipality with extended powers or of the regional president or of the MoI. The regional president has the power to call a state of danger for the region or its part for the time of maximum 30 days with the obligation to inform the MoI. (Government of the Czech Republic 2000)

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

Within the Act No. 239/2000 Coll. from the parliament of the Czech Republic on integral rescue systems the role of citizens is specified. Descriptions are given independently for the emergency management system as well as the crisis management system. For emergency management system, role of citizens are defined by responsibilities, rights and obligations of citizens in general as well as by institutions having responsibilities as secondary units of the Integrated Rescue System (IRS). Civil protection organisations, NGOs and civic associations are considered as integral part of the IRS. Such organisations are only activated in case of request (Parliament of the Czech Republic 2000).

Moreover, persons exempted from labour obligation or labour assistance can provide voluntary assistance. The crisis management authority, which decided about restriction of the right or imposed the obligation, is obliged to pay financial compensation. (Swedish Civil Contingencies Agency 2009)

2.7 Legal regulations for international engagements of first responders and crisis managers

According to (Bakken and Rhinard 2013) the Czech Republic has established a bilateral cooperation with all its neighbours Countriesand. Regional, multilateral and cross-border regional agreements exist to facilitate cooperation in the case of crisis. The country actively participates in the EU mechanisms for disaster assistance and at EU crisis-response exercises. The country is traditionally providing rather than receiving assistance.⁶⁵⁶

The Czech Republic has been cooperating on flood protection and warnings by means of participation in Elbe, Oder and Danube river commissions. National platform cooperates closely with the platforms from Germany, France and Poland in the framework of European network of national platforms (ENNP). Some projects have been submitted to European Commissions but have not been approved yet. In November 1 and 2, a special Workshop devoted to Flash Floods and early warning organized by the Czech platform, ENNP and the Czech Hydrometeorological Institute will take place in Prague. The Czech Republic shares catchments of some rivers and closely cooperates with its neighbours especially in data and warning exchange (Ministry of the Environment of the Czech Republic 2013).

Financial compensation belongs to the legal or natural undertaking entity for restriction of the right of ownership or the right of use, for provision of material assets, performance of labour obligation or labour assistance. The crisis management authority, which decided about restriction of the right or imposed the obligation, is obliged to pay financial compensation. Based on mutual agreement financial compensation can also be provided for voluntary labour assistance. According to this clause financial compensation shall be paid within 6 months after termination or cancellation of the crisis state, in the consequence of which the claim for the financial compensation arose.

In case of labour obligation, labour assistance or voluntary assistance where the amount of compensation cannot be determined by the agreement or in accordance with special legal regulations, compensation is determined in the amount corresponding to usual wage for the same or similar work. Determination of compensation for providing material assets is based on the amount of expenses incurred to the obliged person and on usually required compensation for use of the same or similar material means at the time of provision. Crises management authority is entitled to request reimbursement of expenses incurred as compensation for provision of material assets, performance of labour obligation, labour assistance or voluntary assistance, from the inflictor of the accident) or other event, which caused the crisis situation and crises measures had to be ordered. Incurred expenses) are compensated by this reimbursement (Bakken and Rhinard 2013).

⁶⁵⁶ http://anvil-project.net/wp-content/uploads/2014/01/Czech-Republic_v1.0.pdf

3 Organisation

The role of main focal point fulfils the Department of Security and Crisis Management at the Ministry of the Environment of the Czech Republic and as the second focal point serves the Department of International Relations at the Ministry of the Environment of the Czech Republic.

The Ministry of the Environment is coordinating all activities in the field of fulfilling the tasks of Hyogo Framework for Action. The Ministry of the Interior is a lead coordinating institution for disaster risk reduction. An important part of the Czech system, which ensures the practical application of the activities and objectives of the International Strategy for Disaster Reduction and the Hyogo Framework of Action for the period 2005 - 2015 is the Integrated Rescue System (IRS). IRS is an effective system of links, rules, cooperation and coordination of rescue and security forces, state and local governments, individuals and legal entities in the joint conduct of rescue and relief work and preparing for emergencies caused by natural disasters.⁶⁵⁷

Ministry of the Environment of the Czech Republic and different representatives and experts from the above mentioned institutions are attending joint meetings of the National Platform for Natural Disaster Reduction which take place 2-3 times a year, and are discussing main issues and activities related to the field of disaster risk reduction and prevention (The United Nations Office for Disaster Risk Reduction 2013).

3.1 Organisational chart

The Czech Republic is a parliamentary democracy. The Cabinet, consisting of the Prime Minister and the Ministers, performs the executive powers. The Cabinet, appointed by the President, is responsible to the Chamber of Deputies. The bicameral Parliament consists of the Senate and the Chamber of Deputies.⁶⁵⁸

The National Security Council of the Czech Republic is the governmental advisory body for the security of the Czech Republic. The chairperson is the Minister of the Interior. The other members of the National Security Council are appointed heads of assigned ministries.

To ensure its tasks, the Council has established four permanent working committees. Their responsibilities were assigned by a Government decision in 1998:

- The Defence Planning Committee
- The Civil Emergency Planning Committee
- The Foreign Security Policy Co-ordination Committee
- The Intelligence Activities Committee.

⁶⁵⁷ <http://www.unisdr.org/partners/countries/cze>

⁶⁵⁸ <http://documents.mx/documents/civil-emergency-planning-in-the-natoeapc-countries.html>

The responsibility for Civil Emergency preparedness in all administrative bodies lies with the statutory representatives. Existing Civil Emergency departments operate in both Central Administrative and Territorial Administrative Offices.⁶⁵⁹

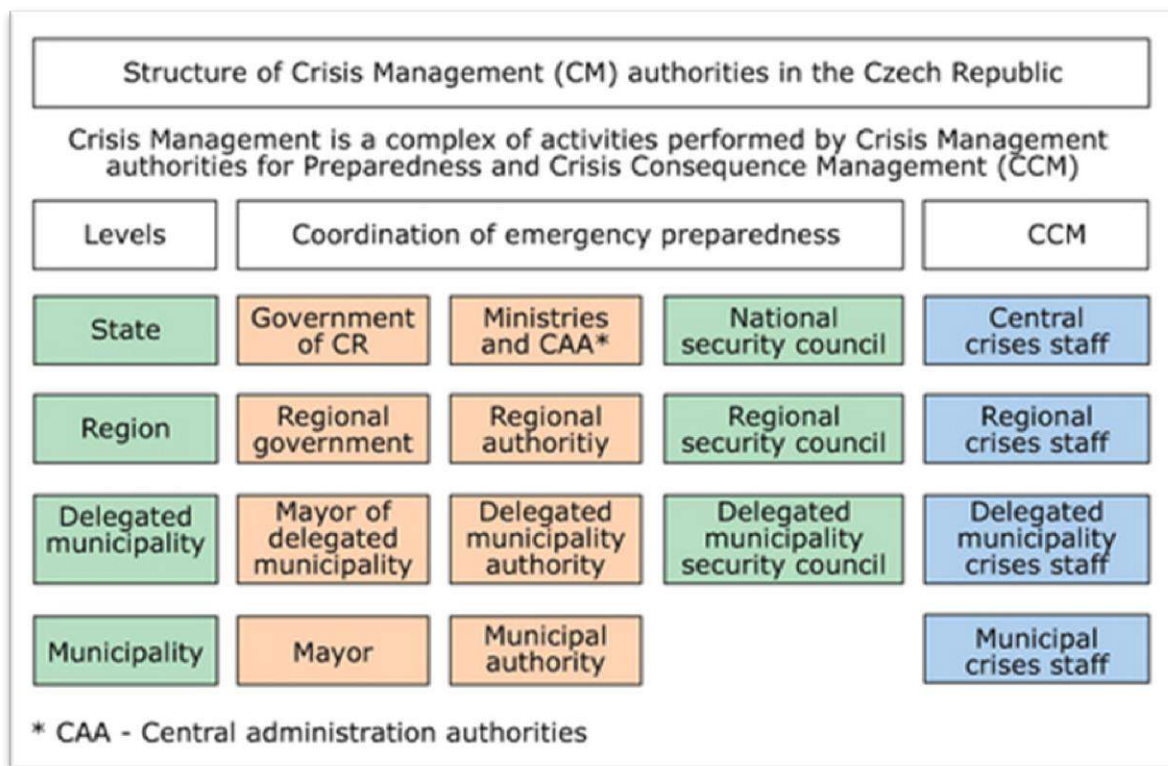

Figure 85. Crisis Management Authorities of the Czech Republic.

The present structural setup:

⁶⁵⁹ <http://documents.mx/documents/civil-emergency-planning-in-the-natoeapc-countries.html>

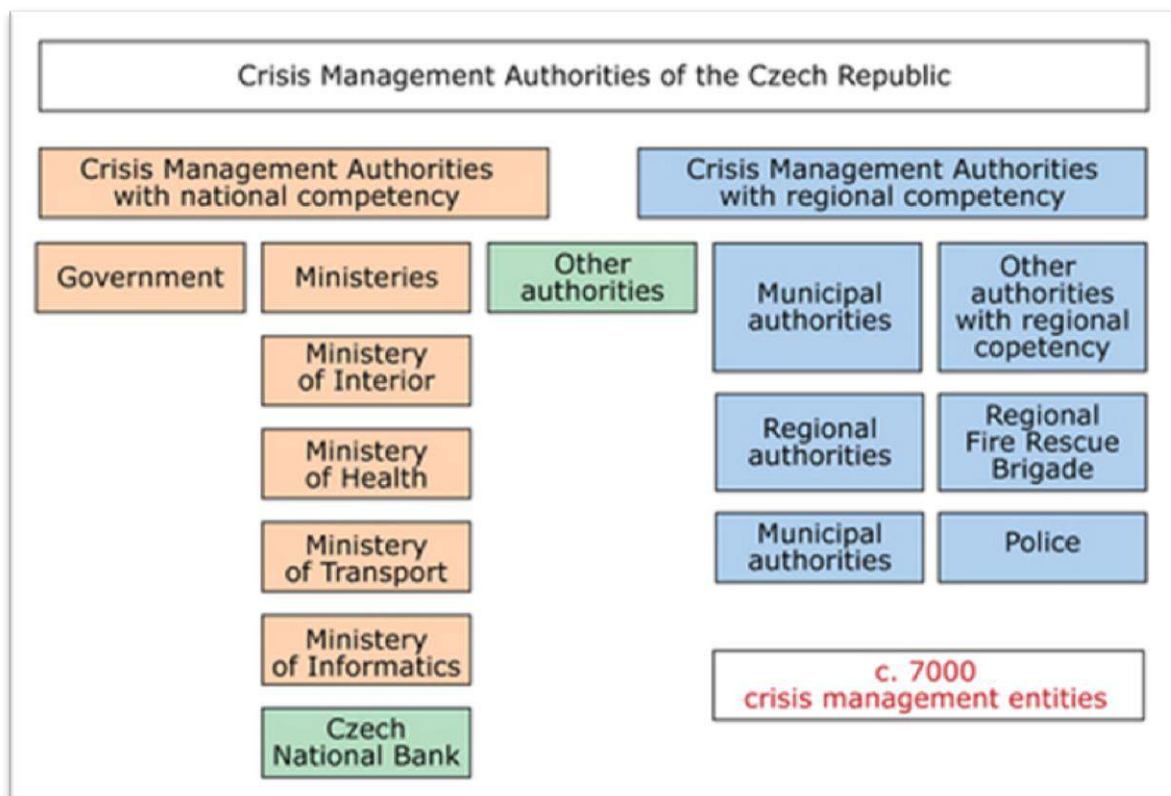

Figure 86. Structure of Crisis Management authorities in the Czech Republic.

- At national level: The Ministry of the Interior (MOI) cooperates with other central administration bodies including municipal authorities in the field of civil protection
- At regional and local level: The regional and municipal authorities work in close cooperation with the central level
- At international level: The MOI coordinates civil protection both at national and international levels and provides future policy guidance and directions for the civil protection process

The role of the Ministry of the Interior (MOI) during non-military crisis situations is to coordinate activities at the inter-ministerial level. The responsibilities of the MOI in non-military crisis situations are the same as the responsibilities held by the Ministry of Defence in military crises. Military forces support civil authorities in emergencies, i. e. when the resources of the local and regional units are inadequate. This support is provided to the Fire Rescue Corps, to the Police and to local authorities.⁶⁶⁰ Assistance from the Ministry of Defence is provided in the form of army troops or in cooperation with Civil Protection Rescue Bases. In military crisis, the civil protection provides all the necessary civilian resources for the army. (European Commission 2014)

- Departmental emergency and disaster management arrangements

The civil security system is rather decentralized. Authority and responsibility for crisis preparation and response rest at the regional level. A state of danger can be declared by the regional council president (hejtman) for the whole region or its part, for a period of maximum 30 days when there is a

⁶⁶⁰ http://ec.europa.eu/echo/files/civil_protection/vademecum/cz/2-cz-2.html

natural disaster, ecological or industrial accident or if life, health or property of citizens is threatened. When a crisis cuts across the regions, the central government assumes responsibility. Up-scaling to a higher degree, then, is the state of emergency which is called by the government for a period of maximum 30 days. The reasons are the same as in the previous case; however, the scale of the disaster must be here “significant”. Typically, the state of emergency is declared when two or more regions are affected by a crisis. (Krulík 2011)

- Local authorities and arrangements for emergency and disaster management

Mayors of municipalities are responsible for crisis planning and crisis preparedness in their municipalities. At all levels of administration, there is a legal requirement to form a security council. When conducting rescue or disposal works, the services of the IRS are obliged to follow the orders of the commander in place (usually from the fire brigades) or of the mayor of a municipality with extended powers or of the regional president or of the Mol. The regional president has the power to call a state of danger for the region or its part for the time of maximum 30 days with the obligation to inform the Mol. (Act Nr. 239/2000 Coll.)

- Volunteers and volunteer organisations; specialised NGOs

The Voluntary Fire Brigades (VFB) are an important part of the Czech civil security system. They have a long tradition in the country and more than 300,000 members. They are also seen as a large potential also for the future. They are an official part of the IRS (as one of the “secondary” bodies) and are involved in official exercises.

- Private businesses

Legal persons are obliged to prepare for emergencies and to participate in the preparation of emergency plans and to provide assistance during a crisis when requested. They can be asked to do so by the regional president or by the mayor of the municipality. (Act nr. 240/2000 Coll., §29)

In the field of civil security provision, the absolute majority of bodies are public ones. As an example of private bodies, for-profit health rescue services can be mentioned. These are typically smaller than the health rescue services which are established by the regional authorities. They specialize e.g. in the transportation of patients or assist at various cultural and sporting events (paid by the organizer). Usually, one such organization exists in every region although they do not necessarily have an agreement with the regional authority or all health insurance companies.

Being an integral part of the IRS, the flight rescue services must be mentioned as well. Currently, there are 10 stations facilitating air rescue. This represents a very dense network (one of the densest in Europe) covering an overwhelming majority of the territory of the country. (Fojtík 2011) The flight rescue services are operated both by private (eight stations) and by state (two stations) bodies. The latter ones are operated by the Police Air Service and by the army. (DSA undated) So far, there have been no criticisms on the functioning of the flight rescue services (Bakken and Rhinard 2013).

3.2 Organisational cooperation

According to (Bakken and Rhinard 2013) the civil security is provided by the so called IRS which is an operating platform to respond to crises. The IRS is made up from three main agencies:

- the fire brigades
- the health emergency services and
- the police.

Usually they operate at the regional level. (Bakken and Rhinard 2013)

The aim of civil protection in the Czech Republic is, by means of planning, coordination and management precautions, to ensure the preparedness of the state to prevent and manage emergencies and crisis situations threatening the population.

The primary scope and focus of civil protection is to cooperate especially in the following areas:

- Performing tasks related to the protection of the population
- Ensuring the continuous function of the state administration, national authorities and municipal authorities
- Ensuring an acceptable form of social and economic life
- Safeguarding the functionality of critical infrastructure
- Enhancing cooperation between the public and private sectors
- Ensuring the availability of civil resources necessary to ensure security
- Taking measures against weapons of mass destruction used against the civilian population
- Coordinating security research
- Coordinating education in the field of crisis management and the protection of the population
- Planning and assessment of exercises performed by crisis management authorities
- Providing and receiving humanitarian aid and rescue operations
- Solving specific problems and coordinating effective systems of communication with the public as an integral part of the preparedness of the Czech Republic to crisis situations
- Enhancing problem-oriented communication and information systems
- Ensuring civil support of armed forces and security corps activities including coordination of requests for armed forces
- International cooperation in the fields mentioned above.

The responsibility for Civil Emergency preparedness in all administrative bodies lies with the statutory representatives. Existing Civil Emergency departments operate in both Central Administrative and Territorial Administrative Offices.

As reported by (Bakken and Rhinard 2013) the Czech Republic has established bilateral cooperations with all its bordering countries - chronological with Austria and Slovakia in 1998, with Hungary in 1999, and with Poland and Germany in 2000.. All of these agreements are treaties under international law on help and cooperation in the time of catastrophes and large disasters. (MFA 2005)

As stated in (MFA 2006) additional agreements were made. The country has signed regional and multilateral provisions: it is a member of the Council of Europe, the EU, NATO, the OSCE and the UN. The Czech Republic is also a party to the Tampere Convention on the Provision of Telecommunication Resources for Disaster Mitigation and Relief Operations of 1998 (effective since 2006) and the 1992 Helsinki Convention on the Trans-boundary Effects of Industrial 147, Accidents (effective since 2002). Coordinating bodies for providing aid in the times of catastrophes in other countries are the MoI and the MFA.

In relation to (State Office for Nuclear Safety online) the Czech Republic is party to the Vienna Convention on Civil Liability for Nuclear Damage. The Czech Republic is also a party to the Convention on Assistance in the Case of a Nuclear Accident or Radiological Emergency, Convention on Early Notification of a Nuclear Accident and the Convention on the Physical Protection of Nuclear Material (effective since 1993).

Besides international agreements, also cross-border regional agreements exist to facilitate cooperation in the case of crises as the floods or the storms Kyrill and Emma. This cooperation takes on different forms. Official methods of cooperation exist between the Czech Republic and Poland. With Slovakia a similar document exists according to (Prudil 2014).

Agreement on Mutual Cooperation between the Fire Rescue Brigade of the Karlovarsky Region and the German THW Chemnitz (in effect since 2005) is another example. Similar cross-border cooperation can be found in the border regions with all three other bordering states. (Volf 2013) For example “protection against catastrophes” has been an integral part of the Agreement of Cooperation between the Federal Country of Lower Austria and the South Moravian, South Bohemian and Vysocina regions. The Czech region of Southern Bohemia also has similar agreement in place with Upper Austria. (Dohoda 2011)

Only recently, in April 2013, a framework agreement on the cross-border cooperation of the health rescue services was signed between Germany and the Czech Republic. This agreement, signed by the ministers of health of both countries, is a first of its kind in the field of health. It concerns two German federal states (Bavaria and Saxony) and five Czech regions (Liberec, Usti, Karlovy Vary, Pilsen and South Bohemia). In case of a crisis, the backbone of this agreement is the governmental agreement between the Czech Republic and Germany on mutual assistance in disasters and major emergencies. In the coming years, a similar agreement to be signed with Poland is expected (TV RTM 2013).

At the local level in the cross-border regions, cooperation can be found as well although usually focused more broadly to include such areas as environment or regional development. An illustrative example provides the agreement on cooperation between two Czech towns, Rumburk and Varnsdorf, and their two German counterparts, Seifhennersdorf and Großschönau. The agreement was signed by the mayors of these towns in February 2013. One of the areas of cooperation being fire protection and security, especially during emergencies such as natural catastrophes, floods, wild fires, etc. (Bakken and Rhinard 2013).

In general, priorities at strategic level are assigned by Fire Rescue Service of the Czech Republic at central and regional levels (Expert Interview 2014).

4 Procedures

In the Czech Republic, very detailed descriptions of procedures are available, which are widely acknowledged by authorities.

According to the Crisis Act, the preparedness for crises and their management is coordinated by the MoI. The GD FRB (which is a part of the MoI) ensures through its regional offices and territorial districts an efficient coordination of the preparation for crisis situations and their management at the regional, municipal and local level. The regional fire rescue brigades are responsible for crisis preparedness and management in cooperation with municipal bodies. (Plzeň city website)

At the regional level, the regional president (*hejtman*) is responsible for crisis management. He/she chairs the security council of the region (a permanent body) and the crisis staff of the region (non-permanent body, called upon a crisis or exercise thereof). Every region (the regional president's office) has a crisis management department or similar. This is (among other) responsible for analyzing the information for the regional president, informational support to the municipalities with extended powers, coordinating of crisis management and planning of the municipalities with extended powers and for analysis and evaluation of exercises for crisis situations. (Pardubice Region Website)

Members of the security councils and crisis staffs, mayors of municipalities and bodies of the IRS are informed about the emergence of a crisis by the fire and rescue brigades through operational and information centres (regional and sectorial). Crisis communication then runs through commercial mobile network with a negotiated priority of connection for specified phone numbers when a crisis state is declared. Routinely, information (e.g. meteorological warnings) is provided through the WAP server of the Fire and Rescue Brigades with a text-message notice. Increasingly, an Automated Message Delivery System is used for disseminating information notices and calling of the security councils and crisis staffs.

4.1 Standing Operating Procedures (SOPs) and Guidelines

The principles of crisis management are codified in the Act No. 240/2000 Coll. on Crisis Management and amending certain acts (the Crisis Act), as amended. Based on this law, a state of danger can be declared to overcome unfavourable trends of situation development. The state of danger can be declared by the regional governor as an urgent measure, when lives, health, property, and environment are threatened, provided the intensity does not reach the danger of considerable extent, and it is not possible to avert threats by normal activities of administrative authorities, regional and municipal bodies, IRS (Integrated Rescue System) bodies or entities of critical infrastructure (The General Directorate of Fire Rescue Service of CR 2014).

Humanitarian aid in the region is then organized by the regional fire rescue brigades. If the regional measures are not sufficient, help can be requested from the central level, from the GD FRB under the MoI. During crises, material help can be also requested from the Administration of State Material

Reserves. Also the participation of NGOs and citizens' initiative is expected.⁶⁶¹ This is coordinated by a standing working group of the crisis staff. (Conception of Civil Protection 2009)

4.2 Operations planning

Civil protection plans are controlled by the General Directorate (DG), the Fire Rescue Service (FRS) and the regional FRS. Operational organisations and civil protection authorities are all part of the DG Fire Rescue Service and operate as one organisation.⁶⁶² The Fire Rescue Service has a unified approach to all kinds of emergencies. Other authorities could be involved according to the type of emergency. (European Commission 2014)

The Czech Republic has established a relatively good system of flood warning and flood protection including "flood plans" for each city and community has been developed, applied and step by step improved. A support from crisis management as well as water (Water Act) legislation has been very important. Also some main made disasters like nuclear events are well covered and regular exercises organized. The recent exercise took place in September 2010. However, some problems could appear with some other types of disaster which occur very rarely

Plans, procedures and resources for extraordinary events have been systematically created and could be released for the use by proclamation of state of emergency by the prime minister and local authority's leaders at state and regional levels. Operational and communication centres create one system throughout the whole state and their functionality has been checked either by real disasters like floods or by regular exercises at various levels. Special attention has always been given to potential failures of nuclear power plants

4.3 Logistics support in crises

The Organisation ASMR provides a coordination role in planning and supporting emergency economic measures. As a matter of priority, the ASMR makes use of material resources of private business entities, and, according to requirements by subject-matter Ministries, the ASMR generates and manages material reserves in commodities, whose ordinary production would not cover for increased consumption in state of crisis/emergency (Administration of State Material Reserves- Czech Republic 2009).

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

The crisis communication is well organized and standardized. The Electronic Communications Act, No. 127/2005 includes a paragraph for the communication with public (2005). It has been explained by the expert, that situational awareness is ensured through an integrated information system at all administrative levels with efficient information provide to population (2014).

The primary means of informing the public about an immediate crisis are sirens, including mobile devices. The "general warning" tone (oscillating tone lasting 140 seconds) is currently used for all

⁶⁶¹ http://anvil-project.net/wp-content/uploads/2014/01/Czech-Republic_v1.0.pdf

⁶⁶² http://ec.europa.eu/echo/files/civil_protection/vademecum/cz/2-cz-1.html

kinds of danger. Prior to 2002, different tones were used in connection with different hazards. The warning signal is followed by verbal information (e.g. “danger of flood wave”, “chemical accident”, etc.). There are about 6,000 sirens installed in the country.⁶⁶³ In places not covered by the warning signal, the municipality ensures alternative warning through mobile devices of the IRS (fire rescue brigade of the region, police of the Czech Republic) or by a personal notification (through members of the voluntary rescue brigades of the municipality or municipal police).

When a crisis appears, warning is technically provided with the help of the so-called Integrated Alert and Warning System—a system of notification centers located with the fire rescue brigades and other entities involved in the integrated warning system. The system was designed to speed up and improve possibilities of informing citizens in crisis situations. Information comes to the centers from the crisis staff or from rescue services or other entities. Information is collected and notification to citizens is then made through sirens, TV and radio, outdoor speakers and sent through mobile phones and pagers. The notification centers operate at four hierarchical levels: central level (placed with the GD FRB for emergencies beyond the territorial reach of the regional centers; regional level; local level (placed with territorial departments of the fire rescue brigades); and the fourth level (located e.g. with the controlling departments of facilities which can impose serious damage, such as chemical plants) (Bakken and Rhinard 2013).

For early warning the Czech Republic has established the following towards professionals:

- ECURIE (Radiological/Nuclear)
- RAS BICHAT
- MIC
- EADRCC
- IAEA.

These systems are integrated within the civil protection system through the Operational and Informational Centre of the DG Fire Rescue Service of the Czech Republic.

The system consists of:

- Controlling workplace
- Electronic sirens with a controlling unit
- Appliance for transmitting radio signal to control sirens and verbal information transfer.

Operative information is exchanged via walkie- talkies, specialized electronic tools for data exchange on the internet and video conferences. Several web pages exist like the web page of the Czech Hydrometeorological Institute, Fire and Rescue Service, River Catchment Authorities. Also the Czech Flood Commission under the Ministry of Environment has special web pages for floods and flood warnings (Ministry of the Environment of the Czech Republic 2013).

⁶⁶³ http://anvil-project.net/wp-content/uploads/2014/01/Czech-Republic_v1.0.pdf

5 Capabilities

In the Czech Republic, an important role is played by the VFB. In 2012, this organization had 345,455 members (including 46,426 children and youngsters). There are 7,810 VFB at the municipal level, 77 district units and 14 regional units of VFB. VFB are typically established by the municipalities and financed mostly through grants from the MoI and the regions. The role of the VFB is also in rescue works and civil protection.

VFB are an important part of the IRS.⁶⁶⁴ Especially during floods, the VFB participate in evacuation, warning and humanitarian help. They are also trained and involved in exercises of the IRS. The members of the voluntary firefighters are also assigned to enterprise units such as chemical plants. (Union of Fire Fighters online)

Another important institution from the civic sector is the Czech Red Cross (CRC). In civil security, it focuses most importantly on first aid – both in a form of educational and training activities as well as actual provision of first aid at different events; search for missing persons after emergencies; and on humanitarian aid and disaster relief. In the field of first aid, the CRC is the main actor from the civic sector⁶⁶². The number of members and volunteers (excl. employees) was 27,060 in 2011. The organization operates on the whole territory of the country. It has 70,381 members working in 1,712 local groups. Local groups (municipal level) are the cornerstone. On a higher level, there are 76 district associations. At the top of the organization is then the National Society of the CRC. There are no regional associations – one of the district associations is authorized to deal with regional institutions in every region. (CRC online)

5.1 Human resources

In case of a major disaster, a central Crisis Staff at municipal, regional or even national levels is called upon who will give orders to an on-site commander. The Czech Republic has an "Integrated Rescue System" composed of the Fire Rescue Service, the Police, the Medical Rescue Service, NGOs, the municipal police and others. Commands on site are given by the authority with the largest part in the emergency response.

In the Czech Republic there is a long tradition of voluntary fire brigades with over 300,000 members. Since democratization in 1989, voluntary activities started to develop and to be organized on a professional basis. Volunteering is now seen as an integral part of the new 'information/ post-industrial' society in the Czech Republic. As stated by (Bakken and Rhinard 2013) the new volunteers exhibit a short-term, occasional approach to volunteering. Typically, the floods create large waves of solidarity with people helping in the affected areas. E.g. immediately after the floods in 2002, 45,000 donors and volunteers were registered. Other thousands of people were donating through phone-lines or SMS messages. Some other local civic organizations focusing at first aid exist as well (e.g. the professional Association of First Aid based in the town of Kladno in central Bohemian Region), yet they are far less important – e.g. the mentioned one has 15 members) (Red Cross EU Office 2013)

⁶⁶⁴ http://anvil-project.net/wp-content/uploads/2014/01/Czech-Republic_v1.0.pdf

In line with (Bakken and Rhinard 2013) the CRC was typically involved during the floods of 2006: The main crisis staff of the CRC was called on 29th March 2006. The crisis staffs of the local groups cooperated with local authorities in the affected territories, e.g. in České Budějovice, Český Krumlov, Písek, Prachatice, Jindřichův Hradec, Liberec etc. The Red Cross initiated a collection aiming at post-flood assistance to the people. There are also other NGOs active partially in the field of civil security – mostly in organizing money or material collections and voluntary help. The best examples here are the ADRA organization and Caritas which participated in the post-flood assistance. However, the scope of these organizations is much broader and the assistance during crises is not their main focus. There is no official data on the exact number of active members. Typically, all of the mentioned NGOs are not directly financed by the state but they get part of their funding through projects which are financed by the state (by the ministries of Interior and Foreign Affairs in this case).

Legal persons are obliged to prepare for emergencies and to participate in the preparation of emergency plans and to provide assistance during a crisis when requested. They can be asked to do so by the regional president or by the mayor of the municipality. (Act nr. 240/2000 Coll., §29) Cooperation and crisis preparedness, however, have not always gone smoothly. E.g. during the floods of 2002 the Spolana Neratovice plant was flooded, leading to leakage of chloride. In the vicinity of the chemical plant, the highest degree of chemical danger had to be declared. Police closed roads and firefighters sprinkled the area with water mist which would “pull” the gas to the ground. Although the responsible company was sued for the leakage, the case was put to a halt. (Baroch 2004)

In the field of civil security provision, the absolute majority of bodies are public ones. As an example of private bodies, for-profit health rescue services can be mentioned. These are typically smaller than the health rescue services which are established by the regional authorities. They specialize e.g. in the transportation of patients or assist at various cultural and sporting events (paid by the organizer). Usually, one such organization exists in every region although they do not necessarily have an agreement with the regional authority or all health insurance companies.

Being an integral part of the IRS, the flight rescue services must be mentioned as well. Currently, there are 10 stations facilitating air rescue. This represents a very dense network (one of the densest in Europe) covering an overwhelming majority of the territory of the country. The flight rescue services are operated both by private (eight stations) and by state (two stations) bodies. The latter ones are operated by the Police Air Service and by the army. So far, there have been no criticisms on the functioning of the flight rescue services. (Bakken and Rhinard 2013)

According to (Bakken and Rhinard 2013) the role of private (for-profit) bodies in other spheres of civil security is slightly more complicated. During the floods of 2002, for example, there was a large group of relatively well organized citizens who in many cases voluntarily participated at the rescue actions, although they were not explicitly asked to do so. These were some 54,000 workers of private security services. Due to the absence of legal regulation of the activities of private security agencies, the integration of these into the IRS remains problematic. (House of Representatives 2002) It has to be noted, however, that this legislation is currently under preparation by the MoI.

Since 2003 the education on civil security has been again on the primary and secondary schools' curricula.

Recently, the goal of creating a program for education of the population has been set⁶⁶⁵. The main

⁶⁶⁵ http://anvil-project.net/wp-content/uploads/2014/01/Czech-Republic_v1.0.pdf

responsibility rests with the MoI, in collaboration with the Ministry of Education, Ministry of Health and the Ministry of Transportation. Typically, the fire brigades are involved in the education of both public and administration. In 2009, the proposition was made to incorporate the topic of civilian protection into the curricula of pedagogic faculties of universities.

The education of teachers to teach the topic of civil security is also supported by the fire rescue brigades. In this way, 1,666 teachers were trained in 2011 in 126 different courses. In sum, more than 16,200 teachers were trained by the year 2012. (HZS ČR 2012) Also, governmental employees at all levels are trained in special courses on civil security management. In total 8,007 servants were trained in 2011. The participation of the mayors of smaller municipalities, however, is rather low compared to others. This can be explained by the fact that for the mayors – unlike the local government officials – this education is not compulsory.

At the central level, the training is organized by the MoI – GD FRB in cooperation with the ministries of Defense, Health, Finance, Environment, Administration of State Material Reserves, Police Presidium and the Security Policy Department of the MoI. The provision of education in the field of crisis management is obligatory by law. Since this legislation entered into force (in 2001), the training has been organized once in every election period (usually after communal elections). So far, the training for mayors has taken place in 2003, 2007 and 2011. (Svitáková 2011)

In the past, the government did run some educational campaigns, including TV spots. So far, the last TV spots directly related to civil security were aired in 2010. (Initiative for Civilian Protection online) In the years 2009-2010, educational spots were aired with the information on important phone numbers (campaign called “What to do When...”). At the regional level, the public is educated through regional press materials, and local radio and TV stations. For example, the Fire Brigades of the Moravskoslezský Region signed a license agreement with two local cable TVs. Six spots on fire and civil protection were made (The General Directorate of Fire Rescue Service of CR 2014).

The following table provides an overview on operational forces as mentioned above:

Table 27. Overview on operational forces for protection and rescue activities in the Czech Republic

Stakeholder Type	Name	Number of Personnel
Voluntary Organisation	Fire Rescue Service (Employed + Volunteers)	300.000
	Czech Red Cross (Employed + Volunteers)	88,000
Agency/Department	Czech Armed Forces	35,000
	Police	18,000
Private business	Private security workers	54,000
Total		495,000

5.2 Materiel (non-financial) resources

Material resources are provided from the “Integrated Rescue System” composed of the Fire Rescue Service, the Police, the Medical Rescue Service, NGO, the municipal police and others. According to Obrusnik (2005) a special institution (State Material Reserve- AMSA) stores emergency relief items and distributes them during and after disaster accordingly with state, regional and local needs.

The generation of state material reserves is encompassed in emergency contingency plans. The ASMR makes sure that resources are contracted pursuant to the requirements of central government agencies. Furthermore, the ASMR supports their financing, renewal, replacement, lending, release, hiring, sale, storage, keeping and inspection. From the viewpoint of their purpose, the state material reserves divide into material reserve, mobilisation reserve, emergency reserve and humanitarian aid reserve.

The ASMR provides a coordination role in planning and supporting emergency economic measures. As a matter of priority, the ASMR makes use of material resources of private business entities, and, according to requirements by subject-matter Ministries, the ASMR generates and manages material reserves in commodities, whose ordinary production would not cover for increased consumption in state of crisis/emergency (Administration of State Material Reserves- Czech Republic 2009).

Material reserve involves selected primary raw materials, materials, semiproducts and products, designated for supporting national defence capability, for consequence management efforts following emergencies as well as for the protection of vital national economic interests. The material reserve chiefly includes primary mineral inputs for oil, metallurgical, chemical, textile and food industry. A decisive portion of the material reserve comprises an emergency stockpile of oil and selected petroleum products in quantity and structure according to requirements under the Act No.189/1999 Coll., on Emergency Oil Reserve, as amended, which implements in the Czech legal order the European Commission Directive No.1968/414/EHS, amended by EC Directive No.1998/93/ES.

Mobilisation reserve comprises primary raw materials, materials, semiproducts, products, machines and other property designated for ensuring the production of necessary assets for armed forces and armed security services, especially for the state of war or the state of national war threat.

Emergency reserve includes selected primary materials and products, designated principally to ensure critical supplies to sustain the needs of the population and for operations of emergency services and fire rescue service units. The reserve is generated in the case when the necessary materials and products in support of crisis management are not available on national territory in necessary quantity and/or in given timeframe.

Humanitarian aid reserve comprises selected primary materials and products designated for a definite period of time to sustain essential life needs of persons who have suffered a grave material damage in an ongoing emergency. That particularly involves foodstuff for individual consumption, critical sanitary aids and the like. In justified cases, they are transferred to municipal government authorities responsible for their distribution to citizens.⁶⁶⁶

5.3 Training

The Ministry of Interior in order to coordinate the performance of state administration in the frame of crisis management organizes briefings and training sessions and participates in training for acquisition of special professional competence of the crisis management staff. All members of the Fire and Rescue Service of the Czech Republic and members of other fire units are trained to provide

⁶⁶⁶ <http://www.hzscr.cz/hasicien/article/crisis-management-in-the-czech-republic.aspx>

effective help in emergencies. Exercises have been regularly organised and the training follows internal Czech standards for crisis management (Expert Interview 2014).

The planning process starts by preparing the annual training plan (national, regional and local). The preparation of annual and monthly exercise plans follows. Each fire station and each regional Fire and Rescue Brigade have their own exercise plans which are coordinated at national level to ensure that other services (regional Medical Rescue Services, the police, the army, ministries and other bodies of the Integrated Rescue System etc.) are incorporated into these plans.

Exercise facilities include, for instance:

- Any possible parts of real environment
- Any possible real facilities (buildings, factories, collapsed structures, streets, roads, motorways, rivers etc.)
- Local training facilities within regional Fire and Rescue Brigades
- Military training facilities
- Training facilities of other bodies of the Integrated Rescue System.

Guidelines for exercise planning: The guidelines are found in the Directive of the General Director of the Fire and Rescue Service No. 7/2009 on the recommended procedures for preparing and performing exercises. According to the Conception of Civilian Protection (Conception 2013), the authorities are responsible for raising awareness about civil security among the public. The *education on civil security* (called “civil defense” at that time) was completely abandoned in the early 1990s with no substitution, resulting in relatively low knowledge of the population about what to do in the state of crisis.

Since 2004, the country has regularly participated in EU crisis-response exercises. These include EUDREX (October 2004), EUPOLEX (June/July 2005), EURATECH (April 2005), ALBIS (May 2008), EU COMMAND POST (May/June 2010), EU CARPATHEX (September 2011), EU COMMAND POST (November 2012) and TARANIS (June 2013). The range of these exercises varies from floods and earthquakes to chemical, biological, radiological and nuclear threats. (European Civil Protection online) the Czech Republic also takes part in other international exercises, such as the MODEX exercise of civil protection modules organized by the Falck Company in Denmark in January 2013 where the Czech Trauma-team participated. The country participates in the provision of aid under the EU Humanitarian Aid and Civil Protection Directorate General (also known as ECHO). (EDRIS online) The Czech Republic also participates in the EU exchange of experts programme. Under the theme *Improve Crisis Management/ Stronger EU Disaster Response* the country was a lead country in 2012. (FEU 2012), (Bakken and Rhinard 2013).

5.4 Procurement

5.4.1 Procurement regulation

The main tool of the Union Civil Protection Mechanism is the European Emergency Response capability (EERC), which consists of a voluntary collection of in advance prepared Member States response capacities including modules, further response capacities as well as the experts. Joint procurement involves sporadically Slovak Republic, but there is a need for additional legislation. Interoperability is not developed fully (Expert Interview 2014).

Civil protection modules are formed from sources of one or more Member States and they are able to carry out the predefined tasks in the area of response, in accordance with the implemented international instructions. The basic advantage of modules is that they can be deployed at very short notice following a request for assistance through ERCC and can work self-sufficiently and autonomously for a given period of time. At the same time the modules are interoperable with the other ones and are able, if needed, to cooperate with other bodies of the Union or international institutions, in particular with UN. Modules are registered in the CECIS system and closely connected to European response capacities.⁶⁶⁷

Within European Union there are c. 200 modules registered which are split into 17 types (MS Line Publishing House 2014). At present, the Czech Republic makes available through the Mechanism for civil protection EU the following modules (MS Line Publishing House 2014):

- 2x Medium urban search and rescue modules (MUSAR) - a unit for search and rescue operation in cities in medium conditions;
- 1x Heavy urban search and rescue module (HUSAR) - a unit for search and rescue operation in cities in heavy conditions;
- 1x High capacity Pumping Module (HCP) - a unit for the pumping and discharge of large quantities of water;
- 1x Chemical, biological, radiological & nuclear detection & sampling (CBRNET);
- Flood Rescue Boats (FRB) – a unit for flood rescue in boats;
- 1x Advanced medical post (AMP) – a unit with advanced medical post.

Czech Defense Ministry (MOD) procurement is plagued by lack of transparency and remains an arena for shady business deals. Successive governments seem to have viewed MOD contracts as a way to reward themselves and their political supporters with lucrative business deals, cheap asset sales, and kick-backs.⁶⁶⁸ The latest controversial contract for the light-armored vehicles suggests that politicians appear able to manipulate the procurement process by utilizing single source tenders, requiring the use of preferred intermediaries,⁶⁶⁹ and paying higher prices than other countries for similar items. Similarly, the case of the barter/sale through EADS of redundant L-159 aircraft for Casa C-295 transport aircraft seemed to be yet another attempt to circumvent an open, competitive tender.⁶⁷⁰ As in the notorious 2004 Gripen fighter aircraft procurement, the Czech government has shown little political will to investigate possible high-level corruption.⁶⁷¹ The large Pandur contract and the tender for new light armored vehicles were two key tests of the MOD's ability to successfully conduct large procurements.⁶⁷² Czech officials have taken some tentative steps toward cleaning up the procurement system. However, much more transparency is needed within the Czech MOD to prevent politicians and defense officials from manipulating the defense procurement process for personal and political gain.⁶⁷³

⁶⁶⁷ [http://en.msline.cz/index.php?page=cdis-review&cislo=cdis-review-2-2014&clanek=activities-of-fire-rescue-service-of-the-czech-republic-in-nato-and-eu-](http://en.msline.cz/index.php?page=cdis-review&cislo=cdis-review-2-2014&clanek=activities-of-fire-rescue-service-of-the-czech-republic-in-nato-and-eu)

⁶⁷² <http://www.globalsecurity.org/military/world/europe/cz-budget.htm>

⁶⁷³ <http://www.globalsecurity.org/military/world/europe/cz-procurement.htm>

- National legislation on procurement not covered by the EU directives

The award procedures for procurement below EU threshold are foreseen by the directive 2004/18/EC. In addition simplified procedures below the threshold can be used. In the simplified procedure below the threshold, the contracting authority shall invite not less than 5 candidates to submit tenders and to demonstrate the fulfilment of qualifications by means of an invitation in writing. The contracting authority shall make public the written invitation in a suitable manner for the entire duration of the time limit for the submission of tenders. The contracting authority has to use the publication forms laid down by the commission regulation, except for the invitation to the below threshold procedure. The forms have to be published at the national web Public Procurement Information System.

5.4.2 Procurement procedures

The Legislation on public procurement according to the Act on Public Contracts provides several options for the contracting authorities to open up a public procurement using of the following procedures (Global Legal Group 2010):

- open procedure;
- restricted procedure;
- negotiated procedure with publication;
- negotiated procedure without publication;
- competitive dialogue; and
- simplified below-the-threshold procedure.

The acquisition of state material reserves and their using provides the Government of the Czech Republic. The state material reserve involves selected primary raw materials, materials, semi-products and products, designated for supporting national defence capability, for consequence management efforts following emergencies as well as for the protection of vital national economic interests (European Defence Agency 2014).

Fire Rescue Services of the Czech Republic have been strongly involved in the procurement of CM Tools, which is well coordinated (Expert Interview 2014). However, the procurement process in cooperation with non-EU countries is not relevant for the Czech Republic.

- Structures responsible for public procurement at central, local and regional level.
 - Office for protection of competition
 - Ministry for Regional Development: it has been established by the Act No. 2/1969 Coll. On establishing ministries and other central authorities of state administration of the Czech Republic, as amended. It is responsible for governmental proposal of legislation on public procurement and concessions contracts.

Every contraction entity is responsible for its own procurements. If contraction entities associate or group in another way for the purposes of common action aimed at the award of a public contract they are considered as the contraction entity.

The Act on Public contracts enables to conclude a contract with central purchasing body. Central purchasing body can be any Contraction authority which is obliged to award public procurement for other contraction entities by contract. It is not created by any state decision.

5.5 Niche capabilities

In the view of the expert, the Czech Republic benefits especially from the relief goods stockpiles and the close cooperation with military actors (Expert Interview 2014). As it has been found out within the ANVIL country study, the Voluntary Fire Brigades with its 300,000 personnel resources provide a beneficial contribution to the security system in Czech Republic (Bakken and Rhinard 2013). The voluntary organization is participating as an official part at the Internal Rescue System (IRS). Furthermore, Bakken and Rhinard (2013) have indicated, that the provision of assistance of the Czech Republic in several missions abroad have been widely acknowledged.

Driving Innovation in Crisis Management for **E**uropean **R**esilience

DENMARK

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: ECORYS (Laura Birkman, Linette de Swart and Rachel Beerman)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by AIT and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

In 2009, Denmark adopted the Emergency Management Act. This act is detailing all aspects of crisis management. The crisis management approach of Denmark assumes the local level to be better placed to tackle local crisis situations than the national level. Private organisations, volunteers and NGO's participate in Danish crisis management. In particular, Falck Redningskorps Ltd⁶⁷⁴, a large private Danish rescue and fire company operates on a contractual basis within many of the Danish municipalities.

Danish Civil Protection League is also supporting, as a non-profit organisation, with 5,000 members. Also the Danish Red Cross acts in crisis situations. But the major national organisation, also international contact point, is the Danish Emergency Management Agency or DEMA⁶⁷⁵. DEMA handles different aspects of the crisis management policy cycle.

DEMA is organised in four core areas, each covering a part of the Danish emergency response from **prevention** (inspection, counselling, supervision and development of national rules and laws preventing fires and explosions, **Emergency planning** (supervision of other governments and private companies on preparedness planning), **Operational** (National Division, International Division, Chemical Division and Nuclear Division and **training** (via the centre for **Education** and **HR Development**)).

The Danish national accounts do not clearly provide an overview on the costs they make to invest in preparedness. Therefore a rough estimation has been made to provide a general idea. The Danish Parliament (Folketing) decides on the **Police** budget. The Parliament sets the Police budget for a 4 year period. In the period 2007-2010 the available annual budget was DDK 7.5 billion (1,008 million euros). The fire services are partially provided by public providers and partially by private operators. The only private operator in Denmark is **Falck**, providing firefighting services for 2/3 of the municipalities in Denmark according to their latest annual report (2013). Besides firefighting services Falck is also responsible for 85% of all ambulance service provided in Denmark. Of the total revenue made in 2013, 46.6% was made in Denmark. The revenue of 2013 amounted to DKK 5.839 million (€ 748 million). DEMA has a staff of 565 employees available divided over 10 different locations (rescue centres and schools). Their annual budget is around DKK 490 million.

The GDP for 2013 was DKK 1,886 billion⁶⁷⁶. The support provided to DEMA is in this case 0.03% of national GDP in 2013. However the costs of DEMA do not cover the entire costs for crisis management as the police forces, the fire brigades as well as the medical assistance play a role in emergency management as well.

⁶⁷⁴ Source: <https://www.falck.com/en/>

⁶⁷⁵ Source: www.brs.dk/eng/

⁶⁷⁶ Source: Statistics Denmark (2015)

Niche capabilities are **Private fire and ambulance services (see above). And the international energy preparedness approach.** A niche preparedness approach of the Nordic countries is found in the energy supply preparedness. The Nordic countries work closely together to create an integrated electricity supply network.

This report gives an overview of the information retrieved from online published resources. As our attempts to contact DEMA and other local experts failed, and many documents with more details were only published in Danish, the current analysis is more high-level than preferred initially.

1 Policy

Denmark is situated in Northern Europe, and extends from the Barents Sea and Arctic Ocean on the north to the Baltic Sea on the south and includes Norway and Sweden. Denmark lies south of Norway and to the southwest of Sweden. Denmark's mainland is Jylland (Jutland), a peninsula that shares a short southern border with Germany and otherwise is surrounded by the North Sea, Skagerrak and Kattegat, and Baltic Sea. Jutland accounts for over two-thirds of Denmark's area, the rest of Denmark consists of more than 400 islands. Sjaelland (Zealand), the largest and most densely populated of the islands, is home to the country's capital of Copenhagen. Ferries, bridges, and small planes connect many of the inhabited islands. (Stone Wyman)

Geography and Climate

Denmark is the smallest of the Scandinavian countries in area, at approximately 42,916 square kilometres (Website Denmark, 2014). As the country is an archipelago it gives Denmark a long, irregular coastline of about 7,314 kilometres, characterized by bays and estuaries, sandy beaches with dunes, and some cliffs (Stone Wyman).

As the lowest-lying Scandinavian country, Denmark has the most homogenous terrain, characterized by flat plains, rolling hills, and many lakes, with its highest natural feature topping out at only about 568 feet (173 meters) above sea level. Land cover in Denmark consists of cultivated areas (66%); forests (12%); bogs, meadowland, heath and sand hills, and lakes (10%), with the remainder devoted to built up and traffic areas (CIA World Factbook, 2014 and Stone Wyman).

Denmark's climate is the most temperate of the three Scandinavian countries. Historically, winters are mild and summers cool due to the Gulf Stream and the westerlies. Average temperatures range from a low of about 0.0 °C in January to a high of just over 16°C in August. Within these averages, however, the actual highs and lows fluctuate considerably (Stone Wyman).

Demographics

With 5,627,235 (2014) inhabitants, Denmark is second to Sweden in total population, but the most densely populated of the three Scandinavian countries. The country is highly urbanized, with 85% of its population residing in cities and towns but has a low population density of 130.50 inhabitants per square kilometre (Statistics Denmark 2014).

Economy

The country's economy includes a high-tech agricultural sector as well as prominent companies in several sectors such as pharmaceuticals, renewable energy, and maritime shipping. Although a net exporter of food and energy, Denmark's manufacturing sector relies on imports of raw materials. The Gross domestic product is DKK 466.2 billion (2013) or 253 billion EUR (2013) (DST, 2014; Stone Wyman, 2014).

The next section will detail the risk assessment for Denmark. The risk methodology, former crises and identified risks are discussed.

1.1 Risk Assessment

1.1.1 Key risks and former disasters

In the World Risk Report 2014⁶⁷⁷ Denmark is qualified as a rather safe country compared to other (EU) countries. On the world risk index Denmark is ranked 149th out of 171 countries. Neighbouring countries Norway and Sweden score a bit better. Germany scores a little lower, especially on exposition.

Table 1.1: Position Denmark in the world risk index

Rank	Country	World risk index	Exposition	Vulnerability	Susceptibility	Lack of coping capabilities	Lack of adaptive capacities
147	Germany	3.01%	11.41%	26.37%	15.41%	37.73%	25.97%
149	Denmark	2.93%	10.87%	27.00%	15%08	39.49%	26.42%
158	Norway	2.31%	8.58%	26.86%	14.41%	40.05%	26.13%
162	Sweden	2.19%	7.97%	27.49%	15.39%	40.90%	26.18%

Source: Alliance Developments Work (2014), edited by authors.

The main natural hazard for Denmark is flooding, as the country consists of a long coastline and many islands. Flooding is mainly a seasonal risk and occurs in some parts of the country. Parts mostly at risk are Jutland (Jylland) and along the southern coast of the island Lolland. Besides these two major parts under threat, other parts of the country are at risk for flooding as well, as the country consists of around 400 islands of which 82 are inhabited with Jutland, Zealand (Sjælland) and Funen (Fyn) being the largest ones, both in terms of km² and number of inhabitants. The country as an overall coast line of 7,314 km (IFEH, 2014).

The main threats, in addition to flooding, identified for Denmark are: fires, storms, snow storms, oil spills, man-made and technical disasters⁶⁷⁸. Although the highest risk of the country is flooding, the disasters causing the highest number of casualties and economic damages are storms and transport accidents. The next table provides an overview of the main disasters in Danish history since 1951.

Table 1.2: Former incidents Denmark between 1951 and 2009

October 2009: Waste Disposal Fire in Toelt
January 2007: Kyrill storm
March 2006: Bird flu
January 2005: Winter storm Gudrun in Denmark, Sweden & Baltic countries
November 2004: Fireworks accident at N.P. Johnsen's fireworks factory in Kolding, Denmark.
March 2001: Collision of the freight ship <i>Tern</i> and the oil tanker <i>Baltic Carrier</i> east of the Danish island of Falster.
December 1999: Violent hurricane.
1988: Railway accident near Soroe (Zealand); 8 dead, 72 injured.
1985: Oil slick from the Jan of Bremen; 20 km of marsh polluted at the island of Laesoe (in the Kattegat).
1984: Oil slick from the Ibn Rochd; pollution at numerous points on the Jutland and Zealand coasts.
1984: Major storms in Jutland causing extensive damage to buildings.
1976: A 1.4 million acres moorland fire at Aabybro (Northern Jutland). Fire action during one month.
1975: Several big forest fires in Jutland lasting weeks.
1975: Fisher trawler loss in the harbour of Hanstholm (Northern Jutland) during a hurricane; 11 dead.
1973: Hotel fire in Copenhagen; 35 dead.
1972: Tank lorry accident in Simmersted (Southern Jutland). Massive phenol pollution in the water supply system and environmental damage to the streams in the area.
1967: Railway accident at Odense (Funen); 11 dead, 30 injured.
1964: Explosion at a gasworks in Copenhagen; 4 dead, 200 injured and extensive damage.
1964: Explosion at a chemical plant in Roenland (Western Jutland); 3 dead.
1959: Fire and explosion on a tourist boat on a lake near Haderslev (Southern Jutland); 53 dead.
1951: Explosion in a mine depot at Naval Base Copenhagen; 16 dead, approx. 50 injured.

Source: EC, 2014

According to the Brussels based Centre for Research of the Epidemiology of Disasters (CRED), the most costly natural disaster in Denmark is a storm that caused a lot of damage in 1999. In terms of damage cause 7 out of the 8 disasters included, were storms. The eight disasters causing high financial damage was the drought of May 1992. The table below shows the top-8 disasters since 1900, measured in their financial impact⁶⁷⁹.

⁶⁷⁹ Source: <http://emdat.be/>

Table 1.3: Largest natural disasters between 1900-2014, measured in economical impact

Disaster	Date	Damage (000 US\$)
Storm	3/12/1999	2,604,939
Storm	7/01/2005	1,300,000
Drought	may/92	751,700
Storm	24/11/1981	250,000
Storm	25/01/1990	120,000
Storm	17/01/2007	100,000
Storm	25/02/1990	60,000
Storm	28/02/1990	10,000

Source: Emdat, 2014

CRED also reported on the number of people killed. As the following table shows not many Danish citizens died during the eight largest natural disasters, included in the CRED database. All disasters included are storms and the storm created the highest number of casualties was a storm in 1981, which resulted in 9 Danish people killed.

Table 1.4: Largest natural disasters between 1900-2014, measured in people killed

Disaster	Date	No Killed
Storm	24/11/1981	9
Storm	3/12/1999	7
Storm	7/01/2005	4
Storm	18/01/1983	2
Storm	28/02/1990	1
Storm	27/10/2002	1
Storm	27/10/2013	1
Storm	7/12/2013	1

Source: EMDAT, 2014

CRED also collected data on technological disasters. The following table presents the major technological disasters since 1900, measured in the number of people killed. As the table shows only four accidents are included in the CRED database. The largest accident was a transport accident in 1989, in which 55 people lost their lives.

Table 1.5 Largest technological disasters between 1900-2014, measured in number of people killed

Disaster	Date	No Killed
Transport accident	08/09/1989	55
Miscellaneous accident	00/09/1973	35
Transport accident	21/08/1917	18
Industrial accident	04/11/2004	1

1.1.2 Risk assessment methodology

In order to mitigate the potential impact of the risks described above frequent risk assessments are conducted. Conducting risk assessments was previously mainly done by private companies and local public bodies. Since the Danish National Vulnerability Evaluation (conducted in 2004) also general risk assessments are carried at the central governmental level.

The Danish Emergency Management Agency (DEMA), more specifically its Centre for Resilience and Contingency Planning, developed a methodology to assess the potential risks. The model conducts a risk and vulnerability analysis (RVA model) which forms the basis for all preparedness planning at the central governmental level. As risk and vulnerability planning is rarely required by law, the DEMA model is used on a voluntary basis (DEMA, 2014a).

The RVA model mainly considers potential effects of a crisis on critical functions. These critical functions refer to all activities and services which are indispensable for society. The model assumes a function to be critical if their partial or entire loss will cause grave consequences for life, health, property or the environment. For each of the functions the model assesses what will happen to it in case of simulated large-scale disturbances, accidents or outright catastrophes. The figure below outlines the different model steps. The model itself is not publically available⁶⁸⁰.

Figure 1.1: DEMA's civil preparedness planning process⁶⁸¹

The results of each model run are included in the National Vulnerability report, which is published yearly. However, no reports could be retrieved (DEMA, 2014a).

1.2 Policy and Governance

1.2.1 Strategy scope and focus

Danish crisis management is mainly organised on the local. In case of an emergency the municipal fire and rescue service is the first to respond to the emergency together with the local police and ambulance services. If the emergency is too large for the responders in a single municipality to combat, these services can ask assistance from services in neighbouring municipalities. In a situation in which specialised equipment or skills are required to sufficiently combat the emergency, local authorities can turn to the national level for assistance. This assistance will be provided by DEMA (see below). This division of tasks and responsibilities is laid down in the Emergency Management Act, the main crisis management act in Denmark.

Although the Emergency Management Act is the main crisis management act in Denmark is mainly focuses on fires and related emergencies. In addition to the Emergency Management Act other acts are adopted, which focus on more specific disasters and challenges, e.g. acts on oil spills, harmful substances at sea, energy sector contingency planning and IT and telecommunications preparedness (Stone Wyman).

At the national one overarching crisis management authority has been establish which is oversees the prevention and preparedness policies and if needed can support the municipalities in combatting emergencies. This authority is the Danish Emergency Management Author (DEMA). Before its merger in 1993 DEMA consisted of two separate organisations the State Fire Inspectorate (Statens Brandinspektion) and Civil Defence Agency (Civilforsvarsstyrelsen)⁶⁸².

DEMA is organised in four core areas, each covering a part of the Danish emergency response:

***‘Prevention** includes inspection, counselling, supervision and development of national rules and laws related to the technical and behavioural aspects of preventing fires and explosions.*

***Emergency planning** includes supervision of other government, regional or municipal agencies and private companies on preparedness planning.*

***Operational** response (National Division, International Division, Chemical Division and Nuclear Division). The Chemical Division undertakes the following tasks: Analytical chemical investigations of unknown substances, including chemical warfare agents (CWA) and explosives; examinations of dangerous goods and hazardous materials; information on hazardous substances, including the "Guidebook for Emergency Response to Hazardous Materials Incidents" and "Manual for Response to Hazardous Materials Incidents"; and advisory services, including the Emergency Response Centre.*

*The Centre for **Education** and **HR Development** carries out professional educational consultancy services for colleges, centres and the municipal civil protection preparedness*

⁶⁸² Source: Stone Wyman

system, including training regulations and plans for preparedness staff; training course administration; management and development of both national and internal training courses and exercises; recruitment of staff, staff administration and staff policy; cooperation with national and international universities and civil protection training centres⁶⁸³.

Important feature of the Danish crisis management system is the possibility for municipalities to outsource the fire and rescue services to a privately owned company (article 13 Emergency Management Act). Currently the only private company offering fire and rescue services is Falck Redningskorps Ltd.⁶⁸⁴. According to their annual report 2/3 of all Danish municipalities outsourced the fire and rescue services to them. In addition to providing fire and rescue services Falck also provides around 85% of all the ambulance services in Denmark. This Danish possibility to enter into agreement with a private company to perform basic emergency management functions is rather unique.

1.2.2 Monitoring and analytical support to policy making; R&D

Not many specific examples regarding R&D have been retrieved during this research. Main R&D effort found is the development of the generic risk and vulnerability methodology for civil contingency planning. Based on this methodology a risk and vulnerability model (RVA model) has been development. The development of this tool was partially funded by DEMA. The model serves as the basis for all preparedness planning in Denmark. (RVA is also discussed in section 1.1).

1.2.3 Policy for Prevention

DEMA is responsible for a wide range of tasks relating to prevention, including fire prevention. These include drawing up regulations and directives, providing advice and campaigns directed at the general public, authorities and companies. (Danish emergency management act, 2009)

DEMA works with prevention through rules and regulations in areas such as:

- Rules and regulations concerning fire and explosion hazards in enterprises and storage facilities;
- Operational directives for community centres, hotels, schools, etc.;
- Approval of major stocks of gases and flammable liquids;
- Approval of enterprises covered by the Seveso II Directive due to fire;
- Explosion hazard;
- Regulations for transport of dangerous goods by road and approval of tanks.

(Danish emergency management act, 2009)

⁶⁸³ Source: DEMA, 2014

⁶⁸⁴ Source: <https://www.falck.com/en/>

DEMA also develops educational material and campaigns aimed at changing behaviour and attitude in respect of fire prevention and emergency management. Each year a number of campaigns are implemented. Examples are:

- Fire prevention campaign aimed at primary school children;
- National warning siren campaign along with full-scale testing of national warning sirens.

(DEMA, 2014c; Danish emergency management act, 2009)

The municipal level is often performing the operational tasks of prevention. The municipal council shall for example carry out inspections of fire prevention arrangements of enterprises, listed buildings, buildings in which many persons are gathered, buildings that are inflammable and stores as well as of floating constructions (Art. 36 of part 7 of the Danish emergency management act, discussed in chapter 2). The reports of the prevention analysis are published on the DEMA website (Danish emergency management act, 2009).

Specific prevention for flooding⁶⁸⁵

Spatial planning in Denmark is rather strict. Main reason for such strict regulation is to prevent and minimise the risks of flooding along the coast line. One specific element of Danish spatial planning is the possibility to give unhabituated land back to the sea. This practise ensures that the effects of flooding become less and populated areas are less at risk. If the practise of giving back the land to sea do not suffice it is possible to undertake preventive measures. These measures are taken by the Danish Coastal authority that mainly opts for beach nourishments or other soft defences.

Three acts of the Danish legislation are important to mention when considering coastal adaptation measures:

- Coastal Protection Act: the municipalities have the right to undertake coastal protection projects when necessary, financed with the money from the local landowners gathered through taxes⁶⁸⁶;
- Nature Protection Act: in the first 300 m zone from the coast no new constructions may be build⁶⁸⁷;
- Planning Act: in the first 3 km from the coast new activities is restricted⁶⁸⁸.

Besides these planning restrictions, most discussion on climate change focus on mitigation. An example of this focus is the publication of the Danish government in March 2008 for a general strategy with regard to climate change adaptation. The main purpose of this strategy is to support coordination and informed decisions about autonomous measures. The policy document, however, does not contain any specific analysis or actions yet. It only sets the strategic agenda.

⁶⁸⁵ Source: Policy Research Corporation

⁶⁸⁶ Text (in Danish only) could be found at: http://faolex.fao.org/cgi-bin/faolex.exe?rec_id=114806&database=faolex&search_type=link&table=result&lang=eng&format_name=@ERALL

⁶⁸⁷ Text (in Danish only) could be found at: <http://faolex.fao.org/docs/pdf/den140206.pdf>

⁶⁸⁸ Text could be found at: <http://naturstyrelsen.dk/media/nst/Attachments/planlovenpengelsk2007.pdf>

Coastal zones are mentioned only briefly in this climate strategy. The strategy says the following:

- Climate adaptation may become a necessity due to sea level rise and more intense storms;
- Enforcement of the protection structures may be needed based on risk-analyses;
- An integrated flood warning system could be useful in the future.

Niche prevention: preparing elderly

A well-functioning scheme in Denmark is that municipalities have a legal obligation to organise home visits to all persons aged 75 or more at least twice a year. In a 1999 evaluation of this practice, 80 percent of the responding municipalities reported that the scheme had helped them reach groups of 'vulnerable' elderly, which they had not formerly known (OECD, 2006).

If this approach resulted in a better preparedness for crisis situations is not retrieved, however this niche approach in preparedness planning is worth mentioning.

1.2.4 Policy for Preparedness

The preparedness planning in Denmark is based on three principles: total defence, sector responsibility and risk assessment.

- The concept of "**total defence**" refers to a collaboration and coordination across Denmark's defence agencies, home guards, police and rescue management units, and all entities engaged in civilian sector readiness (Stone Wyman).
- A fundamental principle of emergency planning in Denmark is the principle of **sector responsibility**. This means that the authorities or institutions, which are in charge of the day-to-day responsibility of a given area, are also responsible for that area in the event of a major accident or disaster. According to the Danish Emergency Management Act, each Minister is responsible for planning within their respective areas of responsibility. Their tasks are to maintain the functions of the Government and public administration, producing necessary legislation and providing guidance to regional and municipal authorities. This principle of sector responsibility is outlined in paragraph 24.1 of the Emergency Management Act, which reads (Emergency Management Act, 2009):
 - The individual ministers shall each within their areas plan the maintenance and continuation of societal functions in the event of accidents and catastrophes, including acts of war, and provide support for the armed forces;
 - The Minister of Defence coordinates the planning regarding the civil sector's emergency management, cf. (1) and provides advice to the authorities. The Minister of Defence shall carry out that part of the planning that does not rest with other authorities;

- At the local level, regional and municipal councils are required to prepare contingency plans for their region designed to maintain critical public sector services during emergencies or restore them as quickly as possible (Stone Wyman).
- Since 2005, **risk** and vulnerability **assessment** has been an organizing principle for setting emergency management priorities. An annual vulnerability assessment report will describe selected emergencies that occurred during the year and discuss specific initiatives (Stone Wyman).

Preparedness planning

The purpose of Danish preparedness planning and crisis management is to prevent that major accidents affect life, welfare and environment. All authorities – municipalities, regions and central authorities – are required to plan for maintaining their most critical functions in event of major accidents and crises.

The Danish authorities are obliged to plan how operation of vital societal functions may be continued or re-established in the event of accidents or disasters. The authorities comprise departments, agencies, state-owned enterprises, regions, municipalities and other public institutions. Also private enterprises should consider preparing a plan for the continued operation of the company in connection with extraordinary events which cannot be handled by means of ordinary resources and procedures. (Emergency Management Act, 2009)

Each Ministry (20 in total) needs to prepare a crisis management plan and develop policies for all areas that do fall under its responsibility. Everything that is not covered by one of the Ministry is covered by the Ministry of Defence. This Ministry formulates all preparedness policies not falling under the scope of one of the other Ministries. The planning efforts are mainly carried out by DEMA on behalf of the Ministry of Defence. DEMA publishes a planning guide, a yearly vulnerability report and holds ongoing information meeting (DEMA, 2009).

Besides the policies developed by the Ministries municipalities are required to develop contingency plans which need to cover all their municipal functions. Most critical point which needs to have a clear policy is the capability of keeping hospitals function during a disaster. Municipalities also need to be prepared to receive and take care for evacuees and other victims of different types of emergencies, e.g. floods, accidents, terrorist act, and other natural and man-made emergencies.

In addition to the policies developed at a national and municipal level DEMA the main crisis management body develops preparedness policies. This organisation does not only coordinate national preparedness, but also provides guidance to the local levels. The work and tasks of DEMA are outlined in the Emergency Management Act: Consolidation Act no. 660 of 10 June 2009. (Emergency Management Act, 2009) The overall mission of DEMA is:

The mission of the national rescue preparedness has been laid down on the basis of the political intentions for the preparedness – that is, the Preparedness Act and the political preparedness agreements concluded at any time. The mission is worded as follows: "The national rescue preparedness is to safeguard the population and society against accidents and disasters in the best possible way. The rescue preparedness authorities shall thus work to minimise the harmful effects of accidents and disasters and increase their preventive efforts in an attempt to avoid the occurrence of accidents and disaster." (DEMA, (a)).

Each policy and planning needs to fulfil seven criteria laid down in the so-called 'Comprehensive Preparedness Planning'⁶⁸⁹:

- 1. Programme management – which should be the central, pivotal point of the planning;**
- 2. Planning assumptions – analyses and ongoing activities that support planning in the remaining areas;**
- 3. Prevention – measures that may prevent incidents or reduce their probability and consequences;**
- 4. Training – for all employees who have a role in the organisation's emergency preparedness;**
- 5. Exercises – which all organisations in the guide's target group should conduct and participate in;**
- 6. Evaluations – in order to utilise the learning potential from incidents and exercises;**
- 7. Crisis management plans – which describe how the organisation has prepared to respond to incidents.**

⁶⁸⁹ Source: DEMA (2009)

DEMA's approach to Preparedness Planning and Crisis Management

Figure 1.2: Preparedness and crisis management planning⁶⁹⁰

Preparedness planning is a continuous process in Denmark. Therefore preparedness plans are regularly updated to ensure that the most pressing risks and threats are always sufficiently addressed. If possible lessons learned and previous experiences are included in these plans as well. In order to ensure that preparedness planning is done in a similar DEMA has developed the Comprehensive preparedness planning guide which can be downloaded at the DEMA website⁶⁹¹.

Nuclear preparedness

DEMA also develops the policy for the nuclear emergency preparedness. This policy includes that Denmark has 24-hours surveillance through a nationwide monitoring system and participates in an international warning network. In case something happens abroad that might affect Denmark the National Police Force will be the main point of contact (DEMA, 2014).

Nordic energy preparedness

A niche preparedness approach of the Nordic countries is found in the energy supply preparedness. The Nordic countries (Iceland, Norway, Sweden, Finland and Denmark) work closely together to create an integrated electricity supply network. When one of the states involved is confronted with a power shortage, other countries can, via cross border connections, supply energy. This limits the chance of severe blackouts in crisis situations (The Nordic Forum, 2005).

⁶⁹⁰ Source: DEMA (b)

⁶⁹¹ brs.dk/eng/Documents/Comprehensive_Preparedness_Planning.pdf. (DEMA, 2009)

Figure 1.3: Cross border energy supply Nordic countries⁶⁹²

However, Denmark in particular has a significant surplus of power generation, and the production is mainly based on fossil fuels with such stocks normally corresponding to at least 3 months' production. Thus the vulnerability due to energy shortage seems to be low in this sense. This makes Denmark less vulnerable to blackouts than the other Nordic countries. (Nordic Energy Regulators, 2006)

In Denmark the relevant legislation with respect to contingency planning and crisis management for the power sector is:

- Article 24 of the Civil Emergency Procedures Act;
- Article 85 b of the Electricity Supply Act;
- Regulation no. 58 of 17 January 2005 governing contingency planning and crisis management for the power sector;
- Regulation no. 917 of 13 November 2002 governing contingency planning regarding fuel storage in the electricity sector.

(Nordic Energy Regulators, 2006)

⁶⁹² Source: Nordic Energy Regulators (2006)

1.2.5 Policy for Response⁶⁹³

Crisis response is mainly organised on a local level as the municipal fire and rescue services are the main actor in emergency management, supplemented with the local police force and medical services. To ensure that emergency response run smoothly the different local parties need to be aware of their tasks and responsibilities as well as each others roles. In the Emergency Management Act the main responsibilities of each actor are laid down and in addition the lines of commands have been described.

If a major accident happens it is possible to establish an Incident Management Team which consists of representatives of the police force, the municipal fire and rescue service and medical services. If needed representatives of other organisations can be included in the team as well.

The overall coordinating responsibility lies with the police force. The police needs to ensure that the area is sufficiently cordoned off, that both the fire brigade and medical service can provide their services undisturbed and that the public does not interfere.

The technical management of the response is conducted by the municipal fire and rescue service. Their leader needs to ensure that the right measures are chosen to sufficiently combat the emergency and minimise the risks as soon as possible. He is also responsible for the general welfare of the deployed units during the entire period of emergency response.

The leader of the medical assistance is primarily responsible for the medical services provided and for the welfare of his personnel. If other organisations need to provide support as well during the emergency response they are also responsible for their own activities. This is in line with the sector responsibility principle, one of the over-arching principles on which the Danish crisis management is based (Please refer to paragraph 2.1).

The division of tasks also has a physical aspect. As the figure below shows the emergency area is divided into several areas. In the centre is the 'scene of accident' – the actual place of the emergency. The scene of accident is surrounded by the inner cordon. Within this cordon is the working area of the municipal fire and rescue services. Between the inner and outer cordon the response area is established. In this area first aid to victims of the emergency is provided. In this area the medical services are active. The outer cordon is guarded by the police. Depending of the involvement of other authorities they will also provided their services ion the response area.

⁶⁹³ Based on: DEMA (2012c)

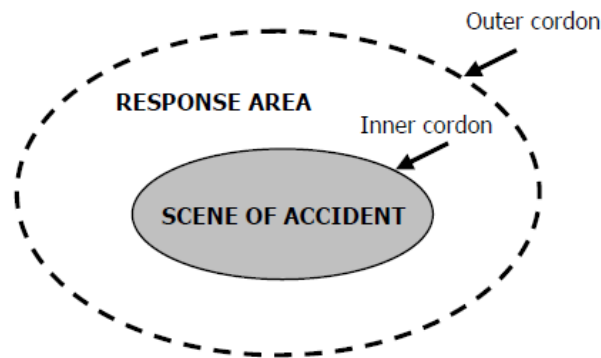

Figure 1.4: Crisis management cordon⁶⁹⁴

DEMA's task

On a national level DEMA issues guidelines for the 'Incident Command System'. The earlier mentioned Incident Command Team forms the core of this system. The guidelines describe the management conditions and co-operation for all types of emergencies covered by the Emergency Management Act. The guidelines provides details on how to act at specific types of emergencies, e.g. chemical accidents etc. The guidelines are available on the website of DEM (only in Danish).

1.2.6 Policy for Relief and Recovery⁶⁹⁵

In case the emergency is larger than the financial capacity of the local government the national government has the possibility to rapidly make additional funds available in order to support the local government in their response and recovery payments.

For flooding some specific policies have been adopted. The national government has adopted a flood insurance scheme which pays compensation in case of coastal flooding. Compensation is paid to landowners, companies or farms that have suffered flood damage due to severe storm events. Since 2000, the fund is covering compensation payments for forest damages as well. In order to be able to pay the compensation money is collected by an annual tax payment charged through all private fire insurance policies. The decision whether or not and to whom compensation will be paid is made by the Danish Storm Council. This council consists of representatives of the Danish ministries, insurance companies and the Local Government Denmark. If needed other parties can become part of the council as well⁶⁹⁶.

⁶⁹⁶ Source: Policy Research Corporation

1.3 Financing

1.3.1 Investing in preparedness

The Danish national accounts do not clearly provide an overview on the costs they make to invest in preparedness. Therefore a rough estimation has been made to provide a general idea of the costs of investing in preparedness. It should also be noted that crisis management is often organised locally and the local fire brigades and police forces are the first responders to an incident. DEMA is informed, but only become active once the crisis cannot be handled on a local level any more. Below a rough estimation of the preparedness costs is provided.

The police budget

The Danish Parliament (Folketing) decides on the Police budget. The Parliament sets the Police budget for a 4 year period. In the period 2007-2010 the available annual budget was DDK 7.5 billion (1,008 million euros). In the consecutive period (2011-2014) the budget has increased to DDK 8.5 billion per year, which equals around 1,142 million euros. The budget is divided over the national police and the 12 separate police forces. Each force needs to have its own administrative procedures in place to allocate the budget sufficiently. It should be noted that the budget is not used for crisis management only, as the police force also needs to carry out other tasks, i.e. criminal investigation and safeguarding public order⁶⁹⁷.

The fire brigade budget

The fire services are partially provided by public providers and partially by private operators. A municipality can choose to have its own fire brigade, hire the fire brigade of a neighbouring municipality or can have a contract with a private operator. The only private operator in Denmark is Falck. Currently, Falck provides firefighting services for 2/3 of the municipalities in Denmark according to their latest annual report (2013). Around 65 of the 98 municipalities do have a contract with Falck for firefighting services. The contracts are awarded through public procurement and negotiating. Besides firefighting services Falck is also responsible for 85% of all ambulance service provided in Denmark. Of the total revenue made in 2013, 46.6% was made in Denmark. The revenue of 2013 amounted to DKK 5.839 million (€ 748 million)⁶⁹⁸.

The DEMA budget

DEMA, the national emergency management agency, is the main responsible body for developing policies on prevention, preparedness and response. DEMA has a staff of 565 employees available divided over 10 different locations (7 rescue centres and 3 schools). Their annual budget is around DKK 490 million. This more or less equals € 66 million. This budget needs to cover all the costs made by DEMA, so not only the emergency preparedness and response costs, but also their administrative and personnel costs. The costs are paid by the Ministry of Defence of which DEMA is an agency⁶⁹⁹.

⁶⁹⁷ Source: Politi

⁶⁹⁸ Source: Falck (2014)

⁶⁹⁹ Source: <http://www.fmn.dk/eng/allabout/Pages/Defenceexpenditure.aspx>

The GDP for 2013 was DKK 1,886 billion⁷⁰⁰. The support provided to DEMA is in this case 0.03% of national GDP in 2013. However the costs of DEMA do not cover the entire costs for crisis management as the police forces, the fire brigades as well as the medical assistance play a role in emergency management as well.

Approach to flooding⁷⁰¹

As indicated in paragraph 1.1 floods are a major risk for Denmark. Therefore investment in flood protection is crucial. Main starting point of the flood prevention policy is that the person benefitting from better protection, should also bear the costs. In practise, this means that private landowners and/or municipalities close to potential flood areas should invest in protective measures. Although the private landowners and municipalities are mainly responsible for flood protection, their actions are overseen by the national government, more specifically by the Danish Coastal Authority (DCA). The DCA is part of the Ministry of Transport. The DCA focuses on policy and strategic issues, such as:

- Supervising the compliance to coastal defence laws;
- Providing advice with regard to coastal defence;
- Approving regional and private plans for coastal protection works;
- Monitoring coastline changes;
- Issuing warnings with regard to storm tide.

The third bullet point indicates that the DCA needs to approve coastal protection plans issued by private landowners or municipalities. DCA will grant permission when the following requirements are fulfilled:

- There is concrete evidence that the landowner will be threatened by violence of the sea within the next 20 to 25 years;
- The project does not harm any nearby Nature 2000 sites;
- The project complies with the coastal planning regulations.

As indicated earlier the starting point of Danish flood protection is that the person benefitting from the protection should pay for it. Therefore private landowners need to seek their own way of financing, e.g. through own means or banks loans. Municipalities have to finance projects with local taxes or through public-private partnerships.

In addition, the Danish government introduced in 1998 a longer term program aiming to yearly investing in dyke maintenance and improvement. For the entire duration of the program (1998-2015) the government reserved a budget of approximately € 315 million, which is on average € 18, 5 million a year.

⁷⁰⁰ Source: Statistics Denmark (2015)

⁷⁰¹ Based on Policy research corporation (2014)

1.3.2 Investing in consequence management

Several actors are involved in investing in consequence management. If objects belonging to the public domain have been damaged, e.g. buildings and roads, the 'government' has to pay. If the objects belong to the national government it will be the responsible ministry that needs to pay, if the objects belong to the regional or local government, these governments will bear the costs. If budgets are tight, the national government can provide assistance. Each of the governments have a budget available for un-expected expenses and these budgets can be used to cover the costs to repair, public roads and buildings if needed.

Also most Danish citizens have insurances that cover damages related to property. According to a Lloyd's report the insurance penetration in 2011 was 2.9% (premiums as a % of GDP). In the list of 42 reviewed countries Denmark was ranked 11th. The list is led by The Netherlands (9.5%), followed by New Zealand (5.2%) and South Korea (4.6%). It should be noted that the penetration rate is not related to the relative risks people are likely to face. The report also calculated if a country is over or under insured by calculating the 'benchmark insurance coverage'. Denmark is ranked number 10, with a benchmark of 1.36, indicated that the country is moderately insured. Citizens are better insured than they strictly need to be, however margins are small⁷⁰².

The industry compared to citizens is relatively poorly insured. The Lloyd's report⁷⁰³ calculated the insurance penetration rated per industrial sector compared to the GVA of this particular sector to the national GDP (see table below). Taking all sectors into account the overall insurance penetration for Danish industry is less than 0.2%, and Denmark is ranked 16th amongst 18 reviewed countries. Frontrunner is the US with a penetration rate of almost 1%, followed by Ireland (0.87%) and the UK (0.75%).

Table 1.6: Penetration rate and GVA contribution per sector (2011)

Sector	Insurance penetration	GVA contribution
Transportation and Storage	0.48%	5.70%
Agriculture, forestry and fishing	0.36%	1.18%
Construction	0.29%	5.66%
Wholesale and retail	0.25%	12.84%
Utilities	0.17%	1.93%

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

No information retrieved. The recent audit on Danish crisis management (see section 1.4.3) however has critique on the post disaster assessment.

Figure 1.5: Report on the Danish government's planning and coordination of the emergency preparedness for major incidents and disaster

1.4.2 Departmental Lessons Learned systems

No information retrieved. The recent audit on Danish crisis management (see section 1.4.3) however has critique on the post departmental approach and knowledge of emergency planning (Rigsrevisionen, 2014).

1.4.3 Centralised (national) Lessons Learned system

In April 2014, a National Audit Report⁷⁰⁴ on the state's preparedness was published. The Audit Office concludes that the key ministries and agencies in preparedness have prepared themselves to deal with major accidents and disasters. The National Audit Office concludes in addition, the Emergency Management Agency has not solved all tasks concerning the coordination of emergency planning satisfying as the Board does not have a comprehensive overall view of contingency planning in Ministries. Finally, the National Audit Office stated that the authorities' efforts in evaluating major accidents and disasters can be improved and that all authorities prospectively writing should evaluate their crisis management at major events and exercises to ensure that the experience is retained and used to improve preparedness.

Some highlights:

- "The Emergency Management Agency has solved the task of supporting ministries contingency planning by establishing a common guide to good contingency planning and providing advice to ministries but has not solved the problem of assessing the consistency of contingency planning satisfactory since it lacks a comprehensive overall view of contingency planning in the ministries and thus not a sufficient basis for assessing the relationship."
- "The authorities' efforts in evaluating major accidents and disasters and exercises can be improved."
- "The authorities have [...] followed up on the learning points from the terrorist attacks in Norway in 2011 with a view to improving the Danish preparedness. The Audit office agrees. "
- "The National Audit Office finds that all authorities prospectively writing should evaluate their crisis management at major events and exercises to ensure that the experience is retained and used to improve preparedness."

1.4.4 International exchange for Lessons Learned

Danish crisis management organisations participate in international preparedness and crisis management training. A recent example is the SKAG EX11 exercise. In this exercise crisis management organisation from Norway, Sweden, Finland and Denmark were involved. Around 3,000 people from approximately 55 organisations participated. The exercise was centred around a fire on the passenger ferry MS Bohus. This ferry operates on the route between Strömstad and Sandefjord. As a result of the fire the vessel collided with a smaller bunkering vessel, the Oslo Tank. The involved organisations all had to practise their specific roles. Once the exercise was finished lessons learned were shared and presented to the national crisis management authorities via the 'SKAG EX11 way forward report'. This report provides details on the exercise as well as the strengths and weaknesses which became apparent during the exercise (DSB, 2012).

⁷⁰⁴ Source: (Rigsrevisionen, 2014)

1.4.5 Regular policy reviews

No confirmed information was retrieved. Based on the information collected for Paragraph 1.1.1 it seems that a Danish National Vulnerability Evaluation exists. However, it seems no recent report has been published since 2005. Moreover, recently an audit was performed on the organisation of Danish crisis management. Based on this evaluation it might be expected that the current policies were reviewed.

1.5 Resilience⁷⁰⁵

The concept of resilience in civil protection, in terms of country's capacity to withstand shocks due to natural and other disasters, to rebuild itself with efficiency, and to improve on the pre-existing state wherever, has not been explicitly established by law or another normative act. However several public education campaigns have been organised in which the public has been informed on what to do in case of a crisis situation. Special attention in these campaigns was paid to flooding. Aim was to improve homeowner's resilience towards storms, storm surges, torrential rain, groundwater flooding etc.

Also several applications for mobile devices have been developed to enable Danish people to be better prepared in case of a crisis. The first application is developed by the Danish Insurance association and gives homeowners instructions on how to better prepare themselves and their homes for extreme weather conditions. The second one is developed by the association of Danish regions. This application provides a quick overview of relevant emergency contacts. In addition the user can quickly retrieve health data, geodata and general advice.

1.6 Information sharing and data protection

Crisis communication

Part 6 of the Emergency management act (detailed in chapter 2) deals with radio communication (Emergency management act, 2009).

According to article 29.1, the municipal council and the regional council shall ensure that the national radio communication network is used for the carrying out of own and joint emergency management tasks. The Minister of Defence, after his negotiations with Minister concerned, may lay down rules stating that parties, including individuals, other than the municipal councils and the regional councils shall use the radio communication network (article 29.2). For example in case of a pandemic, the Minister of Health will negotiate with the Minister of Defence on the message to be provided. After this consultation the Minister of Defence will ensure that the message will be communicated. .

⁷⁰⁵ Based on Preventionweb (2015)

Moreover, the Minister of Defence may lay down rules on the use of the national radio communication network, including connection and utilisation. Subsequent to negotiations with the Minister of Finance, the Minister of Defence may furthermore lay down rules on the payment for connection to and use of the network (article 29.3)..

Data protection

Data protection is not mentioned in the Emergency management act. Based on EU data protection law the public authority is, in principal, required to obtain explicit and unambiguous permission to use personal data. Only exemption is the situation in which the public authority needs the personal data in order to fulfil its public duty in a good and sufficient manner, but no time is available to obtain the consent of the public. An example could be providing instant medical assistance to an unconscious person.

Registration of volunteers

Several crisis management related organisations do use volunteers. However, these volunteers are not registered in one national database. Each organisation involving volunteers has its own database with details on the available volunteers. Therefore, databases on volunteers will be available at DEMA, the Red Cross and the Danish Civil Protection League, the three most important organisations involving volunteers in crisis management situations.

2 Legislation

2.1 Crisis (emergency, disaster) management concept

Danish crisis management is based on five over-arching principles. These principles apply to all phases of crisis management, ranging from prevention and preparedness to response and recovery. Some of the principles are laid down in legislation, e.g. in the Emergency Management Act (refer to following paragraph), while others are not. The principles are⁷⁰⁶:

- *Sector responsibility*: this principle indicates that each department/agency which has a responsibility for a specific sector also remain responsible during a crisis. For example, because the Ministry of Health is responsible for public health in general, the Ministry will also be responsible in case of a pandemic outbreak.
- *Similarity*: according to this principle the crisis management setup should resemble the daily setup as much as possible in order to minimise the changes needed in case the crisis management system is activated.
- *Subsidiarity*: refers to a situation where crisis management activities are conducted on the lowest organisational level possible. This principle refers to the decentralised crisis management approach used in Denmark.
- *Cooperation*: organisations involved in crisis management should cooperate with other relevant organisation when they are planning their crisis management activities. This principle is especially important for maintaining critical infrastructure.
- *Precaution*: relates to the establishment of a crisis management organisation that may respond in case of an emergency. The organisation needs to be established before something actually happens.

Main act in the field of crisis management is the Emergency Management Act which was adopted in 2009. This act lays down the division between municipal firefighting and rescue services, and national firefighting and rescue services. It also outlines the responsibilities of DEMA and provides, in article 1, the overall task of fire and rescue services. This overall task is the following:

‘The task of the fire and rescue services is to prevent, limit and redress personal injury and damage to property and the environment arising from accidents and disasters, including acts of war, or imminent danger as such’⁷⁰⁷

⁷⁰⁶ Source: DEMA (b)

⁷⁰⁷ Article 1 Emergency Management Act

2.2 General crisis (emergency, disaster) management law

As indicated in the previous paragraph the Emergency Management Act⁷⁰⁸ was adopted recently (in 2009). As far as the researcher could establish the act is not under review.

The act is divided in 13 different parts, each covering its own aspects of Emergency management. The following parts have been included:

Outline (Table of contents):

- Part 1 Preliminary provisions;
- Part 2 The national fire and rescue service;
- Part 3 The municipal fire and rescue service;
- Part 4 Deployment of the fire and rescue services;
- Part 5 Emergency management planning etc. within the civil sector;
- Part 6 Radio communication;
- Part 7 Preventative measures etc.;
- Part 8 Expropriation;
- Part 9 Injunctions, orders etc.;
- Part 10 Personnel provisions;
- Part 11 Penalties and disciplinary provisions;
- Part 12 Amendments to other legislation;
- Part 13 Commencement and temporary provisions.

The Emergency Management Act is strongly focused on fire and rescue services, which form the backbone of Danish crisis management. Fire and rescue services comprise two levels; the national level (under direct authority of the Minister of Defence) and the municipal level (under direct authority of the municipal council). Although the municipal fire and rescue services fall under the authority of the municipal council, the Minister of Defence is entitled to supervise these services. The Minister of Defence also has the opportunity to authorise DEMA to take over the supervisory of the Ministry of Defence (Article 4.2). In practise, DEMA has taken over the task of the Ministry of Defence and therefore is responsible for the day-to-day supervision of the local fire and rescue services.

In this two-level system the municipal fire and rescue services form the backbone of the Danish crisis management system as they are the first service to be warned in case of an emergency. If needed the crisis response can be scaled up and the coordination will shift from a local level to the national level. At this point DEMA becomes involved and will share its response capacity.

In principle, each Danish municipality could have its own public fire and rescue services. However, article 13 of the Emergency management act offers the opportunity for municipalities to either share the obligation with other municipalities or enter into a contract with private-owned companies

⁷⁰⁸ The Act can be consulted online via:

http://brs.dk/eng/legislation/act/Pages/the_emergency_management_act.aspx

offering fire and rescue services. Many municipalities have opted for this last option and signed an agreement with Falck, a private company offering fire and ambulance services. The Emergency Management Act also offers the possibility to conclude an agreement with DEMA, in which it is agreed that some of the municipal fire and rescue services will be taken over by the national fire and rescue services.

The main task description of the municipal fire and rescue service is laid down in article 12 which says *'that the municipal fire and rescue service shall be able to provide a justifiable response to prevent personal injuries, damage to property and the environment arising out of accidents and catastrophes, including acts of war. The fire and rescue services shall moreover be able to receive, accommodate and cater for evacuees and other distressed persons.'*

In close connection article 17 of the Emergency Management Act states that the overall crisis response falls under the responsibility of the police commissioner. This commissioner is also responsible for sounding the alerts or warnings, cordoning off, evacuation and other necessary measures (article 17.2). The action needed to combat the fire or the emergency at hand remain with the officer from the fire and rescue service.

The Act also provides the fire and rescue services with the possibility to demand any kind of privately-owned tools and equipment and means of transport if needed. Also the accompanying crew needs to be made available if desired (article 20.1). The individual that provides the goods is entitled to compensation from the municipality for deprivation of material and for any damage to it (article 20.2).

2.3 Emergency rule

The Danish legal system does not provide 'discretionary powers' which means that in case of an emergency or disaster the authorities do not obtain different responsibilities and powers. During each crisis the authorities must follow the regular principles and procedures as much as possible. This is based on the principle of similarity (one of the five principles playing an important role in Danish crisis management) meaning that the actions undertaken by and the responsibilities of authorities should resemble their normal actions and responsibilities as much as possible under the more extreme circumstances⁷⁰⁹.

⁷⁰⁹ Source: DEMA (b)

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

Each Ministry is obliged to draw up an emergency plan that indicates what will happen and which procedures have to be followed in case a disaster in its area of expertise occurs (article 24.1 Emergency Management Act). For example, the Ministry of Transport has a legal obligation to draft an emergency plan indicating what will happen when flooding occurs. In addition to indicate the procedures to be followed, the responsible Minister has to ensure that functions normally carried out in society can be continued as well.

In Article 24.2 the Emergency Management Act lays down that the Ministerial plans need to be revised if recent developments make such changes necessary. Irrespective any developments requesting for a revision of the plan, the Ministry is obliged to review its plan(s) at least every four years. Once the plans have been drafted or revised they need to be sent to DEMA⁷¹⁰, so that DEMA can incorporate the relevant parts in its own emergency response plans.

As already indicated several times, the main focus of Danish disaster response lies at municipal level. To ensure that local response is in line with the emergency response plans drafted at ministerial level, each Ministry has the obligation to draft guidelines, within their own area, on how to incorporate departmental approaches in the regional/municipal emergency plans (article 27 Emergency Management Act). The regions/municipalities have the obligation to follow these guidelines.

Article 28.1 gives the respective Minister the opportunity to involve public authorities as well as public and private enterprises and institution to contribute to the planning or execution of task falling in the area of emergency management. This means that the Minister can opt for state-of-the-art knowledge and skills. However the Minister needs to negotiate with the enterprises and institutions regarding the scope and possible compensation from state (article 28.3).

In addition The Minister has the possibility to require special measures from public and private enterprises and institutions as long as it concerns goods, services, means of production etc. which fall within their normal operations (article 28.2). Also in this situation the Minister has to negotiate about the scope and possible compensation (article 28.3).

⁷¹⁰ Article 24.3 Emergency Management Act

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

Regional/municipal emergency plans

Similar to the ministerial plans each region or municipality has the obligation to prepare a regional/municipal emergency plan. This plan has to be adopted by the municipal council (article 25.1 Emergency Management Act) or the regional council (article 25.2). As indicated in the previous paragraph the plans need to incorporate aspects from the relevant Ministerial emergency plans. Each region/municipality needs assess which aspects it needs to include as not all Ministerial plans will be relevant.

Also the regional/municipal plans need to be revised when certain development makes the revision necessary. Irrespective of such a development, the emergency plan needs to be revised once during each regional and municipal electoral period (Article 25.3). Elections are held at least every four years⁷¹¹, so on average also the regional/municipal plans are reviewed once every four years.

Similar to the Ministerial plans also the plans of the regions and the municipalities need to be sent to DEMA, so that DEMA is able to incorporate the necessary information (article 25.4).

Fire prevention

The Emergency Management Act, in article 36.1, lays down the strict obligation for municipalities to *'carry out inspections of fire prevention arrangements of enterprises, listed buildings, buildings in which many persons are gathered, buildings that are inflammable and stores as well as floating constructions.'* How such inspections need to be carried is harmonized between municipalities as the Ministry of Defence issues detailed rules on how to conduct such inspections and how to remedy and/or punish for any deficiencies detected (article 36.2). Fire inspections can be carried out any moment in time and no court order is needed to access the premises (article 36.3).

Article 36a provides the Minister of Defence with the possibility to lay down rules relating to the publication of the results and sanctions based on the fire prevention inspections of the individual municipalities. Such a publication include the names of inspected natural and legal entities (so all inspections conducted) as well as the names of natural and legal entities who received injunctions or orders, or are subject to sanctions.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

Private sector

⁷¹¹ Source: <http://elections.sim.dk/local-elections.aspx>

As indicated in paragraph 2.2 the Emergency Management Act provides municipalities with the opportunity to enter into an agreement with privately-owned organisations that assists them in carrying out of tasks within the municipal fire and rescue services (article 13). Best known example of a private company hired to provide fire and rescue services is Falck⁷¹².

Volunteers

The Emergency Management Act only regulates the involvement of ‘non-registered’ volunteers. According to article 40 any individual that is present at an emergency side can upon request of the fire and rescue services take part in fire-fighting and rescue operations. These people are not called-up to help out; they are just present at the scene. Often these people will not be trained, unless they have taken courses themselves, e.g. first aid training. Each individual that took part in the fire-fighting has a right of compensation for substantiated loss of earnings. The municipality has to compensate this loss of earnings.

In addition to the ‘non-registered volunteers’ a group of registered volunteers exists. The volunteers are all member of the Danish Civil Protection League which is a non-profit organisation with 5,000 members⁷¹³. On the website of the Danish Civil Protection League Danish citizens can apply to become a volunteer. Based on their experience, possibilities and the need of the League they will be assigned a dedicated role. With the League many different types of roles can be fulfilled, e.g. becoming part of the voluntary fire brigade or work with search dogs. The volunteers of the League predominantly work in local rescue teams. Although they mainly operate on the local level, if needed the teams can also be involved in national preparedness planning. In addition, the League aims to increase the knowledge of preparedness and prevention among the population and through the education of the population to increase their level of self-preservation and robustness (EC, 2014).

NGOs

The most important NGO involved in Danish crisis management is the Danish Red Cross⁷¹⁴. The Danish Red Cross provides aid both in Denmark and abroad. In Denmark the Red Cross is mainly involved in establishing and managing refugee centres. In case of an emergency they can provide medical assistance at the incident location by sending a Quick Response Medical Assistance Team, support the municipal government to provide shelter and relief for the evacuated population and to support the municipal government in registering and tracing missing persons. In addition the Red Cross provides services to supply bandages, mattresses, blankets and so on. Abroad the Danish Red Cross is often operating in areas of conflict or areas affect by disease or large disasters.

The researchers were not able to establish whether or not the involvement of the Danish Red Cross in crisis management is regulated by law, as no information in English was available.

⁷¹⁴ Source: <https://www.rodekors.dk/>

2.7 Legal regulations for international engagements of first responders and crisis managers

Denmark is active in the field of international humanitarian aid. If an emergency happens somewhere in the world nations can turn to DEMA for help. DEMA will assess the international request and if Denmark is able to provide help, DEMA will ensure that response capacity becomes available rapidly. Denmark is able to call up a fully equipped operational taskforce for specific disaster within 12 hours. Specific areas of expertise include earthquake disasters, floods, forest fires, refugee crises, etc. The planning of international operations is supported by the formation of a service package concept (flexible manned equipment modules) that can be applied in connection with disaster response and response to complex emergencies (DEMA, 2014).

The European Union

Denmark, as member of the EU, has implemented the EU regulation with respect to crisis management. The Council Decisions do apply in Denmark. These Council Decisions regulate some aspects of cross border assistance and they focus on the procedural side of assistance indicated how requests should be filled, when countries need to respond and how the teams provided are coordinated. The following decisions and treaties have been implemented:

- Council Decision of 8 November 2007 establishing a Community Civil Protection Mechanism;
- Council Decision 2008/617/JHA of 23 June 2008 on the improvement of cooperation between the special intervention units of the Member States of the European Union in crisis situations.

The Council Decision 2007/779/EC/Euratom of 8 November 2007 was issued to set up an effective cooperation mechanism to coordinate rapid exchange of information and arrange assistance through an European network of civil protection resources. The Community Civil Protection Mechanism is based on establishing amongst others: an inventory of possible assistance and intervention teams at an EU level, a common training programme, a Monitoring and Information Centre (MIC) that forwards requests for assistance by affected Member States to a network of national contact points, a Common Emergency Communication and Information System (CECIS) and the provisions for facilitating the sharing of information on the resources available within the network.

The Council Decision 2008/617/JHA of 23 June 2008 aims to set a framework for the cooperation between Member States' special intervention units in crisis situations. The Decision establishes the general rules and conditions for the provision of assistance by special intervention units to any requesting Member State. According to the provisions of this Decision, the units from countries that provide assistance take up an assisting role and act only within the limits and powers as defined by their own national law. To ensure that experience, expertise and information on managing crisis situations are exchanged joint trainings and exercises between Member States are promoted and may be funded from Community financial programmes.

The United Nations

Denmark is also Member to the United Nations. In the area of civil protection and humanitarian aid, Denmark is involved in the UN Office for the Co-ordination of Humanitarian Affairs, OCHA. In case of a large international disaster requiring specific support Denmark can provide specialised help. During the direct aftermath of a crisis Denmark can send either a, UNDAC or USAR team (Please refer to paragraph 3.2). Besides direct relief operations Denmark is also involved in longer term humanitarian aid. In order to provide this aid sufficient Denmark, together with Sweden, Finland, Norway and the UK is party to the International Humanitarian Partnership (IHP). This partnership lays the foundation for mutual support of equipment models of equipment modules for the purpose of offering manned support and operational packages to the United Nations, including, among others, OCHA and UNHCR (UN High Commissioner for Refugees). In addition this cooperation also includes joint exercises and trainings.

International agreements

Denmark has concluded a series of bilateral and multilateral agreements on early notification of nuclear accidents, the exchange of information relating to nuclear facilities and agreements on mutual disaster aid, etc.⁷¹⁵.

In addition Denmark has concluded bilateral agreements with other Nordic states. These agreements contain obligations regarding early notification of abnormal events or detection of abnormal levels of radiation and exchange of information. Besides these bilateral agreements the Nordic states have ratified the IAEA Early Notification Convention. As Denmark, Finland and Sweden are EU Member States, they have the obligation to implement arrangements regarding crisis management communication. These arrangements regulate crisis communication between the different EU Member States as well as communication between EU and non-EU Member States that have joined the communication system.

Furthermore Denmark is part to several agreements that define different obligations for communication and co-operation. These agreements have been written down in The Nordic Manual (2006, updated in 2008⁷¹⁶). The following countries have agreed to share information in order to improve nuclear safety:

- •Denmark: Danish Emergency Management Agency (DEMA)
- •National Institute of Radiation Hygiene (SIS)
- •Finland: Radiation and Nuclear Safety Authority (STUK)
- •Iceland: Icelandic Radiation Protection Institute (GR)
- •Norway: Norwegian Radiation Protection Authority (NRPA)
- •Sweden: Swedish Radiation Safety Authority (SSM)

3 Organisation

3.1 Organisational chart⁷¹⁷

The Danish crisis and emergency management system is decentralised and day-to-day crisis response is organised on a local level, i.e. municipal level. This means that local fire brigades, police and ambulance services are the first to respond in case of an emergency and the mayor of the city is responsible for all actions taken. The municipal level does not have the obligation to consult the national level (the second layer of Danish crisis management) first before starting response operations. In case of larger or more long-term crisis, which are transcend local capabilities, the national level can get involved.

At the municipal level the main first responder to an emergency are the fire brigade services. In Denmark each municipality has the option to have its own (public) fire brigade or to opt for hiring a private company (mostly Falck) or use a voluntary fire brigade. Irrespective the solution chosen the fire brigade needs to be able to leave the fire station within 5 minutes after the alarm. On the emergency site the fire and rescue services are coordinated by the so-called 'on site commander' often a firefighter. The overall, wider, response is coordinated by the police.

If the magnitude of the crisis is so large that the local fire brigade is no longer able to sufficiently deal with the crisis on its own, they can ask the support of one of DEMA rescue centres. If DEMA gets involved in crisis management, the coordination is scaled up from local to national level.

DEMA as national crisis organisation

An important organisation for Danish crisis management at national level is DEMA. As described before in case of larger crises DEMA can provide support to municipal response services in case these services can no longer deal with the crisis themselves or special equipment/ additional manpower is needed. In addition to providing response capacity DEMA is also involved in crisis prevention and preparedness. As explained in chapter 1 DEMA is responsible to carry out the yearly vulnerability assessment and needs to implement the policies of the Ministry of Defence.

To support municipalities in crisis response DEMA has six rescue centres from which they can provide additional operative support to municipalities. These centres have staff available 24/7 and the staff should be able to leave within five minutes after a request for assistance comes in.

DEMA also has three trainings centres where emergency personnel can be trained. The graph below shows the internal structure of DEMA.

⁷¹⁷ This section is based on: DEMA (b)

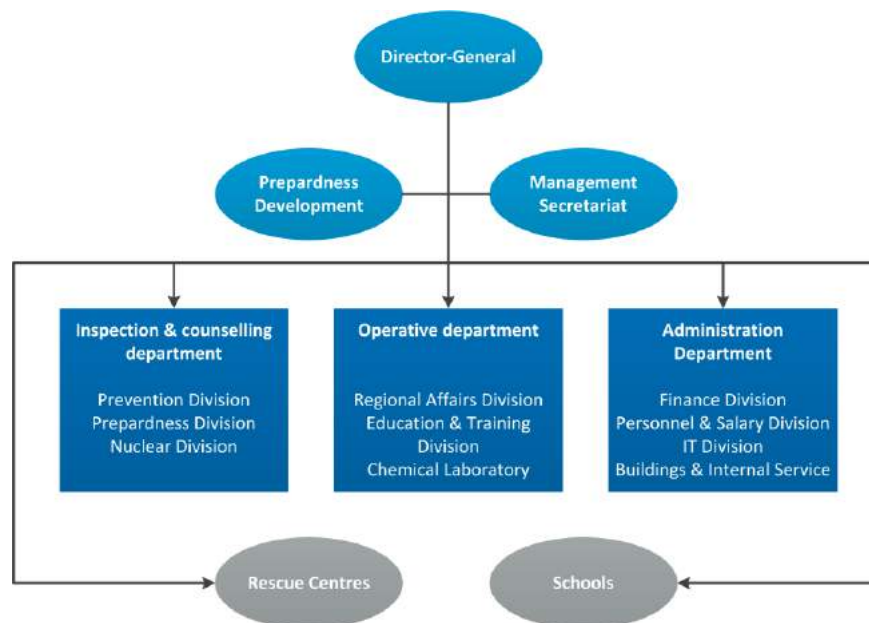

Figure 3.1: DEMA's organisation⁷¹⁸

The rescue centres of DEMA are spread over the main islands and are named Nordjylland, Midtjylland, Sudjullayd, Sjælland, Hedehusenen and Bornholm. The locations are chosen in order to ensure that every part of the country can be reached within 2 hours from one of the centres. The training locations are more clustered, located on Tinglev, Snekersten and Birkerød. Following figure shows the locations of the DEMA rescue and training centres (DEMA, 2014).

Figure 3.2: DEMA's rescue centres and training institutes⁷¹⁹

DEMA in the national structure of government

⁷¹⁸ Source: DEMA, 2014, edited by authors

⁷¹⁹ Source: brs.dk, edited by authors

Before 2004, DEMA was part of the Ministry of Health. As the Ministry of Defence is responsible for coordinating the government's wide civil preparedness planning, implement the taken measures and address all areas not covered by the other Ministries, DEMA became part of the Ministry of Defence in 2004. Within the Ministry of Defence the Office of Emergency Management is responsible for (i) setting the direction of preparedness policy; (ii) negotiating and implementing of political agreements related to crisis management; (iii) leading international cooperation efforts on emergency preparedness; (iv) overseeing both DEMA and the Home Guard and (v) setting the performance requirements for both of them. DEMA is responsible for the day-to-day national coordination of the emergency management and therefore the mission of DEMA is *'to cushion the effects of accidents and disasters on society and to prevent harm to people, property and the environment'*. DEMA has the full responsibility and authority for coordinating the entire spectrum of emergency management, from planning/preparedness to response and recovery. In addition to its overall mission of coordinating crisis management on a national level, DEMA is responsible for operating the rescue centres and training institutes. The figure below presents the embedding of DEMA within the Ministry of Defence.

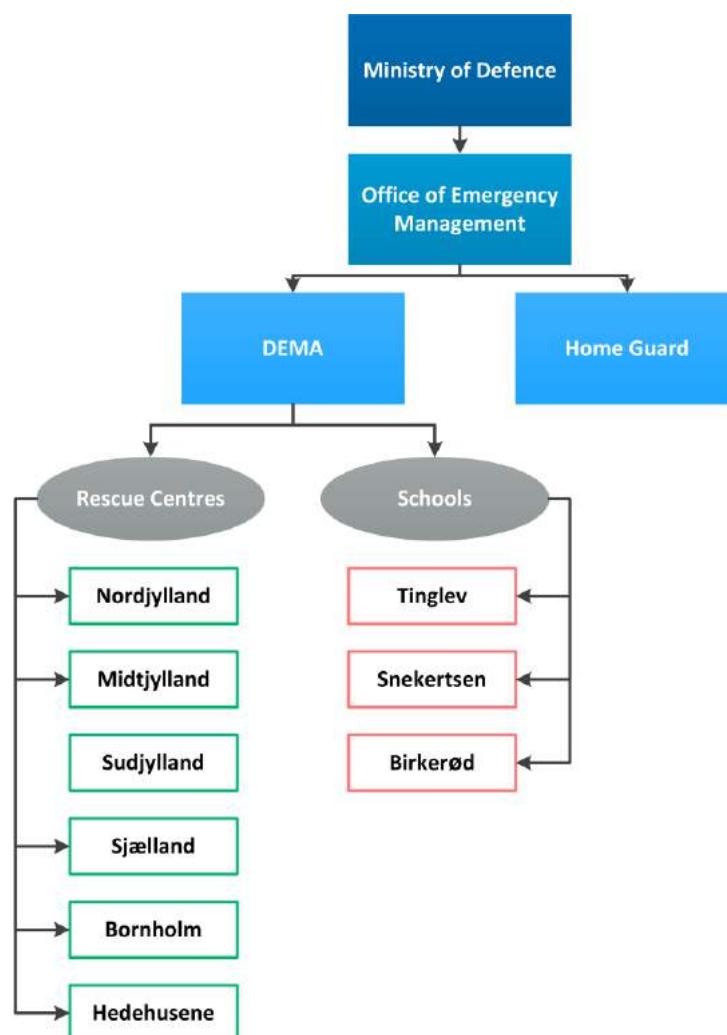

Figure 3.3: DEMA's rescue centres⁷²⁰

⁷²⁰ Source: DEMA, 2014, edited by authors

3.2 Organisational cooperation

Organisational cooperation in national crisis situations

The structure shown above presents the general crisis management system at the national level. This system, for example, applies to larger fires that involve more than one municipality or large scale pollution at sea. As a general starting point the local level, i.e. the municipalities, needs to start their response procedures and their police force, fire brigade and medical assistance will be first on the scene. In case the emergency is larger than they can solely manage the local level can ask for assistance of the DEMA rescue centres (DEMA, (b)).

However it might happen that a crisis is more extraordinary (e.g. pandemic or large floods) and to adequately respond to the crisis special skills and decisions are required. In such a situation the special crisis management system, the so-called Danish National Emergency Management Organization, will be activated. At the governmental three committees/groups will become operative. These three groups make the necessary decisions on different levels:

- **The Government Security Committee:** this is a high level committee consisting of the Danish Prime Minister (chairman of the committee), the Minister of Economic Affairs and Business, the Minister of Foreign Affairs, the Minister of Defence and the Minister of Justice. If needed this group can be expanded by other ministers.
- **The Senior Official's Security Committee:** this committee consists of the highest civil servants, i.e. the permanent secretaries, of the above mentioned Ministries. In addition the Head of the Defence Intelligence Service as well as the Head of Security Intelligence Service are member of this committee. If necessary other permanent secretaries or officials may be included. The Committee's chairman is the Permanent Secretary of the Prime Minister's Department service.
- **The Crisis Management Group:** contains representatives of the departmental and undersecretary level of the Ministries mentioned above. Also representatives of the Ministries of Foreign Affairs, Ministry of Health, the Defence Command Denmark, the National Danish Police and DEMA are presented. The group is chaired by representatives of the Prime Minister's Department.
(DEMA, (b))

Between the three committees/groups a clear hierarchy exists; the government security committee is the highest decision making body, while the other two prepare the decisions taken by the government security meeting and collect the necessary information to do so. The decisions taken are executed by one of the two operational staffs available at national level. In case of a national crisis (only affecting Denmark) the decision will be executed by the National Operational Staff (NOST) and in case of an international crisis affecting Danish people abroad this will be done by the International Operational Staff (IOS). DEMA supports both the NOST and IOS if needed. The graph below presents this structure schematically.

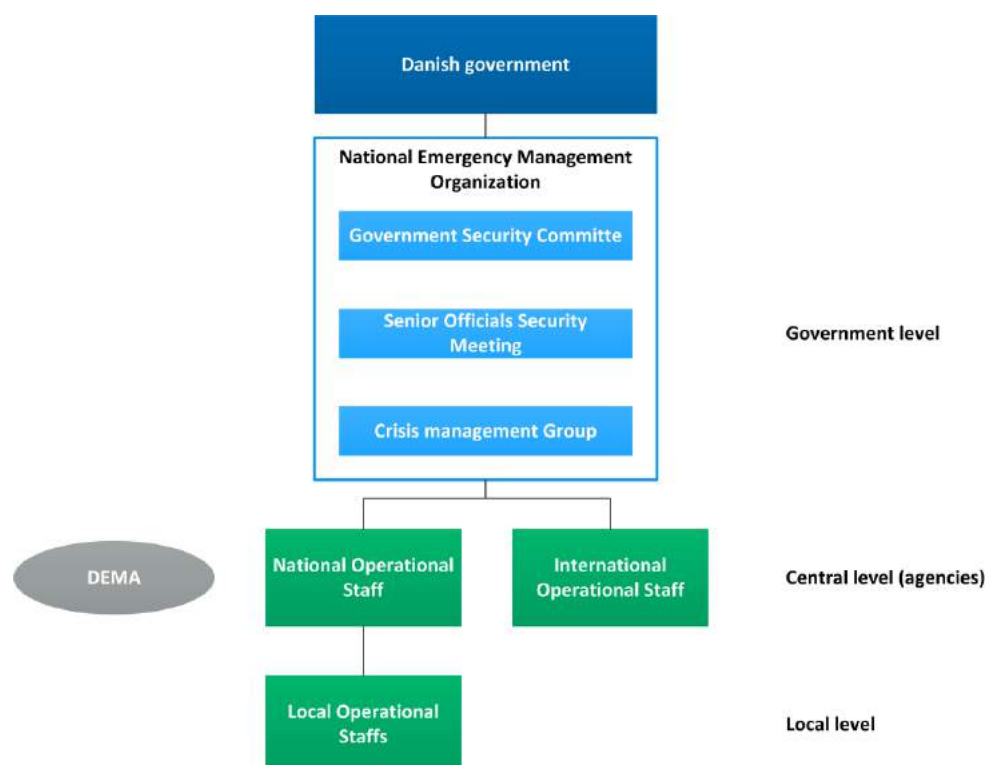

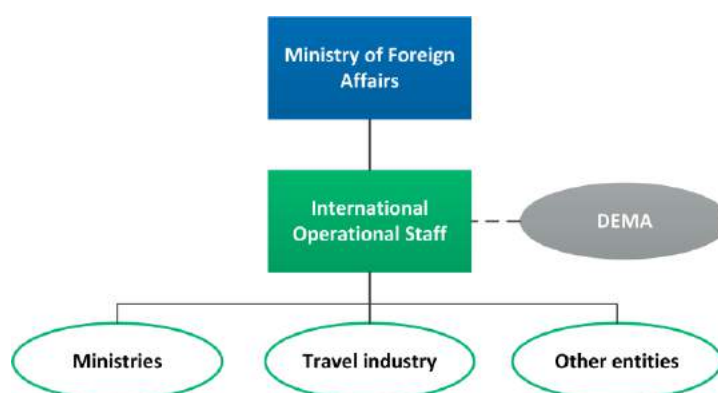

Figure 3.4 Crisis management structure in case of an extraordinary crisis⁷²¹

Organisational cooperation in crisis situations abroad, Danish victims

As indicated in the figure above the IOS is responsible for international crisis management involving Danish people abroad. The IOS is led by the Ministry of Foreign Affairs as this Ministry has all the necessary contacts to retrieve Danish people from abroad. The IOS staff is complemented by representatives of public and private entities. The exact composition of the IOS depends on the crisis itself, e.g. in the recent Ebola pandemic in Africa representatives of the Ministry of Health were involved in the IOS to retrieve Danish people safely, but to ensure quarantine if needed. Often the tourism industry, especially tourism operators, become part of the IOS as they have information on Danish tourists abroad⁷²². DEMA can support the IOS if needed, as the figure below shows.

⁷²¹ Source: DEMA (b), edited by authors

⁷²² Source: DEMA (b)

Figure 3.5 International crisis management structure⁷²³

Organisational cooperation in crisis situations abroad, no Danish victims

DEMA is contact point for international crisis management in case no Danish people are affected by the crisis abroad. In such a crisis DEMA provides humanitarian aid upon request of a foreign governmental body or an international organization. However DEMA cannot take the decision to actually provide humanitarian aid. The decision is made by the Ministry of Defence in concert with the Ministry of Foreign Affairs. The Ministry of Foreign Affairs coordinates and funds the deployment of the Danish governmental humanitarian assistance.

DEMA can provide humanitarian aid in the fields of logistics, transport, management and specialist knowledge alone or in cooperation with other organizations. There is a close cooperation with the EU, UN and NATO as well as with regional partnerships, such as the Nordic International Humanitarian Partnership (IHP).

Dedicated support to the United Nation

The UN can request support from the Denmark in case of disasters happening in other countries. To activate the support the request needs to be addressed to the Ministry of Foreign Affairs and the framework presented in figure 3.5 is followed. The main types of support that can be requested are UNDAC and USAR.

UNDAC

Denmark is Member to UNDAC – United Nations Disaster Assessment and Coordination - since 1993. Experienced emergency managers are available for UNDAC to assist during a crisis. Depending on the type of crisis a manager is appointed. Since 2000 the Denmark has provided assistance 21 times, for example the 2010 flooding in Pakistan, the 2010 flooding in Albania and 2009 typhoon in the Philippines⁷²⁴.

USAR

Denmark also has an urban search and rescue team available. The team was added to the USAR list in 1992 and since 2010 the team is qualified as heavy. This means that at least 55 experts are available and the team can carry out complex technical search and rescue operations in collapsed or failed structures, with special attention top steel structures. The team can assists in five fields: management, search, rescue, medical and logistic. The heavy team can assist during national crises, but on request can be deployed abroad as well. Requirements for the team are⁷²⁵:

A Heavy USAR Team:

⁷²³ Source: DEMA (b), edited by authors

⁷²⁴ Source: UNDAC (2011), 'Emergency response missions'

⁷²⁵ Based on OCHA – INSARAG External classification/reclassification manual 2014

- *Is required to have the equipment and manpower to work at a Heavy technical capability at two separate work-sites simultaneously. A separate work-site is defined as: any area of work that requires a USAR team to re-assign staff and equipment to a different location all of which will require separate logistical support. Generally an assignment of this sort would last greater than 24hrs.*
- *Is required to have both a search dog and technical search capability;*
- *Is required to have the technical capability to cut structural steel typically used for construction and reinforcement in multi-story structures;*
- *Must be able to conduct heavy rigging and lifting operations; and*
- *Must be adequately staffed and logistically sufficient to allow for 24 hour operations at 2 independent sites (not necessarily at the same two sites; the sites may change) for up to 10 days.*

The Danish team currently consists of 73 staff members, who are divided between the five required segments. The team has responded to four international disasters since 1992⁷²⁶:

Table 3.1: Former international engagements

Emergency	# Personnel	Duration
Iran (Bam) earthquake December 2003	39	10 days

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

No information could be retrieved on the SOP's for DEMA or municipalities. Some operational organisational aspects were retrieved. These are either discussed in chapter 3 or in the next sections.

4.2 Operations planning

National /departmental crisis plan

As explained in chapter 2 one of the main principles on which the Danish crisis management system is based is 'sector responsibility'. This principle means that the authorities or institutions that have the day-to-day responsibility for a given area are also the main responsible actor in times of a crisis. For instance, the Ministry of Health has the day-to-day responsibility for public health, so during a pandemic this Ministry will still be the main responsible actor. The principle of sector responsibility also implies that the responsible organisation or institution has to develop a crisis management plan⁷²⁷.

This obligation is laid down in the Emergency Management Act, article 24.1. In order to ensure that each responsible organisation and institution has a sufficient emergency plan in place the Minister of Defence coordinates this planning effort (article 24.2). Commissioned by the Ministry of Defence DEMA has developed guidelines that might help organisations and institutions to develop a comprehensive crisis plan. The guidelines can be downloaded from the DEMA website, but are only available in Danish.

Areas that do not fall under the competence of any organisation or institutions are covered by the Minister of Defence. His ministry will ensure that all relevant areas to have a dedicated emergency plan. Therefore the focus in Denmark lies on the departmental plans and not on a nationwide emergency plan⁷²⁸.

Regional / municipal plans

As indicated in chapter 2 each region or municipality has the obligation to prepare a regional/municipal emergency plan. This plan has to be adopted by the municipal council (article 25.1 Emergency Management Act) or the regional council (article 25.2). As indicated in the previous paragraph the plans need to incorporate aspects from the relevant Ministerial emergency plans. Each region/municipality needs assess which aspects it needs to include as not all Ministerial plans will be relevant.

⁷²⁷ Source: DEMA (b)

⁷²⁸ Source: Preventionweb (2015)

Also the regional/municipal plans need to be revised when certain development makes the revision necessary. Irrespective of such a development, the emergency plan needs to be revised once during each regional and municipal electoral period (Article 25.3). Elections are held at least every four years⁷²⁹, so on average also the regional/municipal plans are reviewed once every four years.

Private company plans

In addition to the departmental and regional/municipal plans also private companies need to have an emergency plan in place. They need to ensure they are able to continue their activities as long as possible. This is particularly important for companies that provide vital services, e.g. electricity companies, hospitals etc. In their plans these companies have to consider what they have to do so that they are sufficiently prepared for extraordinary events⁷³⁰.

4.3 Logistics support in crises

During the desk research no clear indications have been found that private logistical providers are often used in crisis management. They do not form a clear part of the crisis management chain.

*Military logistical support*⁷³¹

Each couple of years the Danish Government concludes the Danish Defence Agreement, in which the tasks and obligation of the Danish Army, Navy and Air Force are laid down. The latest Defence Agreement was concluded in 2012 and covers the period 2013-2017.

The main focus of this agreement is international security and support. In case of large humanitarian crisis parts of the Danish army, navy and air force can provide support. If needed they can also offer support in armed conflict. Main focus of international actions, however, lies on the protection of Danish civilians currently residing abroad.

In addition, to international security and support the Danish army, navy and air force also conduct several civilian tasks. The tasks are divided into two different groups; the dimensioning tasks and the occasional tasks. The dimensioning tasks consists of a number of regulatory functions, which are conducted on behalf of the Ministry of Defence. Examples are national maritime environmental surveillance and national pollution control at sea. The occasional tasks occur less often and assistance during times of crisis do fall under this task description.

Although the army, navy and air force can provide assistance during times of crisis, their support is additional to the support provided by DEMA. So, if needed they can provide logistics, however no explicit agreements are made on this.

⁷²⁹ Source: <http://elections.sim.dk/local-elections.aspx>

⁷³⁰ Source: DEMA (b)

⁷³¹ Based on: Danish Defence Agreement 2013-2017.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

When a major accident or disaster involves an acute danger of injury or property damage, the Danish police has the possible to warn the Danish population of such risk by means of Denmark's national electronic siren warning system. The DEMA operates and maintains the siren network of 1,078 sirens covering about 80% of the Danish population⁷³². These 1,078 sirens are all fixed sirens and are located at buildings or poles in cities and urban areas with more than 1,000 people. In areas with less than 1,000 no fixed sirens are available; however the police can use mobile sirens to warn people that an emergency has happened. The fixed sirens are equipped with a separate uninterruptible power supply that ensures their operation at all times. In case of a power failure the sirens still operate (DEMA, 2012a).

The siren system can be used nationwide, but can also be operated locally or regionally if this is more appropriate. The system is tested once a year – each first Wednesday in May. On this occasion the sirens are tested out loud. Every night the sirens are silently tested.

If the police decides to use the siren system, two national TV stations, i.e. DR and TV2, will broadcast an emergency message informing the public on the nature of the emergency and providing information on what to do in this specific situation. In addition, both TV stations will use teletext messages to provide relevant information as well.

In crisis situations, a dedicated crisis website kriseinfo.dk will go online. This website was already used for the bird flue crisis. In addition to the website it is possible to follow both DEMA and the Police on Twitter, to obtain relevant crisis related information⁷³³.

The European SOS number 112 can be dialled to reach emergency services - medical, fire and police.

⁷³² Persons who are hard-at-hearing or hearing-impaired may subscribe to a DEMA warning system to receive text messages

⁷³³ Source: <http://www.dr.dk/nyheder/indland/foelg-beredskabsstyrelsen-paa-twitter>

5 Capabilities

5.1 Human resources

As described in chapters 2 and 3 the main responsible bodies for emergency response activities are the municipal fire and rescue services. During the desk research it was not possible to find information on the number of available municipal firefighters and ambulance personnel.

In addition to the municipal fire and rescue services, DEMA can provide aid as well. In order to provide the aid sufficiently DEMA has five rescue centres which are 24/7 in operation. In case of an emergency each of these centre can depart within 5 minutes. The centres are located in such a way that all parts of Denmark can be reached within two hours. A DEMA response team consists of at least 14 conscripts and non-commissioned officers. If DEMA is asked to provide support in the event of major incidents, they are able to muster up to 1,200 people rapidly (e.g. conscripts, non-commissioned officers and volunteers)⁷³⁴.

Volunteers

Volunteers are attached to each DEMA rescue centre. Most of the volunteers available are former conscripts. They have signed a contract with DEMA in which they agree to be available on a voluntary basis. Each national rescue centre has 40-100 of these volunteers available⁷³⁵. In addition to this group of volunteers, are the two voluntary response forces, which fully consist of volunteers. These two forces are located near the rescue centres of Hedehusene and Herning, but the volunteers can be deployed all around the country. Within these two forces approximately 400 volunteers are available⁷³⁶. All DEMA volunteer support the local fire and rescue service and police they are attached to. If needed the volunteers can be sent on missions abroad in response to major incidents, e.g. floods or earthquakes.

Besides volunteers directly contacted to the DEMA rescue centres also the Red Cross and the Danish Civil Protection League can provide volunteers. The Red Cross has around 25,000 volunteers in Denmark⁷³⁷. It should be noted that besides crisis management activities in Denmark itself, these volunteers are also active abroad and therefore might not always be available during times of crisis in Denmark. The Danish Civil Protection League has around 5,000 volunteers available⁷³⁸.

*Involvement of private businesses*⁷³⁹

⁷³⁴ Source: DEMA (2012d)

⁷³⁵ Source: DEMA (b)

⁷³⁶ Source: DEMA (2012d)

⁷³⁷ Source: <https://www.rodekors.dk/>

⁷³⁸ Source: <http://beredskab.dk/bliv-frivillig/opgaver-som-frivillig/#.Vm7A4P5liUk>

⁷³⁹ Source: <http://www.falck.com/en/countries/denmark>

Around 2/3 of all Danish municipalities have outsourced the fire and rescue services to Falck, a private firefighting company. Besides firefighting services Falck also offers ambulance services. According to their annual report of 2013, Falck's ambulance services covered 85% of the market. In Denmark Falck has approximately 10,000 employees, divided between the different market segments that are covered by the company. So in case of large emergencies Falck has the possibility to muster up around 10,000 people to provide support.

5.2 Materiel (non-financial) resources

Material resources at municipal level

As indicated in previous chapters Danish crisis management is organised on two levels; the municipal and national level. The municipalities that have their own fire and rescue service in place also need to ensure that sufficient resources are available to sufficiently carry out firefighting and rescue operations. However, the emergency services themselves will purchase the equipment they need. The equipment they use is not only used in case of large disasters, but can also be used during their daily execution of their tasks. So the fire brigade needs to buy, e.g. the ladder trucks and the fire hoses, while the medical health care needs to purchase the ambulances, stretchers and medicines.

The municipalities that entered into an agreement with Falck have to agree with Falck that Falck ensures sufficient resources are available. Falck will invest and own the resources needed however in the agreement the municipality is entitled to lay down certain requirements. For example, a municipality can ask Falck to guarantee a minimum of fire trucks to be available.

Material resources on national level

If the magnitude of a crisis is such that special equipment and large amounts of personnel are needed, municipalities may call on the assistance of DEMA's five fire and rescue centres all on 24-hour turn-out duty. DEMA's centres may dispatch personnel and equipment within five minutes and reach destinations all over the country within approx. two hours⁷⁴⁰.

On the website of DEMA a detailed overview of the available material can be found, detailed per rescue centre. The material is classified in 5 overall categories:

- Firefighting equipment;
- Rescue equipment;
- CBRN equipment;
- Communication equipment;
- Special equipment.

Each of these categories is subdivided in several more specialised categories (see figure 5.1). For instance, the CBRN equipment category is divided in 14 subcategories, ranging from boats and dedicated CBRN vehicles to protective containers and personnel cleaning devices. Again each of these subdivisions is divided in several individual units. In the category boats all different types of

⁷⁴⁰ Source: DEMA (b)

boats available within DEMA are described. On the right hand side of the website the number of available units per rescue centre are listed (see figure 5.2). For a complete overview of all material available please visit the website⁷⁴¹.

Figure 5.2: Screenshot logistics capacity within subdivision on DEMA website

Possibility to commandeer private goods

Art. 20 of the Emergency Management Act states that the fire and rescue services may demand that any kind of privately-owned tools and equipment and means of transportation together with the necessary crews be made available for the response (Emergency management act, 2009). When article 20 is invoked the owner will, after the rescue operation, regain his property.

The Emergency Management Act also contains an article relating to expropriation. Based on article 38 the Minister of Defence or an individual authorised by this Minister may initiate expropriation of private property for the use of fire and rescue services. The expropriation can include means of transport as well. The Act allows the Minister or the individual authorised by him to seize the goods without a court order in case of a crisis. This implicates that the Minister or the individual authorised by him do not have this right in case of a minor incident, e.g. a small fire.

5.3 Training⁷⁴³

The main trainings for professionals are organised by DEMA and held on their training schools located in Tinglev, Snekersten and Birkerød (see chapter 3 for the exact locations). At these schools approximately 900 conscripts per year, follow courses to become a qualified fire-fighter. The average duration of their training is 3 months. Also a more elaborate training is offered. On a yearly basis around 500 conscripts follow this course which has a duration of 6 months. Besides fire-fighting courses, these conscripts also follow courses related to hazardous materials (hazmat) and rescue services. After completion of the 6 months training course the conscripts likely start working for the municipal fire and rescue service or the private fire service.

DEMA Emergency Services College

The trainings described above are the primary trainings for conscripts. Besides these more basic training DEMA also offers more advanced trainings. Such trainings can be followed at the DEMA emergency Services College, which is located at the training centre Tinglev. The trainings given here target sub-officers and officers at the municipal fire and rescue services, and representatives from other authorities and the private sector. The trainings deal with operational and tactical decision making and the knowledge obtained can be used in emergency planning.

The College has a training ground of 13,000 km² available on which incident command situations can be re-enacted. The training ground exists of different types of buildings and ruining in which fire and rescue operations can be conducted. Besides training sub-officers, officers and representatives the grounds are also used to test new emergency response equipment and methods, e.g. new ways to extinct a fire. The figure below shows an air photograph of the training ground.

Figure 5.3 Air photograph of the Tinglev training ground⁷⁴⁴.

⁷⁴³ Based on: <http://brs.dk>

⁷⁴⁴ Source: <http://brs.dk>

DEMA Staff College

The DEMA staff college is part of the training school in Snekersten. Main aim of the staff college is to manage the development and implementation of education programs meant for employees of DEMA itself and the municipal fire and rescue service. Contrary to the college in Tinglev, the college in Snekersten mainly focus on trainings in preparedness (the college in Tinglev focuses on response).

DEMA's international courses

The two above mentioned colleges and the basic trainings focus on Danish first responders. Besides these national oriented trainings, DEMA also organises international trainings. These trainings can be followed by Danish first responders, but also by representatives of international organisations and the foreign fire-fighters. Currently, DEMA is, amongst others, involved in the following international projects:

- Lead partner for European Civil Protection training programme on six annual courses, Information Management Course (IMC), International Coordination Course (ICC), and Security Course (SEC);
- Partner conducting five to six Operational Management Courses (OPM);
- Partner in the European Union's IPA programme on Civil Protection Cooperation for the candidate countries and potential candidates.

Trainings in volunteer organisations

Also the two largest volunteer organisations, the Danish Red Cross and the Danish Civil protection League to offer trainings for their volunteers. The trainings of the Danish Red cross mainly focus on first aid courses. The training program of the Danish Civil Protection League is more elaborate and consists, amongst others, of trainings concerning food provisioning and temporary housing, fire service, rescue work, use of rescue dogs, communication and SAR-teams (Search and Rescue). They training program is supplemented management trainings in order to better select members for the organisations. Also first aid courses for members and the general public are organised. Focus of these trainings is on the capability to extinguish small fires and handle accidental situations before they become major disasters (EC, 2014).

5.4 Procurement

5.4.1 (European) procurement regulations

The procurement of public contracts needs to be in line with the principles of European treaties and especially with the free movement of goods services, capital and people. Furthermore the procurement needs to comply with the principles of equality, proportionality etc. For some types of procurement additional regulations are codified in directives. Within the European legislation, three different procurement directives apply. These directives are mutually exclusive meaning only one of the directives applies to the public procurement. Directive 2014/25/EU (on procurement of utilities) and directive 2009/81/EC (on procurement in the defence and security industry) are topic specific. If

these specific directives do not apply, public sector directive 2014/24/EU is applicable, which is the replacement of directive 2004/18/EC. The aim of the new directive is to simplify the rules on public procurement; improve the participation of SMEs and stimulate cross border joint procurement.

Stimulation of cross border joint procurement is helpful in case of a major internal crisis or a cross border crisis. The directive states in the preamble that contracting authorities should be able to choose to jointly provide their public services in cooperation with other authorities, without being obliged to use any legal form. These services don't have to be identical. The cooperation does not require all participating authorities to fulfil the obligations of the contract, as long as there is a commitment to contribute to the cooperative performance. The preamble points out that there are difficulties in cross border joint procurement. Therefore new rules have to be made. In these rules, the conditions for cross border procurement have to be clarified, as well as the applicable regulations. In addition, contracting authorities should be able to set up joint entities established under national or EU law. The new rules are specified in article 39 of the regulations.

If the procurement is executed by a centralised purchasing body located in another MS, the procurement shall be conducted in accordance with the national regulations of the MS where the purchasing body is located. In addition, it may possible that multiple contracting authorities located in different MS jointly award public contracts, conclude framework agreements or operate dynamic purchasing systems⁷⁴⁵. Participating contracting authorities will then conclude an agreement that determines all responsibilities of the parties and the internal organisation of the procedure. As said before, the contracting authorities can set up a joint entity. The parties shall decide on the applicable rules on procurement. They can choose the rules of the MS where the entity has its registered office or where the entity carries out its activities.

This project evolves around the procurement related to crisis management, for example the procurement of ambulances, emergency packs or trainings. The utilities directive applies to gas and heat, electricity, water, transport services, ports and airports and postal services (article 8-13). The directive on defence and security applies to supply of military equipment and sensitive supplies. The majority of procurement in crisis management will be procured by normal NCCs and local authorities like the fire department or police and will not be secret. So in most cases the public sector directive (2014/24/EU) is applicable. This chapter will therefore focus on this directive. Keep in mind that the other directives can also be applicable, for example if the army is used to solve a major crisis. The directive is addressed to Member States and has no direct effect on the national regulations. The directive needs to be implemented first.

Scope of the public sector directive

The public sector directive applies to procurement by contracting authorities with respect to public contracts as well as design contests whose value is estimated to be not less than (article 4):

- € 5.186.000 for public works contracts;

⁷⁴⁵ Source: article 39 public sector directive 2014/24/EU

- € 134.000 for public supply and service contracts and design contests, awarded by central government;
- € 207.000 for public supply and service contracts or design contests awarded by sub-central contracting authorities.
- € 750.000 for public service contracts for social and other specific services listed in Annex XIV.

This directive should not apply to certain emergency services where they are performed by non-profit organisations or associations, since the particular nature of those organisations would be difficult to preserve if the service providers had to be chosen in accordance with the procedures of the directive. Furthermore the directive does not apply to public contracts with the purpose of providing public communication networks or electronic communication services; public contracts organised pursuant to international rules; several types of service contracts, e.g. rental, legal services and employment contracts and service contracts based on exclusive rights; and last, public contracts between entities within the public sector (articles 8-12).

5.4.2 Procurement procedures

On a European level, procurement is executed by the European Commission. The public sector directive contains several award procedures:

- open procedure,
- restricted procedure,
- competitive procedure with negotiation,
- competitive dialogue,
- negotiated procedure without prior publication.

The *open procedure* applies when no other procedure is chosen. In the open procedure, the contracting authority submits a call for tenders. Interested companies may submit a tender. The best offer is chosen, based on the selected award criteria (article 27).

The *restricted procedure* consists of two phases. In the first phase a call for expression of interests is set out. Interest candidates may submit an invitation to tender. The contracting authority will then invite the most suitable candidates to submit a tender. The contracting authority will award the contract to the best tender, based on the selected award criteria (article 28).

In the *competitive procedure* with negotiation any interested candidate may submit a request to participate in the negotiations, in response to a call for competition. In this call for competition, the contracting authority has provided a description of their needs and the characteristics of the works or services to be procured. Only the interested candidates that are invited may submit an initial tender, which will be the basis of the negotiations (article 29). In several cases the negotiation procedure can be used without prior publication, for example when the public contract contains a

creative achievement; when there is no competition; when intellectual property rights need to be protected, or when there are reasons for extreme urgency (article 32).

In the *competitive dialogue* any interested candidate can submit a request to participate in response to a contract notice given by the contracting authority. The contract notice provides the information on and the needs and requirements of the contracting authority, as well as the chosen award criteria. The selected interested candidates will join the competitive dialogue, in which the means best suited for satisfying the contract will be defined (article 30).

A new procedure within this directive is the *innovation partnership*. In the innovative partnership procedure, in response to a contract notice, each economic operator may submit a request to participate in the partnership. The economic operator can do so by providing information requested by the contracting authority. The innovation partnership can be set up with one partner or several partners. Only the economic operators invited by the contracting authority participate in the procedure. After each phase, the contracting authority may decide after each phase to terminate the partnership or reduce the number of partners within the partnership, based on the targets.

According to article 26, the open procedure and restricted procedure are the standard procedures to apply in case of procurement. The other procedures can be used in a limited number of situations, for example when the service is innovative, or when the technical specifications can't be determined (art. 26, sub 4.).

Contracting authorities can use framework agreements, provided that they apply the procedures in this directive. The agreement can not exceed four years. Contracts within the agreement will be awarded according to the rules in article 33.

In most procedures the candidates are chosen with the use of selection criteria. The selection criteria may relate to suitability to pursue the professional activity; economic and financial standing and technical and professional ability. All criteria need to be related and proportionate to the matter of the contract (article 58).

5.4.3 *National regulations and procedures*

Scope

In Denmark, the old procurement directives are implemented without any exemptions. The Danish Tender Act is applicable to all procurement outside the scope of the EU directives, because the threshold value isn't met. In other words, the Danish rules are secondary in relation to the European directives. The Danish act has no threshold value on public works; the value for public services is DKK 500,000

Procurement is executed by the bodies codified in Appendix I of the European directive, which are the state, regional and local authorities and bodies governed by public law. Private entities are only subject to the Danish Tender Act if the public contract is publicly funded.

Procedures

The contracts to which the European directive is applicable all the European procedures are permitted. If the procurement is within the scope of the Danish Tender Act, three different procedures are available: public tenders, restricted tenders or informal bids. There are no restrictions on the use of the procedures, although the contracting authority needs to make sure there is enough competition.

In a public tender the contracting authority announces its intents to contract. This announcement includes technical ability and economical standing of the tenderer. Furthermore the contracting authority should announce if the contract is awarded to the most economically advantageous tender, or the lowest price.

A restricted tender can be performed with or without a prequalification round. The contracting authority In case of a prequalification round, the contracting authority will announce the tender in the press or electronic media. If there is no pre-qualification round, the contracting authority directly invites the chosen participants.

The contracting authority has the authority to negotiate with the tenders, but only with the lowest bidder or with the three most economically advantageous tenderers. This may not result in a substantial change of the project or award criteria.

Informal bids can only be used when the estimated value of the contract is below DKK 3,000,000.

Award criteria

The Danish Tender act prescribes two award criteria: the lowest price or the most economically advantageous offer. If the most economically advantageous offer is used, the contracting authority shall list and explain the sub-criteria, with the relative weight, linked to the public contract. When the lowest price or the most economically advantageous tender has been identified, the tender is awarded to the winner.

5.5 Niche capabilities

Private fire and ambulance services

Danish fire and rescue services can be carried out by a privately owned company (according to article 13 emergency Management Act). Currently, around 2/3 of all Danish municipalities has entered into such a contract with a privately owned provided (65 out of the 98 municipalities). The only private

operator in Denmark is Falck, who therefore offers its services to 2/3 of all the municipalities⁷⁴⁶. Besides firefighting services Falck is also responsible for 85% of all ambulance service provided in Denmark.

International energy preparedness

A niche preparedness approach of the Nordic countries is found in the energy supply preparedness. The Nordic countries work closely together to create an integrated electricity supply network. When one of the participating countries involved, is confronted with a power shortage, other countries can, via cross border connections, supply energy. This limits the chance of severe blackouts in crisis situations⁷⁴⁷.

Resources

Legislative acts

At national level

Overall, the legislative framework for Danish civil preparedness is mainly based on:

- The Constitutional Act of the Kingdom of Denmark
- Acts (three readings in the Parliament)
- Statutory orders/administrative directives/decrees (depending on the legal authority)
- Circulars
- Guidelines.

The major legislative framework for civil preparedness is the following:

- Emergency Management Act (Consolidated Act No. 660 of 10 June 2009, LBK no. 137 of 01/03/2004 as amended);
- Act on Shelters (Beskyttelsesrumsloven (LBK nr. 732 of 20. August 2003);
- Act on Safety and Environmental Control of Nuclear Installations (Lov om sikkerhedsmæssige og miljømæssige forhold ved atomanlæg (LBK no 244 of 12/05/1976);
- At ministerial level;
- At ministerial level, there is a number of statutory orders governing civil preparedness within the sphere of responsibility of the respective ministry:
- Order of the Ministry of Environment No 1156 of 18 November 2005 on the control of major accidents involving dangerous substances (Miljøministeriets bekendtgørelse nr. 1156 af 18. november 2005 om kontrol med risikoen for større uheld med farlige stoffer);
- Order of the Ministry of Defence no 765 of 3 August 2005 regarding risk-based municipal fire and rescue service as amended by Order no 872 of 6 July 2007 (Forsvarsministeriets bekendtgørelse nr. 765 af 3. august 2005 om risikobaseret kommunalt redningsberedskab som ændret ved bekendtgørelse nr. 872 af 6. juli 2007).

Inter-ministerial cross-cutting co-ordination

- Legal acts such as The Police Act (Law No. 444 of 9 June 2004 as amended) on general co-ordinating powers;
- The Danish Emergency Management Act on co-ordination of efforts at the accident site;
- At international level;
- International intervention is governed by political agreements. Denmark participates in the EU emergency and crisis co-ordination arrangements (CCA), and the Ministry of Foreign Affairs acts as the Danish point of contact in relation to the CCA;
- Military interventions are governed by the Defence Law (Law no 122 of 27 February 2001), while civil interventions are governed by the Civil Preparedness Act (LBK no. 137 of 01/03/2004 as amended);

- Regional agreements.

The Council of the Baltic Sea States (CBSS).

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by ECORYS and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

The Estonian crisis management system is based on measures that can be taken in order to protect human life, property and the environment during civil emergencies. In Estonia the highest authority responsible for emergency and disaster management is the Ministry of Interior. It is responsible for policy formulation and its execution in the area of civil security. At regional level county governors are directly responsible to the Minister of the Interior for crisis management matters. The county governor is the highest crisis management authority at regional level. At local level the main body responsible for civil protection is the local government council which has established the local crisis management committee chaired by the mayor.

Figure 4. Logo of the Estonian Rescue Board⁷⁴⁸

The Estonian Rescue Board is directly subordinate to the Ministry of Interior and has a key role in representing Estonia in various international forums such as the UN, EU and NATO and other relevant civil security organisations. Another national government institution under the authority of the Ministry of Interior is the Emergency Response Centre responsible for processing emergency calls to the emergency 112 number and sending out rescue teams to the place of the emergency.

As in the other Baltic Region States the organisational structure is centralised, i.e. coordinated and mostly organised by the central national civil protection authority, as is the case with Estonia, Latvia, Lithuania. Additionally, the use of private rescue services is low in the Baltic Countries.⁷⁴⁹

The Defence Forces could be deployed in response of crisis or disaster, but only in cases where all the other crisis management capabilities of the state have been exhausted or where the required resources or capabilities are only available to the Defence Forces.

The civil protection expenditures are approximately 0.6% of GDP of Estonia.⁷⁵⁰

The most important non-profit and volunteer organisations in Estonia are regarded the Red Cross, the Estonian Volunteer Fire-Fighters Union, the Estonian Association of Fire and Rescue Chiefs, and

⁷⁴⁸ Source: https://en.wikipedia.org/wiki/Estonian_Rescue_Board

⁷⁴⁹ EUROBALTIC Survey: Civil Protection Research in the Baltic Sea Region, p.13

⁷⁵⁰ http://ec.europa.eu/echo/files/civil_protection/vademecum/ee/2-ee-1.html, last accessed 18.12.2014

the Estonian Life Saving Association and Defence League, who have also been given the task of assisting in rescue work.

The main regulative framework for civil protection and emergencies is defined by the Emergency Act and the Rescue Act of Estonia.

The National Security Concept of the Republic of Estonia is a key document that establishes the objectives, principles and directions of security policy. The National Security Concept highlights crisis management as one of the essentially important tasks. Another important conceptual document is the Strategy of the Estonian Rescue Board 2015-2025 which plans the Board's activities in a ten year timeframe.

The systems for training in the field of civil protection are quite different in the Baltic region, however they share some basic features. Education in civil protection and rescue has a legal foundation in all of the Baltic Region countries. Basic and advanced education at the national level is standardised through the use of certificates, as well as the development of educational and training curricula. All of the Baltic region states have specialised schools and colleges which carry out education in civil protection and rescue area.⁷⁵¹

Estonia has signed regional and multilateral provisions of the Council of Europe, the EU, the NATO and the OSCE for assistance in crisis situations. Estonia is also an active initiator in the field of maritime cooperation and of strategic and operational dialogue among the Baltic Sea countries.

Potential niche capability in which Estonia could realistically contribute to the European crisis management community is the development of software solutions in the cyber defence and the programming of autonomous platforms and systems field of expertise. Estonia could provide software solutions and expertise from which EU member states could benefit and establish new ways for cooperation in the cyber security field.

1 Policy

According to article 2 of the Emergency Act of Estonia “*emergency is an event or a chain of events, which endangers the life or health of many people or causes significant proprietary damage or significant environmental damage or severe and extensive disruptions in the continuous operation of vital services and responding to which requires the prompt co-ordinated activities of several agencies or the persons engaged by them*”; while Crisis Management is described as ‘*a system of measures, which includes preventing emergencies, preparing for emergencies, responding to emergencies and mitigating the consequences of emergencies.*’⁷⁵²

In other words, crisis management is defined as national arrangements that are prepared and implemented by governmental organisations in cooperation with local governments, private enterprises and non-profit organisations in order to guarantee safety of the population and continued functioning of vital services during an emergency.⁷⁵³

Key crisis management activities are considered (i) the identification of potential emergencies or risk analysis; (ii) to prevent or reduce the severity of consequences of emergency measures in the development and implementation; and (iii) the action plans for emergency action (i.e. emergency plans).⁷⁵⁴

The Government of the Republic of Estonia has the responsibility to develop a national crisis management policy, and to direct and co-ordinate the crisis management activities of ministries, the State Chancellery and county governors. In addition, It also approves the national crisis management plan and forms a permanent crisis management committee in order to harmonise and co-ordinate crisis management activities.⁷⁵⁵

1.1 Risk Assessment

Estonia’s risk assessment mechanism/procedure is specified in the *Emergency Act*, which is in force since 2009. Further, risk assessments the Ministry of Interior establishes guidelines for preparing an emergency risk assessment through a regulation named - *Guidelines for preparing continuous operation risk assessments*, which is in force since June 2010.

The Emergency Act defines emergency risk assessments as a document, which describes the following aspects which are relevant on the national and, if necessary, on the regional and local government level:

⁷⁵² Emergency Act of Estonia, Chapter I, art.2 (2)

⁷⁵³ International CEP Handbook 2009, Civil Emergency Planning in the NATO/EAPC Countries, p.77

⁷⁵⁴ <http://www.rescue.ee/642>, last accessed 18.09.2014

⁷⁵⁵ Ibid

- the emergency;
- the threats and hazards causing the emergency;
- the probability of the emergency;
- the consequences of the emergency;
- other important information related to the emergency;
- references to models, source materials and other such information, on the basis of which the risk assessment is prepared.⁷⁵⁶

The Government establishes list of emergencies, concerning the preparation of risk assessments and appoints competent agencies of executive state power to prepare the assessments. At least once in every two years the Government must assess the need to amend the list of emergencies, concerning which risk assessment has to be prepared.⁷⁵⁷

The procedures for organising the preparation of risk assessment of important social services called vital services are described by the “Guidelines for risk assessment”. These vital services include healthcare, safety and security as well as the economic and social welfare of the public.⁷⁵⁸

The institution or person preparing a risk assessment submits it to the relevant institution that organises the continuous operation of vital services on a yearly basis. There are 43 vital services and approximately 140 provides in Estonia.⁷⁵⁹

According to “Guidelines for risk assessment”, a risk assessment consists of the following parts:

- table of contents and a list of persons engaged in preparing the risk assessment;
- analytical part;
- necessary tables and diagrams prepared for performing the assessment;
- risk matrix;
- summary of the risk assessment.⁷⁶⁰

The Government forms a permanent crisis management committee which provides an opinion on the guidelines for preparing emergency risk assessments and operations. It also approves the risk assessment summaries of emergencies.⁷⁶¹ At regional level, County Governors are directly responsible to the Minister of the Interior for the review of the risk analysis of an emergency of a certain region. At local level, the head of the local government crisis management committee is the

⁷⁶⁰ Guidelines for risk assessment, art.4 (1)

⁷⁶¹ Emergency Act of Estonia, Chapter I, art.3 (1)

rural municipality mayor or the city mayor, who is responsible for reviewing the risk assessment of a certain region.⁷⁶²

In addition, the crisis management plan of a county has to be reviewed by the county crisis management committee, which on its part presents opinion to the county governor. County governors shall review crisis management plans as necessary but not less frequently than once in every two years. An amended crisis management plan shall be submitted to the Minister of Internal Affairs for approval.⁷⁶³

Key risks and former disasters

The key risks and areas of concern in Estonia include extreme weather conditions, more precisely winter storms, extreme temperature, forest fire and flooding. Major transport and technological accidents, such as the sinking of the MS Estonia in 1994 and the Copterline helicopter crash in 2007, have also occurred and have resulted with significant casualties.⁷⁶⁴

The „Gudrun“ storm, which struck the Baltic Sea area and caused considerable floods in the Estonian towns of Pärnu and Haapsalu in 2005, raised enormous attention among population, crisis managers and authorities.

In addition, the fact that more than 20% of the terrain in Estonia is covered with forests increases the risk of fires. Measures are taken by the County Rescue Services to prepare forest fire suppression plans each spring. A development project was launched by the Estonian Forestry Board to increase the fire resistance of forests. Estimation reveals that on yearly basis over 800 forest fires occur in Estonia and it is considered as one of the main hazards.⁷⁶⁵

Estonia's security could be threatened not only by natural disasters and catastrophes, but also by infectious diseases, radiation and transport accidents. Despite the fact that Estonia does not possess nuclear plants, the threat of radiation accidents is increased by older type nuclear power plants that are still in operation in the Baltic Sea area. Intensified ship traffic and the increase in the transport of oil and oil products in the Baltic Sea area increase the threat probability of a major marine disasters or extensive environmental pollution.⁷⁶⁶

1.2 Policy and Governance

The Estonian civil protection could be best described as centralised due to the fact that the different ministries and agencies are responsible in their respective functional fields for civil emergency issues,

⁷⁶² http://ec.europa.eu/echo/files/civil_protection/vademecum/ee/2-ee-1.html#bilagr, last accessed 18.09.2014

⁷⁶³ Emergency Act, p.7

⁷⁶⁴ ANVIL Project Country Study: Estonia, p.8

⁷⁶⁵ Strategic Evaluation on Environment and Risk Prevention Under Structural and Cohesion Funds for the period 2007-2013 – National Evaluation Report for Estonia, p.62

⁷⁶⁶ National Security Concept of Estonia, p.9

while the Ministry of the Interior has overall responsibility for civil protection and emergency situations.

The civil security system is two-dimensional – on one hand, the functional responsibility allows a certain ministry to be in charge of a specific emergency or disaster management duty at national, regional and local levels. On the other hand, the area of responsibility is based on geographic mapping of respective areas.

At national level the highest body for civil emergency planning is the Governmental Crisis Committee. The committee's tasks are (i) to monitor national policy on crisis management; (ii) to coordinate crisis management on the ministerial and county levels and (iii) to present proposals to the national government regarding crisis management issues. The Governmental Crisis Committee is supported by the Ministry of the Interior.⁷⁶⁷

At regional level county governors are directly responsible to the Minister of the Interior for crisis management matters. The county governor is the highest crisis management authority at regional level and chairperson of the County Civil Protection Committee.⁷⁶⁸

At local level the main body responsible for civil protection is the local government council which has established the local crisis management committee chaired by the mayor or an equivalent official.⁷⁶⁹

In addition, the Estonian Rescue Board is a key government institution under the jurisdiction of the Ministry of the Interior and has a leading role in planning preparedness for emergencies and the operational management of the four regional rescue centres. It is also responsible for the development and implementation of national rescue policies. There are four territorial interagency emergency preparedness committees that are managed by the Estonian Rescue Board.⁷⁷⁰

The Estonian Rescue Board is actively involved in the crisis management mechanism at local, regional and national levels. The county governors report directly to the Minister of Interior and are responsible for crisis management development and planning at regional level. The Board examines and reviews the regional dimensions of the national crisis management system, the regional risk map and the overall preparedness to respond to risks. The Estonian Rescue Board also organizes crisis management training, supports the regional civil protection agencies and establishes and maintains the territorial crisis committee which is chaired by the head of the regional crisis centre.

The Board has the responsibility to review and implement the national crisis management systems at local level. Other key duties include risk mapping, development and enhancement of disaster prevention and maintaining preparedness. Additionally, the Rescue Board provides training related to preparedness, responsiveness and consequence management. It also provides support in terms of

⁷⁶⁷ International CEP Handbook 2009, Civil Emergency Planning in the NATO/EAPC Countries, p.77

⁷⁶⁸ International CEP Handbook 2009, Civil Emergency Planning in the NATO/EAPC Countries, p.77

⁷⁶⁹ ANVIL Project Country Study: Estonia, p.9

⁷⁷⁰ Ibid p.13

communication systems and coordination to the local government agencies dealing with emergency management.⁷⁷¹

Following the Fukushima nuclear accident and in concert with changes in legislative framework, Estonia has revised its Emergency Preparedness and Response procedures. Further:

Estonia is a State that has no nuclear facilities under the definition given in Convention. There are no plans to build an NPP in Estonia at present time. After the Fukushima accident, the focus of Estonia in nuclear safety is primarily related to the safety of nuclear installations in the neighbouring countries and to the implications that accidents at such installations, should they occur, may have on the health of the population and on the environment. There is a number of NPPs in neighbouring countries close to Estonian borders – the closest one is approximately 70 km away. Therefore, it is of utmost importance for Estonia to fulfil its obligations according to the Article 16, to "take the appropriate steps for the preparation and testing of emergency plans for their territory that cover the activities to be carried out in the event of such an emergency".⁷⁷²

1.2.1 Strategy scope and focus

The Estonian crisis management system is based on measures that need to be taken for the protection of the population, property and the environment during civil emergencies. The aims of crisis management system are:

- To define possible emergency situations by risk analyses;
- To define prevention and mitigation measures for emergency situations;
- To develop crisis management plans;
- To prepare crisis management structures;
- To guarantee mitigation resources;
- To deal with emergency situations;
- To organise the management of public information and early warning;
- To organise emergency management training courses;
- To restore critical infrastructure services.⁷⁷³

During the last decade Estonia had several significant crises affecting the civil security system. These include the flooding of the Northern Baltic Sea following the 2005 storm, the Copterline transportation accident in 2005 and the cyber-attacks in 2007. These cases revealed some requirements to improve the Estonian crisis management system, including situational awareness and rapid response mechanisms. Following inquiries made at political level there have been improvements in operational, tactical and strategic perspective in the civil security system.⁷⁷⁴

⁷⁷¹ Ibid., p.10

⁷⁷² Estonian National Report on lessons learned and actions taken in response to the Fukushima Daiichi nuclear accident, p.3-5

⁷⁷³ International CEP Handbook 2009, Civil Emergency Planning in the NATO/EAPC Countries, p.76

⁷⁷⁴ ANVIL Project Country Study: Estonia, p.24

According to data from prevention web, the overall risk of natural hazards or crises in Estonia is relatively low.⁷⁷⁵ The different policies and measures provided by the state authorities for prevention, preparedness, response and recovery in crisis situation, are taken to ensure that the Estonian crisis management system is well prepared and equipped.

In addition, the 2014 Security Policy document of the Ministry of Interior reveals that Estonia has built upon previous years to achieve better life-saving capabilities, decrease in crime, increased number of volunteers and community involvement, improved fire and traffic safety and faster response of the emergency response teams.⁷⁷⁶

To a great extend people feel safe in Estonia. More than 95% of the residents of Estonia consider the Rescue Board to be a highly trustworthy organisation.⁷⁷⁷

Another conceptual document concerning crisis management is the Strategy of the Estonian Rescue Board 2015-2025. It plans the Board's activities in a ten year timeframe. The Strategy has been developed in accordance with the foundations of safety policies, development plans and other governmental planning documents. The document stresses on the importance on the changes in the operating environment of the Board, the impact of the globalisation processes and advanced technologies, the social economic environment. In addition, it sets out objectives which target fewer fatalities caused by fires and drowning, decline in number of rescue events and operations and property damage.⁷⁷⁸

1.2.2 Monitoring and analytical support to policy making; R&D

The Estonian Academy of Security Sciences develops activities of Internal Security and Law Enforcement related subjects including rescue and crisis management. The Research and Development activities of the Academy include innovative learning technologies such as Virtual Training Exercises as tools for joint instruction and evaluation of crisis management command and control both on operational and strategic level. New training methods, such as the above mentioned systems, play an important role in the development and training of prepared crisis management specialists. The Academy has a leading role as centre of excellence of Internal Security in Estonia and has participated in many valuable research and development projects with EU Agencies, such as CEPOL and FRONTEX, as well as networks and European-wide cooperation bodies, such as EFSCA, EURASHE, NISPAcee, The Baltic University Network and others.⁷⁷⁹

An important annual event is the International Internal Security and Law Enforcement Conference, held every year in the month of November in Tallinn. The seminar gathers high-level international

⁷⁷⁹ <http://www.sisekaitse.ee/eass/index.php?id=14084&highlight=crisis,management>, last accessed 18.09.2014

scientists and security experts that exchange ideas and discuss innovative views of current developments and future trends on societal security affairs.⁷⁸⁰

A research and development asset that contributes to crisis management activities is developed under the supervision of the Estonian Information System Authority and is named the Virtual Situation Room (VSR). VSR has been created as a platform for crisis prevention which enables efficient cooperation between service providers, government agencies and also between service providers themselves. The VSR communication platform allows sharing of situational data between government agencies responsible for detecting, managing and preventing crises and companies providing vital services. The VSR also provides platform for analysis and visualisation of data, providing training using actual and simulated events, and for improving crisis management communication, decisions and procedures.⁷⁸¹

The modernisation and adoption of new technologies to improve the effectiveness for prevention and rescue efforts is foreseen in the Strategy of the Estonian Rescue Board. This process includes training and practice processes, adoption of e-solutions for prevention efforts and introduction of contemporary fire safety related technological solutions to the population.⁷⁸²

1.2.3 Policy for Prevention

Estonia's security policy is aimed at preventing threats as well as responding to them in a swift and flexible manner. Estonia's security is ensured through co-ordinated foreign and domestic policy measures.⁷⁸³

In the Emergency Act it is stated that crisis management committees shall be formed in counties in order to organise preventive and preparatory work in the field of crisis management and to respond to emergencies. Coordination and cooperation between civil protection and disaster prevention are provided by the Estonian Rescue Board.⁷⁸⁴

According to the Rescue Act, the Rescue Board's functions for prevention are immediately applied, unavoidable and urgent activities upon the occurrence of a rescue event, countering and eliminating a threat and alleviating the effects of that event.⁷⁸⁵

The Estonian Rescue Board conducts risk mapping, develops and enhances holistic disaster prevention and maintains preparedness. The Board also has the responsibility to review and implement the national crisis-management systems at the local level.

⁷⁸⁰ <http://www.sisekaitse.ee/eass/index.php?id=14084&highlight=crisis,management>, last accessed 18.09.2014

⁷⁸¹ <https://www.ria.ee/vsr/>, last accessed 18.09.2014

⁷⁸³ National Security Concept of Estonia, Unofficial translation, p.4

⁷⁸⁴ http://ec.europa.eu/echo/files/civil_protection/vademecum/ee/2-ee-3.html, last accessed 18.09.2014

⁷⁸⁵ Rescue Act, Chapter II, art.5 (4)

The prevention efforts of the Rescue Board have resulted in decrease in number of accidents due to work done on prevention. In order to improve the quality of rescue service operations the Estonian Rescue Board has acknowledged the need for involving new technologies that would make it possible to reduce both the response time of reaching affected people and the damage caused by accidents. Volunteer rescue brigades continue to gain strength in Estonia as well, and their increased involvement in not only rescue operations but also prevention efforts is an important asset.⁷⁸⁶

The Estonian Information System's Authority (EISA) is part of the administrative area of the Ministry of Economic Affairs and Communications, responsible for large-scale cyber incident, maintains and updates an emergency handling plan.⁷⁸⁷

Additionally, Estonia applies measures for preventing the spread of environmentally hazardous substances, and the neutralisation of sources of pollution on land and sea. In terms of prevention of marine pollution, the country is developing vessel traffic regulation and surveillance systems in the Baltic Sea. Remote surveillance of marine pollution is being developed, including air surveillance aimed at the early detection of pollution and the identification of the origin of the pollution.⁷⁸⁸

With regard to forest fires, the emergency measures for mitigating the consequences are established in the Fire Safety Act and include spatial planning, specific prerequisites for forest fires or landscape protection, as well instructions to the vital service providers and the public.

1.2.4 Policy for Preparedness

Forest fire is considered as one of the most hazardous threats in the Estonian landscape that require national preparedness and prevention measures. The Ministry of the Interior has established an emergency plan, which provides comprehensive directions for emergency management related to forest fire. The plan anticipates the participation in the management of emergencies of the Rescue Board and the Police and Border Protection Service, primarily for protection of public order, evacuation, traffic management, monitoring of flights; the Environment Agency for consulting and environmental assessment; the Environmental Inspectorate for consulting and environmental assessment; the Environmental Research Centre for conducting an air quality assessment; various health care providers, local governments responsible for evacuation and critical service providers.

Consideration of the risks involved in the planning stages is needed in order to raise the awareness of the local authorities through development of education and training programmes for local government officials.

In order to be prepared for reacting in emergency situations Estonia organises training exercises involving cooperation of all key sectors – civil, local governments, state authorities, business and non-profit entities. Rescue workers for crisis situations are trained and prepared by an emergency

⁷⁸⁶ Strategy of the Estonian Rescue Board 2015-2025, p.16

⁷⁸⁷ <https://www.mkm.ee/en/ministry-contact/crisis-regulation>, last accessed 18.09.2014

⁷⁸⁸ National Security Concept 2010, p.19

readiness and rescue training system, which includes: the Rescue College of the Public Service Academy – specialised in preparation of college-educated specialists for Rescue Service, and the Estonian Rescue School of the Public Service Academy in Väike-Maarja – specialised in preparation and training of fire fighters and rescuers.

1.2.5 Policy for Response

The policies and procedures for response in emergency situation are defined by the Emergency Act of Estonia. The Act also regulates the declaration of, the response to and the termination of an emergency situation.⁷⁸⁹

The Government, upon declaring the emergency situation, has to appoint a minister to direct and coordinate the response to the emergency due to which emergency situation was declared.⁷⁹⁰

The crisis management committee of the Government of the Republic of Estonia has to assist the agencies responding to emergencies in the organisation of exchange of information and the coordination of the response to the emergency. It also has to assist the emergency situation response coordinator in the coordination of the response to the emergency due to which the emergency situation was declared and if required to perform other duties assigned by the emergency situation response coordinator. The crisis management committee makes proposals to the Government of the Republic and to the emergency situation response coordinator for the implementation of measures established in legal acts.

The emergency situation response coordinator has the right to issue orders for responding to the emergency to the coordinator of emergency situation work and the state and local government agencies appointed by the Government. The orders are given in the form of administrative acts.⁷⁹¹

The Rescue Board ensures preparedness and readiness for tackling forest fires through special rescue capabilities and management of the involvement of volunteers. In case of large-scale forest fire Estonia has signed mutual assistance agreements with Finland, Sweden and Latvia for cooperation.

Furthermore, in such scenario, the international assistance could be sought through the NATO EADRCC and the European Union's Civil Protection Mechanism.

The Estonian Rescue Board is responsible for ensuring a response to an emergency on the basis of the Emergency Act. The emergency response functions of the Emergency Response Centre include receipt and processing of an emergency call to the emergency 112 phone number or a notification received in another manner and an order to respond to the Rescue Board and a provider of emergency services.⁷⁹²

⁷⁸⁹ Emergency Act, Chapter I, art.1

⁷⁹⁰ Emergency Act, Chapter III, art.18 (1)

⁷⁹¹ Emergency Act, Chapter III, art.18 (2)

⁷⁹² Rescue Act, Chapter 2, art. 5. 9 (1)

The vision of the Estonian Rescue Board is to reach the level achieved by the Finland, Sweden, Denmark, Norway and Iceland by the year 2025, in terms of the level of rescue-related safety and in terms of the number of accidents and extent of consequences.⁷⁹³

The key steps for response to emergencies encompass immediate notification to the emergency 112 helpline, followed by an immediate reaction by the relevant agencies or legal persons for notifying the Ministry of Interior. The next step for response in a crisis situation is to warn the public of the impending risk of the occurrence of an emergency that threatens the public and may endanger human lives and health or cause major infrastructural damage. The government of Estonia or the relevant crisis management authorities may use the media for informing for an emergency situation.⁷⁹⁴

In 2005 major storm the Estonian Government enforced the media to inform people in timely manner and without interpreting the government announcement. A website was created where all the government announcements, warnings and other information were stored. The Governmental Crisis Management Committee and local crisis management committees were set up in the towns of Pärnu and Haapsalu. The data from the storm was analysed, proposals regarding the compensation of the damages were drafted and sent to the Government.⁷⁹⁵

The experience from the 2005 flooding contributed to the development of a more systemic response, planning and streamlined crisis management in Estonia. It also enhanced the communication between the crisis management actors and improved the cross-border cooperation and information exchange between agencies in Estonia and Finland.⁷⁹⁶

1.2.6 Policy for Relief and Recovery

The Estonian Disaster Relief Team

The Estonian Disaster Relief Team (EDRT) is a rescue unit that provides international cooperation and can operationally take part in international rescue actions as well as to react to emergencies in Estonia. Since its establishment in 1996 the EDRT has participated in more than 20 international training exercises and missions in Indonesia, Pakistan and Latvia. The EDRT consists of five teams: search and rescue team; medical team; chemical team; support team and a group of experts.⁷⁹⁷

The Defence forces

When conducting disaster relief, responding to natural or technological catastrophe, conducting search and rescue operations, or when mitigating extensive pollution to the environment, the Defence Forces could be employed without announcing the emergency situation or state of emergency. The Defence Forces, with the support of the Defence League (see p.34), are the primary

⁷⁹⁵ Are Kont, Jaak Jaagus, Kaarel Orviku, Valdeko Palginõmm, Urve Ratas, Reimo Ravis, Ülo Suursaar, Hannes Tõnisson, *The 9 January 2005 storm impact on the Estonian coastal area*, p.54

⁷⁹⁶ ANVIL Project Country Study: Estonia, p.14

⁷⁹⁷ ANVIL Project Country Study: Estonia, p.19

supporter of the civilian authorities in ensuring domestic security in case of crisis. Acknowledging that the Ministry of the Interior has the overall responsibility for ensuring domestic security and crisis management, the Defence Forces are employed to settle civil emergencies in cases where all the other crisis management capabilities of the state have been exhausted or the required capabilities are only available to the Defence Forces. The use of the Defence Forces for ensuring domestic security is only possible by a decree from the Government of the Republic.⁷⁹⁸

The crisis management structures within the area of governance of the Ministry of Defence are ready to support the civilian structure in compliance with the crisis management plans that are developed by the Ministry of the Interior and approved by the Government.

1.3 Financing

1.3.1 Investing in preparedness

Investing in emergency preparedness is one of the most important factors when it comes to crisis management. The planning of financial resources needed to implement the objectives of the national strategy will be in accordance with the planning of the state budget. Due to the objectives, particular attention will be paid on increased funding of volunteers, proportion of investments and increased wages. The Civil protection expenditures, according to data of the European Commission, are approximately 0.6% of the GDP of Estonia.⁷⁹⁹

The Strategy of the Estonian Rescue Board 2015-2025 foresees increase in financing for the available technology and equipment with an appropriate service life and safety requirement. Investments currently account for 2.8% of the Rescue Board's budget. The Strategy also expects increase in the average salary of Rescue Board employees in order to match the average salary in the public administration and national defence sectors.⁸⁰⁰

In accordance with the trends in volunteer rescue, it is planned to increase the amount invested in the competence of volunteer rescuers to 1.5 million euros by the year 2016.⁸⁰¹ Moreover, state financial support for volunteers has increased significantly in recent years, reaching 938,874 in 2013 and 1,146,748 euros in 2014.⁸⁰²

Contributing factor for the decreasing number of fatalities caused by fires and drowning is the increased budget for prevention work. In 2014, Estonia allocated over 700,000 euros.⁸⁰³

⁷⁹⁸ Estonian National Defence handbook 2010, p.43

⁷⁹⁹ EC, Vademecum, Country profiles - Estonia – prevention & preparedness, last accessed 18.09.2014

⁸⁰¹ Strategy of the Estonian Rescue Board 2015-2025, p.34

⁸⁰² Strategy of the Estonian Rescue Board 2015-2025, p.40

⁸⁰³ Ministry of Interior, Security Policy 2014, p.9-11

Additionally, Estonia has signed framework agreements with the Swiss Agency for Development and Cooperation (SDC) for the implementation of two projects related to emergency preparedness. The first one was for prevention and management of natural disasters worth around 1,3 million euros. The project lasted over two years and resulted in improved fire safety of the Estonian social and health service institutions, decrease of the potential fire sources in these institutions and improving the preparedness among the staff to react in danger situations.⁸⁰⁴

The second similar project was for strengthening information and communication technology systems of the Emergency Respond Centre and the grant was estimated at almost 1,67 million euros. This project lasted for three years and resulted in improvement of the time needed for responding and processing emergency calls and sending rescue vehicles. The projects will also aid the establishment of an emergency management monitoring system onto an electronic map, which will enable to display information regarding the location of the emergency caller and the location of the available rescue vehicles.⁸⁰⁵

Estonia has developed good collaboration with the private sector, as the Estonian civil security authorities are looking at solutions for improving and upgrading their data exchange and operational efficiency. Many private entities actively take part in the EU funded projects and programmes in civil security domain.⁸⁰⁶

1.3.2 Investing in consequence management

The Government by regulation establishes the bases and procedures for financing the response to the emergency due to which emergency situation was declared.⁸⁰⁷

The January 2005 “Gundun” severe winter storm that struck Estonia and the Baltic Sea area could provide an example for understanding the processes related to investing and allocating funding for consequence management.

The damages were estimated at 48 million euros, of which 28,2 million were attributed to the private sector and 19,6 million euros to the public sector. Following the storm, the EU Solidarity Fund granted Estonia 1.3 million euros for mitigation and recovery. The rapid activation of the EU Solidarity fund aided the restoration of power lines and communications systems which was completed within few days after the storm. Any further postponement would have resulted in much higher costs.⁸⁰⁸

⁸⁰⁴ <http://www.fin.ee/prevention-and-management-of-natural-disasters-increasing-fire-safety-in-social-and-health-service-institutions/?highlight=crisis,management>, last accessed 12.09.2014

⁸⁰⁵ http://www.fin.ee/pe3_ last accessed 13.09.2014

⁸⁰⁶ ANVIL Project Country Study: Estonia, p.24

⁸⁰⁷ Emergency Act, Chapter III, art.20

⁸⁰⁸ Are Kont, Jaak Jaagus, Kaarel Orviku, Valdeko Palginõmm, Urve Ratas, Reimo Rivis, Ülo Suursaar, Hannes Tõnisson, *The 9 January 2005 storm impact on the Estonian coastal area*, p.54

At national level, the Government allocated more than 1,4 million euros compensation in support to the most deeply affected people, with low income to purchase basic goods, and for support of immediate repair works.

At local level, dry firewood, pumps for watering out the flooded houses and organising cleaning of the dirt left by the storm were allocated by that the local administration allocated in the aftermath of the storm. Pärnu City Government has covered the expenses of its citizens with low income for heating, roof restoration and electricity. The total amount allocated for 208 families is about half a million euros.

At international level, the Red Cross, UNICEF and Norway (Buskerud County) all allocated funds in support of the affected population.

The insurance companies have compensated damages caused by the storm amounting to 11.7 million euros.⁸⁰⁹

The 2005 storm was the biggest natural disaster to hit Estonia since its independence in 1991. The data provided above reveals that the main responsibility for covering the costs of such crisis lies with the Estonian government, local government authorities and insurance companies. Depending on the scale of the damages inflicted, there are other actors that allocate funds and efforts for mitigation.

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

This information could not be obtained within the given timeframe.

1.4.2 Departmental Lessons Learned systems

The Crisis Management Bureau of the Ministry of the Interior conducted an analysis following the emergency situation caused by the 2005 storm, based on the information received from the counties and ministries.⁸¹⁰

The report analysed the actions of the different state offices that reacted during the storm as well as the description of the problems that became evident as a result. The analysis also presented proposals for improving preparedness in emergency situations and preventive measures that need to be implemented in order to avoid difficulties in similar situations in the future.

⁸⁰⁹ Ibid., p.51

⁸¹⁰ <https://www.siseministeerium.ee/13310/?highlight=emergency,act>, last accessed 18.09.2014

Following the events in 2005, it was analysed that there is a need for informing the people about anticipating risks in case of natural hazard or other extreme situations, the information exchange between the relevant institutions needs to be improved and the operational radio communication between the institutions subordinated to the Ministry of Interior should be developed.

The Prime Minister tasked the Minister of Finance to set up a Committee for assessing the damages with the Secretary General of the Ministry of Finance acting as Chairman. The members include secretary-generals of involved ministries and county governors of the three most affected counties.⁸¹¹

The Committee assessment document noted and recommended measures that include updating the crisis plans of several ministries and counties and improvement in the information service and better communication between the authorities. Additional highlighted measures were the need of improved forecast and prognoses of the water level rise velocity and enhanced cooperation between neighbouring countries.

1.4.3 Centralised (national) Lessons Learned system

In Estonia there is no specific lessons learned system or framework outside of the competence of the Ministry of Interior and the local/regional authorities.

During one of the crisis events of 2010 - snow storm Monika, which hit Estonia at the beginning of December - the rescue crews were required in various places in northern and central Estonia where nearly 200 vehicles with total of 600 people were trapped in snow. In less than 24 hours the rescue teams managed to conduct an operation and 177 people were evacuated from the trapped vehicles. Despite conducting a successful operation in very inhospitable weather conditions, the rescue team required more available capabilities, more particularly, modern off-road rescue vehicles. Improved crisis communication between the involved actors is another identified shortfall from the operation.⁸¹²

In 2010, with the support of the European Fund for Regional Development, the Rescue Board acquired specialised technology and equipment for responding to various types of rescue events. This allowed the Board to considerably improve the efficiency of responding to chemical accidents, oil pollution capture works, and the logistical support and management of large scale rescue works.

Moreover, the capability of responding to floods was improved by the joint programme of the Baltic States, or also known as the BaltFloodCombat. The joint Baltic unit participated in two foreign missions in 2010, eliminating the consequences of floods in Poland and Moldova.

⁸¹¹ Are Kont, Jaak Jaagus, Kaarel Orviku, Valdeko Palginõmm, Urve Ratas, Reimo Ravis, Ülo Suursaar, Hannes Tõnisson, *The 9 January 2005 storm impact on the Estonian coastal area*, p.53

⁸¹² Security Policy 2011, p.57

1.4.4 International exchange for Lessons Learned

Estonia evaluates and exchanges lessons learned in the field of crisis management through collaboration in various cross-border and international exercises and activities. See point 3.2 for more information regarding cross-border cooperation.

1.4.5 Regular policy reviews

The Estonian Rescue Board has the responsibility to review and implement the national crisis management systems at local level. The Board supports the local government agencies with regard to communication systems and coordination, as well as provides comprehensive training for preparedness, response and consequence management where it is deemed necessary.⁸¹³

At regional level, County Governors are responsible for the review of the risk analysis of an emergency of a certain region. At local level, the head of the local government crisis management committee is the rural municipality mayor or the city mayor, who is responsible for reviewing emergency policies and risk assessments of a certain region.⁸¹⁴

The same procedures apply for local and rural municipalities or cities, where the crisis management committee is the main responsible entity. The crisis management plans are reviewed not less frequently than once a year and are submitted to the county governor.

Following the Fukushima nuclear accident and in concert with changes in legislative framework, Estonia has revised its Emergency Preparedness and Response procedures with special attention to communication between the authorities and to the public. In order to assess the capabilities and the preparedness of Estonia to respond to nuclear or radiological emergency, the country hosted the Emergency Preparedness Review Mission of the International Atomic Energy Agency in 2011.⁸¹⁵

1.5 Resilience

Resilience concepts are namely developed for critical infrastructures such as the supply of basic services like water, food, energy, transport, housing, communications, etc.

Resilience concepts need also to take into account the necessity to anticipate, to plan and to implement in the crises time a substitution process aiming to deal with a lack of material, technical or human resources or capacities necessary to assume the continuity of basic

⁸¹³ ANVIL Project Country Study: Estonia, p.10

⁸¹⁴ http://ec.europa.eu/echo/files/civil_protection/vademecum/index.html, last accessed 17.09.2014

⁸¹⁵ Estonian National Report on lessons learned and actions taken in response to the Fukushima Daiichi nuclear accident, p.5

functions and services until recovery from negative effects and until return to the nominal position.⁸¹⁶

The resilience capability of Estonia to prevent and avert security threats depends on the readiness to maintain critical services. In promoting and enhancing resilience concepts, the state cooperates and involves other members of civil society, thus improving social cohesion and social risks are prevented. The prevention of social risks is addressed in the national economic and social policy.⁸¹⁷

In order to ensure the resilience of critical services, Estonia develops operational capability to recover interrupted services, provides sufficient reserves and action plans. Continuous evaluation and monitoring of risks that may disrupt or cause malfunction in critical services is conducted.⁸¹⁸

Moreover, to safeguard the state's resilience, a plan for organising the functioning of national command and control and guaranteeing continuity of government in the event of risk situation and crises shall be drafted under the co-ordination of the Ministry of Defence.⁸¹⁹ The Rescue Board also develops emergency plans in support of maintaining the resilience of the country.

Besides the National Security Concept of Estonia and the National Defence Strategy the resilience concept is not frequently used in other policy or legislative documents, nor in academic research in the disaster management domain.

1.6 Information sharing and data protection

According to the Rescue Act disclosure of personal data is permitted only in such case and to such an extent it is unavoidably necessary for the notification of a threat or a rescue event. In order to perform its functions the Rescue Board or other rescue authority may process personal data on the bases of and pursuant to the procedure provided for in the Personal Data Protection Act.⁸²⁰

Since the unprecedented cyber-attacks in 2007, Estonia unequivocally acknowledged the need to protect information systems and data. The coordinated cyber-attacks against the Estonian government, banks, media and telecommunications companies demonstrated vulnerability of the information systems as one of the important aspects of national security.⁸²¹

The 2008-2013 Cyber Security Strategy of Estonia was developed by experts from various ministries and agencies. The document recommended the development of a national legal framework for cyber security concerning areas which are either not covered or are insufficiently covered by the existing legislation.

⁸¹⁶ <http://ec.europa.eu/research/participants/portal/desktop/en/opportunities/h2020/topics/1072-drs-07-2014.html>, last accessed 15.09.2014

⁸¹⁷ National Security Concept of Estonia, Unofficial translation, p.17

⁸¹⁸ National Security Concept of Estonia, Unofficial translation, p.17

⁸¹⁹ National Defence Strategy, Ministry of Defence, p.26

⁸²⁰ Rescue Act, Chapter 4, 14 (2)

⁸²¹ Cyber Security Strategy of Estonia 2008-2013, p.6

The analysis showed that Estonia's current legal policy for IT is decentralised and, in fact, partly contradictory. For instance, Estonia has adopted a liberal policy concerning the use of e-services and the information society generally; at the same time, the policy for personal data protection is rather conservative and the regulation of information society services complies only with the EU's minimum requirements.⁸²²

Furthermore, the Strategy emphasizes on the importance of the establishment a clear legal basis for processing any kind of personal data. The Personal Data Protection Act aims at fulfilling this as it provides general organisational, technical and physical security measures to ensure the availability, integrity and confidentiality of data.

However, it is necessary to point out that for national security reasons exceptions to the Personal Data Protection Act should be made, as EU Directive 95/46/EC on the protection of personal data and the Council of Europe Convention ETS 108 allows. The Cyber Security Strategy of Estonia recommends that these exceptions could be formed by amending the Personal Data Protection Act or through a separate regulation addressing the protection of the critical infrastructure.⁸²³

The rescue information system

According to the Rescue Act, the Ministry of the Interior shall establish a database for the collection of data related to operations and proceedings related to the functions of the Rescue Board for the efficient and speedy performance of the functions of a rescue service agency and for the performance of efficient supervision. The official name of the database is *rescue information system* and its chief processor is the Rescue Board.⁸²⁴

The MAppERS project

Estonia participates in the Mobile Application for emergency Response and Support (MAppERS) project. It is funded by the European Commission and it is aimed at identifying gaps in the information sharing system in terms of territorial knowledge, risk prevention and emergency.

Further, the application deals with human role as "crowd sourced mappers" through the development of a smart phone application that allows sharing of precise, GPS-localised information regarding the location of risk situations from the population to civil protection operators in a contest of geospatial response. The implementation of the project implies the design and testing of a smartphone application for volunteers and for citizens to be used as a communication device between citizens, volunteers and headquarters during phases of emergency.⁸²⁵

⁸²⁴ Rescue Act, Chapter III, art. 9.(1)

⁸²⁵ <http://ec.europa.eu/echo/node/2628>, last accessed 10.09.2014

The expected results of the project, with its completion scheduled for the end of 2015, include creation of a collaborative user environment for emergency response and support during crisis, raising public awareness and easy-to-use data for crisis management.⁸²⁶

2 Legislation

The 2013 Anvil Country Study describes the legal statute of the Estonian civil security system as:

fragmented and rests upon formal distinct bodies of formal legislation at the state and regional levels. From the functional perspective, the statutory basis is divided into laws for different emergency response services, sector specific regulations, and provisions for a formal state of emergency and for other kinds of disasters and crises. The Estonian civil security is a mixture of one level or institution coordination and, on the other, a combination of versatile vertical and horizontal control and command lines. A bottom line principle is to support the local decision-making process as much as possible.⁸²⁷

The main regulative framework for civil protection and emergencies is defined by the Emergency Act and the Rescue Act of Estonia.

The Emergency Act, in force since June 2009, provides the legal basis for crisis management, preparation of and responding to emergencies. It regulates the use of the Defense Forces and the National Defense League in responding to emergency situations and rescue operations.⁸²⁸ It also defines the mechanisms to be activated in case of large scale natural or man-made disasters. The Emergency Act lists 42 vital services which are provided by public sector agencies, and imposes duties on authorities to maintain the sustainability of vital services as well as on service providers to provide vital services.⁸²⁹ For example, The Ministry of Economic Affairs and Communications shall organise the continuous operation of vital services such as functioning of electricity and gas supply. The Ministry of the Environment shall organise the functioning of air surveillance and early warning; and functioning of hydrological and meteorological monitoring and early warning.⁸³⁰

The Rescue Act provides the functions, organisation and rights of a rescue service agency and the rights and obligations of voluntarily participating persons in the activity of a rescue service agency. The specifications of the organisation of the rescue service agency activities are provided by the State of Emergency Act.⁸³¹ This Act provides the basis, conditions and procedure for declaration of a state of emergency, and the competence of authorities managing a state of emergency; and the measures to be implemented during a state of emergency, and the rights, duties and liability of persons during a state of emergency.⁸³²

The main civil security and emergency management actors are four territorial inter-agency emergency preparedness committees that are managed by the national rescue board.⁸³³

⁸²⁷ ANVIL Project Country Study: Estonia, p.12

⁸²⁸ Emergency Act of Estonia, Chapter I, art.1

⁸²⁹ <https://www.ria.ee/documents/>, last accessed 14.09.2014

⁸³⁰ Emergency Act of Estonia, Chapter IV, art.34

⁸³¹ Rescue Act, Chapter I, art.1

⁸³² State of Emergency Act, Chapter I, art.1

⁸³³ ANVIL Project Country Study: Estonia, p.2

The National Defence League Act establishes the legal basis and portrays the activities of the Estonian Defence League, which may include participation in resolving an emergency, in rescue work and ensuring the safety according to the procedures provided in the Emergency Act.⁸³⁴

2.1 Crisis (emergency, disaster) management concept

The National Security Concept of the Republic of Estonia is a key document that establishes the objectives, principles and directions of security policy. The National Security Concept highlights crisis management as one of the essentially important tasks.

The Concept foresees as a vital task the readiness and preparedness for crisis management. The document emphasises on the importance of preventive diplomacy and the efforts in the prevention of conflicts through exchange of information and dialogue between partners. Participation in crisis management operations of NATO and the European Union as well as in NATO Response Force and EU battle groups is also described as an integral part of Estonian security policy.⁸³⁵ Further, the concept envisages that Estonia's national security relies on the membership in NATO and European Union, as well as to close cooperation with its allies and international partners.⁸³⁶

The implementation of the strategy will be monitored and analysed on a yearly basis. An assessment will be developed regarding the progress made towards the established objectives. Following the completion of the analysis, proposals will be made to update the strategy and the related documents as appropriate.⁸³⁷

2.2 General crisis (emergency, disaster) management law

The Emergency Act is in force since June 2009 and provides the legal bases for crisis management, including preparing for and responding to emergencies. *"The Act also regulates the declaration of, the response to and the termination of emergency situations and the use of the Defence Forces and the National Defence League in responding to emergencies, performing rescue operations and ensuring security."*⁸³⁸

The Act sets out the arrangements for the organisation of the preparation for emergencies, including for emergency risk assessments and plans, crisis management exercises and the organisation of responding to emergencies.⁸³⁹

⁸³⁴ The Estonian Defence League Act

⁸³⁵ National Security Concept of Estonia, Unofficial translation, p.12

⁸³⁶ Ibid, p.4

⁸³⁷ Strategy of the Estonian Rescue Board, p.42

⁸³⁸ Emergency Act, art.1 (1)

⁸³⁹ Emergency Act, p.2-9

The Emergency Act provides the legal basis for the organisation of emergency preparedness and for crisis management by the government, government agencies and local governments. The Act defines the crisis management tasks and the duties of the responsible institutions with regard emergency preparedness.⁸⁴⁰ The tasks for crisis management require preparation of risk assessments in order to identify possible emergencies, the possibilities for avoiding them, as well as for mitigating the consequences. As other crisis management tasks listed are the preparation of crisis management plans, the organisation of crisis management training, and the build-up of the structure of units for responding to emergencies. The authorities must ensure the necessary resources for responding to emergencies, organising the informing of the population and raising public awareness on responding to an emergency.⁸⁴¹

Furthermore, the Rescue Act provides the functions, organisation and rights of a rescue service agency and the rights and obligations of persons participating voluntarily in the activity of a rescue service agency. The Rescue Act defines the rescue service agencies and their functions, as well as the participation in international rescue work and explosive ordnance disposal.⁸⁴²

2.3 Emergency rule

The State of Emergency Act, which entered into force on 16 February 1996, provides the basis, conditions and procedures for declaration of a state of emergency, the competence of authorities managing a state of emergency, as well as the measures to be implemented during a state of emergency, and the rights, duties and liability of persons during a state of emergency.⁸⁴³

A state of emergency is declared on the basis of the Constitution of the Republic of Estonia in case of a threat to the constitutional order of Estonia, and when it is not possible to eliminate a threat to the constitutional order of Estonia without the implementation of the measures provided of the State of Emergency Act. According to the Act, the Government can declare a state of emergency throughout the state for no longer than three months. During a state of emergency, acts and other legislation are valid unless the State of Emergency Act does not provide otherwise.⁸⁴⁴

A threat to the constitutional order of Estonia may arise from an attempt to overthrow the constitutional order of Estonia by violence; terrorist activity; collective coercion involving violence; extensive conflict between groups of persons involving violence; forceful isolation of an area of the Republic of Estonia; prolonged mass disorder involving violence.

The Act also defines that during a state of emergency *it is possible to restrict in the interest of national security and public order the following, rights and liberties of persons:*

⁸⁴⁰ Emergency Act, Chapter II

⁸⁴¹ Emergency Act, Chapter II

⁸⁴² Rescue Act, p. 1-12

⁸⁴³ State of Emergency Act, Chapter I, art.1

⁸⁴⁴ State of Emergency Act, Chapter I, art.6

1) the right to free self-realisation; 2) the right to liberty and security of person; 3) the right to freely choose domain of activity, profession and employment; 4) the right to freely participate in political parties and some types of non-profit associations; 5) the right to freely possess, use and dispose of property; 6) the right to inviolability of home; 7) the right to freedom of movement and to choice of residence; 8) the right to leave Estonia and to settle in Estonia; 9) the right to confidentiality of messages sent or received by post, telegraph, telephone or other commonly used means; 10) the right to freely access information disseminated for public use; 11) the right to access, pursuant to the procedure provided by law, information held by state authorities and local government bodies and in state and local government archives; 12) the right to freely disseminate ideas, opinions, beliefs and other information by word, print, picture or other means; 13) the right to assemble peacefully and to conduct meetings without prior permission.⁸⁴⁵

Upon declaring a state of emergency state authorities and rural municipality or city governments shall notify the President of the Republic, the Government of the Republic and the Commander of the Defence Forces of the threat to the constitutional order of Estonia that has occurred. The crisis committee, established by the government for the implementation of measures regarding the threat, develops the state policy and action plans to forecast, prevent and eliminate the threat. The committee also develops an analysis concerning the prevention and the planning of elimination of the emergency situation and presents the results to the Prime Minister.⁸⁴⁶ The Prime Minister is the head of state of emergency.

During a state of emergency, the head of state may give orders to the chief of internal defence and to heads of governmental authorities and local government bodies. Furthermore, the Prime Minister may restrict the freedom of movement partially or in the entire territory of Estonia, provide broadcasters with information relating to the state of emergency and issue other orders by authorisation of the Government of the Republic.⁸⁴⁷

The Government, upon declaring an emergency situation, has to appoint a minister to direct and co-ordinate the response to the emergency due to which emergency situation was declared.⁸⁴⁸ Estonia has not officially declared a state of emergency after its new independency in 1991.⁸⁴⁹

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

The Rescue Act provides fundamentals of activity of the rescue service agency, the functions of the rescue service agency and the measures of the Rescue Board.⁸⁵⁰

⁸⁴⁵ State of Emergency Act, Chapter I, art.4

⁸⁴⁶ State of Emergency Act, Chapter I, art.8

⁸⁴⁷ State of Emergency Act, Chapter I, art.18

⁸⁴⁸ Emergency Act, Chapter III, art.18 (1)

⁸⁴⁹ ANVIL Project Country Study: Estonia, p.25

⁸⁵⁰ Rescue Act, p. 1-12

Duties of rescue service agencies and the organisation of inter-agency crisis management exercises are set out in the Emergency Act.

The leading responsibility in the field of crisis management in Estonia is held by the Ministry of Interior. The ministries and agencies are responsible in their respective areas for the following:

- Ministry of Internal Affairs - maintenance of public order, fire extinguishing and rescue work, organisation of protection of data banks;
- Ministry of Economic Affairs - functioning of the energy system, organisation of supply with staple goods;
- Ministry of Agriculture - organisation of supply with food;
- Ministry of Finance - functioning of the financial system;
- Ministry of Social Affairs - organisation of health care, social insurance and social welfare, provision of psychological and social aid, assistance to refugees and the evacuated, labour force calculation;
- Ministry of Transport and Communications - organisation of telecommunications, postal services and transport;
- Ministry of Culture - organisation of protection of cultural property;
- Ministry of the Environment - organisation of environmental protection and monitoring.⁸⁵¹

According to the Emergency act the duties of the ministries are as follows:

- to perform risk assessment in order to identify the emergencies which may occur in its area of government. Only exception is the Ministry of Defence that does not perform risk assessments;
- to prepare a crisis management plan and ensure the implementation thereof in an emergency;
- to form a structural unit in the ministry or designate one of the departments to be responsible for the general organisation of crisis management in the area of government of the ministry;
- to form a crisis management team;
- to determine the crisis management duties of agencies and inspectorates in the area of government of the ministry;
- to plan the use of resources necessary for responding to an emergency;
- to direct the responding to an emergency in its area of government;
- to organise crisis management training in its area of government;
- to perform an assessment in its area of government in order to identify the resources which are necessary for participation in international crisis management.⁸⁵²

⁸⁵¹ Emergency Act, p.2-4

⁸⁵² Emergency Act, Chapter II, art.5 (7)

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

Estonians historically have a tradition of preference of the local self-government instead of strong state power.⁸⁵³ At regional level, the responsibility for civil security is shared between the fifteen county rescue services, which have since 2005 been subordinated to the national rescue board. At local level, the four regional services are the highest civil emergency planning authorities.⁸⁵⁴ (see 3.1 for organizational chart)

The Emergency Act sets out that the local rescue service agencies of the Rescue Board have to form permanent regional crisis management committees to operate in their respective regions. The main responsibilities of this regional committee include monitoring and analysing the crisis management system, including the preparation for emergencies, responding to emergencies and ensuring the continuous operation of vital services in the region; analysing the probability of the occurrence of emergencies and making proposals to the government crisis management committee and the respective competent agencies; reviewing the part of the emergency risk assessment concerning the area of activity of the crisis management committee; assisting the emergency situation response coordinator in the coordination of the response to the emergency; assisting agencies responding to emergencies with regional effect in the organisation of exchange of information and the coordination of the response to the emergency.

Additionally, the regional crisis management committees are responsible for the organisation of regional crisis management exercises; for informing the public of the emergency and forming a territorial crisis management committee. The head of the local rescue service agency is the chairman of the regional crisis management committee.⁸⁵⁵

The rural municipality or city government establishes the statutes and approves the staff of the crisis management committee of the local government. The draft statutes and the staff of the crisis management committee have to be agreed with the local rescue service of the Rescue Board.⁸⁵⁶ The Minister of the Interior shall establish the statutes and approve the staff of the regional crisis management committee.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

Chapter 7 of the Rescue Act provides the basis for the participation of volunteers in the activities of the relevant rescue service agency. Further, rescue service agency may enter into civil law contracts with legal persons for organising the activity of volunteer rescuers participating in rescue work and prevention work. The Act provides definition of volunteer rescuer, the procedures for acceptance,

⁸⁵³ ANVIL Project Country Study: Estonia, p.11

⁸⁵⁴ Ibid., p.3

⁸⁵⁵ Emergency Act, Chapter I, art.4

⁸⁵⁶ Emergency Act, Chapter I, art.5

training and participation in prevention work, social benefits and guarantees, the work organisation and other related provisions.⁸⁵⁷

The Estonian crisis management legislation emphasises on the role of the private sector at all levels of preparedness but not so much at the level of response. The role of non-profit relief organisations is limited because after the independence of Estonia in 1991 the sector has not yet fully developed. However, the existing non-profit organisations are included in all public crisis management structures and major exercises.

According to the contingency plans, the most important non-profit and volunteer organisations in Estonia are the Red Cross, the Estonian Volunteer Fire-Fighters Union, the Estonian Association of Fire and Rescue Chiefs, and the Estonian Life Saving Association and Defence League, who have also been given the task of assisting in rescue work.⁸⁵⁸

In 2013 the “National development trends in volunteer rescue work 2013-2016” document was issued. The document’s main aim is to develop a nationwide volunteer rescue network that brings together different people from the society with trained professionals.

There are also several national support organisations created by citizens or private entrepreneurs. These include the Defence Involvement Fund, the Estonian Injured Veterans Association, the Estonian Border Guard Officers Union, and the Estonian Reserve Officers Union.⁸⁵⁹

The Estonian Red Cross is certified by the Ministry of Education and Research (renewed in 2010) to provide the courses to the population. In 2013 alone the Estonian Red Cross has provided 459 courses for 6234 persons and 138 trainers have been prepared by the organization.⁸⁶⁰

2.7 Legal regulations for international engagements of first responders and crisis managers

Participation in international rescue work and explosive ordnance disposal outside the territory of the Estonia takes place on the basis of a request for help submitted under an international rescue agreement or by a Member State of the European Union or on the basis of the Participation in International Civil Missions Act.⁸⁶¹

The procedure for sending a team to perform rescue work and explosive ordnance disposal is established by the Estonian government by a regulation. Under an international agreement the Rescue Board may involve an administrative authority of another country in rescue work on the

⁸⁵⁷ Rescue Act, Chapter 7, art.37

⁸⁵⁸ ANVIL Project Country Study: Estonia, p.23

⁸⁵⁹ ANVIL Project Country Study: Estonia, p.20

⁸⁶⁰ <http://www.redcross.ee/en/activities.html>

⁸⁶¹ Rescue Act, Chapter 6, art.31

territory of Estonia. The Estonian Rescue Board may be involved in rescue work on the territory of another country, the procedures for which is regulated according to the international agreement.⁸⁶²

The purpose of the International Civil Missions Act, entered into force in April 2011, is to organise the system of participation in civil missions and to create a clear legal basis therefor. It also solves issues regarding salary, insurance and training of experts. The Act provides the possibility to also send experts employed in the private sector and freelance experts on a mission. The expenses related to preparation and participation in missions is covered from the state budget, usually from the funds allocated to the Ministry of Foreign Affairs or the Rescue Board. Furthermore, the Act defines the area of responsibility in the preparation and participation in mission.⁸⁶³

Internationally, a Framework Agreement between Estonia and Latvia for mutual assistance in the event of natural or technological disasters. Moreover, the Estonian Rescue Board and the Republic of Latvia have signed a national fire and rescue cooperation agreement. Estonia also has signed an agreement with the Government of the Kingdom of Sweden for emergency prevention, preparedness and consequence management. Additionally, agreement with Finland for maritime and aeronautical search and rescue has been signed. Please see 3.2 for more information related to international cooperation and agreements.

⁸⁶² Rescue Act, Chapter 6

⁸⁶³ <http://www.riigikogu.ee/index.php?id=67130>, last accessed 19.09.2014

3 Organisation

3.1 Organisational chart

The Republic of Estonia is a parliamentary republic. The government has the executive power and the function of coordination and supervision of institutions of the executive power of the state and is comprised of the prime minister and up to 14 ministers. Administratively, Estonia is divided into 15 counties and each county is led by a county governor. Counties consist of local governments that are led by local government councils. There are 227 local governments that consist of 194 rural municipalities and 33 towns.

In Estonia the highest authority responsible for emergency and disaster management is the Ministry of Interior. It is responsible for policy formulation and its execution in the area of civil security. The Estonian Rescue Board is directly subordinate to the Ministry of Interior and has a key role in representing Estonia in various international forums such as the UN, EU and NATO and other relevant civil security organisations.

The Rescue Board also develops emergency plans, develops communication systems for the rescue services, coordinates the fire-fighting and rescue operations when necessary, develops the legal basis for civil security mechanism, drafts the general principles and rules for fire-fighting and rescue work and its applications.⁸⁶⁴

Additional national government institution under the authority of the Ministry of Internal Affairs is the Emergency Response Centre. It is responsible for processing the receipt and processing of an emergency call to the emergency 112 phone number, sending out rescue teams, ambulances, other needed technical means and rescue specialists to the place of the emergency, as well as informing the chairman of the local crisis commission of the county or the local administration in case of a crisis.⁸⁶⁵

The Estonian Rescue Board's tasks include:

- Participation in national and international development and implementation of crisis management policy;
- Providing advice to the Minister of the Interior regarding crisis management plans and risk analyses;
- Presenting proposals for the development of communications and early warning systems;
- Providing advice to local governments on crisis management matters;
- Coordinating crisis management related cooperation activities of the local governments with non-profit organisations and foundations;

⁸⁶⁴ ANVIL Project Country Study: Estonia, p.13

⁸⁶⁵ <http://www.rescue.ee/23023>, last accessed 13.09.2014

- Planning and participating in crisis management training;
- Participating in crisis management related research activities;
- Conducting and coordinating crisis management activities in the rescue field;
- Participating in national and international crisis management operations;
- To gather, analyse and transmit national and international information related to emergency situations.⁸⁶⁶

Civil protection

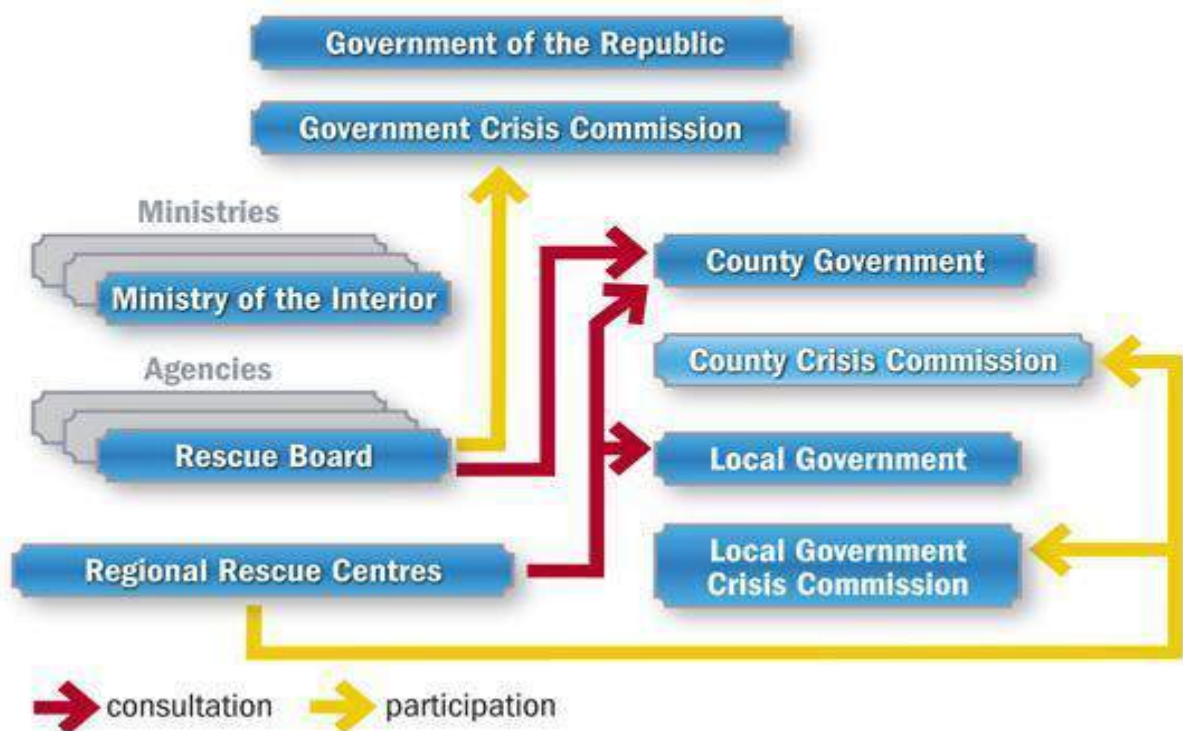

Figure 5 Organisation of Estonian Civil Protection⁸⁶⁷

⁸⁶⁶ International CEP Handbook, p.77

⁸⁶⁷ Source: Estonian Rescue Board

Organization of Estonian Rescue Services

Figure 6 Organisation of Estonian Rescue Services⁸⁶⁸

The police

The Police and Border Guard Board agency employs more than 5000 people. The main tasks of the Police and Border Guard Board are securing of the external border of the European Union and the security and public order within the state and the investigation and prevention of offences. The tasks are divided between four work areas: border guard, public order, criminal police, and citizenship and migration. The Police and Border Guard Board is a police authority and all officers, regardless of their position are police officers.

The tasks and prime objective of the Estonian Security Police are related to reducing security threats aimed at the Republic of Estonia and to maintain national security. Additionally, it has “actively cooperate with the security and law enforcement authorities of other states and with international organizations.” With regard to crisis management, one of the key tasks of the Estonian Security Police is related to the multiple fields of critical infrastructure protection.⁸⁶⁹⁸⁷⁰

The defence forces

The Defence Forces could be deployed in response of crisis or disaster, but in cases where all the other crisis management capabilities of the state have been exhausted or where the required resources or capabilities are only available to the Defence Forces. In principle, the Defence Forces and the Defence League participate in the crisis management without using military activities or weapons.⁸⁷¹

⁸⁶⁸ Source: Estonian Rescue Board

⁸⁶⁹ <http://www.politsei.ee/en/organisatsioon/>, last accessed 16.09.2014

⁸⁷⁰ ANVIL Project Country Study: Estonia, p.16

⁸⁷¹ Estonian Defence Handbook 2010 p.42-43

The Defence League has a military supportive role in case of civil emergencies and disasters. This includes also the National Cyber Defence League. The Estonian Defence League is a volunteer militarily organised national defence organisation operating under the rule of the Ministry of Defence and part of the Defence Forces.⁸⁷²

The Defence League incorporates other affiliated organisations such as Women's Home Defence, Young Eagles and Home Daughters. Altogether the number of enlisted volunteers in action is 21,000.⁸⁷³

The Department of Critical Information Infrastructure Protection at the Estonian Information System's Authority (RIA) works in the field of protection of information systems that are needed for the sustainability of vital services. The department is responsible for planning the protection for the state's critical public and private information systems on the national level. The Computer Emergency Response Team of Estonia (CERT) handles the protection of the information systems necessary for the provision of vital services.⁸⁷⁴

The most important non-profit and volunteer organisations in Estonia are regarded the Red Cross, the Estonian Volunteer Fire-Fighters Union, the Estonian Association of Fire and Rescue Chiefs, and the Estonian Life Saving Association and Defence League, who have also been given the task of assisting in rescue work.⁸⁷⁵

In Estonia the most significant non-governmental organisation is the Estonian Red Cross (ERC). Founded back in 1919 the ERC has over 3900 members including 500 active volunteers. The ERC has 257 trained volunteers which are prepared to act during the emergency situation. The ERC works in cooperation with Ministry of Interior, Ministry of Social Affairs, Estonian Rescue Service, Police and Border Department. In 2013 in cooperation with the Finnish RC the ERC started the training of volunteers for participation in foreign missions. The structure of the organisation consists of network of 16 local branches. The General Assembly meets every four years and elects the ERC Chairman, Head Committee, the Executive Board, as well as the auditing commission and the commission of statutes and ethics. Every local branch has its own board and auditing commission.⁸⁷⁶

The Estonian authorities are looking at potential solutions for improving and upgrading the existing operational capabilities for data exchange. It is likely that many private entities will take part in the EU funded projects and programmes within the civil security domain.⁸⁷⁷

3.2 Organisational cooperation

International cooperation

Estonia has signed regional and multilateral provisions of the Council of Europe, the European Union, NATO and OSCE for assistance in crisis situations. However, Estonia has not officially requested assistance in the form of international support or cross-border assistance.

Operational cooperation within the European Union and Estonia has taken place mainly by information exchange and joint events and exercises.⁸⁷⁸ Estonia actively participates in several working parties as well as hosting conferences regularly. Estonia has been an active initiator in the field of maritime cooperation and of strategic and operational dialogue among the Baltic Sea countries. The European Commission contributes to research and professional civil security training, which has been mainly facilitated by the Estonian Academy of Security Sciences.

The Academy is a state institution that provides professional education for civil servants, under the umbrella of the Ministry of the Interior. Its goal is through internal security related academic education, research and development activities to create a secure state and conditions for stable development across the state of Estonia.⁸⁷⁹

Cross-border cooperation

Cross-border operation cooperation is essential in crisis management due to the fact that the emergency may affect more than one country, for example in a major flood or forest fire. Therefore the development of transnational cooperation between states and international organisations in disaster management remains a key task. Another benefit of such cooperation is in the cases in which one state does not have enough resources and capabilities to cope with the emergency situation on its own. In such scenarios it is necessary to have effective cooperation with the neighbouring countries and international organisations.

Estonia has signed a series of agreements for cooperation in the rescue and crisis management domain with its immediate neighbours. Additionally, Estonian experts participated in EU Civil Protection Mechanism missions during EU citizens' evacuation from Lebanon through Cyprus (2006); in Environmental Assessment Mission in fire devastated areas of Nagorny-Karabakh (2006); in the floods in Ukraine and Moldova (2008); in the disaster following the 2010 earthquake in Haiti; the floods in Pakistan (2010) and Moldova through BaltFloodCombat (2010).⁸⁸⁰

BaltFloodCombat is a cross-border cooperation project between Estonia, Latvia and Lithuania. The three Baltic States are represented respectively by the Estonian Rescue Board, Latvian Fire and Rescue Service and Lithuanian Fire and Rescue Department under the Ministry of the Interior. The project is within the framework of Preparatory Action of the Civil Protection Mechanism and is

⁸⁷⁸ ANVIL Project Country Study: Estonia, p.28

⁸⁷⁹ Ibid, p.28

⁸⁸⁰ Jevgeni Jutkevits, Eva-Liisa Ristsoo, Kriisireguleerimise osakond, Päästeamet Sūgis, 2010, p.2

funded by the European Commission. The European Commission finances 80% of the project while the remaining funding comes from the national budgets. The aim of the project is to create reliable and efficient national flood response capacity, and also to establish and register in CECIS a multinational High Capacity Pumping (HCP) module, consisting of commonly trained personnel and up-to-date equipment. Main objectives of the project include enhancing national flood response capability; strengthening European rapid response capacity, and also to discover, through innovative approach, possibilities and ways of multilateral civil protection capacity building.⁸⁸¹

Estonia conducts operational cooperation with the EU through the Estonian Disaster Relief Team's participation in the following EU exercises: ESCEX (2004), Finland and EU POLEX (2005), Poland, which simulated earthquake and other related emergencies in a fictitious third country; DANEX Denmark (2006), which anticipated terrorist accidents and severe weather scenarios; FLOODDEX (2009), Netherlands, exercising reaction in flooding situation; and EU CREMEX (2011). Additionally, Estonia participated in 2010 AMPS EU Civil Protection Mechanism and 2011 MUSAR exercises in Germany/Netherlands.⁸⁸²

Another on-going cross-border cooperation initiative was established in 2007 with the Estonia - Latvia Programme. The programme is implemented according to the principles of European Territorial Cooperation and it supports cross-border cooperation between the two countries. It is funded by the European Regional Development Fund, the Republic of Estonia and the Republic of Latvia. The objective of the Programme is to promote sustainable development and economic competitiveness through achieving an integrated and cross-border approach to economic, social and environmental development in ways, which involve and benefit local people and communities. Under the Estonia – Latvia Programme the JATE Project (Building Cross-border Capacity to Perform Joint Activities in Tough Environment) was created and implemented by the Estonian Rescue Board and the Latvian State Fire and Rescue Service.⁸⁸³

This project's goal is to look for ways for improving the initial reaction capabilities in remote areas and for rescue events. The aim is to reduce the response times and capacity building in areas where access is difficult or limited, and there are no fire-fighting water supplies needed.⁸⁸⁴

Further, the Framework Agreement between Estonia and Latvia for mutual assistance in the event of natural or technological disasters relates to the co-operation and rendering of mutual assistance in the event of a disaster with the aim of preventing or avoiding human casualties and damage to the health, environment and property. According to the Framework Agreement either country could request assistance directly from the competent authorities of the other Contracting Party. The

⁸⁸¹ http://www.baltfloodcombat.eu/index.php?option=com_content&view=article&id=22:whats-new-in-15&catid=29:the-cms, [last accessed 13.09.2014](#)

⁸⁸⁴ <http://www.estlat.eu/supported-projects/?project=65>, [last accessed 19.09.2014](#)

competent authorities maintain direct contacts and for Estonia they are the Ministry of Internal Affairs; the Rescue Board; and the Radiation Protection Centre.⁸⁸⁵

Moreover, the Estonian Rescue Board and the Republic of Latvia have signed a national fire and rescue cooperation agreement, which foresees joint actions for implementing and facilitating the provision of assistance and cooperation in cross-border rescue operations, to develop operations applicable to common procedures and plans, and to develop cooperation in research and development programs reflecting the information and disaster response experiences.⁸⁸⁶

Estonia has signed an agreement with the Government of the Kingdom of Sweden for emergency prevention, preparedness and consequence management. According to this agreement the countries will cooperate in the development of appropriate preventative measures to protect people, the environment and cultural heritage and other assets of natural, technological and environmental disasters. The Parties undertake to provide mutual assistance within its means and in accordance with the cooperation agreement.⁸⁸⁷

Additionally, agreement with Finland for maritime and aeronautical search and rescue has been signed. Its provisions extend to the responsibilities, the operational guidelines and implementation of the maritime and aeronautical search and rescue cooperation.⁸⁸⁸

The operational cooperation of Estonia in the Baltic region and with the EU is also conducted with the Baltic every day accident, disaster prevention and resilience (BaltPrevResilience) project. The project organised between Sweden, Finland, Estonia, Denmark, Poland and Latvia. The project coordinator is the Swedish Emergency Management Agency (MSB). Other partners in the project include Finnish National Institute for Health and Welfare, Injury Prevention subdivision (THL), Estonian Rescue Board, Frederikssund-Halsnæs Fire & Rescue Service, FHFRS, Denmark, Main School of Fire Service Warsaw, SGSP, Poland, Jelgava City Municipality, JCM, Latvia and Karlstad University of Sweden. In addition to the seminar are invited to participate in the Norway, Iceland and Lithuania Representatives.⁸⁸⁹ The aim of the project is to prevent and reduce consequences of accidents and crises and to create a common understanding of accident statistics and evaluation of experiences. It also aims at establishing a platform for sharing statistics, experiences, best practices and methodology for lessons learned.⁸⁹⁰

⁸⁸⁵ Framework Agreement between the Government of the Republic of Latvia and the Government of the Republic of Estonia on Mutual Assistance in the Event of Disasters

⁸⁸⁶ Framework Agreement between the Government of the Republic of Latvia and the Government of the Republic of Estonia on Mutual Assistance in the Event of Disasters

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

The information could not be obtained within the given timeframe. Within the framework of this country study such procedures have not been highlighted in policy or legislative documents related to civil protection or crisis management.

4.2 Operations planning

The ANVIL study identifies four levels of responsibility for operational crisis management: state level, regional level, municipal/county level, and private/volunteer level, and also describes the operational procedures in case of crisis:

Operational crisis management responsibility typically lies with the counties and independent cities and municipalities. Depending on the character of the crisis and available resources, local and regional authorities may include permanent staff for civil security tasks. Once a state of emergency or state of disaster has been declared, the counties or independent cities may form specialized task forces that are led and coordinated by the local political actor or institution. Specialized state agencies will provide assistance when needed and when the situation escalates.⁸⁹¹

Civil protection planning in Estonia consists of risk-based planning, holistic preparedness planning, national contingency planning (central, national), planning methodologies, risk analysis and risk assessment methodologies. Particular feature of the planning mechanism is the bottom-up approach where plans are prepared at local, regional and national levels. Every national institution concerned has to prepare its own contingency plans.⁸⁹²

The Government Regulation No. 17, in force 21 June 2010, titled “Guidelines for preparing continuous operation plans”, regulates the organisation of the preparation of plans for the continuous operation of vital services provided by a provider of vital services. The document provides specific guidance for the organisation of the preparation of plans, the preparation of plans itself and the terms and conditions for introducing the plan.⁸⁹³

According to the Emergency Act an emergency plan is a document, which describes the organisation and the management structure of responding to emergencies, the responsibilities of the agencies participating in responding to emergencies and the organisation of informing the public of

⁸⁹¹ ANVIL Project Country Study: Estonia, p.15

⁸⁹² http://ec.europa.eu/echo/files/civil_protection/vademecum/index.html, last accessed 19.09.2014

⁸⁹³ Government Regulation No. 17, passed 08.06.2010, regarding “Guidelines for preparing continuous operation plans”

emergencies. These components are valid at national and, if necessary, on the regional and local government level. The Government is responsible for the establishment of a list of emergencies that require preparation of an emergency plan and enacts the competent agencies of the executive state power to prepare it.⁸⁹⁴

The Government establishes a list of emergencies, identifying which emergency plan has to be prepared, and subsequently appoints the competent executive power agencies to prepare the emergency plan. The emergency plans are then approved by a regulation of the Estonian Government. The plans need to be updated regularly, at least once in every two years, while the Government has the obligation to amend the list of emergencies at least every two years. The guidelines for preparing the emergency plans are established by a regulation of the Minister of the Interior.⁸⁹⁵

4.3 Logistics support in crises

The Estonian Disaster Relief Team occasionally participates in international humanitarian missions, as it was the case in 2012, when the Team provided logistical support to the UNHCR refugee camp in Dollo Ado, Ethiopia.⁸⁹⁶

Additional information could not be obtained within the given timeframe as it requires internal agency-specific information.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

According to the Emergency Act, the Ministry of the Environment shall organise the continuous operation of the following vital services, such as functioning of air surveillance and early warning; hydrological and meteorological monitoring and early warning; and the functioning of the system for early warning of a risk of radiation.⁸⁹⁷

There are three crisis management committees on national level, on regional level and on local level. In case of an emergency they are called together and take necessary actions to solve it.⁸⁹⁸

According to the procedures set out in the Emergency Act in case of emergency, natural persons must notify immediately the 112 emergency helpline about the impending risk they have

⁸⁹⁴ Emergency Act, Chapter II, art.2 (7)

⁸⁹⁵ Ibid, p.5-6

⁸⁹⁶ <http://vm.ee/et/node/2714>, last accessed 15.09.2014

⁸⁹⁷ Emergency Act, Chapter IV, art.34 (5)

⁸⁹⁸ AN ANVIL Project Country Study: Estonia VIL, p.21

encountered. Agencies or legal persons have to notify the Ministry of the Interior of the emergency that has occurred in the fulfilment of their responsibilities or in their area of activity.

The Government has the obligation to establish the procedures for notifying the public of the impending risk of the occurrence of an emergency and the response to the emergency, the requirements for the information to be communicated as well as the organisation of exchange of information between the agencies and persons responding to the emergency.⁸⁹⁹

The Estonian Information System Authority (RIA) coordinates the cooperation, development and administration of the state information systems and also organises activities related to information security and handles the security incidents occurred in Estonian computer networks.⁹⁰⁰ The RIA provides advisory services for the providers of public services on how to manage their information systems and if required monitors them. In addition, RIA is an implementing entity of the structural assistance of the European Union.⁹⁰¹

An early warning system is expected to be implemented, allowing the public to be notified of the occurrence of accidents and emergencies. The system will be able to warn about the possible failure in communication and power. In 2011, the Rescue Board with the Estonian National Broadcasting implemented a project for providing operational information to the public, in case of emergencies.⁹⁰²

Additionally, Estonia has an automated Early Notification System that is in place for emergencies, composed of 10 Permanent Monitoring Stations. However, the systems' capabilities are outdated and in need of an upgrade.⁹⁰³

The country also has an early radiation warning system which is used to identify and notify of any radiation accidents at nuclear plants in neighbouring countries. Estonia devotes efforts to enhance radiation protection, as well as to ensure the safety of nuclear power plants and reduce radioactivity within the Baltic Sea region.⁹⁰⁴

5 Capabilities

5.1 Human resources

Over the last four years the Rescue services in Estonia have significantly improved based on the experience from past crises and emergency situations. There are more than 6,000 people working in the field of civil security in Estonia.⁹⁰⁵ For example, air rescue units are capable of reaching people and ships in need of assistance within one hour and 45 minutes, while helicopter and airplane crews are on duty from 09.00 to 17.00 to perform patrol flights.⁹⁰⁶

Since 2011 the rescue capability was enhanced through restructuring - nine units were closed and the rescuers were transferred to other insufficiently manned units. In 2013 Estonia had 65 units with 24-hour capability, with at least three rescuers on alert at all times and able to offer real assistance to people in case of an accident. The speed of the rescuers to reach people also improved, compared to previous years. Another result from the restructuring of the rescue services was the improved service coverage as rescue workers are 15 minutes away from 93% of the population. The decrease in the number of fatal accidents, compared to 2011, reveals the high standard and preparation of the rescue capability and rescue units.⁹⁰⁷

Estonia has developed the capability to provide rescue and humanitarian aid that meets international standards and allows the country to send the Estonian Disaster Relief Team (EDRT) to tackle disasters and crises.⁹⁰⁸ The fundamental goal of the Estonian Disaster Relief Team is to ensure the readiness of the country to participate in international rescue and humanitarian aid operations and, when necessary, react to possible emergencies in Estonia. The Team has been sent on missions by the Foreign Ministry in cooperation with the Estonian Rescue Service if a request by the UN, EU, or nations has been submitted. The EDRT has participated in humanitarian aid missions in Namibia, Pakistan, and Indonesia, as well as in Poland, Moldova and Latvia.⁹⁰⁹

The specialists in the Disaster Relief Team are primarily in the fire-fighting or rescue service, however there are representatives from the border guard, police force, medical institutions, and other government or private institutions. The operational capability envisages a search and rescue unit, a medical unit, and a chemical unit. The team also comprises of a support unit and expert group.

In 2013 the number of certified volunteer rescue workers increased significantly to almost 1,300 volunteers distributed along more than 100 units and contributing over 2,500 working hours to fire safety prevention and disaster response. In the 2014 Security Policy document, prepared by the Ministry of Interior, is anticipated that by 2016 Estonia should have 1,600 volunteers for prevention

⁹⁰⁵ ANVIL Project Country Study: Estonia, p.15

⁹⁰⁶ Ibid, p.51

⁹⁰⁷ Security Policy 2014, p.27

⁹⁰⁸ <http://vm.ee/en/estonia-provider-humanitarian-aid>, last accessed 19.09.2014

⁹⁰⁹ Ibid.

and rescue work. Where possible, volunteers are also provided with equipment and other technical aids. Volunteer maritime rescuers participated in 31 rescue operations in 2013, compared to 23 in 2014. 54 people were saved by the police and volunteers together. Volunteers also participated in joint trainings and drills.⁹¹⁰

Additionally, Estonia is in cooperation with other countries, pursuing safety of navigation in the Baltic Sea along the Gulf of Finland. In this regard special attention is paid to search and rescue at sea and the development of capabilities of detecting and response to marine pollution.

5.2 Materiel (non-financial) resources

The Government forms an operation stockpile, or contractually secured resources in case of an emergency, to be used for mitigating the consequences of a crisis. Usually these stockpiles contain health and food supplies.⁹¹¹

The state healthcare stockpile shall be formed by the Ministry of Social Affairs or an agency in the area of governance of the Ministry of Social Affairs appointed by a decree of the Minister of Social Affairs. The state food stockpile shall be formed by the Ministry of Agriculture or an agency in the area of governance of the Ministry of Agriculture appointed by a decree of the Minister of Agriculture. Other stockpiles shall be formed by state agencies appointed by orders of the Government of the Republic. Entities forming the state operation stockpiles shall be responsible for the organisation of the storage, use, control, and renewal and reporting of the stockpile.⁹¹²

The government establishes by regulation the procedures for storage, use, control and renewal and reporting of state operation stockpiles.⁹¹³

Moreover, Estonia has signed a contract for the procurement of a multifunctional ship intended for localising pollution incidents and for pollution control. In addition, in 2014 Estonia purchased various life-saving capabilities that include 90 thermal cameras, 12 hydraulic equipment and 17 telescopic poles for the 66 state rescue crews. The use of thermal cameras helps rescue crews effectively identifying the location of people in premises filled with thick smoke while the telescopic rescue poles will improve the water rescue capability.⁹¹⁴

One of the main hazards and area of concern for Estonian crisis management authorities is forest fire. In order to better respond and ensure preparedness of the population, vital service providers and enterprises, and to mitigate the consequences of forest fires, the State Forest Management

⁹¹⁰ Security Policy 2014, p.38-44

⁹¹¹ Emergency Act, Chapter III, art.42

⁹¹² Emergency Act, Chapter III, art. 42 (4)

⁹¹⁴ Security Policy 2014, p.78

Centre (RMK) placed over 250 labels “Fire” and installed fire separators in over 340 kilometres of actively visited forest areas.⁹¹⁵

In 2015 the Estonian rescue workers are expected to be equipped with additional aerial ladders and trucks that will enable the team to reach people in need of assistance in higher buildings and places.

The Estonian Red Cross has more than 25 trained volunteers prepared to act during the emergency situation. In addition, cooperation with the Finnish Red Cross started for training of volunteers for participation in foreign missions. Further, 20 Estonian Red Cross volunteers have been involved in the training cycle. One ERC volunteer has been involved in international team in foreign mission – 2013 August-September assembling the field hospital in Jordan and 2013 December/2014 January working at the basic health clinic in Philippines.⁹¹⁶

5.3 Training

The Emergency Act of Estonia states that national emergency response exercises shall be conducted at least once in every four years. The aim of the exercises is to assess the procedures and capability of responding to one or more emergencies, which include all the competent agencies. The procedures for these exercises and the capabilities required shall be approved by the crisis management committee of the Government at national level. At regional and local levels the time and the organiser of regional emergency response exercises and emergencies as well as the capabilities that are assessed, shall be approved by the regional crisis management committee and local crisis management committee, respectively.⁹¹⁷

Nationally, there are two main organisations that provide extensive preparation for future rescue workers. The Rescue College of the Academy of Security Sciences and the Rescue School located in Väike-Maarja.

The Rescue College organises a four year higher education programme which allows students to acquire knowledge of rescue management, crisis management, monitoring of fire safety and prevention in the field of rescue work. The obtained qualifications and knowledge could then be applied in the specialty of rescue service, in the field of fire safety supervision, crisis management and operational service.⁹¹⁸

The Rescue School in Väike-Maarja provides vocational training that specializes in preparation of rescuers, rescue specialists, or dispatchers. The educational programmes use situational simulations to which every person taking on employment is exposed.

⁹¹⁵ http://www.rescue.ee/vvfiles/0/LISA1_RA_Metsa_maastikutulekahju.pdf, p.11

⁹¹⁶ <http://www.redcross.ee/en/activities.html>

⁹¹⁷ Emergency Act, Chapter II, art.8

⁹¹⁸ <http://www.sisekaitse.ee/eass/colleges/rescue-college/rescue-school/>, last accessed 1.12.2015

Estonia also maintains cooperation with foreign countries in the field of rescue training and education, which include Finland, Poland, Sweden, Latvia, Lithuania and Russia. Additionally, close interaction with the Rescue Board, the Regional Rescue Centers as well as with Tallinn University of Technology has been developed.⁹¹⁹

Training of volunteers is an important task for the Estonian crisis management authorities. In cooperation with the Ministry of Interior, the Rescue Board and the Police and Border Guard a seminar was held in 2010 for sea and lake rescue volunteer associations. Further, a yearly 2-day training event is organised, in order to practise and improve the skills needed during sea rescue operations and to practice cooperation between different parties.⁹²⁰ It is anticipated that by 2016 Estonia 30% of the volunteer rescuers for prevention and rescue work should undergo at least 10 hours of regular training of national rescue units.⁹²¹

The Estonian Ministry of the Interior develops the exercises while the Estonian Disaster Relief Team (EDRT) regularly participates in international exercises⁹²² The Estonian Disaster Relief Team participated in the 2008 NATO Uusimaa exercise conducted in Helsinki, Finland. The aim of the exercise was to practice the Euro-Atlantic Disaster Response Coordination Centre procedures and Euro-Atlantic Response Unit capabilities, in order to improve nations' ability to respond to a disaster. Furthermore, the collaboration and information sharing between international organisations and the capabilities of crisis management teams were exercised.⁹²³ The exercise enhanced the effectiveness of the national capabilities to effectively coordinate consequence management operations.

Other recent examples of cross-border and multinational training exercises include the sea rescue training event 2010 Baltic Sarex in Denmark and the joint practice and training event with sea rescue volunteers at Võsu. The EU Chemical and Radiological Emergency Management Exercise 2011 (CREMEX 2011) exercise was organised by the Estonian Ministry of Interior with the contribution by the EU, and its aim was to test the understanding, knowledge and response in the framework of the Union Civil Protection Mechanism.⁹²⁴ One of the main deliverables of the exercise was the testing of the coordination of assistance through the EU Monitoring and Information Centre, as well as the successful testing of the Estonian Emergency Act. The exercise provided valuable experience to the Civil Protection teams from the different participating EU members and organisations which participated. The exercise exploited the opportunity to use a complicated CRBN scenario within two different locations in Estonia – the city of Tartu and Tallinn Airport, thus involving all relevant authorities who have their role in Estonia responding to Chemical and Radiological incidents.

The exercise managed to achieve its objectives and to test and verify the operational and strategic procedures for resolving CRBN emergency, as well as to test the EU Mechanism for Civil Protection and coordination. CREMEX 2011 also accomplished its goals by enhancing operational cooperation

between all involved parties and provided learning opportunities, and also by providing valuable lessons learned for tactical response and inter-organisational co-operation.⁹²⁵ The results of the exercise provided valuable experience in testing arrangements in requesting and receiving international assistance. During the exercise Estonia tested its crisis management system and coordination of international assistance.⁹²⁶

5.4 Procurement

5.4.1 Procurement regulation

Please see below (p. 5.4.2), additional information could not be obtained within the given timeframe.

5.4.2 Procurement procedures

Public procurement in Estonia is regulated by the Public Procurement Act and supplemented with several regulations of the Government of Estonia. The Ministry of Finance is the institution responsible for public procurement policy, related legislation, providing supervision and consulting.

Public Procurement notices are published on-line in the central State Public Procurement Register and all contracting authorities and suppliers have access to the information. Additionally it is possible for suppliers to access electronic tendering documents in case the contracting authority has made them available in the register.⁹²⁷

5.5 Niche capabilities

Estonia has to carefully concentrate its R&D investments in a few niche areas, where it can achieve excellence.⁹²⁸

The BaltFloodCombat initiative is already producing excellent results in reacting to floods. The capabilities of the three-nation initiative could be deployed in EU Member States in need of immediate support in tackling emergency situations caused by floods. In the near future the initiative intends to work not only for strengthening national and European rapid response capacity in one of the most common types of disaster, but also to show, through the innovative approach, possibilities and ways of multilateral civil protection capacity building. The team has been deployed in the 2014 floods in the Western Balkans and in Moldova (August 2014).⁹²⁹

⁹²⁹ http://www.baltfloodcombat.eu/index.php?option=com_content&view=frontpage&Itemid=28, last accessed 17.09.2014

Additional niche capability in which Estonia could realistically contribute to the European crisis management community is the development of software solutions comprised of several knowledge elements, which include cyber defence, programming of autonomous platforms and systems, etc.⁹³⁰

Following the cyber-attacks in Estonia, the state has focused efforts for ensuring the safety of its critical infrastructure and maintaining vital services. Many experts and IT specialists have been trained and prepared to work in this environment. Estonia could provide software solutions and expertise from which EU member states could benefit and establish new ways for cooperation in the cyber security field.

An example in this sphere is the establishment of NATO Cooperative Cyber Defence Centre of Excellence. It is a NATO-accredited research and training facility dealing with education, consultation, lessons learned, research and development in the field of cyber security. The Centre's work will contribute not only to NATO competence in the cyber defence field, but also for the enhancement of the national expertise of Estonian authorities.

The EU could potentially develop cooperation with the Centre for collaboration on projects related to the cyber security domain, or even establish similar centres for research and analytical activities in the field.

Furthermore, Estonia has been an active initiator in the field of maritime cooperation and of strategic and operational dialogue among the Baltic Sea countries. Many projects have been initiated in this domain, where Estonia could contribute not only to cross-border cooperation, but also in international exercises, events and missions.

Driving Innovation in Crisis Management for **E**uropean **R**esilience

FINLAND

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: FhG-INT (Isabelle Linde-Frech, Maike Vollmer)

Source: Finnish Ministry of the Interior http://www.intermin.fi/en/ministry/the_flag_and_arms_of_finland

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by CSDM and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

Finland has set the objective to become the safest country in Europe with the most effective rescue services. If the country's exposure to disaster risks appears lower than other EU or OECD countries, its specific vulnerabilities to major shocks justify such ambitious public policy goals. The high dependence on critical infrastructures and global supply chains for the security of Finnish society and economy, its sparse population in remote areas, and its Nordic climate conditions are all factors shaping the risk portfolio Finland has to manage and prepare for. In this context, Finland has developed advanced policies and capacities in risk management, with well-established cutting-edge national strategies. These are based on whole-of-society approaches to secure the vital functions of society, and to develop self-awareness. These policies benefited also from a high level of trust among citizens, a cooperative attitude in society and a sense of solidarity, and high-quality public services from national to local levels. Furthermore, considerable use of research and information and communications technology (ICT), and the highly developed education system and social policies in Finland, contribute to an effective national risk management system which takes advantage of state-of-the-art innovations.

The Finnish disaster risk management system boasts:

- An ambitious **whole-of-government and whole-society approach** to address all-hazards and threats.
- A strong sense of autonomy and self-preparedness among the population.
- Well-developed interactions with the private sector to **ensure business continuity**.
- A significant **use of research and technological innovation** to support policies and capacities.
- An **open-data policy** allowing appreciable availability of risk-related information.
- **Government agility**, with a willingness to reform and learn from past experience.
- Strong regional cooperation mechanisms supporting risk management.⁹³¹

*The Finnish civil security system could be characterised by a high degree of decentralisation and divided tasks based on substantial expertise of and competences across levels and issues.*⁹³² A main role in this heavily decentralised system takes the **Ministry of the Interior** with its **Department for Rescue Services**, which, inter alia, directs and steers regional rescue services (22), maintains oversight of their coverage and quality and is in charge of the preparedness and organisation of rescue services at national level as well.

Funding for risk management comes from different sources such as Government budget, municipalities' budget and specific financial mechanisms. As in most other European and OECD countries, Finland has not made a comprehensive estimation of the resources spent on disaster risk reduction from the national to the local level. (Peer Review Report, 2014).

⁹³¹ Key findings (p.6) of the *Peer review report Finland* (2014)

List of Definitions

Comprehensive concept of security	The comprehensive concept of security comprises security issues which, if exacerbated, may turn into threats that can jeopardise or seriously harm Finland, Finns or the functions vital to Finnish society. Wide-ranging threats include premeditated action such as the use of military force, terrorism or interference with information networks. They can also occur spontaneously, such as widespread failures of the electric grid or extreme forces of nature.
Disturbance	This is a threat or an occurrence which endangers security in society, capacity to act or the population's living conditions. Co-operation and communication of the authorities and other actors on a wider or more intensive scale are needed to manage the situation.
Threat assessment	An assessment of a competent authority or another actor, based on a threat scenario and regarding the tasks the authority is responsible for and disturbances. The scenario concretely describes the origin of the threat, target, method of implementation, probability, effects on the authority's tasks as well as response options and the time required for advance preparations.
Threat scenario	A threat scenario is a general description of disturbances in the security environment. It presents the impact mechanism, source, target and impact on the target, probability and the most serious disturbances in the threat scenario that are identified.

1 Policy

1.1 Risk Assessment

1.1.1 Key risks and areas of concern

In Finland, the most likely types of *natural disasters* are hydro meteorological disasters with an emphasis on floods, storms, forest fires and problems caused by exceptional temperatures and drought. In addition to these, the Finnish Policy Framework also takes into account that Finnish people abroad can be affected by earthquakes, tsunamis and volcanic eruptions.

The *impact of climate change* on Finland's ecosystems and society is evaluated by the Finnish Environment Institute (FEI / SYKE (after the Finnish name))⁹³³ based on different climate change scenarios provided by the Finnish Meteorological Institute (FMI). The national strategy for adaptation to climate change of 2005⁹³⁴ was revised in 2014 and led to *Finland's National Climate Change Adaptation Plan 2022*⁹³⁵ and a new *Climate Act*⁹³⁶ (approved in 6.3.2015, see also). According to the Adaption Plan (p.10 ff), in all scenarios the temperature rise in Finland is above what is expected in the global mean temperature. Estimations range from 2,3 up to 6 degrees. It is expected that climate change may raise the risk e.g. for floods, which is significantly important in urban areas.

As can be seen from table 1 and 2, Finland is a country with a very low risk profile in terms of major natural disasters in general and of a specific type. The most disastrous incident for Finland in terms of natural disasters was the Tsunami in the Indian Ocean in 2004, which caused death for 179 Finnish citizens.

Regarding *man-made disasters*, there have been some technological disasters and transportation accidents. The sinking of the M/S Estonia in September 1994 is still the most disastrous civil security crisis in Finnish history. The ship with 989 people was en route from Tallinn to Stockholm over-night. The Estonia was in international waters but near Finnish territory, and therefore Finland was responsible for the international rescue operation. In total, 852 persons died.⁹³⁷

Due to Finland's low risk profile, national hazard maps are mainly limited to flooding, which also are available for some urban areas like Helsinki and Pori. Regarding earthquake risk assessment, this is only needed by nuclear power plants, in addition to a thorough evaluation of the risk of coastal flooding which is regularly updated for their sites. Comparable single-hazard risk assessments also exist for specific *man-made risks* such as chemical incidents, air and shipping accidents. Nuclear risks are a significant threat in relation with the country having four nuclear reactors and a fifth under construction, as well as a number of significant cross-border nuclear risks from neighbouring countries like Russia.⁹³⁸

1.1.2 Risk assessment approaches

Finland has adopted several approaches to risk assessment, driven by different aspects and objectives. Due to the low risk profile, the approaches preliminary doesn't aim on assessing risks for specific disasters, meaning what could *cause damage*, but focuses on what could *be damaged*, for whatever reason.

As a result, at the national level, the *Security Strategy for Society*⁹³⁹ (see 1.2) has adopted a risk assessment approach that is in the first instance based on the identification of the vital functions and their vulnerabilities of Finnish society that have to be secured in all situations.

*Threat scenarios*⁹⁴⁰ have been developed that could affect the vital functions for society. To these threat scenarios, a list of possible disturbances are correlated to improve prevention measurements and policies (see also 1.2).

To enhance the risk assessment in different areas, *risk zones* are defined for the whole country based on the national incident database as well as on vulnerability information derived from population density and the built environment. These data are aggregated through a high-technology GIS-based mapping of the country on a 1-km resolution grid. To each square kilometre is attached a risk probability correlated with a level of service which requires emergency first responders to be present in a certain time period.⁹⁴¹ The OIVA⁹⁴² Service of the SYKE provides data even with a resolution of 250x250 metres that can be e.g. used for land use planning⁹⁴³.

There are four risk zones, corresponding to 6-minute, 10-minute, 20-minute, or no-limit time periods. This technology-based and practical approach provides the regional rescue services (see chapter 3) with a *tool for capability planning*, required on a regional basis as requested by the Rescue Act (see chapters 2+5). The rescue authorities of the different regions carry out these assessments and update the status of the risk zones regularly.⁹⁴⁴

Between these approaches – threat scenarios to vital functions and the practical level of capability planning – methodologies for the quantitative assessment of significant national risks are in the process of being harmonized.⁹⁴⁵

In addition to these national and regional all-hazards risk assessments, several processes to assess specific risks are in place, i.e. with regard to flooding as already mentioned under 1.1.1 .

The 2014 Peer Review Report on Finland's implementation of the Hyugo Framework for Action evaluates the current risk assessment process as followed (p.6):

The risk assessment process in Finland would benefit from a more comprehensive approach and better coordination from the national to the local level. This should include improving the methodology for assessing large-scale risks nationally and the harmonisation of regional risk assessments. Flood risk assessment efforts should continue to map and characterise potential impacts of fluvial and urban floods, including water levels at the housing scale, so that prevention and emergency preparedness can be precisely tailored.

1.1.3 International Cooperation with regard to risk assessment

Finland has a long history in cooperating with its neighbouring countries, i.e. among the Scandinavian Countries, around the Baltic Sea, the Arctic Area in various multi-national treaties and bilaterally with Russia (see also chapter 3.2.2).

An example is the cooperation of the meteorological services of the Nordic and Baltic region countries. Important projects have been the development of the European HIRLAM⁹⁴⁶ model (High Resolution Limited Area Model), the weather radar network for the Baltic Sea Region BALTRAD⁹⁴⁷ or the co-operation for the exchange and composition of timely weather radar data: the Weather Radar Network NORDRAD of the meteorological services of Sweden, Norway, Denmark, Estonia, Latvia and Finland.⁹⁴⁸

The cooperation of Nordic National Meteorological Services in the field of infrastructure is called NORDMET and was established in 1998. The idea of NORDMET is to achieve a better cost efficiency by sharing resources inter alia in the fields of observation, information management, product development as well as training and education. Next to NORDRAD, it lists several projects and working groups that can be related to risk assessment as well⁹⁴⁹.

Some examples:

- Working Group NORDSAT - concerned with satellite data and the operational use of these
- Nord MetNet - Co-operation in the Field of Nuclear Accidents
- NFCS Nordic Framework for Climate Services

There are also several cooperation agreements related to specific risks not restricted to meteorological services, such as the risk of a major shipping accident or oil spill accidents.

*One of the most important tasks of the Arctic Council is to monitor and assess the state of the environment in the region and to alert to any changes.*⁹⁵⁰

The 2014 Peer Review Report on Finland's implementation of the Hyugo Framework for Action describes the international cooperation in terms of risk assessment as followed:

There is a strong and historic cooperation among the Scandinavian countries as well as around the Baltic Sea with the Council of the Baltic Sea States. Joint monitoring and data sharing is effective through the common weather radar mosaic, produced together with Sweden and Norway. Trans-boundary rivers are also jointly monitored together with neighbouring countries.

⁹⁴⁶ European HIRLAM model <http://www.hirlam.org/>

⁹⁴⁷ Baltic Sea Region BALTRAD <http://baltrad.eu/>

⁹⁴⁸ Weather Radar Network NORDRAD <http://blog.fmi.fi/nordmet/node/21> or <http://www.smhi.se/en/weather/2.732/rainfall-radar>

⁹⁴⁹ NORDMET <http://blog.fmi.fi/nordmet/>

⁹⁵⁰ Prime Minister's Office. *Finland's Strategy for the Arctic Region 2013*. (p44)

Issues of specific concern related to the Baltic Sea such as the risk of a major shipping accident or pollution control are followed closely by the riverine countries and joint actions are conducted. To prevent pollution, for instance, there is a permanent airborne observation and regular contacts with the Russian authorities. The risk of nuclear accidents in neighbouring countries is also taken into consideration in the risk assessment.

At EU level, Finland is a participating country in the European Civil Protection Mechanism, which facilitates cooperation in civil protection between European countries in order to improve prevention, preparedness and response. The risk assessment being prepared by the Finnish authorities will contribute to the work being developed at EU level on risk assessment.

In addition, within the EU Strategy for the Baltic Sea Region, finalised at the end of 2013, Finland contributed actively to a project aiming at the development of scenarios and the identification of gaps for all main hazards in the Baltic Sea region.

On a regional basis, Finland participates in the Baltic Marine Environment Protection Commission, which regularly develops joint risk assessments of the Baltic Sea environment and plans for measures to respond to major maritime incidents. Finland cooperates also with the other Nordic countries within the framework of the Council of the Baltic Sea States (the civil protection network coordinates joint measures in the field of civil protection, critical infrastructure protection and emergency preparedness issues), the Barents Euro-Arctic Council (joint committee on rescue cooperation) and the Arctic Council (emergency prevention, preparedness and response working group).

One example for the international cooperation in risk assessment and monitoring is the Baltic Marine Environment Protection Commission – HELCOM, which is the governing body of the Convention on the Protection of the Marine Environment of the Baltic Sea Area, known as the Helsinki Convention to protect the marine environment of the Baltic Sea from all sources of pollution through intergovernmental cooperation⁹⁵¹. HELCOM has developed a Monitoring and Assessment Strategy which is translated in a Monitoring and Assessment System (see Fig. 1). Part of the monitoring is the Automatic Identification System (AIS) which monitors the maritime traffic with special regard to oil tankers, in the Baltic Sea with land based stations, enabling the Baltic as the first region in the world to monitor maritime traffic in real-time since 2005.⁹⁵² Status 2016 of course, except for a few not identified ships sometimes, marine traffic is monitored worldwide close to real-time⁹⁵³.

1.2 Policy and Governance

The objective of the Finnish Government is to make Finland the safest country with the most effective rescue services in Europe, as highlighted in the “*Security Strategy for Society*”⁹⁵⁵ adopted in 2010. This ambition is reflected in a comprehensive legal and policy framework for disaster risk reduction, which has been significantly renewed over the last years and is constantly improved.

The Finnish disaster risk management policy is clearly set out in a number of key documents, including the Security Strategy for Society, the Finnish Security and Defence Policy Report and the Internal Security Programme.

Policy making in context of disaster risk reduction is done on the national level, following the mentioned Security Strategy for Society. Disaster preparedness is implemented at all levels of society. All administrative sectors are obligated to draw up preparedness plans and maintain preparedness in case of emergency conditions or disturbances in normal conditions. Responsibility lies with the authorities, to which the duties are assigned by law, following *a concept of competent authorities*, meaning that tasks are distributed based on substantial expertise and competences of each authority.

Another rule is the *principle of strict legality in the administration*. *Horizontally, every sector has rather independent powers in decision making, and also vertically the possibilities of upper administrative levels to lead directly over the lower levels are restricted by law.*⁹⁵⁶

The homepage⁹⁵⁷ of the Security Strategy for Society states:

⁹⁵⁴ <http://www.helcom.fi/Documents/Action%20areas/Monitoring%20and%20assessment/Monitoring%20and%20assessment%20strategy/Monitoring%20and%20assessment%20strategy.pdf>

⁹⁵⁵ Ministry of Defence. *Security Strategy for Society*. Government Resolution 16.12.2010. Helsinki 2010

⁹⁵⁶ Country Study: Finland. The ANVIL project. June 2013 (p.3)

⁹⁵⁷ MoD - Secretariat for Defence Committee / Security in Society <http://www.yhteiskunnanturvallisuus.fi/en/>

The functions vital to society must be secured in all times: in normal conditions as well as in crises. In the security strategy for society the vital functions form the basis for preparedness. The following are regarded as vital functions:

- Management of Government affairs
- International activity
- Finland's defence capability
- Internal security
- Functioning of the economy and infrastructure
- The population's income security and capability to function
- Psychological crisis tolerance

All actors in society – authorities, companies, organisations and communities involved in security studies – play an important role in securing these functions.

The Security Strategy for Society lists 49 strategic tasks clustered under the above mentioned seven vital functions for society, which aim to secure these vital functions in case of disturbances⁹⁵⁸ and assigns responsibilities to diverse Ministries (the competent authority) for each of these tasks, relevant to their own sphere of operation. (see table 3). Thus, many ministries are involved in the Security Strategy. Tasks related to disaster risk reduction e.g. are under the responsibilities of the Ministry of the Interior for emergency preparedness and response; the Ministry of Agriculture and Forestry together with the Ministry of the Environment is responsible for prevention of floods and droughts; and Ministry of Finance and other sectorial ministries, for business continuity.

Possible disturbances to these tasks and thus, to vital functions have currently (status 2010) been identified and are clustered in 13 threats scenarios⁹⁵⁹ as described on the homepage of the policy⁹⁶⁰:

Threat models have been compiled as the basis of preparedness for the security strategy for society. They are descriptions of situations that may endanger security in society and its vital functions. (the 13) Threat models consist of the following:

- a serious failure of the power supply
- serious disruptions to telecommunications and information systems
- serious disruptions to logistics
- serious disturbances in the community infrastructure
- a serious disruption to food supply
- serious disturbances in the finance and payments system
- failing access to public finances funding
- a serious disturbance in the public health and well-being

⁹⁵⁸ see List of Definitions

⁹⁵⁹ see List of Definitions

⁹⁶⁰ Security in Society – Threats <http://www.yhteiskunnanturvallisuus.fi/en/threats>

- major accidents, extreme weather conditions and environmental threats
- terrorism and other type of crime posing a threat to society
- serious disturbances in border management
- political, financial and military pressure, and
- the use of military force (see also 3.1).

The authorities, organisations and companies can plan their preparedness by adapting the threat models to their own operating environment. For example, in many municipalities a preparedness plan has been drafted on the basis of the Security strategy for society.

This **all-hazards and threats and whole-of-government approach** provides a uniform basis for strategic preparedness to all Finnish institutions from the national level to municipalities, as well as to private sector organisations and NGOs. It is complemented by a number of decisions, strategies and guidelines related to preparedness and crisis management, issued by the Government and different administrative sectors.

The **Prime Minister's Office** also maintains capacities for crisis management (see chapter 3). **National technical agencies**, such as the Finnish Meteorological Institute (FMI), Finnish Environment Institute (SYKE), Emergency Response Centre Administration and National Emergency Supply Agency (NESA), have specialised mandates for hazard monitoring and mapping, and early warning – or to ensure supplies availability, respectively (see 1.2.2 and 4.4).

At the local level, the 320 **municipalities** have a mandatory responsibility to provide welfare as well as rescue services for their citizens. In this **strongly decentralized political system**, municipalities can regroup themselves at the regional level to manage these services with varying administrative borderlines depending on the policy domain.

There are currently 22 **rescue regions** in Finland (see chapter 3), where rescue services organise their operations. As part of the Government's structural policy programme, the aim is to reduce the number to 11⁹⁶¹. While they are under the responsibility of local authorities, the rescue services have to follow guidelines and regulations from the **Ministry of the Interior**, operated by the **Department for Rescue Services**, which oversees their coverage and the quality of services in the rescue regions.

Since a **2010 reform**, Finland has a more streamlined regional state administration to control and regulate policy implementation at the local level in areas related to disaster risk reduction, such as environment, land use or safety. The reorganisation of the administrations may continue in the future with on-going reforms to reduce the number of municipalities. Finally, the specificity of the Åland Islands autonomous region makes its risk management policy rather independent from that of the central government.

⁹⁶¹ Finland's legal preparedness for international disaster response - Finnish Red Cross 2014.(footnote p.30)

Source: "Security Strategy for Society", Government Resolution 16.12.2010, Finnish Ministry of Defense.

1.2.1 Strategy scope and focus

As described in section 1.1, Finland is a country with a very low risk profile in terms of natural and man-made-disasters with nearly no experience in major disasters. Considering the all-hazard approach of the Finish crisis management system which focuses on up-keeping the vital functions of

society in all situations, one can say that the strategy focus is on preparedness and prevention rather than on response and recovery.

1.2.2 Monitoring and analytical support to policy making; R&D

Data on key hazards and vulnerabilities are monitored, archived and disseminated by various ministries and technical agencies in Finland depending on the hazard characteristics, to better assess the risks of disturbances and threats.

Regarding hazard monitoring, Finland is equipped with efficient modern and high-tech monitoring networks, operated by its technical agencies. The **Finnish Meteorological Institute (FMI)** is responsible for real-time 24/7 monitoring, achieving and disseminating data associated with weather and marine events. The **Finnish Environment Institute (SYKE)** monitors water levels and discharges in rivers and lakes. There are also 288 stations continuously measuring radiation in the environment operated by the **Radiation and Nuclear Safety Authority (STUK)**. When needed, specific monitoring and surveillance processes can be activated by Ministries. For instance, the Ministry of the Interior organises air patrolling on behalf of the 22 rescue services (see chapter 3) to detect forest fires from the air during periods of dry conditions, while the Ministry of Agriculture has agreed on an action plan with the National Land Survey, FMI and SYKE for taking and processing rapid aerial photos in case of natural events and disasters, such as storms and floods. *Space technology* is also used in Finland for forest-fire detection as well as for situation assessment after disasters.

Loss-data collection is operated by the Ministry of the Interior via the national incident database. In addition, the Finnish Environment Institute collects flood loss-data from municipalities. *Insurance companies* have also developed their own database.

See also chapter 1.1.3 for international cooperation in monitoring.

1.2.3 Policy for Prevention

Finland's policy approach of crisis management doesn't differ between prevention, preparedness, response and relief & recovery, though the focus is on preparedness, as mentioned before. As mentioned under 1.2 and 1.2.1, each "competent authority" at all levels is responsible for ensuring the maintenance of vital functions for society within their duties. This covers all aspects of prevention, preparedness, response, relief and recovery.

If the Finnish approach should still be separated into different phases, it would according to the Country Report Finland 2004⁹⁶² be prevention, early warning measures and effective response, each one using the following three methods: legislation, technical solutions and education.

1.2.4 Policy for Preparedness

See 1.2.3

⁹⁶² Ministry of the Interior. *Country Report Finland*. 2004 (p.3)

1.2.5 Policy for Response

See 1.2.3

1.2.6 Policy for Relief and Recovery

See 1.2.3

1.3 Financing

1.3.1 Investing in preparedness

Disaster risk reduction resources according to the 2014 Peer Review Report on the Implementation of the HFA:

Funding for risk management comes from different sources such as Government budget, municipalities' budget and specific financial mechanisms. As in most other European and OECD countries, Finland has not made a comprehensive estimation of the resources spent on disaster risk reduction from the national to the local level.

At the national level, resources for risk management are in fact embedded in the general budget of each responsible ministerial department, as well as for technical agencies. The specific funding mechanism of the National Emergency Supply Agency (NESA), financed by consumption through VAT, secures its large budget. It is aimed at guaranteeing the availability of all forms of supplies to ensure business continuity in all sectors. Citizens also contribute through the fire tax, which adds to the fire prevention fund (€9 million per year).

(The Fire Protection Fund, managed and supervised by the Ministry of the Interior, is a fund outside the State Budget. Every year, the Fund grants nearly EUR 10 million for projects that are designed to improve fire prevention and rescue operations. This assistance has focused on training and education provided by rescue service organisations, research and development projects supporting the work in the field, procurement of equipment and building of fire stations.)⁹⁶³

Developers contribute by financing shelters in all new buildings (€39 million per year). Overall, resources from the national budget appear to have covered well the funding needs to ensure the proper implementation of national strategies in risk management, as in other areas of public policy.

As further fiscal consolidation may be needed in the medium term to tackle new economic challenges, Finland may face competing demands for public funding in the future, requiring risk management activities to demonstrate further their cost-effectiveness.

⁹⁶³ Ministry of the Interior - Department for Rescue Services. *Rescue services in Finland*. 2013

This contraction in resources is particularly important at the local level. Municipalities are the principal contributors to the budgets of regional rescue services, estimated at a total of €385 million. They have a strong independence from central government to decide their budget allocations, with 50 per cent of their budgets coming from local taxation. In the current context, where many municipalities are facing budgetary difficulties, ensuring that rescue services have the same level of preparedness at the local level could become more challenging, especially when it comes to persuading politicians to make it a priority given the country's low risk profile. The on-going reforms of local government, which propose incentives to merge municipalities, as well as those of the social and healthcare system and of the rescue services, are forward looking initiatives aimed at addressing this budgetary challenge for risk management. Plans to reduce the number of rescue regions were considered as part of this process, but were not agreed upon because of the political, social and economic costs involved in such reform.

1.3.2 Investing in consequence management

Finland's Peer Review Report 2014 on "Financial reserves and contingency mechanisms" regarding consequence management (p.25):

Several public financial instruments and contingency mechanisms are available in Finland in case of disasters. They are currently facing significant evolutions with the on-going structural reforms in the country.

*The **national Recovery Fund**, managed by the Ministry of Finance, can support municipalities in case damages to public infrastructure exceed their own budgets. The Ministry of the Environment also manages the **Finnish Oil Pollution Compensation Fund**⁹⁶⁴, which is available to compensate damages caused by oil spills and associated emergency and de-pollution costs when the cause of the incident is unknown or the culpable party is unable to pay the compensation in question. The compensation granted from the fund must be repaid by the party that caused the oil spill, or by another responsible party.*

*The **State** may also contribute to maintaining preparedness for emergency health care and major accidents by providing state funding towards contingency activities where special reasons make this expedient. The Red Cross also manages a **Disaster Relief Fund** with non-earmarked funding.*

The major evolution in the public compensation approach relates to flood disasters: due to budget restraints, the system for flood damages compensation through governmental funds was replaced in 2014 by a new private-insurance-based system. Under the new scheme, private insurance companies will provide damage compensation for all types of floods, including urban pluvial floods.

⁹⁶⁴ Finnish Oil Pollution Compensation Fund
http://www.ym.fi/en-US/The_environment/Finnish_Oil_Pollution_Fund

However, this will apply only to floods above a pre-defined threshold, defined with the regulating authorities. Flood insurance is now included in a package with home insurance, with no increase to insurance premiums (at the start of policies, at least). After a few years, it is expected that premiums will be recalculated to eventually reflect the risk level. Ministry of Finance statistics show that domestic premiums amount so far to a total of €4.1 billion. However, according to SYKE's analysis the scale of the economic impact of flooding is rather limited, with maximum damages in even high-risk areas estimated at only around €10 million – compared with the €100 million damages caused by the 2011 winter storms. Insurance companies will use the flood-risk maps prepared during implementation of the EU Floods Directive. In the future, time and experience from incidents will provide the best indication of how this policy change will impact and be perceived by Finnish citizens and businesses.

Assistance from the **EU Solidarity Fund** may of course be requested in cases of major disasters, but since to be eligible for funding, the total direct damage caused by the disaster must exceed 3 billion euros or 0.6% of the country's gross national income, Finland hasn't make use of it so far.

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

As mentioned before, Finland has not experienced major disasters in its recent history, and thus no concrete examples of, or dedicated policies for, recovery and reconstruction have been developed that specifically include risk reduction measures. Nevertheless, the drive to strengthen the resilience of critical infrastructure is constant, also stressed by the objectives of the Security Strategy for Society. As an example, measures are taken to secure the power networks and reduce the risk of power failures in the repair and rebuilding of local electricity networks that has been damaged due to wind or snow storms⁹⁶⁵.

1.4.2 Departmental Lessons Learned systems

Each “competent authority” at all levels is responsible for recording and analysing all management measures that have been taken when disturbances occur in Finland or abroad, as requested by the Security Strategy for Society. (see also 1.4.5)

Furthermore, as stated e.g. in Finland's Cyber Security Strategy⁹⁶⁶,

different sectors' preparedness in securing the vital functions in disturbed conditions will be improved by organising regular exercises. Each actor will develop its national and international participation in exercises. The actors will improve the utilisation of best practices and lessons-learned accrued through international exercises by improving the exchange of information and mutual coordination. The goal of exercises is to enhance the participants' chances of exposing the vulnerabilities of their own actions and systems, in developing their capabilities and training their personnel.

⁹⁶⁵ Peer Review Report Finland 2014

⁹⁶⁶ Finland's Cyber Security Strategy. Government Resolution 24.1.2013.

Since this is also in general requested by the Security Strategy for Society, it is applicable to all “competent authorities” at all levels.

1.4.3 Centralised (national) Lessons Learned system

In addition to organisations internal lessons learned processes, there is also a lot of exchange on inter-agency or inter-sectoral level at national as well as on international level. Moreover, at national level,

*the **Finnish accident data-base** provides a good basis for post-event reviews as it records all interventions and actions which are taken in responding to an emergency or disaster. The **Safety Investigation Authority** of Finland, previously known as the Accident Investigation Board, investigates all major accidents, regardless of their nature. Investigation reports are prepared for each case and include recommendations for improving systems and processes. ‘Lessons learnt’ exercises were conducted following the 2010 storms, which led to improving pre-warning processes – especially of citizens – and emergency preparedness.*

In the past, lessons have also been drawn from international disasters such as the 2004 tsunami. This has helped improve inter-agency coordination and joint operation capacity for response outside Finnish borders.⁹⁶⁷

1.4.4 International exchange for Lessons Learned

International exchange of information as well as common exercises with regard to disaster preparedness and response are fostered by the Security Strategy for Society, as stated under 1.4.2.

Finland actively participates, especially, in the work of the EU and NATO, which also leads, inter alia, to the improvement of the national evaluation processes.

In addition, there is a close cooperation with neighboring countries in terms of CM, correlated with several bi- and multilateral agreements, Finland as a nation is part of as well as single authorities. Even on municipality-level, cross-border agreements exist (for international cooperation, see 3.2).

1.4.5 Regular policy reviews

Requested by the Security Strategy for Society (2010), the national policy review is conducted by monitoring the implementation of its strategy, which is to be based on at least the following entities:

- ministry reports and assessments on how their strategic tasks have been taken into account in the administrative sector’s preparedness and the capabilities to manage a disturbance
- compiling and analysing the lessons learned from having managed disturbances
- assessments on the functioning and development needs of the security of supply

⁹⁶⁷ Peer Review Report Finland 2014.

- arrangements in their administrative sector, and
- experiences from the preparedness exercises of administrative sectors, the Government and the authorities nation-wide

According to the Security Strategy for Society,

the monitoring of the Strategy's implementation also produces grounds for security research in administrative sectors and also for national co-operation in the field of security research. National and international security research is conducted and forms of cooperation are developed through the strategy for national security research; the Advisory Board for Sectoral Research is in charge of the strategy's implementation. Furthermore, the Scientific Advisory Board for Defence (MATINE), the security programme of the Finnish Funding Agency for Technology and Innovation (TEKES), the EU's framework programme for security research and the technology programmes and excellence networks of the Defence Forces produce research to support the Security Strategy.

On the international level, Finland volunteered, as a second country, after United Kingdom, for the evaluation through a Peer Review Process with regard to the implementation of the Hyogo Framework for Action (HFA) and its related priorities into the national crisis management concept⁹⁶⁸. As a result, Finland benefits from the feedback of high-level experts from the EU Commission (DG Humanitarian Aid and Civil Protection (ECHO)), the UN office for disaster risk reduction (UNISDR) and the Organisation for Economic Co-operation and Development (OECD).

Objectives of the Peer Review Process are:

- enhance the effective implementation of and reporting on the HFA, contributing to improved policy-making on disaster risk reduction through external assessment and mutual learning;
- increase the consistency between the national disaster risk reduction policies and stimulate transferability of good and innovative practices;
- contribute to developing and implementing EU policy initiatives in disaster risk management in EU Member States as well as in neighbouring countries;
- encourage awareness-raising through broad involvement of stakeholders in the review process and wide dissemination of the results;
- foster policy dialogue in Europe and enhance regional cooperation between countries exposed to common hazards and risks

The development in the respective Progress Reports on the Implementation of the Hyogo Framework for Action⁹⁶⁹ shows that the quite young strategy is still in the implementation phase in all levels and thus provides several examples for the realization of recommendations/implementation of the results of policy and strategy reviews.

⁹⁶⁸ Peer Review Report Finland 2014.

⁹⁶⁹ Ministry of the Interior: National progress report(s) on the implementation of the Hyogo Framework for Action, 2012 (2009-2011), 2013 (2011-2013), 2014 (2013-2015, interim)

1.5 Resilience

Since Finland's policy and strategy approaches in terms of CM have all been renewed or reviewed in recent years, the concept of resilience as understood today by academics or within the European Union, is widely implemented. Increasing Europe's resilience to crises and disasters is one of the five strategic objectives in the 2010 Security Strategy for Society.

Even specific aspects of resilience are emphasised in the general policy: strengthening psychological resilience is listed as a separate strategic task in the Security Strategy for Society under the responsibility of the Ministry of Education (see table 3). Psychological resilience to crisis is for instance part of the instructions on crisis communication of the Prime Minister's Office⁹⁷⁰.

1.6 Information sharing and data protection

Data sharing and dissemination is very effective in Finland as it follows an open-data policy: all data paid for through public budget can be accessed by Finnish citizens.

This means that the Ministry of the Interior, the Emergency Response Centre Administration, the Finnish Meteorological Institute (FMI) and the Finnish Environment Institute (SYKE) – and also other actors – are relevant owners of data, and are open to data sharing.

The Emergency Response Centre Administration, for instance, shares its data on accidents with a number of other organisations, such as FMI or SYKE, and receives data from them free-of-charge. FMI and SYKE will further this policy of data exchange by establishing a joint flood centre. There seem to be no obstacles in the national data-sharing policy which could hamper disaster risk reduction. The energy sector also uses FMI databases on frequencies and impacts of storms. Similarly, cooperation with the insurance sector to share loss data has facilitated the development of flood risk assessment. At the regional level, weather radar data sharing among the Scandinavian countries brings benefits to each of them by improving monitoring at a lower cost⁹⁷¹.

As a result of high-level contingency planning and the need to secure official data flows and data security, both during peacetime and crises, the *safety network project TUVE* has been set up with the aim to implement a Government Security Network in 2013⁹⁷². Upon a government decision in 2011 TUVE's management, maintenance and development will gradually be transferred after the construction phase to State Security Networks Ltd., the same operator who runs the VIRVE radio network for the rescue authorities (see 4.4).

⁹⁷⁰ Central Government Communications in Incidents and Emergencies. Prime Minister's Office 03/2013

⁹⁷² Ministry of the Interior: *National Platform for Disaster Risk Reduction*. Ministry of the Interior publication 14/2012

2 Legislation

2.1 Crisis (emergency, disaster) management concept

The VADEMECUM platform⁹⁷³ summarizes the concept as followed:

Each authority is responsible for its statutory functions not only during peacetime, but also during crises such as serious international disturbances, the threat of an armed attack, war, post-war situations, economic crises and disasters. To prepare for emergencies, authorities are obligated by law to take precautionary measures such as making contingency plans, acquiring special equipment and training personnel.

In principle, the same or similar emergency plans apply to the civil administration during both wartime and peacetime civil emergencies.

One guiding principle of the Civil Emergency Planning (CEP) is that each authority continues with its normal functions also during a state of crisis. However, in such a case, authorities can assume specific additional responsibilities related to their normal functions. Another principle is that as few new bodies as possible are introduced into civil administration in case of a crisis.

Organisational changes are kept to a minimum. In addition to authorities, governmental bodies, companies and institutions are to continue with their peacetime functions. Authorities are expected to allocate the necessary funds for emergency planning and other preparatory measures in their annual budgets.

See also chapter 1.2

2.2 General crisis (emergency, disaster) management law

Naturally, the underlying law in Finland is the Constitution of the country, which prescribes the grounds for expanding the authorities' powers in case of emergency conditions. Disaster preparedness in society is based on powers of authority in normal conditions, and special powers of authority to be issued in emergency conditions are based on these.

With regard to the so called crisis legislation, the **Emergency Powers/Readiness or Preparedness Act** has been updated 2011 and aims to guarantee the nation's livelihood and the national economy, maintain law and order, protect the basic rights of citizens and safeguard the territorial integrity and independence of the nation in extraordinary situations by regulating authority powers in emergency conditions. It could be applied before or beside the **State of Defence Act** of 1991, which gives additional powers for the government in the defence against an armed aggression.

⁹⁷³ VADEMECUM: Finland - Emergency planning

http://ec.europa.eu/echo/files/civil_protection/vademecum/fi/2-fi-2.html#cipro

The Finnish **Rescue Act**, which is the country's basic law for disaster management, requires not only the rescue services but also various other stakeholders, including other state agencies and the private sector, to undertake specific disaster risk management actions. The Act, also amended in 2011, covers prevention, preparedness and response and lays down, among other things, the tasks of rescue services and the administration and the powers of rescue authorities from national to local levels. Thus, the Rescue act is the key general act regulating functions during disturbance in normal conditions, where the situation in question is not a crisis pertained to in the Emergency Powers Act (see also 2.3)⁹⁷⁴.

The rescue service authorities have broad jurisdiction, as stated in the Red Cross's report on legal preparedness for international disaster response (2014, p.27):

According to Section 36 of the Rescue Act, regional rescue authorities and the rescue authorities of the Ministry of the Interior have the right to "order people to protect themselves and evacuate people and property; take any such necessary action that may cause damage to immovable or movable property; order that buildings, communications links and equipment, as well as equipment, supplies, foodstuffs, fuel and lubricants and extinguishing agents required in rescue operations shall be made available; take any other action as required by rescue operations". In addition to rescue service authorities, the police have the right to order people to provide assistance in rescue operations.

There are several other acts / laws related to crisis management in Finland, e.g. translations of the national policies into legislation, such as the Climate Change Act (609/2015)⁹⁷⁵. Please see also the chapter Resources for the list of acts with regard to relevant legislation according to the Finnish Red Cross's report on legal preparedness.⁹⁷⁶

2.3 Emergency rule

The Finnish Red Cross's report on legal preparedness for international disaster response 2014 (p.24) summarizes the criteria for emergency conditions as followed:

*The application of the provisions of the **Emergency Powers Act** requires that the Government and the President confirm that the criteria for emergency conditions are met and a Government Decree on using the emergency powers is issued. The Decree must immediately be submitted to Parliament for approval. Emergency powers must be specified accurately and realistically.*

According to Section 3 of the Emergency Powers Act, emergency conditions include military conflicts, particularly serious incidents or threats to the livelihood of the population or the foundations of the national economy that put at risk the functions vital to society, particularly serious catastrophes and their aftermath, and dangerous communicable diseases that have

⁹⁷⁴ Finland's legal preparedness for international disaster response - Finnish Red Cross 2014.

⁹⁷⁵ Ministry of the Environment http://www.ym.fi/en-us/The_environment/Legislation_and_instructions/Climate_change_legislation

⁹⁷⁶ For available translations of the respective acts, please check <http://www.finlex.fi/en/laki/kaannokset/>

spread extremely widely and are similar in their effects to particularly serious catastrophes. Emergency powers can only be used if the situation cannot be controlled through the normal powers of authority. If the situation in question is not a crisis pertained to in the Emergency Powers Act, but a disturbance in normal conditions, the authorities shall operate in accordance with the normal legislation, decrees and preparedness plans along with other official arrangements.

The scope of decision-making or emergency powers during emergency conditions is wide, encompassing large parts of the economy (including for example price controls and the distribution of goods), the organisation of public administration, the postponement of local elections and the transfer of municipal powers, compulsory labour, the confiscation of goods, a duty to submit information to the government, etc. Nevertheless, government decisions on such issues must be put to parliament⁹⁷⁷.

According to the Emergency Powers act, exceptions to basic rights and personal liberties can only be made in terms of use of labour of Finnish residents. However, exceptions to international human rights obligations cannot be made under any circumstances.⁹⁷⁸

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

A real specificity of Finland is the *Security of Supply Act*, which aims to safeguard all economic activities that are necessary for maintaining the population's livelihood, the country's economy and national defence during a crisis, having resulted in the creation of a related public-private partnership and of the National Emergency Supply Agency (NESA) (see also 3.1).

Other important legislative acts referring to disaster risk reduction include the *Land Use and Building Act*, the *Environmental Protection Act*, which aim to reduce the underlying risk factors, or specific arrangements like the *Dam Safety Act 2009* or the *Government Decree on Emergency Response Arrangements at Nuclear Power Plants 2008*.

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

Because municipalities for the most part have the responsibility for organising basic services and other functions vital to society, their role in local administration is central. The Finnish Red Cross's report on legal preparedness for international disaster response 2014 summarizes the regulations on the local/regional levels as followed (p.14-15):

The local administration contains the municipalities, whose administration shall be based on the self-government of their residents, in accordance with Section 121 of the Constitution.

⁹⁷⁷ Khakee, Anna. *Securing Democracy? A Comparative Analysis of Emergency Powers in Europe*. Geneva Centre for the Democratic Control of Armed Forces (DCAF). Policy Paper – №30

⁹⁷⁸ Finland's legal preparedness for international disaster response - Finnish Red Cross 2014.

Provisions on the general principles governing municipal administration and the duties of the municipalities are laid down in legislation. The municipalities have the right to levy municipal tax in order to cover costs incurred, and to manage their tasks. There are 320 municipalities in Finland. They hold a significant responsibility for providing basic services and organising other vital operations in society. The public administration also contains the church administration and indirect public administration. The region of Åland is autonomous in accordance with the provisions of the Act on the Autonomy of Åland.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

According to the Finnish Red Cross's report on legal preparedness for international disaster response 2014 (p.30-31),

a large number of companies, associations and voluntary organisations participate in public administration. Private service providers play an increasingly significant role in the maintenance of the basic services in society. As a member of the European Union, Finland is committed to the principles of free competition and the freedom to provide services, as well as the related EU legislation.

According to Section 51 of the Rescue Act, voluntary organisations and persons may be used to assist in the training, advisory and educational duties of rescue services and in rescue operations; they may not, however, be used in duties that involve a substantial use of public authority, such as the use of official powers or inspection. The authorities assigned by law are always ultimately responsible for statutory duties. The police can use members of voluntary organisations in carrying out search operations and other assistance tasks that do not involve the substantial exercise of official authority. The Finnish Red Cross is an organisation whose foundation and activities are governed by public law.

*The **Volunteer Rescue Service (Vapepa)** is an association of 50 organisations. Its purpose is to support the authorities, particularly in operations requiring a large number of rescue personnel. If requested, Vapepa works in collaboration with the authorities, supporting and complementing them. Its organisations have a number of agreements on both the local and the national levels with the police, rescue authorities and social welfare and health authorities. Voluntary rescue services in general are coordinated by the Finnish Red Cross. The Finnish Lifeboat Institution coordinates voluntary sea rescue services, and the Finnish Air Rescue Society coordinates voluntary air rescue services.*

2.7 Legal regulations for international engagements of first responders and crisis managers

International engagements of Finish first responders abroad are regulated by the Act on the Participation of Civilian Personnel in Crisis Management (1287/2004).

According to this act (chapter 2, section 5(1)),

A person participating in crisis management abroad has a fixed-term employment relationship, governed by public law, with the State, which is represented as an employer by the Ministry of the Interior. The State as an employer is, however, represented by the Ministry for Foreign Affairs, if foreign and security policy considerations warrant it.

With regard to rights and obligations of persons in employment relationships in chapter 2, the act further gives information on:

- Leave of absence and continuation of an employment or civil service relationship
- Holiday compensation
- Family leave and sick leave
- Group life insurance
- Pension rights
- General retirement age
- Basic salary
- Compensation for conditions
- Compensation for certain costs
- Termination of employment relationships

3 Organisation

3.1 Organisational chart

In Finland, disaster preparedness is implemented at all levels of society. All administrative sectors are obligated to draw up preparedness plans and maintain preparedness in case of emergency conditions or disturbances in normal conditions. The administrative system in Finland is based on the **principle of strong mutual trust**: the authorities trust and comply with decisions made by other authorities within their jurisdiction. The authorities support one another and collaborate. Responsibility lies with the authorities to which the duties are assigned by law⁹⁷⁹ (see also chapter 1 & 2).

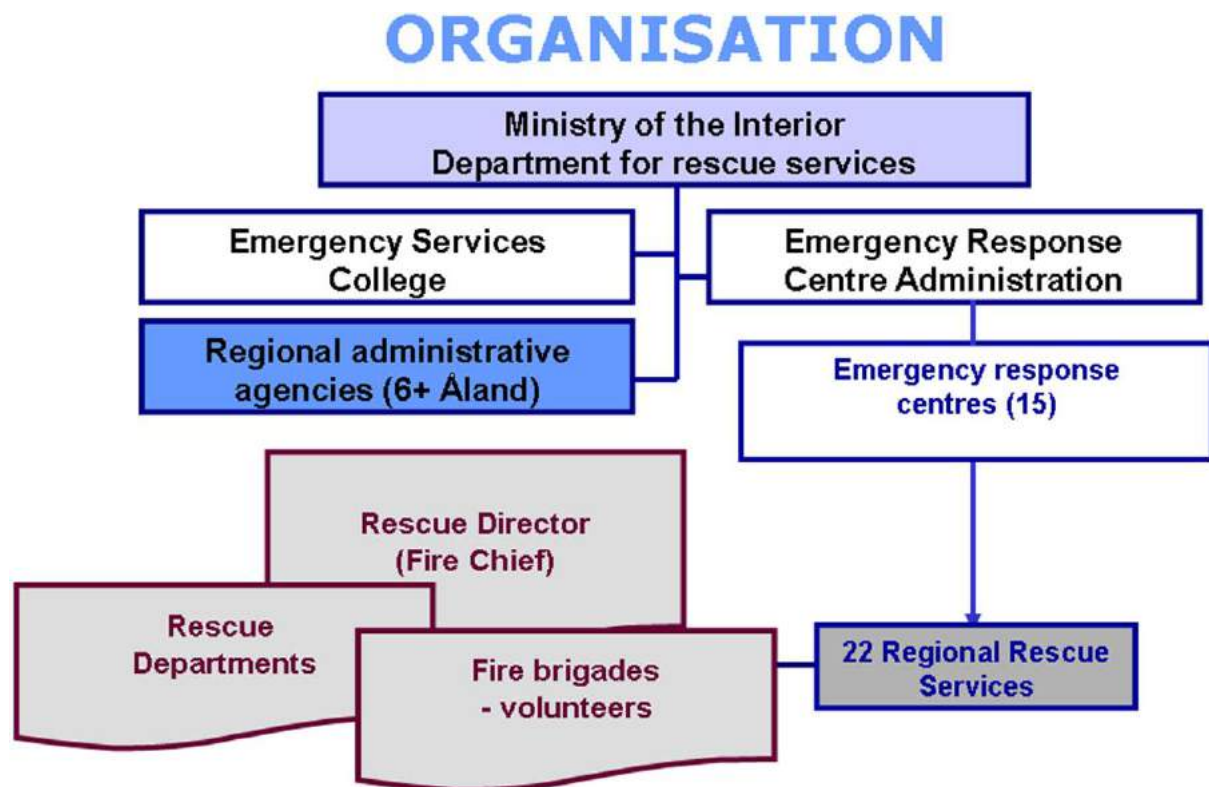

Figure 8: Organisational Chart of the Crisis Management Structure of Finland
Source: http://ec.europa.eu/echo/files/civil_protection/vademecum/fi/2-fi-1.html

Finland has established a strong and comprehensive disaster management system which at present remains highly decentralized.

At national level, the **Prime Minister's office** is responsible for the coordination of crisis management. The Permanent Secretaries of the ministries are responsible for securing the functions of their respective administrative branches in a state of emergency as provided for in the Security Strategy for Society. A committee of the **Heads of Preparedness** of all ministries can be convened in case of a crisis.

The **Ministry of the Interior's Department for Rescue Services** has been appointed the **National Coordinator** for the implementation of the Hyogo Framework for Action. The task of the National

⁹⁷⁹ Finland's legal preparedness for international disaster response - Finnish Red Cross 2014 (p.25)

Coordinator is to report to the United Nations on the results of work to prevent disasters caused by natural hazards and mitigate their damage.

The *Finnish Cooperation Network* was appointed on 7 May 2010 to act as a cooperation body and to prepare a **National Platform for Disaster Risk Reduction**. The Cooperation Network consists of a *steering committee* and an *expert committee*, whose tasks are specified in the letter of appointment and does not have independent competences.

The aim of the Cooperation Network is to clarify the overall picture of preparedness for natural disasters and to identify areas that require further action or development. The National Platform aims also to monitor the progress in each issue. In addition, the Cooperation Network aims to find issues for which there is a clear need for development.⁹⁸⁰

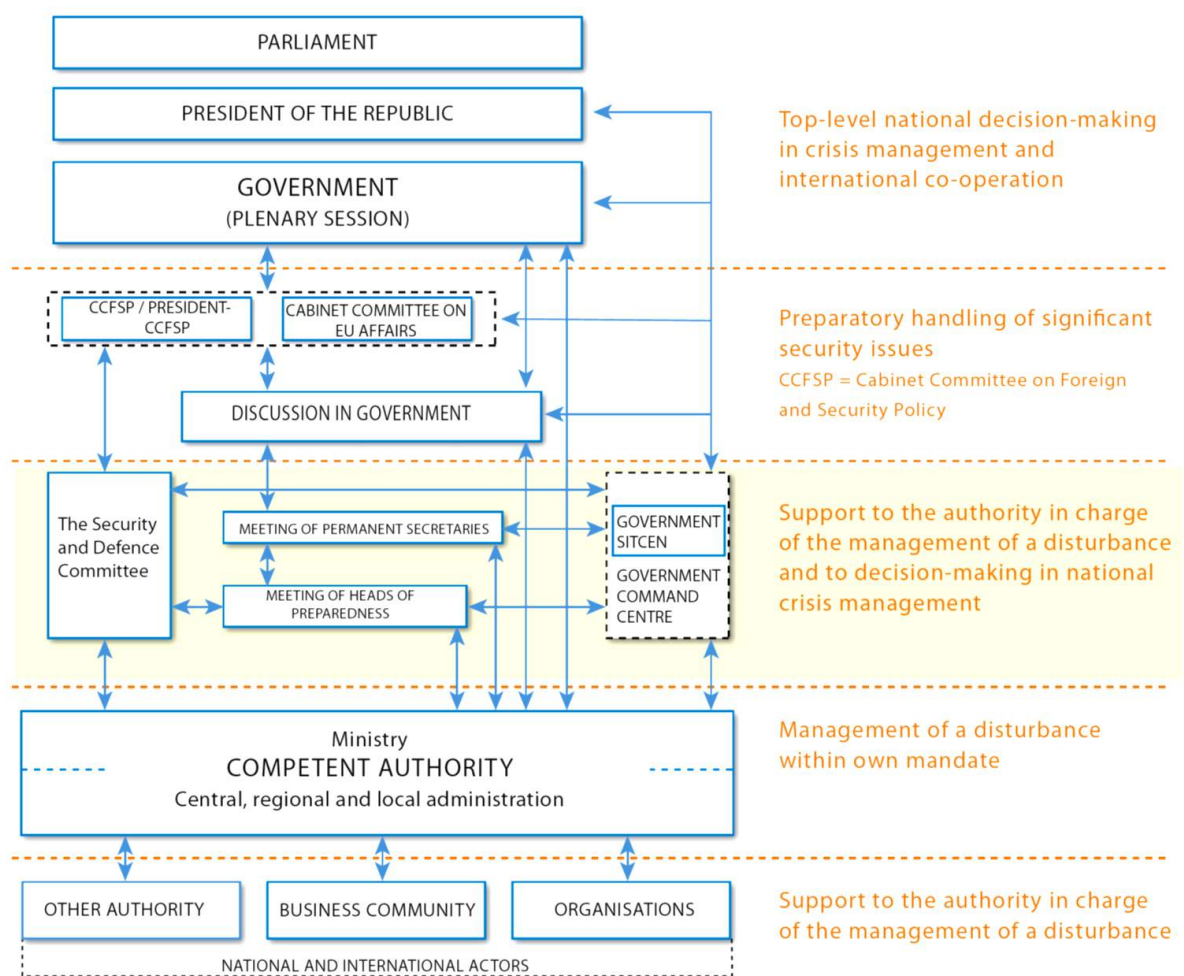

Figure 9: The principle of the management of disturbances
Source: "Security Strategy for Society", Ministry of Foreign Affairs 2010.

⁹⁸⁰ Ministry of the Interior: *National Platform for Disaster Risk Reduction*. Ministry of the Interior publication 14/2012

The Ministry of the Interior Department for Rescue Services directs and monitors rescue services. According to the Homepage of the Ministry of the Interior⁹⁸¹, the Department for Rescue Services is responsible for the following matters:

- rescue services
- emergency response centre operations, the **Emergency Response Centre Administration** and performance guidance for it
- the **Emergency Services College** and performance guidance for the College
- the Fire Protection Fund, excluding its operational and financial control
- international rescue operations
- contingency planning
- joint preparedness of regional authorities for emergency and abnormal conditions and the related central government duties
- Finland's Public Authority Radio Network (VITRE)
- lifesaving medals
- the Finnish Red Cross

The Department deals with the following matters in cooperation with the Police Department: performance guidance, budget and setting up of working groups of the Emergency Response Centre Administration; any other matters important for the work of the Emergency Response Centre Administration.

At regional level, Finland is divided into **22 regional rescue services** which manage operations in their respective regions (see Figure 4). Municipalities (at present 320 in total) are jointly responsible for the **Rescue Services** within designated regions and must have an agreement regarding the organisation within the region. Tasks of the rescue services consist primarily of firefighting, combating industrial disasters, and providing relief in case of traffic accidents, land-based oil spills and releases of hazardous material.

To prevent fires and other incidents, rescue departments work together with other authorities and with local residents and communities (see also 3.2.1), and take part in local and regional safety planning (see also 4.1 and 4.2). Main authorities are:

- the **police**
- the **Frontier/Border Guard** - mainly when helicopters or other aircraft is needed, e.g. in cases of forest fires or other major accidents or for airborne ambulance services in isolated and/or remote areas (the Coast Guard is part of the Frontier Guard and takes the key role in open sea rescue interventions)
- the **Defence Forces** - providing equipment, manpower and special expert services necessary for rescue activities where this is deemed necessary with regard to the extent and special nature of the accident

⁹⁸¹ Ministry of the Interior: Dep. Of Rescue Services

http://www.intermin.fi/en/ministry/organisation/department_for_rescue_services

- **social and health authorities**
- authorities and institutions in charge **of agriculture and forestry** – e.g. the Forest and Park Service is liable to provide expert assistance in the fighting of forest fires
- **environmental** authorities – e.g. provide rescue operators expertise concerning oil and other harmful material in case of spills or releases (*environmental authorities from Ministry over the Finnish Environment Institute SYKE down to local authorities are heavily involved in disaster preparedness and prevention and thus play a key role next to the rescue authorities*)
- authorities in charge of **passenger and goods transport and communications**
- agencies and institutions in charge of **radiation and nuclear safety** and **weather services**

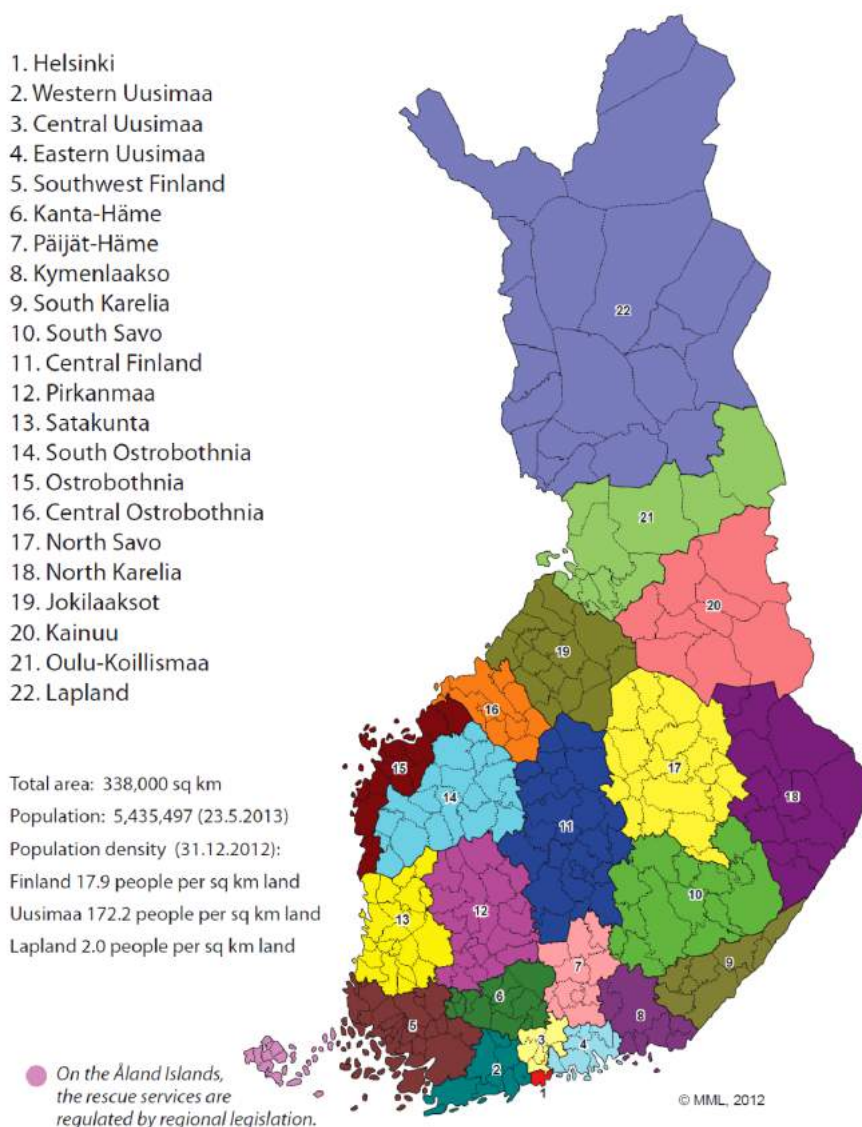

Figure 10: The 22 Rescue Services Regions of Finland

Source: Ministry of the Interior - Department for Rescue Services - "Rescue services in Finland" www.pelastustoimi.fi/

Voluntary, institutional, industrial and military **fire brigades** (contract fire brigades) also participate in performing rescue service duties as agreed between the brigades and the regional rescue services. **Voluntary fire brigades** (over 600 nationwide) play a significant role in the rescue services system. Organised in the form of private associations, they take part in operations according to an agreement with the permanent rescue service authority in the region. In some municipalities, the firefighting is entirely a voluntary fire brigade's task.

The *use of assistance provided by the Defence Forces*, as described above, is restricted by the Act on the Defence Forces 11.5.2007/551:

The Defence Forces may assist another Finnish authority in providing rescue or other assistance to another country in case of a terrorist attack, a natural disaster, a major accident or similar occurrence. The Defence Forces may assist by contributing equipment, material or expert assistance. Military force may not be used in providing such assistance.

The decision regarding the participation of the Defence Forces in an operation as described in subsection 1 above is taken by the Ministry of Defence at the request of the competent Ministry, after consulting the Ministry for Foreign Affairs.

If the project is extensive and an important principle is at stake, or if the significance of the matter otherwise requires, the decision regarding the participation of the Defence Forces in an operation as described in subsection 1 above is taken by the Government in general session. If the providing of such assistance is of major foreign policy importance, the decision is taken by the President of the Republic.

The Defence Forces may not be assigned to the duties referred to in subsection 1 without the decision-making procedure referred to in subsection 2 or 3, unless the authority of the Commander-in- Chief of the Defence Forces allows otherwise.

Finland is divided in 15 **Emergency Response Centre (ERC)** areas and all areas have their own ERC. The **ERC Administration** is directed and managed by the Ministry of Interior in cooperation with the Ministry of Social Affairs and Health. All emergency calls are made to one number, 112, and managed by ERC.

Rescue departments carry out the duties of rescue services in their respective rescue regions. They are supported by the Ministry of the Interior and represent the key actors to provide full coverage with rescue services at a defined level and to ensure that adequate tools and mechanisms for disaster risk management are in place. Regional rescue services are thus responsible for standards of service, appropriate organisation of the operations of the rescue departments as well as for other duties specified in the Rescue Act.

Six regional **State Administrative Agencies (AVI)** (+ Åland) supervise and assess the coverage and quality of rescue services and preparedness. They guide and direct rescue services' planning and coordinate plans in their respective regions.

The State Administrative Agencies together with the **Centres for Economic Development, Transport and the Environment Centres (ELY)** play a central role in the preparedness of regional administration.

As mentioned above, the environmental authorities are another key player in Finland's disaster preparedness and response. For instance, the **Finnish Environment Institute (SYKE)** operates

subordinate to the Ministry of the Environment. The Institute has research facilities and in combating chemical releases at sea it takes the general command over rescue units. Vessels utilised in these situations are mainly operated by the Frontier Guard, the Defence Forces or municipalities.⁹⁸²

Another example of a competent authority is the *Radiation and Nuclear Safety Authority (STUK)*, which operates 288 stations continuously measuring radiation in the environment (see also 4.2).

The *Finnish Crisis Management Centre (CMC Finland)*, located in Kuopio, is a governmental institution and a centre of expertise in *civilian* crisis management. Thus, it is not within the focus of this study, but worth mentioning. The main tasks of CMC Finland are to train and recruit experts for international civilian crisis management and peacebuilding missions as well as conduct research focusing on civilian crisis management. CMC Finland acts as a national head office for all seconded Finnish civilian crisis management professionals.⁹⁸³

3.2 Organisational cooperation

3.2.1 National Cooperation

All competent ministries have strong links and mechanisms for cooperation with local governments as well as key agencies and associations who support them in translating national policy into local and regional delivery. Resulting from the heavily decentralized system in correlation with the responsibility to cover all aspects relevant for disaster risk reduction in each competent authority, a lot of networks, specific agencies and sectoral cooperation exist at all levels including all sorts of stakeholders and actors as well as cross-border/bi- and multilateral international agreements (see 3.2), to fulfil the respective tasks within the authority's mandate.

For example, the *Red Cross*, as a major *non-governmental* response organization, has an auxiliary response capacity and is well integrated in public preparedness planning. It coordinates 50 voluntary response organizations within the framework of a Voluntary Rescue Service network (Vapepa, see also 2.6).

Environment accident response is another example of cooperation between a wide range of authorities and actors. They include the Finnish Environment Institute; Centres for Economic Development, Transport and the Environment; municipalities; the Finnish Transport Safety Agency; the Finnish Navy; the Rescue Departments and the Finnish Border Guard.

Businesses and organisations also participate, e.g. in *oil-spill response* at sea; the increase in marine traffic in the Baltic Sea is leading to an increased risk of oils spills. The Ministry of the Environment is responsible for general guidance and monitoring with regard to prevention of and response to oil spills and chemical spills at sea and land. SYKE, the Institute for Environment, is responsible for the prevention of and response to oil spills from ships whereas regional rescue services are responsible for the prevention of and response to land-based oil spills.⁹⁸⁴

⁹⁸³ Crisis Management Centre Finland CMC http://www.cmcfinland.fi/en/crisis_management_centre

⁹⁸⁴ Emergency Prevention, Preparedness and Response Working Group (EPPR) of the ARTIC COUNCIL <http://www.arctic-council.org/eppr/about-eppr/>

As mentioned under 2.4, the **National Emergency Supply Agency (NESA)** has been created, with the task to promote and co-ordinate the preparedness of the authorities to steer the country's economy for crisis situations and serious disturbances, thus securing the critical infrastructure and production activities of society, as requested by the Security of Supply Act and the Security Strategy for Society. This has resulted in a Public-Private Partnership in Security of Supply (see Figure 4).

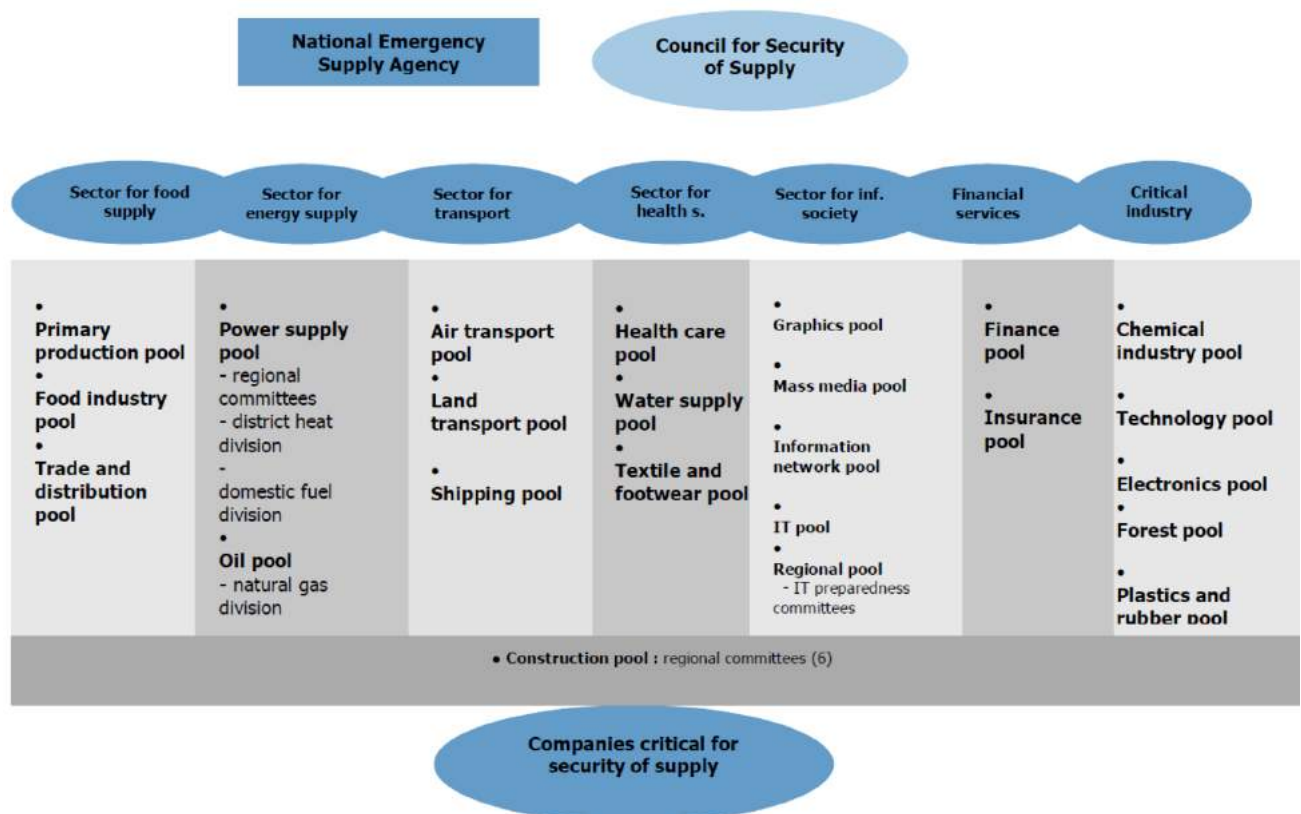

Figure 11: Public-Private Partnership in Security of Supply

Source: Ministry of the Interior: National Platform for Disaster Risk Reduction. Ministry of the Interior publication 14/2012.

Public opinion polls show that 99 per cent of all Finnish citizens trust the rescue services and evaluate their work positively. As mentioned earlier, the Government has furthermore set an ambition to make the Finnish rescue services the most effective in Europe and is currently planning a reform to improve their cost-effectiveness.

3.2.2 International Cooperation

The Country Study on Finland within the ANVIL project⁹⁸⁵ summarizes international cooperation as followed:

⁹⁸⁵ Country Study: Finland. The ANVIL project. June 2013

Up to now, Finland has not officially requested disaster assistance through regional and international arrangements. Nonetheless, Finland has entered into multiple bilateral agreements on mutual crisis management assistance which cover all neighbouring countries. In addition, Finland has signed related regional and multilateral provisions of the Council of Europe, the EU, NATO, the OSCE and the UN. On the regional level, Finland has signed provisions of the Council of the Baltic Sea States (CBSS), the Nordic Council of Ministers (NCM), the Baltic Development Forum and the Baltic Sea States Subregional Cooperation (BSSSC).

Finland takes part in international relief and rescue operations mainly under agreements signed with its neighbouring countries as well as through the European Union Civil Protection Mechanism (Monitoring and Information Centre, MIC) and on assignments from the United Nations Office for the Coordination of Humanitarian Affairs (OCHA). Finland takes part actively in developing crisis preparedness under NATO's Partnership for Peace programme. Finnish assistance has taken place through the UN's UNDAC team (United Nations Disaster Assessment and Coordination Stand-By Team), or in the EU/MIC team of experts. Since 1993, Finland has maintained the FRF (Finnish Rescue Force) which is a 200 person task force for search and rescue missions in international assignments. A typical FRF team comprises 40 people and their equipment with a capacity of two weeks' self-sustaining operation in a disaster area.

Finland has been relatively careful in offering assistance and aid in civil security crises; a recent example of the Russian forest fires in 2010 showed the traditional careful consideration and respect of formal state agreements and hierarchical proceedings in providing help. The decision to provide assistance overseas is made by the Ministry of Interior at the request of another state or an international organisation. Capacity building, training and other practical tasks for international missions are ensured by the Crisis Management Centre (CMC) in Kuopio. Once a decision is made to provide assistance, the members of the task-force will be recruited among regional rescue services staff trained for international missions.

Rescue operations may include firefighting, searches, rescue, first aid, clean-up of oil and chemical spills, damage assessment and water rescue missions. Assistance may also include helping the population on site or evacuating the population, in which case leadership, electricity and power generation, cleaning and supplying water and arranging temporary accommodation may be involved.⁹⁸⁶ Thus, Finland contribute civilian resources—civil protection assets and UN Disaster Assessment and Coordination (UNDAC) personnel—or make cash contributions to humanitarian agencies. Finland does not contribute *military assets* to disaster responses⁹⁸⁷, but has as strong focus on developing niche capabilities of Defence Forces with regard to international assistance in military and civilian crisis management.⁹⁸⁸

Regarding regional cooperation and bilateral treaties, the Finnish Red Cross's report on legal preparedness for international disaster response 2014 states:

Finland participates in regional collaboration through various cooperation bodies and local and bilateral agreements. The regional divisions related to the agreements and cooperation bodies

⁹⁸⁶ VADEMECUM: Finland http://ec.europa.eu/echo/files/civil_protection/vademecum/fi/2-fi-2.html#inter

⁹⁸⁷ Stockholm International Peace Research Institute SIPRI. *The effectiveness of foreign military assets in natural disaster response*. Solna, 2008.

⁹⁸⁸ Ministry of Foreign Affairs. *Finland's Comprehensive Crisis Management Strategy*. 2009

are not necessarily consistent, and the system of agreements is not hierarchical. The most relevant agreement is usually applied to rescue services and international aid.

International obligations are usually implemented by law and/or a Government Decree. If regulations contain provisions of a legislative nature they are implemented in accordance with Section 94 of the Constitution of Finland.

For regional agreements, the report lists⁹⁸⁹:

1. Nordic agreements
 - a. Nordic agreement on rescue services (NORDRED)
 - b. Nordic Framework Convention on Health Care (NORDHELS)
2. Barents Treaty
3. Agreement on cooperation on aeronautical and maritime search and rescue in the Arctic
4. bilateral agreements between municipalities of Norway and Sweden based on the NORDRED agreement with regard to intermunicipal cooperation (agreements are based on the principle of reciprocal services and operations)
5. possible agreements of authorities on assistance, costs and cooperation with the Russian authorities, based on the Barents Treaty

For bi-lateral (national) agreements (additional to the above mentioned multilateral agreements):

1. Russia
 - a. Cooperation in sea and air rescue
 - b. Agreement on cooperation for the prevention of accidents and their consequences
2. Sweden
 - a. Agreement on cooperation in maritime and aeronautical rescue services
3. Norway
 - a. Agreement on cooperation regarding search and rescue services in border areas
4. Estonia
 - a. Agreement on cooperation and mutual assistance in cases of accidents
 - b. Agreement concerning cooperation on maritime and aeronautical search and rescue

3.2.3 Operational aspects regarding international assistance

The Finnish Red Cross provided a very good overview on the regular processes regarding international assistance⁹⁹⁰:

⁹⁸⁹ For more information on the respective agreements, see Finland's legal preparedness for international disaster response - Finnish Red Cross 2014 under <http://www.ifrc.org/en/what-we-do/disaster-law/news/europe/>

⁹⁹⁰ Finland's legal preparedness for international disaster response - Finnish Red Cross 2014 (p.34 f)

Requesting assistance

In Finland, the duty and jurisdiction for requesting international assistance is determined by the nature of the incident and by the system of agreements within which the request is being made.

Requesting international assistance does not presuppose that a national emergency or a state of emergency has been declared. No special criteria have been set in legislation or preparation for requesting assistance. There is no obligation to request international assistance or accept offers of assistance. Finland can reject all offers of assistance or specify the assistance it needs or is willing to accept, from individual employees to vehicles. Requests for assistance must be explicit and specified.

*In accordance with Section 35 of the Rescue Act, if authorities from more than one sector take part in rescue operations, the officer in charge of the rescue operations is in overall charge of the situation. In practice, the officer in charge of rescue operations in the area of the accident notifies the Department for Rescue Services of the Ministry of the Interior of the accident (or the officer on duty at the ministry outside office hours). They also assess the need for requesting international assistance. According to Section 38 of the Rescue Act, “the Ministry of the Interior may also request international assistance in the field of rescue services from the European Union, other states or international organisations”. The decision to request assistance is made by the **Director-General of the Department for Rescue Services** at the Ministry of the Interior of his or her deputy.*

*All administrative sectors have their own general leadership and, in cases such as cross-border threats to health, international assistance can be requested by the **Ministry of the Interior** or, in incidents relating to radiation safety, by **STUK**. Each authority decides on requesting assistance and the content of the assistance within its sector.*

*The **Finnish Red Cross** can request assistance independently from national Red Cross organisations in other countries, the International Federation of Red Cross and Red Crescent Societies (IFRC) and the International Committee of the Red Cross (ICRC). In the Cap of the North, the Finnish Red Cross can request assistance independently in Finland, Sweden, Norway and Russia. The Nordic countries have made agreements on mutual assistance between national Red Cross organisations (the cooperation is based on agreements made at regular meetings).*

Finland has no common arrangements in place for requesting international assistance nor a designated body to process the offers of assistance received when international assistance is requested. At the international level, in particular in the case of large-scale disasters, several operators from different sectors and systems may offer assistance. In order to guarantee and define the correct and rapid assistance it would be useful to create a national system for processing offers of assistance.

National Contact Points

*The national contact point in Finland is the **Government’s Situation Centre** which operates under the **Prime Minister’s Office**. The **Government Situation Centre** is an around-the-clock*

contact point for officers on duty at ministries and for situation centres in various administrative sectors.

The Government Situation Centre is responsible for international communications related to the information it has received. Using the CECIS, the Government Situation Centre passes on the requests for international assistance made by Finnish authorities to the ERCC and other possible providers of assistance.⁹⁹¹

The principle rule is that the Ministry of the Interior is the competent authority and provides guidance in arrangements related to international assistance when many authorities are involved in a situation, but other agencies may have been designated as the national contact point in different agreement systems. Agreements relevant to this report include emergency notification and assistance systems of the IAEA, where the Radiation and Nuclear Safety Authority (STUK) under the Ministry of the Interior serves as the authority responsible for cooperation and situations of cross-border threats to health, where the jurisdiction lies with the Ministry of Social Affairs and Health. For sea rescue, the decision to request international assistance is made by the Maritime Rescue Coordination Centre. In air rescue, international assistance is requested by the aviation authority.

Rescue departments in Finnish border municipalities have special agreements on mutual assistance in rescue services with border municipalities in Sweden, for example. With Russia, Finland has adopted various common methods developed in practice over time. Local agreements may designate rescue departments or emergency response centres as contact points. According to the Barents Treaty, the primary national contact point in Finland is the emergency response centre in Oulu.

Finland has a long history of cooperation with Russia, and national contact points may be defined differently in various agreements. In addition, part of the information in the agreements is outdated.

Several reforms have taken place in the Finnish administration since Finland signed many international agreements; for example, the new Emergency Response Centre Agency was established in Finland, and in the agreements the definitions of contact points are not entirely up to date. The Ministry of the Interior has proposed that all contact point operations based on treaties be concentrated at the Government Situation Centre.

⁹⁹¹ The Government Situation Centre has no jurisdiction to issue decrees or regulations and serves as a coordinating authority only. It receives event notifications and reports from international partners and follows the news cycle. (Red Cross report)

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

According to section 47 of the Rescue Act, authorities, agencies and state and municipal enterprises are all required to provide their executive and expert assistance as need be to prepare emergency plans under the direction of the rescue services.

There is also an obligation to ensure business continuity and cooperate during responses to disasters and emergencies. Furthermore, dedicated emergency plans have to be set up for public events as well as for specific risk-prone buildings or industrial sites, under the responsibility of the owner or the occupant. Plans, which should follow the minimum requirements defined in the Rescue Act and be submitted to the rescue services, are checked regularly by the regional state agencies. The Rescue Act also requires educational institutions and hospitals to prepare and update emergency plans anticipating dangerous situations and their impacts, with detailed instructions for evacuation. Under the Internal Security Programme, local security plans should also be prepared at the local level. Community participation in emergency planning is furthermore enabled by the Finnish National Rescue Association and also by programmes of the Red Cross.

For specific areas, like nuclear facilities (fostered by the government decree on Emergency Response Arrangements at Nuclear Power Plants 2008) or ports, cooperation within the development of emergency plans with relevant business and industrial operators is requested.

Though, emergency plans most likely exist for all possible situations at all levels, a dedicated written (English) example could not be found within this study.

An example for emergency plans resulting in guidelines is the Safety Manual of the Port of Kokkola⁹⁹².

4.2 Operations planning

As mentioned before, each authority is responsible for its statutory functions not only during peacetime, but also during crises such as serious international disturbances, the threat of an armed attack, war, post-war situations, economic crises and disasters. Due to the all-hazard approach and the low risk profile of Finland, usually no specific operations planning are set out, but *contingency planning*.

The responsibility for self-preparedness also applies for owners or holders of a building, an industrial or commercial entrepreneur, an agency, institution or other organisation as well as for those, running operations which may particularly endanger people, property or the environment. The liability includes preparing rescue measures which they can take at their own initiative. The population exposed to the danger must be heard when drawing up the plan and informed thereof.

Rescue services must be planned and arranged so that the measures may be taken efficiently and without delay. The service level of the rescue services must correspond to the accident threats

⁹⁹² Safety Manual of the Port of Kokkola <http://www.portofkokkola.fi/safety/guide/?lang=en>

present in the municipality. The municipality's duty is to assess the threats present in its area and determine the service level of its fire brigade according to the threats (see also 1.1.2).

The Ministry of the Interior, for example, states:

The Ministry of the Interior, along with other authorities, is obliged to ensure that it can perform its duties not only in normal conditions but also in abnormal and emergency conditions. The Emergency Powers Act obliges public authorities to ensure that they can also perform their duties with the least amount of disruption in emergency conditions. The authorities must do this by drawing up contingency plans, preparing for emergency operations and taking other measures. Preparedness for emergency conditions is managed, supervised and coordinated by the Government and by each Ministry in its field of operations.

Within the duties of each ministry lies the ensuring of the strategic tasks appointed to them by the Security Strategy for Society (see Table 3).

As a result, the Ministry of the Interior is responsible for the nation-wide rescue-service preparations and arrangements as well as for the co-ordination of the tasks of rescue services belonging to the spheres of operation of different ministries. The Ministry directs rescue services as well as supervises their availability and level.

Another example is STUK, the Radiation and Nuclear Safety Authority, which shall specify detailed safety requirements concerning the implementation of safety level in accordance with the Guide for Nuclear Power Plant Emergency Preparedness 2010, as originally requested by the Nuclear Energy Act (990/1987).

Respective contingency planning may include international actors or may also face emergency situation abroad. A few (very divers) examples for contingency planning:

- [Winter navigation risks and oil contingency plan \(WINOIL\)](#) of the Finnish Institute for Environment SYKE
- [Nordic Contingency Planning and Crisis Management](#) of The Nordic Forum for Emergency Matters regarding the Power Sector (between Finland, Denmark, Norway and Sweden)
- [Joint Contingency Plan for the Nordic Embassies in Kathmandu, Nepal](#)
- ARTIC COUNCIL: [Agreement on Cooperation on Marine Oil Pollution Preparedness and Response in the Arctic – Appendix IV Operational Guidelines](#)

4.3 Logistics support in crises

As mentioned throughout this study, each competent authority is responsible for ensuring the vital functions for society within its mandate in all aspects. As a result, no general authority for supporting logistical equipment during natural or man-made disasters could be found. Each authority is obliged to arrange related agreements if necessary.

Finnish Defence Forces may contribute equipment for logistical support, however the use of military assets is restricted (see 3.1)

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

Following the principle of the “competent authorities” (see 1.2), responsibilities for warning the population in times of crisis and emergencies are shared by a number of stakeholders and carried out on different levels and through multiple channels. The latest resolution for communications during crisis are the instructions of the Prime Minister’s Office of May 2013 Central Government Communications in Incidents and Emergencies, which *pay particular attention to seamless coordination of preparedness, management and communications activities as well as to effective flow of information. Reliable, efficient and timely internal and external communications are an inseparable element of incident management.*⁹⁹³ These instructions replaced the guidelines of 2007 Government Communications in Crisis Situations and Emergencies⁹⁹⁴.

The main early warning system in Finland is **LUOVA**, which is a *multi-hazard early warning system* operated by the Finnish Meteorological Institute in cooperation with other actors through a multi-agency process (FMI, SYKE and the Institute of Seismology at the University of Helsinki).

The strength of this state-of-the-art warning system is that it provides the appropriate technical platform to integrate and disseminate warnings. The platform is composed of several tools to integrate risk information and disseminate easy-to-use warning messages and maps through multiple channels to the risk management stakeholders. Initially developed for natural hazard warnings, it is now used for weather, marine, flood, earthquake, tsunami and space weather warning in close cooperation with other technical agencies. It builds on the 24/7 forecasting operations of FMI, and its daily colour-coded weather warnings based on pre-defined thresholds. LUOVA can be used to deliver tailored warnings with different lead-times and risk information depending on the users’ needs.

Other technical systems are also available to provide dedicated warnings for forest fires through automatic satellite detection, or nuclear radiation detection. On the basis of the information received from the LUOVA system, the authorities plan on their own actions and warn the public.

Currently, FMI and SYKE are working jointly to establish the **Flood Warning Centre** which is expected to become operational as of 2014. The aim of the Flood Centre is to provide Finnish society with information related to floods from one point of contact available 24/7.

The Emergency Warnings Act 10.8.2012/466 legislates on emergency warnings issued by the authorities to be broadcast on the radio or on television. Emergency warnings are brief announcements to warn and instruct the public that can be issued by the competent authority if it is necessary to warn the public when a dangerous incident may threaten the lives or health of people or destroy or severely damage property. Regarding warning dissemination, specific partnerships with major broadcasting media have been set-up to allow programmes to be interrupted or to have a text message appearing on TV screens nationwide or at the regional level.

Public warning sirens are also used as they cover more than 80 per cent of the population.

⁹⁹³ Central Government Communications in Incidents and Emergencies. Prime Minister’s Office 03/2013 (Foreword)

⁹⁹⁴ Government Communications in Crisis Situations and Emergencies. Prime Minister’s Office 20/2007

Neighbouring countries are notified of nuclear accidents as well as oil and chemical accidents at sea or on boundary waters. The Ministry for Foreign Affairs plays a central role in foreign communications.

Finnish authorities currently use and continue to develop new methods for utilising the social media in context with emergency warnings, e.g. by participation of the Emergency Services College in the EU FP7 project ISAR+ (Online and Mobile Communications for Crisis Response and Search and Rescue).⁹⁹⁵

At the national level, the authorities communicate using the **VIRVE network**, which is based on the TETRA standard and is operated by the State Security Networks Ltd. The network covers the entire area of Finland, and access is limited to specific user groups. The network is primarily used by rescue departments, the police, Finnish Customs, the Finnish Border Guard and the Finnish Defence Forces. The Ministry of Transport and Communications decides on the user groups entitled to use the VIRVE network.

Furthermore, Finland is, according to the 2014 Peer Review Process⁹⁹⁶, currently developing two new operational systems making use of high technologies and introducing innovative working processes to improve cooperation and exchange of information during emergencies:

*The **ERICA** common operational platform will integrate information flows from all emergency response authorities nationwide (police, fire & rescue, medical, border guard), with GIS mapping, risk assessment information as well as operational models for emergency response for overall accident management in the Emergency Response Centres.*

*To complement this coordination platform of crisis centres, the operational **KEJO** system will support emergency operations of the Finnish authorities in the field. These systems aim to ensure that Finland has a coherent, reliable and networked nationwide emergency response administration by 2015. There is also a situation awareness system for environmental emergency response (Baltic Oil Response Information System, **BORIS 227**) for oil spills.*

⁹⁹⁵ More information on EU FP7 project ISAR+ at <http://isar.i112.eu/index.html>

⁹⁹⁶ Peer Review Report Finland 2014.

5 Capabilities

5.1 Human resources

The Comprehensive Report on the Rescue Services in Northern Finland from 2009 indicates resources related to the relevant tasks of rescue services as followed:

Within the 22 rescue service regions there are rescue departments with full-time (5000) and part-time personnel. On top there are 635 voluntary fire-brigades and 153 industrial brigades in Finland. The number of part-time and voluntary fire-fighter is 14300. Disaster planning, fire inspections and other duties of the authority are conducted by full-time rescue personnel. Law given duties of regional rescue services are: education and advising public and expert advisory to matters concerning rescue services, prevention of accidents and fires, civil defence, training for rescue personnel, planning and coordinating with different authorities, carry out rescue operations. Finnish rescue services have 4000 vehicles available and the annual expenditure is 340 million euro and they carry out 85000 missions annually. The missions are distributed between fires (18%), rescue missions (25%), checking and verification (35%), first response (medical) (15%) and assistance (7%).

Regional reforms and the joining of responsibilities are estimated here as reasons for the decreasing numbers of authorities but nearly constant numbers of personnel.

The Finnish rescue services currently lists its personal as follow⁹⁹⁷:

- 570 volunteer fire brigades⁹⁹⁸
- 105 institutional and industrial fire brigades Personnel
- 4,800 full-time employees
- 14,600 part-time and voluntary fire brigade members

To better estimate their capabilities; here are some average numbers of their operations:

- Emergency missions per year
The total number of call-outs for rescue departments is about 110,000 a year
- Fires
Every year, rescue departments are called out to about 15,000 fires.
Of these:
 - 6,300 are structural fires
 - 2,500 are vehicle fires

⁹⁹⁷ Ministry of the Interior - Department for Rescue Services. *Rescue services in Finland*. 2013

⁹⁹⁸ Number vary between 570 and 635 (RESCUE SERVICES IN NORTHERN FINLAND - COMPREHENSIVE REPORT 2009) from different resources, nevertheless the official statement by the rescue services from 2013 is listed

- 3,000 are wildfires (The number varies considerably from year to year, depending on the dryness of the summer.)
- 3,300 are other fires.
- Other call-outs

The average number of other callouts is 29,640 per year.

Of these

- 13,500 are traffic accidents
- 9,000 are loss prevention tasks
- 2,500 are tasks to combat oil spills
- 2,200 are tasks to rescue people
- 2,000 are tasks to rescue animals
- 320 are tasks relating to hazardous substances
- 120 are explosions and collapsed buildings, roads and other structures.

Both information on the rescue service's resources have to be topped with numbers of all divers other authorities involved in disaster preparedness and response, such as police, medical healthcare (pre-hospital and hospital healthcare), the Frontier Guard, the Emergency Response Centres, relevant agencies, equipment and personal of defence forces or the Network of voluntary organisations Vapepa (see 2.6), coordinated by the Red Cross etc. Volunteer rescue workers participate in search and maintenance, help and support for casualties and their families.

5.2 Materiel (non-financial) resources

See 5.1

5.3 Training

The competent authority for training of rescue services in Finland is the **Emergency Services College** in Kuopio under the supervision of the Ministry of the Interior (see 3.1).

As summarizes by the comprehensive report on the Rescue Services in Northern Finland (2009),

the Emergency Services College, in Kuopio, provides education and training in its field of specialisation under the supervision of the Ministry of the Interior. The College provides basic vocational training and further training in rescue services, preparedness training for emergency situations, and other training related to rescue services. The College provides training leading to a vocational degree in the following training programmes:

- Firefighter

- Emergency Response Centre Operator
- Sub-Officer
- Fire Officer, Bachelor of Engineering
- The Fire Officer's Training Programme is arranged in cooperation with Savonia University of Applied Sciences.

The College also provides in-service training for the personnel working for the rescue services and emergency response centres. The main goal is to ensure that these organisations have access to the best possible knowledge and skills to maintain the standard of the services they provide.

All vocational qualifications in the field of rescue services are awarded by the Emergency Services College. A matriculation examination or vocational qualification is a prerequisite for admission to an educational programme leading to a professional qualification in rescue services.

Training is also provided in international civil protection and civilian crisis management.

As an example for decision-makers training, the report states that

the ERC operator gets an 18 months long training at the Emergency Services College where they trained to receive and handle different types of emergency calls. After the initial risk assessment suitable actions are taken by the operator: send suitable response to the site or refer the caller to other services available.

According to Finland's Peer Review Report (2014),

*Training is also provided by individual associations and organisations, offering courses on an array of issues, including empowering people to take responsibility for their own security. For example, the **Finnish National Rescue Association (SPEK)** groups 37 NGOs dedicated to the advancement of rescue and safety to build an understanding of self-preparedness within Finland's communities. It cooperates closely with the Ministry of the Interior to develop and conduct courses in accident prevention, volunteer activities and preparedness, and civil protection. It also supports specific activities aimed at women and youth.*

*The **Finnish Red Cross**, with its 500 branches and some 30,000 volunteers, also offers courses in first aid and organises campaigns aimed at resilience-building. Its work is particularly impressive in supporting local communities to build risk awareness in scenarios such as winter power cuts or storms, as well as in supporting women's roles in resilience-building.*

*The **Finnish Association of Fire Chiefs** also provides fire, rescue and safety training, produces and publishes educational and training materials and makes proposals to improve safety.*

Cross-border and multinational trainings takes place in exercises within the respective bi- and multilateral agreements of Finland and its rescue service authorities (see 1.4.4 and 3.2.2).

5.4 Procurement

Various information about procurement aspects has been found within this study, though no specific answers to procurement regulations or procedures with regard to disaster risk reduction capabilities could be found within the given timeframe.

The **Public Procurement Act** (1505/1992; amendments up to 1530/2001 included), which is (probably) applicable for the procurement of most resources (the Act hasn't been mentioned by name in any related document)

The State authorities, local authorities and other contracting entities referred to in this Act shall, with a view to promoting competition and ensuring equal and non-discriminatory treatment of those who participate in a tendering procedure, observe this Act in their contracts.

*This Act shall **not** apply to:*

(1) contracts which are declared secret or contracts where the protection of the basic interests of the State's security requires a different procedure or where special safety regulations shall be observed in accordance with the laws, regulations or administrative provisions;

(2) supply contracts which are principally suited to military use;

(3) contracts awarded pursuant to the particular procedure of an international organisation;

(4) contracts awarded in pursuance of an international cooperation agreement entered into by Finland. (1247/1997)

The European Commission shall be notified of the international cooperation agreements referred to in section 1(2)(4) above. (1247/1997)

As a result, it could not be ruled out that specific regulations with regard to procurement of relevant capabilities exist.

The Finnish Red Cross for example, states⁹⁹⁹ about its own rules:

The procurement rules of the Finnish Red Cross ensure that all purchases are made cost-effectively. The rules are based on Finnish legislation, EU regulations and the rules of the Humanitarian Aid department of the European Commission (ECHO).

5.4.1 Procurement regulation

See 5.4

⁹⁹⁹ Logistics Centre of the Red Cross <https://www.redcross.fi/node/1556/what-finnish-red-cross/logistics-centre-finnish-red-cross>

5.4.2 Procurement procedures

See 5.4

5.5 Niche capabilities

Finland doesn't strive to develop specific niche capabilities relevant for the response of natural or man-made disasters. However, regarding niche capabilities in military and civilian crisis management, national strategies exist.

In context with civilian crisis management, Finland's National Strategy for Civilian Crisis Management (update 2014) states:

In addition to police, rule of law, border security, human rights and gender equality expertise, Finland is improving its capacity in offering civilian crisis management related niche capabilities to those situations that call for special expertise such as forensic pathology, victim identification and investigation of war crimes, rapid search and rescue support to supplement the local capacity, and different techniques for criminal sanctions, such as correctional services. One should also look into other fields within the judicial sector, from which Finland has a lot to offer, such as the development of legal services, legal assistance and areas involving access to justice. Attention will be paid to competence related to the operating environment as well as conflict and culture sensitivity. There is a global demand for Finnish civilian crisis management know-how. The aim is to increase the export of expertise in civilian crisis management, social and gender equality and international security.

The development of niche capability in military crisis management is requested by the Security Strategy for Society (2010).

Nevertheless, some of the above mentioned capabilities also apply to response capabilities related to natural or man-made disasters, as treated in this study. Considering the high level of education and the up-to-date technical standard, it is assumed that individual experts, such as **Finnish communication experts** are recognized, for example for technical assistance support teams for On-Site Operations Coordinations Centers, though it couldn't be found out within the timeframe of this study.

Resources

Legislative acts

The Finnish Red Cross's report on legal preparedness for international disaster response 2014 lists the following acts as sources with regard to legislation:

Act on Centres for Economic Development, Transport and the Environment 20.11.2009/897

Act on Cooperation between the Police, Customs and the Border Guard 11.9.2009/687

Act on Emergency Response Centre Operations 20.8.2010/692

Act on Health Care Professionals 28.6.1994/559

Act on Oil Pollution Response 1673/2009

Act on Regional State Administrative Agencies 896/2009

Act on Relief of Double Taxation 18.12.1995/1552.

Act on State Civil Servants 19.8.1994/750

Act on State Treasury 15.2.1991/305

Act on the Airport Network and Airport Charges 11.3.2011/210

Act on the Autonomy of Åland 16.8.1991/1144

Act on the Defence Forces 11.5.2007/551

Act on the Delimitation of the Territorial Waters of Finland 18.8.1956/463

Act on the Emergency Services College 21.7.2006/607

Act on the Finnish Meteorological Institute 19.12.2008/957

Act on the Finnish Red Cross 25.2.2000/238

Act on the Formation of Rescue Service Regions 1214/2001

Act on the Openness of Government Activities 21.5.1999/621

Act on the Participation of Civilian Personnel in Crisis Management 30.12.2004/1287

Act on the Provision of Assistance by the Defence Forces to the Police 5.12.1980/781

Act on the Recognition of Professional Qualifications 30.11.2007/1093

Act on the Use of Certain Internationally Protected Symbols 21.12.1979/947

FRANCE

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: EPLFM (Frédérique Giroud)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by FhG-INT and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

The French crisis management & disaster response concept is driven by the ORSEC mechanism (Organisation of the Civil Defence Response) which organizes event management and crisis management. As it is modular and progressive, it can adapt to the type, scale and evolution of the event. In the occurrence of a major disaster, the Prime Minister is the head of upper level operations. Operations are coordinated with the other ministries. The operational organization managing crises at the Directorate-General for Civil Protection is the Interministerial Crisis Management Operating Centre (COGIC). The COGIC can activate national means in response to crises. All French departments have an operational centre or crisis unit. At the departmental level, the department Prefect, invested with police powers, is the Director of Rescue Operations (DOS). He commands the ORSEC mechanism (Organisation of the Civil Protection Response). He activates the Departmental Operational Centre (COD) and deploys the Operational Commandment Post (POC). At the departmental level, the Prefect gathers around him a hard core of actors: Departmental Fire and Rescue Service (SDIS); sanitary and social services; police; gendarmerie (military police); regional council; equipment agency; civil protection associations. Each entity has its own organization and its own operational response. Of course, NGOs participate to crisis management but they must receive an agreement from the General Directory of Civil Protection and Crisis management (DGSCGC) in order to work and to be integrated into an emergency device. Moreover, private businesses can be requisitioned by the Prefect as needed. Each institution involved in crisis management participates with its own funds and according to their policy to the preparation of rescue operations and response. Financing can be from national or local (region, department, municipal...) sources.

Concerning international cooperation, the Ministry of the Interior, through a specific unit, is in charge of managing the engagement for disaster response and relief.

France owns several modules that can be sent in reinforcement for crisis in the EU or other MS.

1 Policy

1.1 Risk Assessment

Risk assessment in France is established based on the study of hazards and stake vulnerability, it is integrated in risk prevention plans, elaborated at the initiative of the State, and stipulated and approved by the Prefect after consulting local authorities and after a public inquiry.

This knowledge relies on three foundations:

- Knowledge of past events thanks to historical researches and to the creation of data bases (seismicity, climatology, snow layer study), atlases (flood risk area maps, avalanche hazard maps), etc..;
- Research conducted by different services of the State, such as Météo-France (French national meteorological centre), and by French and European laboratories with the aim of penetrating phenomena mechanisms and anticipating their behaviours, either for earthquakes, ground movements, forest fires or hydraulic and technologic risks;
- Technical studies that enable to establish maps predicting the increase and intensity of the phenomena. Those studies sometimes allow predicting the appearance of some events a few hours or a few minutes before their appearance.

The regional Prefect, with the support of the regional directorates, operates the management and the coordination of government policies, especially the ones related to crisis management, implemented under the authority of the departmental Prefect.

The Prefect is required to inform the Mayor of the risks present on his municipality (*art. L.121-2 du Code de l'Urbanisme; French town planning code¹⁰⁰⁰*). Nevertheless, local elected representatives can take the initiative of additional studies if needed. The “porté à connaissance” (brought to notice) of the Prefect is the Mayor’s main source of information for natural hazards. In addition to the DDRM (Dossier Départemental des Risques Majeurs: Departmental File for Major Risks), the Prefect has to forward to the Mayor all available documents concerning the natural and technological risks present on the district.

France is mainly subject to flood and ground movement hazards (especially clay shrinkage and swelling) but also to phenomena linked to atmosphere (storms, cyclones in the DOM TOM (Departments and Territoires d’Outre Mer: Overseas Departments and Territories), lighting, hail, snow and freezing rain), to periods of intense cold, heat waves or drought, to forest fires and to avalanches. The country is also subject to seismic risks and more locally to volcanic eruption. The tsunami risk should also be taken into account.

¹⁰⁰⁰<http://www.legifrance.gouv.fr/affichCodeArticle.do?cidTexte=LEGITEXT000006074075&idArticle=LEGIARTIO00006814375&dateTexte=20100204>

According to the Ministry, two out of three municipalities are more or less submitted to at least one natural risk. For a total of 36 000 municipalities, more than 18 000 are vulnerable to flooding (more than one out of four French person and one out of three jobs would be situated in a potential flooding area).

Likewise, more than 11 000 municipalities are vulnerable to ground movements, not less than 21 000 municipalities are subject to seismic risk and more than 6 000 are threatened by forest fires.

The notion of technological risk, opposed to the one of natural risk, gathers the risks from anthropogenic origins: industrial, nuclear and biological risks. Four sources of major technological risk are presents in France: industrial facilities, nuclear facilities, large dams and hazardous material transports. Furthermore, mining sites can also be a source of accidents.

1.2 Policy and Governance

1.2.1 Strategy scope and focus

In the following table are reported the actors in charge of each activity, showing that the strategic scope of crisis management is fully covered.

What	Who	How
Hazard knowledge	Ministry of Sustainable Development Ministry of Agriculture (forest)	Financing of scientific and technical studies
Monitoring	Ministry of Sustainable Development Ministry of Agriculture Ministry of the Interior (Home Office) Ministry of Research	Equipment of the areas with means to monitor floods, volcanism, large ground movements, earthquakes, tsunamis.
Information	Ministry of Sustainable Development Ministry of Interior (Home Office) Mayor	The Prefect creates, with the Ministry of Sustainable Development financing, the DDRM (Department File for Major Risk). The Mayor creates the DICRIM (Dossier d'information communal sur les risques majeurs: Municipal Information File for Major Risks) The Ministry of Sustainable Development operates a national dissemination of the information via internet.
Education	Ministry of National Education Ministry of Sustainable Development Ministry of Research	Transcription in Middle school and high school programs and in the multi disciplinary sixth-grade school project (TPE: travaux personnels encadrés)

		Network of Coordinators besides the local education officers National day for the risk
Risk Awareness and Land Planning	Ministry of Sustainable Development	Establishment of risk prevention plans (PPR: plans de prévention des risques). National regulatory compliance of seismic risk prevention (seismic zones, earthquake-resistant construction rules) Checking of regulatory compliance
Mitigation	Ministry of Sustainable Development	Training of professionals (architects, engineers, tradesmen)
The preparation of the crisis	Ministry of the Interior (Home Office) Mayor	Depending on the scale, civil protection services or the Mayor prepare the crisis. See section 2.5.
Experience feed-back	The participants to the preparation of the emergency plans	Missions of disasters analysis : experience feed-back
Crisis management	Ministry of Interior (Prefect) Mayor Regional Council (fire fighters)	Mobilisation of means for response and recovery (state employees, public services, possibly army)
Compensation	Committee for natural disasters (Ministry of economy, Ministry of Sustainable Development, Ministry of Interior, Central reinsurance Agency)	Once the Order of Natural Disaster is taken, the insurances set up a specific compensation procedure

Table 5 Responsibilities of crisis management players (EPLFM document)

1.2.2 Monitoring and analytical support to policy making; R&D

The French State works to improve a global environment favourable to companies and to innovation, and to sustain the research and development effort (R&D) led within competitiveness clusters. Therefore, at the national or regional levels, it supports their research and development projects:

- By granting, via the Interministerial single fund (FUI: Fond Unique Interministériel), financial aids to the best R&D projects having an economical objective, via calls for projects; besides the financial aid of the State, the projects will benefit from aids from local authorities and community funds (ERDF: European Regional Development Fund).
- By setting specific or generic supports through the program for investment with prospects;

- By involving various partners: National Agency for Research (ANR: Agence Nationale de la Recherche), Public Bank for Investment (BPI France: Banque Publique d'Investissement), Deposit Office (Caisse des Dépôts).
- By facilitating the access to information on European programs to support innovation, through the European Enterprise Network (EEN) in particular.

Every year, the National Research Agency (ANR) launches a generic call for projects, open to all scientific fields and to all kinds of researches, from the most academic projects to applied researches carried out in the frame of partnerships with companies, SMEs (small and medium-sized enterprises) and SOHOs (single office/home office) in particular.

The scientific and thematic fields targeted by this call for projects and the financial instruments available are numerous and include regularly the theme of crisis management. This integrated tool is included in the frame fixed at French level by the strategic Agenda “France Europe 2020”.

Furthermore, to facilitate international collaborations, the ANR has concluded bilateral agreements with homologous agencies. The projects integrated in this frame (PRCI: Projets de Recherche Collaborative Internationale; International Collaborative Research Projects) are included in the generic call for projects but are submitted to a specific submission timetable.

Otherwise, all local authorities (city halls, prefectures, and region) can launch a request for proposals in research and development on the theme of crisis management depending on territorial needs.

1.2.3 Policy for Prevention

The French State guarantees the protection of the population and of the environment. Both at the departmental and regional level, State services work to prevent and manage natural and technological risks (natural risks, mining, technological, industrial and sanitary) and to guarantee population protection. The head office for risk prevention (DGPR: Direction Générale de la Prévention des Risques), is one of the seven specialised modules of the central office of the Ministry of Ecology, of Sustainable Development, of Transports and of Housing (5 head offices and 2 delegations of power) which includes various expertise in order to implement the policies stemming from the multiparty debate on the environment (Grenelle de l'Environnement¹⁰⁰¹).

The DGPR (head office for risk prevention) develops and implements the politics for the knowledge, assessment, prevention and reduction of technological, natural and hydraulic risks, risks linked to human activity, pollution and nuisances, as well as waste management. It also works on the nuclear safety and radioprotection policy, under the joint custody of the Minister of Sustainable Development, of the Minister of Industry and of the Minister of Health. Finally, its role of interministerial coordination is applied on matters of major risk prevention, on fight against noise and on waste management.

¹⁰⁰¹ http://www.side.developpement-durable.gouv.fr/userfiles/memento_maires.pdf

The prevention policy leans on the seven pillars of prevention, which complement each other, they are:

- knowledge of hazards and stakes;
- monitoring, forecast, awareness and warning;
- training and preventive information of citizens;
- monitoring of urban development and of building methods through regulations and plans for risk prevention;
- reduction of vulnerability;
- protection and planning of rescue teams;
- preparation to emergency situations by taking into account experience feedback.

This policy adapts and gets richer by fighting against oblivion and by analysing past crises.

1.2.4 Policy for Preparedness

When a phenomena starts, the best operational response must be given as quickly as possible (alert and information, emergency response, support). Each organisation, each participant to crisis management, previously and operationally prepares its response in terms of staff and means, with different tools and supports.

The policy of preparedness is based on plans at various levels:

- At the local level, from where the crisis starts, specific plans are set up by local authorities:
The local protection plan, (PCS: Plans Communaux de Sauvegarde¹⁰⁰²) organises the mobilisation of the resources of the municipality in case of civil protection events. It is mandatory for some municipalities exposed to localised major risks. At this local level, the Mayor can constitute a municipal civil protection reserve, used to protect people.
- At the inter-municipalities level, the specific intervention plan (PPI: Plan Particulier d'Intervention¹⁰⁰³) is a device defined in France to protect populations, goods and environment, to face specific risks linked to the existence of one or more industrial equipments. This PPI, designed and written by the public authorities, is part of the departmental ORSEC device.
- At the departmental level or zone level, the organisation of the civil protection response (ORSEC: Organisation de Reponse de Sécurité Civile¹⁰⁰⁴) worked out by the State, aim to prepare actors, in a preventive way, to the management of natural and technological risks

1.2.5 Policy for Response

« The political and strategic leadership for response to major crisis is given by the President of the Republic and by the Prime Minister. They provide the impulse and political decisions during a crisis. They must be able to rely on commandment means adapted to major crises, enabling

¹⁰⁰² http://www.mementodumaire.net/wp-content/uploads/2012/07/Guide_PCS.pdf

¹⁰⁰³ www.interieur.gouv.fr/content/download/36242/.../plaquette%20PPI.pdf

¹⁰⁰⁴ <http://www.interieur.gouv.fr/Le-ministere/Securite-civile/Documentation-technique/Planification-et-exercices-de-Securite-civile>

them to be informed in real time on the crisis and to steer government communication. This organisation must be known by the public, media and by the different interveners in France and abroad. It will be the natural entry point into the crisis management device for European and International high level interlocutors. »

Extract from the White Paper on Defense and National Security¹⁰⁰⁵ (p.192)

The political and strategic leadership of the crisis is based upon a crisis unit, permanently activated at the Hotel de Matignon in the occurrence of a crisis. This unit is under the authority of a member of the cabinet of the Prime Minister. The General Secretariat of defence and national security is in charge of office duties.

The crisis unit of the Prime Minister oversees strategic crisis steering and is in permanent liaison with the minister in charge of operational action enforcement.

The composition of the crisis unit is not rigid but adapted to the specifics of each crisis.

The Prime Minister is in charge of steering the operational aspects of a crisis on the national territory. In this respect, the Directorate of National Security Planning (DPSN: Direction de Planification de Sécurité Nationale) manages the Interministerial Crisis Centre located Place Beauvau. This centre guarantees the transmission of information to the political and strategic leaders of the crisis (President of the Republic and Prime Minister) and to the Ministry of the Interior. It suggests strategic decisions to the political and strategic leaders of the crisis (DPSC), guarantees interministerial operational continuity through the operational centres of the ministries and elaborates in close collaboration with the DPSC the crisis communication strategy.

If the crisis is restricted to the departmental or zone level, the prefect will be the director of rescue operations and will determine the strategic axes for crisis management. His objective is: « return to the normal situation as fast as possible and in the best conditions ». He can mobilise the whole of public and private means.

If the crisis is restricted to the municipality level, the Mayor, with his police power, is the director of rescue operations.

1.2.6 Policy for Relief and Recovery

Emergency planning is defined by the DGSCGC within the Ministry of Interior. Depending on the extent of the disaster, in addition to emergency professionals, different actors can be mobilised on different levels, in the public and private domains. Indeed, state services, rescue services, territorial authorities, network operators (telecommunications, electricity, transport, water), associations, and operators of classified sites can intervene.

The involvement of territorial authorities is very important because they have increasing human and material resources and they have good field knowledge. Regarding defence and national security, the cooperation between civilians and militaries remains a major asset. Finally, it seems essential to integrate the citizen into the crisis management system to favour risk awareness so he can play an active role. This would strengthen the resilience capacity of a population.

¹⁰⁰⁵ <http://www.defense.gouv.fr/actualites/la-reforme/livre-blanc-2013>

During a disaster, France is divided into four territorial levels:

- The local level;
- The departmental level;
- The zone level;
- The national level.

In order to efficiently perform their functions and to be properly informed all the authorities concerned have, at these different levels, all the respective commandment structures.

In a crisis management situation, the roles are well defined.

The Director of rescue operations (DOS: Directeur des Opérations de Secours) determines the strategic axes for crisis management. His objective is: « return to the normal situation as fast as possible and in the best conditions ». He can mobilise the whole of public and private means.

During events on his municipality, the Mayor, with his police power, is the DOS. In larger crises, the Prefect is the DOS, and if he is absent, this function can be taken on an interim basis by the Prefect's Chief of staff.

The director of the Departmental Fire and Rescue Services (SDIS Director) is usually the Incident Commander (COS: Commandant des Opérations de Secours), but this role can be carried out by the Departmental Director of Public Security (DDSP: Directeur Départemental de la Sécurité Publique) for an internal security crisis. Under the authority of the DOS, he carries out, on the accident site, the coordination of all public, private or associative rescue means, to accomplish rescue operations.

This commanding unit (DOS/COS), articulated between a strategic and a more operational level, allows the coherence of operations and constitutes one of the first fundamental principles as well as a specificity of the French Civil Protection.

The recovery policy concerns two different topics:

- Once relief and rescue operations are completed, crisis management actors must evaluate, establish damage extent, observe what happened, understand the causes and the spatial and time evolution of the disaster, but also the strengths and weaknesses of the relief device that was applied. These findings allow to establish and to carry out management plans, repairs and improvements. For this, the office of planning, exercises and feedback is responsible, pursuant to Decree ORSEC of 13 September 2005¹⁰⁰⁶, of ensuring the synthesis and dissemination of lessons learned made under the authority of the representative of the state after any resort to the ORSEC device. Since 2010, the ORSEC portal is the instrument of feedback transmission. It is interesting to note that this tool is every year more and better used.
- Repair and compensation which go through the following steps:
 - Compensate
 - Repair
 - Finance

¹⁰⁰⁶ <http://legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000000421070>

- Perform the work

1.3 Financing

1.3.1 Investing in preparedness

Each institution participates with its own funds and according to their policy to the preparation of rescue operations and response. Financing can be from national or local (region, department, municipal...) sources.

The SDIS, for example, are autonomous administrative public entities and have an annual budget voted by the board of directors. The income (investment and operating) mainly originates from the following contributions: municipalities, inter-municipal public entities (EPCI), General Council (Conseil Général) and State (mainly investment aid funds – FAI).

Companies invest in prevention, preparation and rescue actions according to their safety policy and regulatory or legislative constraints.

For natural disasters, the Barnier funds have been planned. Created in 1995, the aim of these funds for the Prevention of Major Natural Disasters (FPRNM)¹⁰⁰⁷ was to finance the expropriation of assets exposed to natural hazards and representing a serious risk for human life. It is financed in part by insurance premiums for natural disasters. In 2005, its purpose was extended to:

- amicable purchase by the State, municipalities or groups of municipalities of assets strongly damaged by a natural disaster,
- actions to reduce vulnerability listed in a risk prevention plan (PPRN¹⁰⁰⁸) for assets positioned in risk areas,
- prevention studies and contractor works for local authorities having a PPRN plan.

1.3.2 Investing in consequence management

Each institution participates with its own funds to rescue operations. In France, free rescue is the principle and the cost must not be covered by the people who are rescued.

- The SDIS are in charge of the direct rescue and emergency operations expenses ;

¹⁰⁰⁷ http://www.cepri.net/tl_files/pdf/circulaire2007fondsbarrier.pdf

¹⁰⁰⁸ http://www.performance-publique.budget.gouv.fr/sites/performance_publique/files/farandole/ressources/2015/pap/pdf/jaunes/jaune2015_risques_naturels.pdf

- Municipalities finance expenses for immediate population needs (food, emergency accommodation, psycho-medical assistance, cleaning of streets...). The expenses for personnel and equipment of the SDIS are mandatory.
- The State pays for expenses linked to public and private means coming from outside the department (salaries, transport, personnel accommodation and subsistence, replacement of destroyed equipment...).

Insurances also finance part of the recovery with the Natural Disaster Fund. Indeed, in France there is a principle of solidarity and equality. This principle is applied to natural disasters.

Law n°82-600 of 13 July 1982¹⁰⁰⁹ promulgates the texts for the compensation of victims of natural disasters.

Any person having an insurance contract for property damage pays an insurance premium according to the chosen guarantees and capital. An undifferentiated extra premium, regardless risk type and exposure to natural hazard, is determined by the State and represents a percentage of the insurance fee: extra premium of 12% for house insurance and 6% for a car insurance contract.

The natural disaster condition is declared through the publication of a ministerial decree decided by an Interministerial Commission. The expenses are divided between the insurance and the insurance reinsurance fund (CCR – Fond de reassurance des Assurances). If the expenses are very high and exceed the CCR capacity, the State is called as a guarantee.

Finally, law n°95-101 of 2 February 1995¹⁰¹⁰ concerning environment protection, states the polluter-pays principle. Expenses resulting from pollution prevention, reduction and fight must be paid by the polluter.

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

In general, post-disaster assessment begins when the emergency services involved in crisis management leave from the disaster area. Of course, the transition from an emergency phase to the post-disaster phase is difficult to define. In any case, the emergency services will still have to participate in the early phase of post disaster.

We can therefore distinguish two steps in the post-disaster assessment: the short term one (post disaster) and the long term one (recovery & reconstruction). The post disaster may be a relatively short phase, covering the period between the withdrawal of services who managed the emergency phase and the beginning of the development of a device to handle reconstruction. This period can vary from several days to several months.

The reconstruction period that follows is much longer and can last several years. Themes of the post-disaster management can be grouped under the following framework:

¹⁰⁰⁹ <http://legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000000691989>

¹⁰¹⁰ <http://www.legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000000551804>

- Supporting people
- Evaluation and reporting of damage
- The administration of reconstruction
- The reconstruction
- The feedback.

1.4.2 Departmental Lessons Learned systems

Law No. 2004-811 of 13 August 2004¹⁰¹¹ on the modernization of the civil protection emphasises the need to improve the ORSEC plan by conducting exercises and feedback (lessons learned). This allows actors of crisis management (firefighters, SAMU, police officers, etc.) to better know each other and develop good habits; the feedback allows learning real or simulated accidents through those exercises. For large crisis (example, German Wings aircrash), there is always a Retex (retour d'expérience: feedback) report on what happened on how it was managed, and what could be improved.

The minister in charge of Civil Protection must disseminate the results as widely as possible. A methodological guide is available to apply the lesson learned systems.

At the local level, lessons learned process is conducted by the prefect. A meeting is organised with all the involved institutions. The mayor, having a major role in the post disaster phase can be supported by civil protection associations to support victims. As an example, the Specific Intervention Plans include general regulations to proceed to environment cleaning after a technological accident.

1.4.3 Centralised (national) Lessons Learned system

- Is there a centralised (national) Lessons Learned system (state/federal level)? If so, which is the responsible agency? How stakeholders exchange information about problems and success in previous events?

At the national level, this system is applied by Interministerial or parliamentary committees. The Ministry has specific structures and personnel in charge of elaborating the feedback system. The framework is the following:

- Gathering and analysing the data related to the disaster
- Setting up expertise groups participating to the definition of policies for prevention purposes.
- Disseminating the lessons learned from previous disaster analyses (in France or abroad)

At the moment, the lessons learned system is more focused on prevention and response and recovery management than on post disaster management. For this last problem, regulations mainly cover the compensation of victims through law n°82-600 of 13 July 1982¹⁰¹², creating the CATNAT

¹⁰¹¹ <http://www.legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000000804612&categorieLien=id>

¹⁰¹² <http://legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000000691989>

system (Natural disaster) and law n°2003-699 of 30 July 2003¹⁰¹³ and its application decree n°2005-1466 of 28 November 2005¹⁰¹⁴, creating the CAT-TECH device (Technological disaster).

- How is the system connected or planned to be connected to efforts at EU-level (i.e. DG ECHO lessons learned system)?

DGF ECHO organises *lessons learned* meetings for all the emergencies under the umbrella of the Civil Protection Mechanism. The French national civil protection focal point (an officer from the Ministry of the Interior) is invited by DG ECHO to participate at a lesson learned session that follows each activation of the EU Civil Protection Mechanism for a real crisis or for an exercise. For example, this was the case for the Croatia floods in 2014.

1.4.4 International exchange for Lessons Learned

After an international crisis, a lesson learnt session is organised by OCHA. If French rescue forces were involved in the crisis, the French representative (from the Ministry of the Interior or Ministry of Foreign Affairs) participates to this session, where the lessons learnt by the French forces are presented and discussed.

This was the case of the lessons learnt from UsAR procedures applied during the Haiti earthquake (Etude en temps réel de la gestion de la crise en Haïti après le séisme du 12 janvier 2010, groupe URD, Etude financée par la Délégation aux Affaires Stratégiques du Ministère de la Défense).

1.4.5 Regular policy reviews

The lessons learned process is primarily devoted to highlight the required areas of improvements. At the end of the lessons learned process, actions, associated to a schedule are proposed. Until now, lessons learned from previous disasters allowed numerous prefectures to set up structures improving civil protection events:

- Public information unit
- COD operating regulations
- ...

Those areas for improvement can be concerned by the correction of deficiencies observed during the crisis, but also in the promotion of attitudes and behaviours of organisations that have proven to be effective by reducing the impact of the crisis.

1.5 Resilience

- Does the country/IO implement the concept of resilience? If yes, please describe how it fits into the crisis management ecosystem

¹⁰¹³ <http://www.legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000000604335>

¹⁰¹⁴ <http://www.legifrance.gouv.fr/eli/decret/2005/11/28/ECOT0591227D/jo/texte>

The White Paper (2008 and 2013)¹⁰¹⁵ on defence and national security defines resilience as "the willingness and the ability of a country, society and government to withstand the consequences of an attack or major disaster, and to quickly restore their ability to work normally or at least in a socially acceptable mode."

In France, due to the increase of disaster frequency such as floods, regulatory and legislative measures have been taken. Can be listed, for example:

- Law No. 87-565 of 22 July 1987¹⁰¹⁶ organising civil protection and major risks prevention, creating the right to information.
- Law No. 95-101 of 2 February 1995¹⁰¹⁷ on strengthening environment protection, called "Loi Barnier."
- Law No. 2003-699 of 30 July 2003¹⁰¹⁸ on technological and natural risks prevention and on damage repair.
- Law No. 2004-811 of 13 August 2004¹⁰¹⁹ on the modernization of civil protection.

These laws were enacted by the state following the increase of major disasters and life loss occurrence. Following feedbacks from major crises, these laws mainly allow strengthening the evaluation and alert capacities of authorities. And emergency works can be carried out to ensure a faster return to normal.

There are two trends in the concept of resilience: reactive resilience to short-term and proactive resilience to long-term. The provisions to overcome a crisis are on the one hand the static vision of resilience (reactive resilience to short-term) with the ability to return to the original condition. It is an idea of a rapid return to the initial equilibrium (engineering resilience). And on the other hand, a dynamic vision of resilience (proactive resilience to long-term) which is the ability of a system to adapt, transform or to change direction to reach a new equilibrium (ecological resilience).

In France, the methods used in risk management and supported by competent authorities remain much focused on engineering resilience which is based on the return time of a system to equilibrium or to normal after trauma.

Source: http://geographie.ens.fr/IMG/file/resilience/Quenault_presentation.pdf

- Do CM organisation, local community and private business apply related standards, e.g. ISO 22301 "Business Continuity Management - Requirements" or any other (formal or industrial) standards? Please specify.

In 2013, the Department of Defence and National Security established a guide to elaborate a plan for business continuity (PBC) for State organisations, local communities and private businesses. PBC is mandatory for State organisations, but not for local communities. In this guide, all notions of compliance refer to the ISO 22301 standard.

¹⁰¹⁵ <http://www.defense.gouv.fr/actualites/la-reforme/livre-blanc-2013>

¹⁰¹⁶ <http://www.legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000000508820&dateTexte=>

¹⁰¹⁷ <http://www.legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000000551804>

¹⁰¹⁸ <http://www.legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000000604335>

¹⁰¹⁹ <http://www.legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000000804612&categorieLien=id>

In France, various industrial groups and companies participated with AFNOR (French Association for Standardisation) certification body, to the elaboration of the Annual Full NF X50-259 relative to crisis management and which partly meets the requirements of the ISO 22301 standard on the "management system of the business continuity".

(Guide pour réaliser un plan de continuité¹⁰²⁰, Secrétariat Général de la Défense et de la Sécurité Nationale, 2013)

1.6 Information sharing and data protection

1.6.1 Data protection and Information sharing in Crisis Management

- The sharing of personal data during crises [in 'extreme cases'] or for crisis management purposes, e.g. data on people with particular disabilities .

Created in 1978 in France, the CNIL (Commission Nationale Informatique et Liberté: National Commission for Computing and Freedom) is an independent administrative body that operates in accordance with the data protection legislation of 6 January 1978¹⁰²¹ as amended on the 6 August 2004¹⁰²². The independence of the CNIL is guaranteed by its composition and organisation.

The CNIL has been entrusted with the general duty to inform people on the rights that the data protection legislation gives them. It tries to reach out to the general public, either through the press, its internet site, social network sites or by providing teaching tools.

Concerning personal data protection during crises, a specific deliberation was adopted to dispense the declaration of personnel data treatment of people involved in crisis management. It is proceeding n° 2012-389 of 8 November 2012¹⁰²³.

- The sharing of classified information (internally and with third states/ organisations), e.g. data about specific vulnerabilities or about terrorist threats.

In October 2009, the CNIL established two decrees, establishing personal data processing for crimes against public security on date of 16 October 2009 and published in the Official Journal of 18 October 2009¹⁰²⁴. They concern "people whose individual or collective activity indicates that they may affect public safety". This includes "collecting, storing and analyzing information regarding the persons who may be involved in collective acts of violence, particularly in urban areas or during sporting events".

The Office of the Ombudsperson was created by Security Council resolution 1904, adopted on 17 December 2009, and its mandate was extended by resolution 1989, adopted on 17 June 2011, by resolution 2083, adopted on 17 December 2012, and by resolution 2161, adopted on 17 June 2014. It

¹⁰²⁰ http://www.sgdsn.gouv.fr/IMG/pdf/Guide_PCA_SGDSN_110613_normal.pdf

¹⁰²¹ http://www.sgdsn.gouv.fr/IMG/pdf/Guide_PCA_SGDSN_110613_normal.pdf

¹⁰²² <http://www.legifrance.gouv.fr/eli/loi/2004/8/6/JUSX0100026L/jo>

¹⁰²³ <http://www.cnil.fr/documentation/deliberations/deliberation/delib/284/>

¹⁰²⁴ http://www.cnil.fr/fileadmin/documents/en/CNIL-30e_rapport_2009-EN.pdf

has formal agreements and arrangements in place to access Confidential/Classified/Sensitive Information. As well, some States have been willing to share such information on an ad hoc basis without either an arrangement or agreement. France signed an agreement on 15 May 2012¹⁰²⁵.

1.6.2 Voluntary Organisation Databases

There is a web site (www.secourisme.net) where all the voluntary organisations involved in crisis management are listed. Each association or organisation employing volunteers is required to prepare an annual capacity list for the various jobs requiring a national training (instructor, rescuer,...). This list must be communicated to the local prefect.

1.6.3 Social media and crisis management

No official plan or procedure exists concerning data gathering from social media during crisis. Nevertheless, two actions have been undertaken by two defence zones (East and South), during the last two catastrophic flood episodes that occurred in November 2014 in the South of France (Lamalou and Ales, Gard Department). A lot of information was acquired from social networks during the floods and transmitted to the French DGSCGC. Please see section 4.4 for further information.

International volunteers supporting virtual operations (VISOV) were grouped in a non-profit organisation providing technical, methodological and operational support reinforcements during actions on Social Media in Emergency Management (SMEM).

One person involved belongs to the National Operational Crisis Management Centre, and has created a specific monitoring and analysis unit. Some initiatives are taken by ENTENTE/ENSOSP on this topic and in November 2014 has been organised a specific workshop in the South of France. The objective was to create a working group on this topic and to officially develop this activity in France.

¹⁰²⁵ <http://www.franceonu.org/15-May-2012-Security-Council-6246>

2 Legislation

2.1 Crisis (emergency, disaster) management concept

The ORSEC mechanism (Organisation of the Civil Defence Response) organises event management and crisis management. As it is modular and progressive, it can adapt to the type, scale and evolution of the event.

It includes the inventory and the analysis of the risks, an operational set-up answering this analysis and personnel preparation and training methods.

It organises the mobilisation, implementation and coordination of any public or private person participating to the general protection of populations.

According to the situation, the ORSEC mechanism can be used totally or only partially by the Department Prefect, the Zone Prefect or the Naval Prefect.

The circular n° NOR : INT/E/06/00120/C of 29 December 2006¹⁰²⁶ defines the ORSEC mechanism.

2.2 General crisis (emergency, disaster) management law

The White Book on the defence and national security¹⁰²⁷ assesses that the politic and strategic direction of the major crisis is under the authority of the President and the Prime Minister of the French Republic.

The Law 2004-811 of 13 August 2004 modernising Civil Protection¹⁰²⁸ has for objective to mobilise the whole competences implied in the prevention and organisation of the rescue regarding the technological, natural and terrorist risks.

The decrees that determine the ORSEC mechanism were established in 2005, 2006 and 2012¹⁰²⁹ are:

- Decree n°2005-1157 of 13 September 2005 related to the ORSEC mechanism (department, zone and sea).
- Circular N°NOR :INT/E/06/00120/C of 29 December 2006 defining the departmental ORSEC mechanism

¹⁰²⁶ [www.interieur.gouv.fr/content/download/8031/.../INTE0600120C .pdf](http://www.interieur.gouv.fr/content/download/8031/.../INTE0600120C.pdf)

¹⁰²⁸ <http://www.legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000000804612>.

¹⁰²⁹ <http://legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000000421070&dateTexte=&categorieLien=id>
<http://www.cedre.fr/fr/lutte/guide-elu/orsec06.pdf>
http://circulaires.legifrance.gouv.fr/pdf/2012/01/cir_34453.pdf

- Circular n°5567-SG of 2 January 2012¹⁰³⁰ : governmental organisation in case of major crisis management

Additional laws (CBRN cases):

- Circulars 007/SGDN/PSE/PPS of 8 October 2009¹⁰³¹ and 747/SGDN/PSE/PPS of 30 October 2009¹⁰³²: intervention doctrines when facing a CBRN terrorist threat or attack, defines interveners and State doctrine.
- The CBRN governmental plan 10135/SGDN/PSE/PPS CD of 16 September 2010¹⁰³³ : its aim is to provide a decision aid to the Prime Minister and to his ministers during CBRN threats and events.
- Circular 700/SGDN/PSE/PSS of 7 November 2008¹⁰³⁴ : urban chemical attack against civilian population and Circular 800/SGDN/PSE/PSS of 18 February 2011 on radioactive attacks.
- Circular 2002-119 of 29/05/2002¹⁰³⁵ : elaboration of a specific security plan against major risks for schools.
- Circular of 3 May 2002¹⁰³⁶: set up of an emergency preparedness plan (white plan) for every public health facility in order to cope with numerous victims.

2.3 Emergency rule

In case of major cross-industry crisis with a National impact, the Prime Minister can decide to activate a CIC (Interministerial Crisis Unit¹⁰³⁷) that merge the whole ministries affected by the event. He can decide to coordinate himself the Governmental action or to entrust it to a Minister depending on the event kind. In case of major crisis on the National territory, the Minister of Interior will ensure in principle the governmental coordination of this unit.

If the crisis is even more major, the European level can be engaged with the ERCC (Emergency Response Coordination Centre). “The EU is committed to providing disaster response in a timely and efficient manner and to ensure European assistance meets the real needs in the population affected, whether in Europe or beyond” from ECHO description of the ERCC¹⁰³⁸.

The ERCC’s role is to support a coordinated and quicker disaster response using resources from the Countries participating in the European Union civil Protection Mechanism.

In case of crisis such as terrorist attack where National security is threatened, the President of the French Republic can have extra power.

¹⁰³⁷ http://www.sgdsn.gouv.fr/site_rubrique106.html

¹⁰³⁸ http://ec.europa.eu/echo/what/civil-protection/emergency-response-coordination-centre-ercc_en

The exceptional powers of the President or « powers of crisis » have been defined by the “Article 16 of the Constitution of the 5th Republic¹⁰³⁹”. This law allows the President to get hold of exceptional powers in case of major crisis.

The principle is that the President of the Republic takes the necessary measures required by the circumstances in case of crisis. However this competence is submitted to content and form conditions.

The first “content” conditions are that the integrity of the national territory, independency of the country or international engagements should be threatened in a serious and immediate way. The second “content” conditions are that the measures should have for objectives to ensure to the public powers the means to accomplish their mission.

In addition, “form” conditions apply. The President should consult the Prime Minister, the Presidents of the two Parliaments and the Constitutional Council and inform the country of the implementation of the Article 16.

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

Two circulars regulate the management of disaster and emergency in France.

- Circular n°5567-SG of 2 January 2012¹⁰⁴⁰: governmental organisation, major crisis management with the creation of an Interministerial Crisis Unit (Cellule Interministérielle de Crise) under the authority of the Prime Minister.
- Decree 2011-988 of 23 August 2011¹⁰⁴¹: created the General Directorate of Civil Protection and Crisis Management (Direction Générale de la Sécurité Civile et de la Gestion de Crise) as well as its organisation and attributions.

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

2.5.1 Departmental level

The Departmental entity for emergency and disaster management are the SDIS.

- Law n°96 -369 of 3 May 1996¹⁰⁴² related to fire and rescue services, created in each department a public entity called SDIS which incorporates a departmental fire-fighter unit (professionals and

¹⁰³⁹ <http://www.vie-publique.fr/decouverte-institutions/institutions/approfondissements/pouvoirs-exceptionnels-du-president.html>

¹⁰⁴⁰ circulaires.legifrance.gouv.fr/pdf/2012/01/cir_34453.pdf

¹⁰⁴¹ <http://www.legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000024497281&categorieLien=id>

¹⁰⁴² <http://www.legifrance.gouv.fr/affichTexte.do?cidTexte=LEGITEXT000005620885>

volunteers) organised in brigades. The decree 97-1225 of 26 December 1997¹⁰⁴³ details the organisation mode of the SDIS.

Two kinds of fire fighters and rescue personnel exist: professional and volunteers:

- Decree 2013-412 of 17 May 2013¹⁰⁴⁴: concerns voluntary fire-fighters status updating.

A circular specifies the creation, organisation and functioning of the CODIS – CTA (Departmental Fire and rescue Operational Centre – Alert Treatment Centre).

- Circular of 24 July 1991¹⁰⁴⁵.

2.5.2 Local level

The Law 2004-811 of 13 August 2004¹⁰⁴⁶ modernising civil protection created the civil protection reserve with circular 2004-811 of 12 August 2005 which details the related arrangements. The aim of these reserves is to support civil protection services in case occur: events exceeding their usual capacities or specific types of events. The reserves participate to population assistance and are under the authority of the mayor.

The Article 13 of law n°2004-811 of 13 August 2004 establishes the local protection plan (PCS - Plan Communal de Sauvegarde). This local protection plan defines the basis of the local organisation (men, means, missions) that will enable to quickly react to an emergency. The decree of 13 September 2005 details the contents of this decision aid tool.

The Law 2007-294 of 5 March 2007¹⁰⁴⁷ related to the health system preparation created a health reserve unit in order to complete those set up by the state and by local authorities. This unit is constituted by professionals and by retired health professionals.

Please see section 4 for additional information.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

The French state has several relays to develop risk culture and NGOs are among them.

France has ratified (law 98-1166 of 18 December 1998¹⁰⁴⁸) the European Convention on the recognition of the legal personality of International nongovernmental organisations.

¹⁰⁴³ <http://www.legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000000569559&categorieLien=id>

¹⁰⁴⁴ <http://www.legifrance.gouv.fr/affichTexte.do?cidTexte=LEGITEXT000027519941>

¹⁰⁴⁵ <http://www.legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000000360939>

¹⁰⁴⁶ <http://www.legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000000804612&categorieLien=id>

¹⁰⁴⁷ <http://www.legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000000461266&categorieLien=id>

¹⁰⁴⁸ <http://legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000000208976>

A nongovernmental organisation (NGO) is a public interest organisation which is neither part of a State or of an International institution. NGOs do not have the status of an International law subject. An NGO is a non-profit organisation.

It is usual to keep the term for non-profit legal entities financed by private funds.

Article 1 of the law of 1901 defines the association as a « convention through which two or several people put in common, permanently, their knowledge or activity in a purpose different to sharing profits ».

In France, the association law is a branch of private law ruled by the Civil Code and by the law of 1 July 1901 which regulates the functioning of French associations. Law n°82-1169 of 31 December 1982¹⁰⁴⁹ concerning the administrative organisation of the cities of Paris, Marseille and Lyon and of intermunicipal (between cities) public entities plans that associations can participate in city activities if they make the request. When this is the case, town halls provide dedicated advertising boards.

The National Council of Association Life was created by the decree of 25 February 1983.

The circular of 22 December 1999 sets up departmental delegates for associative life (DDVA). Their task is to accompany the development of associations and their daily management.

In order to assist the prime Minister, decree n°2001-865¹⁰⁵⁰ of 21 September 2001, created a permanent group in charge of guaranteeing dialogue between public authorities and associations for all aspects of associative life.

Two types of personnel are present in associations:

- Employees: this status is characterised by two necessary and sufficient conditions :
 - Work paid through a salary, housing, car or flat-rate.
 - Existence of a subordination relationship. The Court of Cassation stipulates that it is the link characterised by work carried out under the authority of an employer who provides instructions, orders and controls work program with the ability to punish the failures of his subordinate.
- Volunteers: freely participate and receive no payment. The volunteer has no social protection in case of an accident but the civil responsibility of the association can be searched. The laws of 17 January 1986 and of 17 January 1986 give employees who are voluntary members of an association time-off in order to represent their association in all state authorities listed by law.

Responsibility of the association and of its leaders:

An association is a legal entity governed by private law. Most legal disputes fall within the jurisdiction of judicial courts except for disputes related to trade. In this case they fall within the jurisdiction of the Commercial Court or administrative courts if the dispute occurs between an association and a public entity.

As a legal entity, the association can incur liability:

¹⁰⁴⁹ <http://legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000000880033>

¹⁰⁵⁰ https://fr.wikipedia.org/wiki/Droit_des_associations_en_France

➤ Civil justice

An association, as a legal entity, is liable if the decisions are taken by the members of the governing body or by members of the board. This responsibility is extended to members and to third parties acting on their own, in case of serious personal misconduct or authority overstepping. For example, failure to respect a general obligation having caused damage not covered by insurance. However, unlike for penal responsibility, some damages can be covered by insurances.

➤ Criminal justice

The association can be liable on criminal aspects if it commits acts punished by criminal law such as involuntary or negligent manslaughter, embezzlement, forgery etc...

As a physical person, a manager can be held liable.

Administrators can be personally prosecuted:

- for civil matters : non-compliance to statutory obligations, authority overstepping, damage caused to third party, bankruptcy and liquidation of assets in case of mismanagement or negligence to respecting legal, social or fiscal obligations.
- for criminal matters : can be criminally liable if he/she is responsible for the offence.

2.7 Legal regulations for international engagements of first responders and crisis managers

The French international engagements towards countries affected by catastrophic events are mainly regulated by European laws. The following EUROPEAN texts regulate the different actions undertaken.

- Council Regulation (CE) no 1257/96 of 20 June 1996¹⁰⁵¹ on humanitarian aid.
- Council Decision 1999/847/CE of 9 December 1999¹⁰⁵² providing a community action program in the field of civil protection.
- Council Decision 2001/792/CE of 23 October 2001¹⁰⁵³ establishing a Community mechanism to facilitate reinforced cooperation in civil protection assistance interventions.
- Commission decision of 29 December 2003 laying down rules for the implementation of Council decision 2001/792/EC, Euratom establishing a Community mechanism to facilitate reinforced cooperation in civil protection assistance interventions. (Modified by Commission Decision of 20 December 2007 n°2007/779/CE and Commission Decision of 29 July 2010 n°2010/481/UE).

3 Organisation

3.1 Organisational chart

- National/ IO authority for emergency and disaster management; chain of command and high-level decision-making

In the event of a major disaster, the Prime Minister is the head of the upper conducting operations. Operations are coordinated with the other ministries.

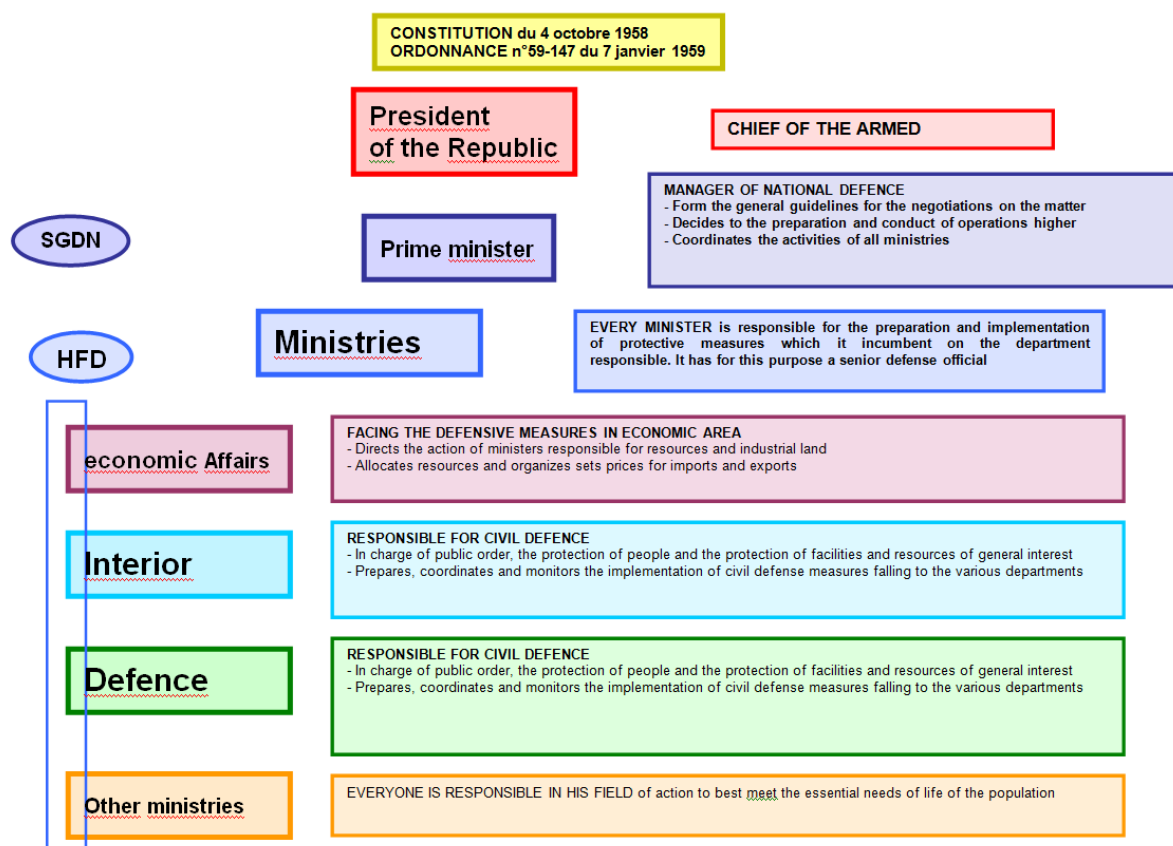

Figure 12: Authority Powers at the Central Level (EPLFM)

There are four levels:

- ✓ national level;
- ✓ zone level;
- ✓ departmental level;
- ✓ local level

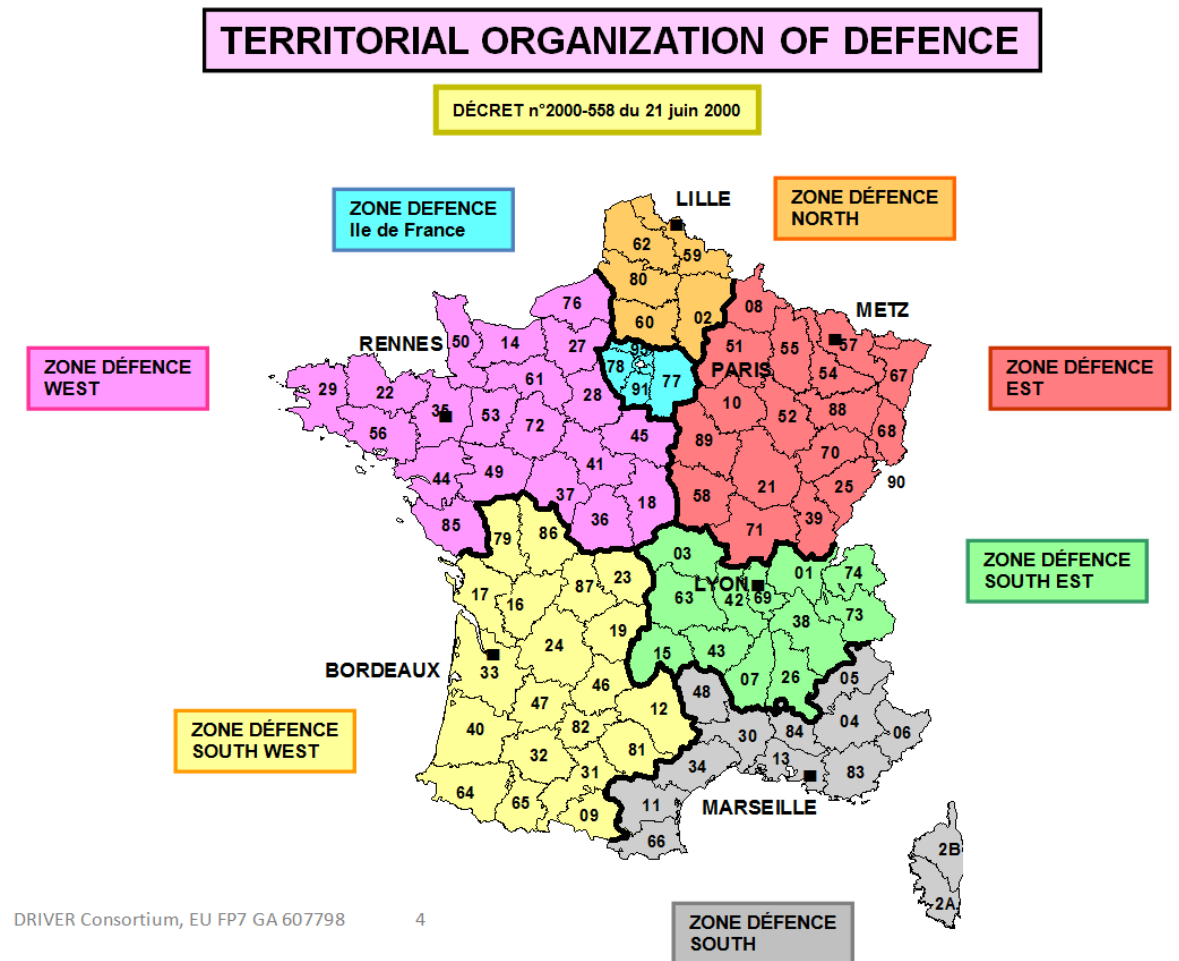

Figure 13: Territorial Organization for Defence (EPLFL document)

France has a comprehensive approach of crisis management, which is why all ministries are involved.

However, in most cases only the Ministry of the Interior, (possibly the Department of Defence) needs to be activated.

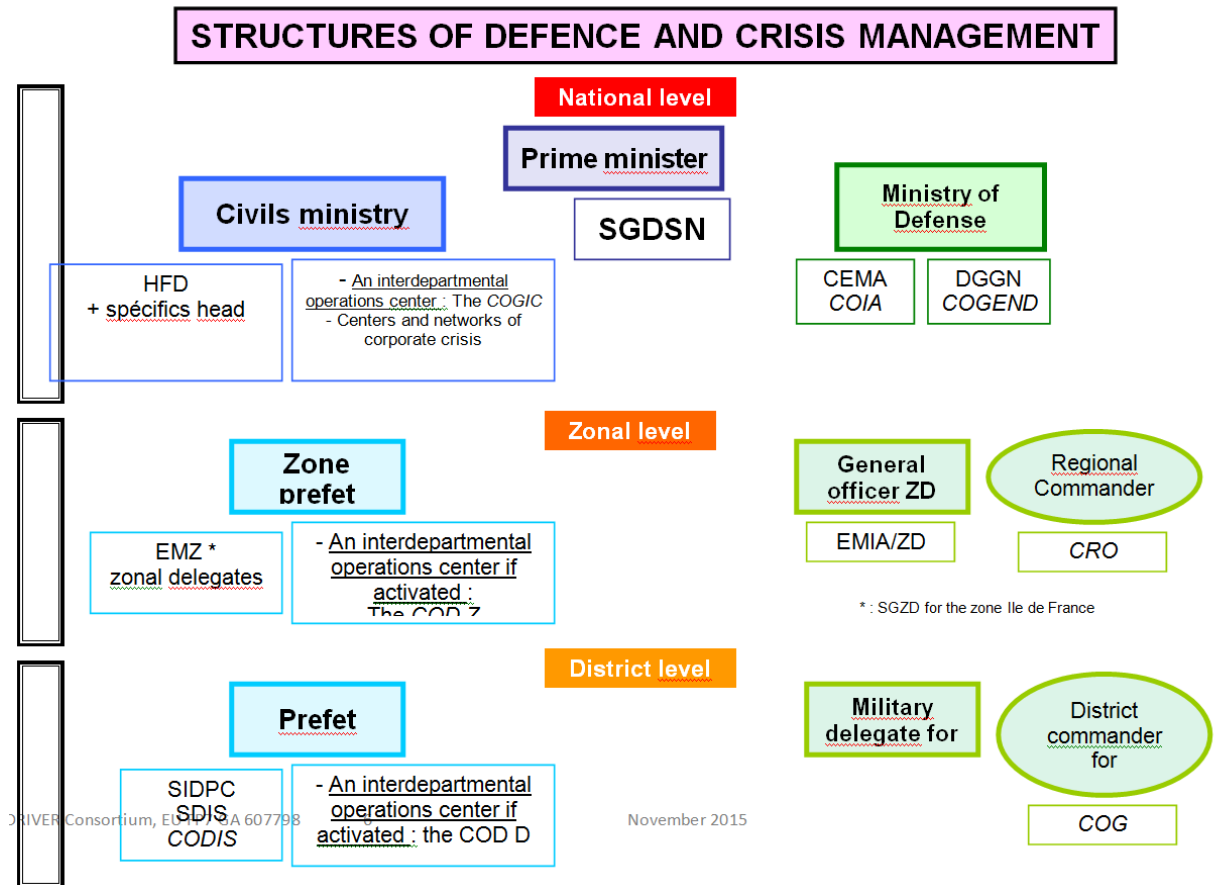

Figure 14: Structures for Defence and Crisis Management (EPLFM document)

- National permanent emergency and disaster management unit(s)/ formations; first responders

For crisis management and civil protection, the government and the Minister of the Interior have the Interministerial Crisis Management Operating Centre (COGIC) which is the operational organisation managing crises at the Directorate-General for Civil Protection.

The COGIC can activate in response to crises the following national means:

- ✓ military civil protection units (FORMISC);
- ✓ water bomber aircrafts;
- ✓ helicopters;
- ✓ logistic Bases (ESOL);
- ✓ bomb-disposal expert.

In constant contact with the operational centre of the National Police and the Planning and Conduct of Operations Centre (CPCO) of the Department of Defence, the COGIC continuously informs the minister's office, offers intervention procedures, prepares and coordinates the action of government interventions.

The centre occupies a total area of 500 m², divided into several structures:

- ✓ an operational centre dedicated to continuous monitoring, (24/7), defence and civil protection;
- ✓ a crisis centre, activated when needed;
- ✓ a communications centre, plays a key role in informing the public through the pre-established national alert network links with key national media;
- ✓ a documentation centre.

A total of 40 officers and non-commissioned members maintain the COGIC.

- Planned/ anticipated use of specialised military assets

During the summer season, there is an agreement between the Ministry of Defence and the Ministry of Interior for the provision of specialised assets and means (helicopters, engineer assets, etc).

On the other hand, Prefects may, at any time, requisition military means to deal with unusual disasters.

- Regional authorities and arrangements for emergency and disaster management (e.g. crisis HQ)

The intermediate level is the zone level. There are 7 areas of defence and therefore 7 inter-ministerial Defence Zones (EMIZ).

The EMIZ has an operational centre.

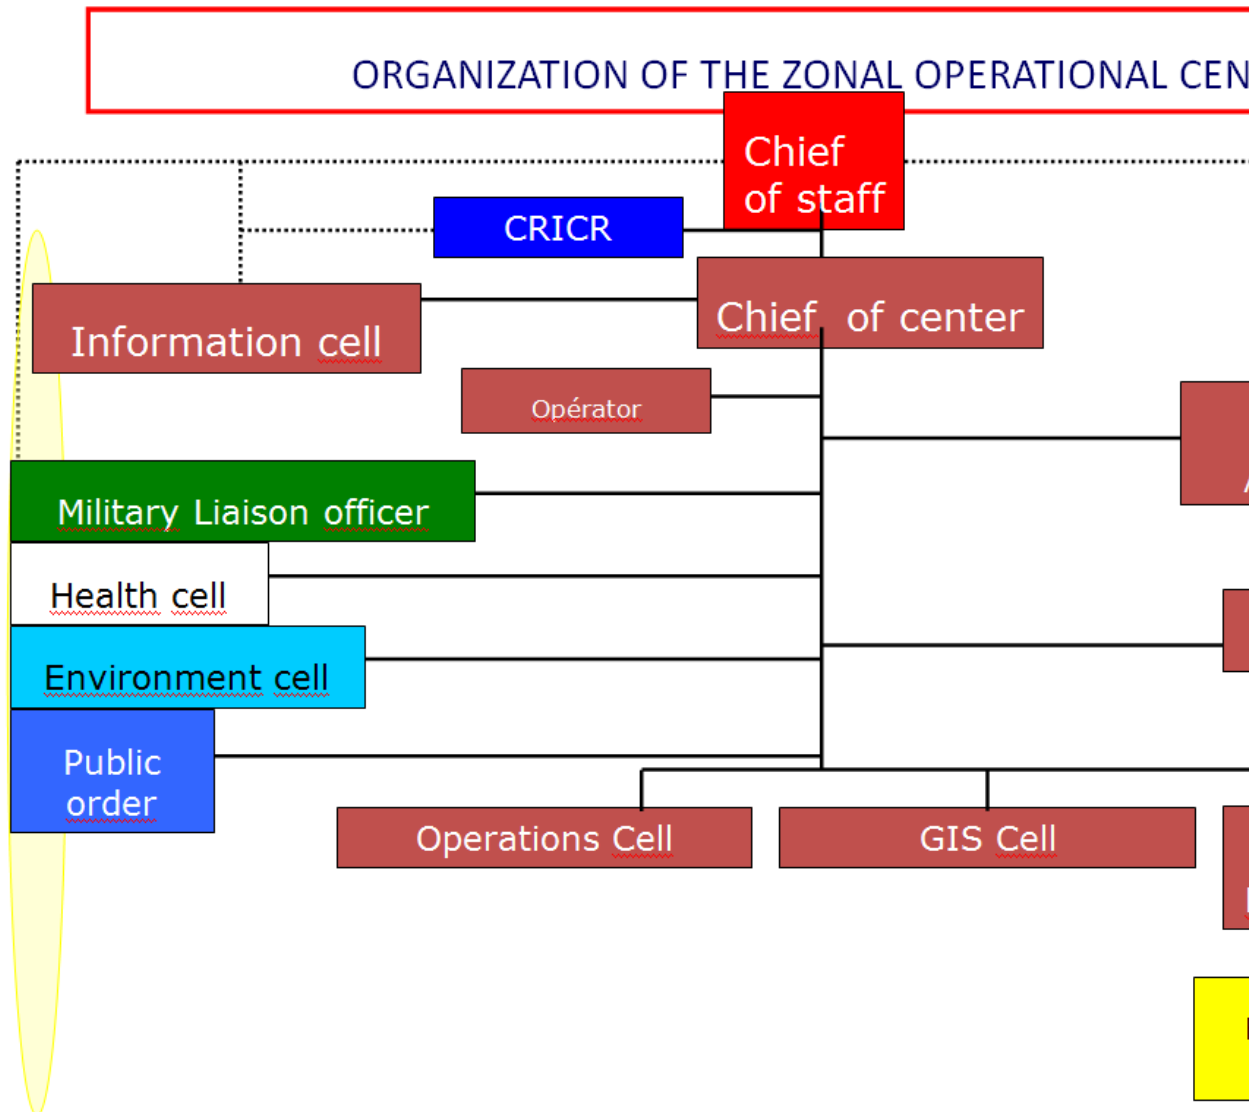

Figure 15: Organisation of the Zone Operational Centre (EPLFM Document)

- Departmental emergency and disaster management arrangements

All French departments have an operational centre or crisis unit (CODIS). Some are not activated 24/7. When there is a disagreement between some departments, it is the Prime Minister who arbitrates.

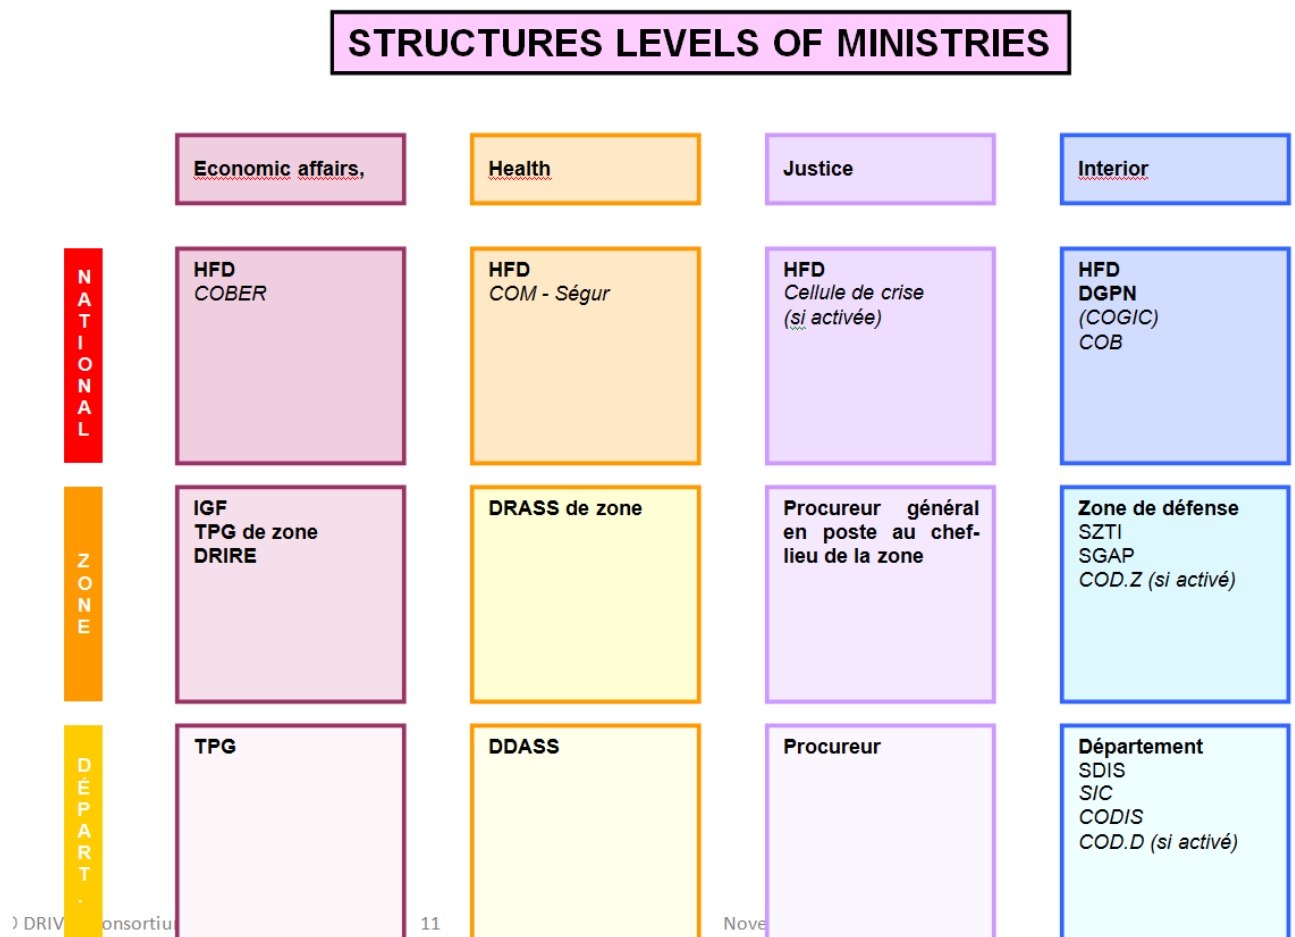

Figure 16: Structure Levels of Ministries (part 1, EPLFM document)

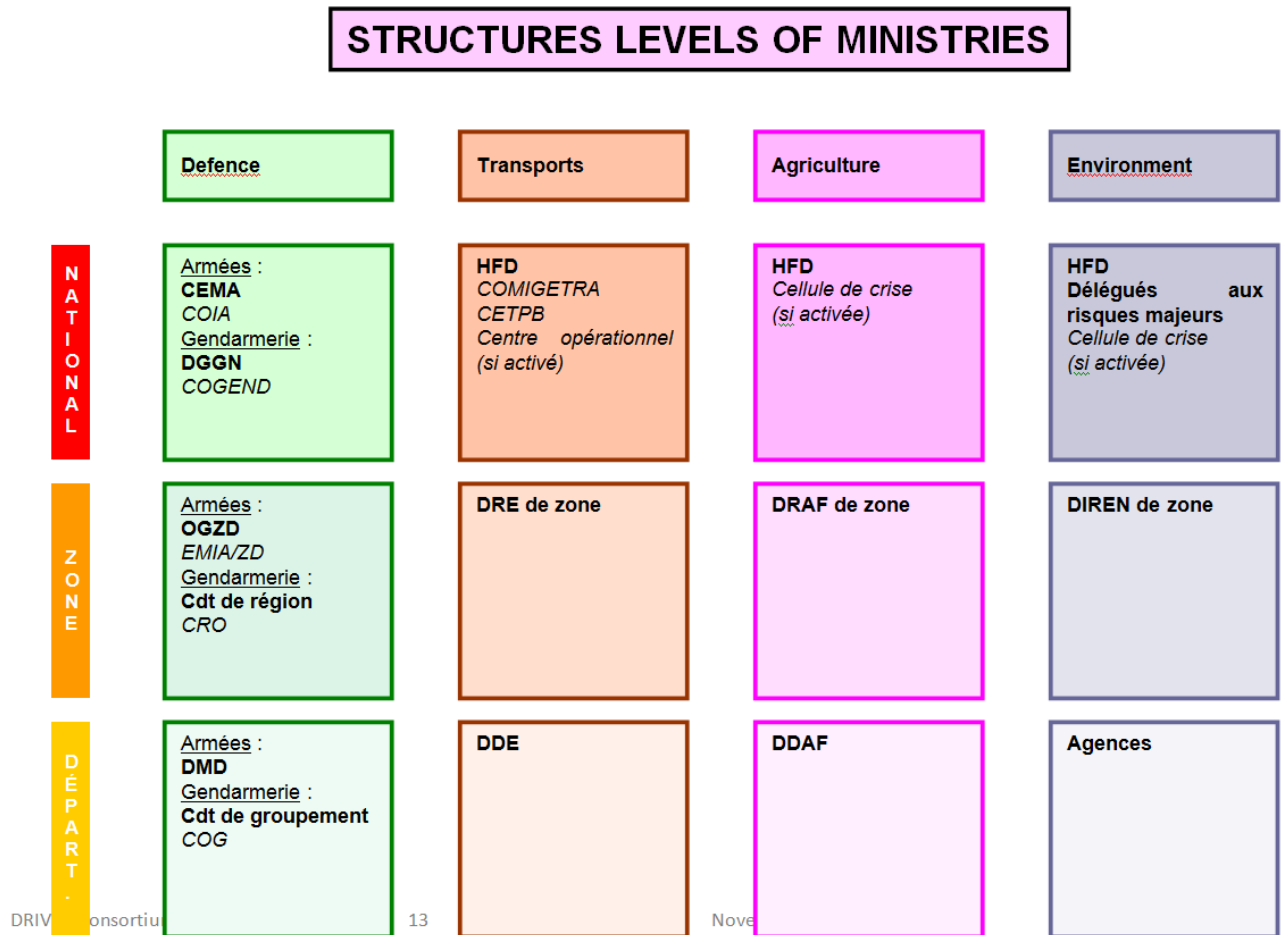

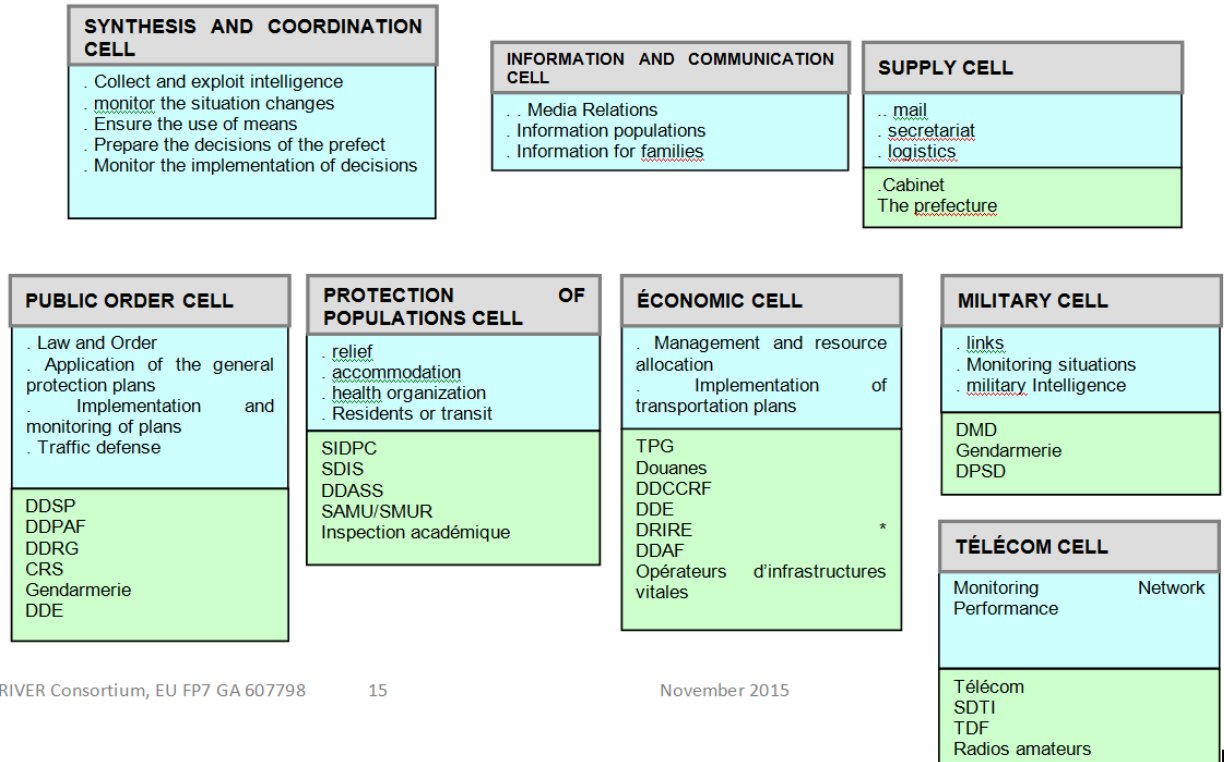

Figure 17: Structure Levels of Ministries (part 2, EPLFM document))

- Local (municipal, town) authorities and arrangements for emergency and disaster management

At the level of the department, the Prefect manages the crisis in a specific operational centre: the Departmental Operational Centre “COD”.

ORGANIZATION OF THE DEPARTEMENTAL COMMAND POST

PREFET

© DRIVER Consortium, EU FP7 GA 607798

15

November 2015

Figure 18: Organisation of the Departmental Command Post (EPLFM document)

- Volunteers and volunteer organisations; specialised NGOs

In order to work and to be integrated into an emergency device, NGOs must receive an agreement from the DGSCGC.

- Private businesses

They can be requisitioned by the Prefet as needed.

3.2 Organisational cooperation

- Operational cooperation (e.g., coordinated CM operations planning and response at national level, cross-border operational cooperation, operational cooperation within the EU)
 - How priorities are assigned in the case of simultaneous occurrence of events?

In France, the priorities are guided and determined by the issues and they are:

- ✓ population;
- ✓ property;
- ✓ economic activities;
- ✓ damage to the environment.

- How cross-border collaboration is organised? Please identify procedures used by stakeholders for cross-border cooperation (e.g., how is it initiated)

For small operations there are agreements of the Prefects.

For larger operations involving the work of other departments or national resources, the decision falls within the Ministries of the Interior and of Foreign Affairs.

4 Procedures

See section 3 for additional information.

4.1 Standing Operating Procedures (SOPs) and Guidelines

- Is there a written/ published document(s)?

There are standard operating procedures and guidelines¹⁰⁵⁷. These are published by the DGSCGC. The command organization is taught at all levels. The officer's School¹⁰⁵⁸ of Aix en Provence guarantees the use of this doctrine at the national level.

- What is the scope of the SOP document(s)

The SOP document is related to all the procedures needed at the national level.

- Are SOPs understood and accepted by all parties, and implemented in practice?

Operating procedures and national guidelines are obviously used in practice, not only nationally but internationally in many partner countries.

- Are the SOPs regularly tested both by activation and by exercise?

SOPs are unified in France. They are written in the national reference guides. SOPs are taught in the county and national schools from the lowest levels to the highest level of the hierarchy. SOPs are used in exercises and in real intervention.

4.2 Operations planning

- Is there a national crisis/ emergency, disaster/ plan?

There are emergency plans at the National level and in each department (see section 3), the ORSEC plan¹⁰⁵⁹.

- Are there departmental crisis/ emergency, disaster/ plans? Please enumerate.

Regarding the Ministry of the Interior and Civil Protection, plans are available for each type of disaster (flood, earthquake, etc.). All the plans are described in specific Guides books¹⁰⁶⁰.

¹⁰⁵⁷ <http://www.interieur.gouv.fr/Le-ministere/Securite-civile/Documentation-technique/Les-sapeurs-pompiers/Doctrines-et-techniques-professionnelles/Guides-nationaux-de-reference-des-techniques-professionnelles>

¹⁰⁵⁸ <http://www.ensosp.fr/SP/>

¹⁰⁵⁹ <http://www.interieur.gouv.fr/Le-ministere/Securite-civile/Documentation-technique/Planification-et-exercices-de-Securite-civile>

- Are there local crisis/ emergency, disaster/ plans?

Plans are linked from the national to the municipal level (ORSEC plan).

4.3 Logistics support in crises

- Planned/ anticipated use of private logistics providers (e.g. DHL)

The French Civil Protection has 4 logistic bases located in the territory and that respond to many disasters. However, a prefect authority has the ability to command private companies for relief purposes.

- Planned/ anticipated use of military logistics support

The armed forces are involved in civil protection missions, either through an agreement signed for several years or after a requisition made by a Prefect.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

- Who is responsible for crisis communication? Who coordinates crisis communication within and among MSs? How is the inter-organisational coordination of information exchange about crisis communication to the general public organised and managed?

Each ministry provides its own communication. When a crisis requires an inter-departmental management (COGIC), the DGSCGC performs crisis communication with its own office. All the classic ways of communication are used: press, radio, TV. News tools such as MSGU¹⁰⁶¹ (Médias Sociaux en Situation d'Urgence: Social Medias in Emergency Situation) are also developed by all the national organisations implied in crisis management : Ministry of Interior, Prefet, Police, Civil safety...

- How long does it take for the general public to become informed about pending hazards?

Once the departments agree on the elements of language, the DGSCGC can make public information through radio channels and national television. Usually the general public will be informed within the first hour. However the delay can be shorter by the official (oral) communication of the public authorities and the Social Medias official accounts of the administration.

- Which technical infrastructure is used to achieve situational awareness at local/ national/ European/ international level?

¹⁰⁶⁰ <http://www.interieur.gouv.fr/Le-ministere/Securite-civile/Documentation-technique/Planification-et-exercices-de-Securite-civile>

¹⁰⁶¹ <http://www.risques.gouv.fr/risques-majeurs/utiliser-les-medias-sociaux-en-situation-durgence-msgu>

Television, radio, newspaper, national, zone and departmental command posts, sirens, municipal and national police, ERCC, etc...

5 Capabilities

5.1 Human resources

- Permanent emergency and disaster management personnel

At the local or municipal level, the mayor is in charge with police powers and a local command post (PCC). The mayor manages local means (municipal police, urban planning, etc.) and has the capacity to requisition. He has a Local Protection Plan (PCS) and when crisis management is activated he becomes the Director of Rescue Operations (DOS).

The mayor has a Local Civil Protection Reserve (RCSC) consisting of voluntary citizens whose mission is to support town services in the occurrence of a crisis exceeding usual capacities and to contribute to population support and assistance.

When the mayor is exceeded by the events, when response capacities are not enough or when the disaster goes beyond municipal limits (boundaries), the department Prefect takes over.

At the departmental level, the department Prefect, invested with police powers, is the Director of Rescue Operations (DOS). He commands the ORSEC mechanism (Organisation of the Civil Protection Response). He activates the Departmental Operational Centre (COD) and deploys the Operational Commandment Post (POC).

The Departmental Operational Centre (COD) is divided into 8 units :

- public order unit ;
- population protection unit ;
- military unit;
- telecommunications unit
- economic unit;
- communications unit (media);
- support;
- synthesis and communications unit.

As the DOS has the power to requisition, he can mobilise any public or private means. The Interministerial Service of Defence and Civil Protection (SIDPC) can provide support to study risk and develop a rescue plan, the SDIS is placed under its authority.

As previously, when the crisis exceeds departmental boundaries or response capacities and that crisis management reaches the zone level, it is the Zone Prefect, with the Zone Operational Centre (COZ), who takes over crisis management.

France is made up of 7 defence zones:

- North zone;
- Ile-de-France zone;
- West zone;
- Southwest zone;
- East zone;

- Southeast zone;
- South zone.

The zone Prefect has a General Secretarial Office for Police Administration (SGAP), a Zone Information and Communication Systems Service (SZSIC) and a Regional Information and Road Coordination Centre (CRICR).

Finally, at the national level, for large scale crisis, it is the Ministry of the Interior who supervises crisis management with the Interministerial Crisis Management Operational Centre (COGIC) and temporarily the Interministerial Crisis Centre (CIC).

A general secretary coordinates the actions of civil protection services (DGSCGC) and public safety (General Directorate of the National Police (DGPN)) which are reinforced by the General Directorate of National Gendarmerie (DGGN).

At the International level, the Ministry of Foreign Affairs works with the Health Ministry of the stricken country.

To summarise, the permanent staff of crisis management and emergency are people from municipal police, fire-fighting forces, Paris Fire Brigade (BSPP), Marine Fire Brigade of Marseille (BMPM), Military Civil Protection Units (UIISC), mine-clearing units, Logistics and Operational Support Unit (ESOL), Air Groups and civil protection associations.

- Capacity to mobilise personnel

The law of 22 July 1987, in Article 10¹⁰⁶², states that the competent authorities of the State in charge of managing rescue operations or launching the ORSEC mechanism (Prime Minister, state representative in the department where the headquarters of the defence area is located, state representative in the department), can "each" requisition necessary private rescue means.

In practice, these requisitions respond to an emergency situation by quickly completing the available rescue means and specific equipment (specialised repair vehicles, staff of companies involved in handling hazardous chemicals, etc.) during rescue operations. They cannot be implemented "*in ordinary circumstances*." Concerned businesses and individuals are compensated at a later stage.

- Involvement of volunteers, volunteer organisations, and specialised NGO personnel

National human resources come from public services (and / or private) but also from many civil protection associations. These associations are made up of volunteers and employees. Authorities do not always have sufficient resources (human and material) to overcome the emergency. It is therefore essential in order to cope with a crisis, to have the support of civil protection associations. These associations intervene to complement public service missions when a request is made by the competent authorities. Article 35 of the law of 13 August 2004¹⁰⁶³ created a 5 year agreement for associations that want to be integrated into the systems put in place by the government. These associations are authorised to respond to any or all of the following types of missions:

¹⁰⁶² <http://legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000000421070>

¹⁰⁶³ <http://www.legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000000804612>

- rescue operations;
- support actions for disaster victims;
- supervising volunteers during actions to support affected population;
- provisional rescue devices.

Annual agreements are signed between public authorities and the SDIS to define the circumstances, intervention methods and their integration into the rescue plans.

Below are three major associations groups:

- The French Red Cross, the French Society of Disaster Medicine (SFMCI), the French Society of Emergency Medicine (SFMU), the National Federation of Radio Transmitters at the service of Civil Security. (FNRASEC), ...
- Representations of health professionals, the SAMU of France, the association of emergency doctors of France (AMUF), the National Association of Medical Students of France (ANEMF) ...
- NGO: Doctors Without Borders, Doctors of the World, Bioforce,

Another association needs to be listed because its support from a health point is very important: it is the Establishment of Preparedness and Response to Health Emergencies (EPRUS). EPRUS has the capacity to respond to health threats, in France and abroad. Indeed, this association has facilities to organize and deploy health forces during severe health crises. This health reserve includes all types of health professionals. After being trained they participate in emergency missions in case of serious health crises, and their pharmaceutical establishment manages the national strategic health stock needed to protect the population in case of emergency.

The National Federation of Civil Protection should also be mentioned. It provides operational reinforcement for public rescue services (SAMU, fire brigade) during rescue plans, participates in supporting affected population in case of disasters and supervises volunteers.

- Involvement of private businesses

As we have said before, competent authorities have the power to requisition, as needed, private resources for rescue purposes and very often this is done in the frame of a partnership. Various operators such as SNCF, telephone operators, motorway companies, water and electricity distributors can be mobilised. In addition, upon request of the person requisitioned, the administrative court can grant an advance payment representing all or a part of the compensation.

- National educational programme(s)

Since the law of civil protection modernization of 13 August 2004, training has become a permanent obligation. In order to test rescue plans, verify procedures (and tools developed) and to evaluate the means and the teams, exercises are performed each year involving all stakeholders at all levels (representatives of the political and administrative authorities, media, elected officials, public and private operators).

The new program for modernization of civil security has for aim to involve population that lives nearby a major risk. Today populations are not implied in those exercises even if they receive documentation to inform them on action to be taken in case of crisis.

Reference: « Exercices de sécurité civile: mémento en 10 points¹⁰⁶⁴. »

These exercises enable to identify shortcomings in the crisis management chain and to propose appropriate modifications. Communal exercises work on the evacuation and / or containment of a neighbourhood. For departmental exercises, the themes are given by the DGSCGC. They can focus on a pandemic crisis, a CBRNE disaster, or a road crisis. Zone exercises are initiated by zone prefects in order to train departments at working at the zone level on pandemics, winter weather.... Interdepartmental government exercises sometimes involve the zone or the department.

5.2 Material (non-financial) resources

- What specific non-financial resources (dedicated equipment etc.) have been allocated to crisis management (central, regional, local preparedness and response)?

It is very difficult to know the specific resources that have been allocated to crisis management. However, the French Red Cross annually publishes a report on the actions conducted.

For 2011:

- 55 million meals distributed;
- 539 lockers and 278 clothing stores put in place;
- 98 institutions dedicated to early childhood and child protection;
- 118 accommodation facilities affected.

For 2012:

- 831 food aid structures installed;
- 318 clothing stores put in place;
- 2263 accommodation places affected;
- 113 reception facilities dedicated to infancy and early childhood.

For 2013:

- 1002 food aid units installed;
- 412 clothing stores put in place;
- 2630 accommodation places affected;
- 2970 places dedicated to early childhood and child protection.

- Permanent reserve stocks (fuel, food, medicines, tents, blankets, etc.)

The national reserve of the General Directorate of Civil Protection and Crisis Management (DGSCGC) is constituted of materials for the reinforcement of national rescue and protection of persons and

¹⁰⁶⁴ www.interieur.gouv.fr/content/download/.../memento%20exo%20SC.pdf

property. All this equipment complements the material of local and regional authorities for large scale disasters.

There are three ESOLs (Establishments of Operational and Logistical Support of the DGSCGC): one in the North, one in the West, one in the South, plus an annex in the East. The stock of the national reserve is made up of seven families according to their action areas.

The first family contains equipment to produce and supply drinking water. The types of risks that match these materials are:

- Flood;
- Biological Pollution;
- Earthquake;
- Displacement of populations;
- Cyclone.

In this family, we find water treatment units (CELTE), automatic bagging machines for 2L bags, water distribution headers with 5 taps, 1000m flexible food grade pipes to supply water, water pressure regulators, a mobile overpressure unit and different types of tanks.

The second family contains cleanup and search and rescue equipment. The types of risks that match these materials are:

- Flood;
- Biological Pollution;
- Oil and Chemical Pollution;
- Cyclone.

There are autonomous hot and cold water pressure cleaners, sawing materials, storage tanks with a total capacity of 0.5 to 20 m³, various containers (garbage cans, buckets, wheelbarrows, ...), hand tools (shovels, forks ...), plastic covers, rolls of polyane, oil spill gloves and coveralls.

The third family contains energy materials and outdoor lighting. The types of risks that match these materials are:

- Flood;
- Earthquake;
- Displacement of populations;
- Cyclone.

In this family we find power generators ranging from 2.5 to 110 KVA having a total capacity of 2 000 KVA, outdoor lighting from 300 to 1000 Watts with a total capacity of 70 000 Watts and lighting balloons between 1 200 and 4000 Watts.

The fourth family contains equipment for accommodation and catering. The types of risks that match these materials are:

- Flood;
- Earthquake;

- Displacement of populations;
- Cyclone.

The equipment consists in modular tents with a total capacity of 2000 people, camp beds, sleeping bags, blankets, and a collective catering unit.

The fifth family consists in pumping and flood fighting equipment. The types of risks that match these materials are:

- Flood;
- Cyclone;
- Marine submersion.

Here we find mobile pumping units with 5400 m³/h capacity, mobile pumping with 850 m³/h capacity, heat engine pumps from 15 to 150 m³/h, electric submersible exhaustion pumps from 15 to 360 m³/h, a total pumping capacity of over 52 000 m³/h, more than 5 km of flood dam, over 900 m² of modular elements to build platforms and floating walkways.

The sixth class is composed of CBRN equipment and protective equipment. The types of risks that match these materials are:

- Chemical and Biological Pollution;
- Nuclear Pollution;
- Oil spill pollution.

There are CBRN decontamination light clothing kits, respiratory protection masks, personal protective kits, disposable suits and autonomous thermal sprayers.

And finally the seventh family contains specific forest fire intervention equipment (2 wildfire batches in the North and in the South).

- Planned /anticipated/ involvement of specific military assets (e.g. reconnaissance assets, search and rescue helicopters, fire-fighting planes/helicopters, CBRN, etc.)

The support for territorial civil protection services is provided by the operational services of the General Directorate of Civil Protection and Crisis Management of the Interior Department.

To cope with disasters, the sub-directorate of crisis planning and management must handle the three phases of the crisis: preparedness, response and feedback.

This sub-directorate analyzes the various risks such as natural hazards, technological risks, nuclear risks ...). It also ensures fire prevention and regulations.

The sub-directorate of risk management also defines the framework for rescue planning. It invests in information and public awareness concerning risks and threats, including warning systems. Active in the national policy for civil protection exercises, it organises the feedback and contributes to ensure the training for risk and operations management.

Operational services operate throughout the French territory and contribute to International rescue actions. They include different structures including:

- Air assets pool (GMA);
- Mine-clearing centre;
- Military units.

Civil protection military units reinforce territorial fire-fighters when circumstances require support or special preparation facing risks. These units (UIISC: civil protection instruction and intervention units) are specialised in the areas of forest fires, technological risks and buried victims search.

Civil protection bomb-disposal experts mainly carry out safeguarding missions.

The civil protection air assets pool is divided into two groups:

- A helicopter group: :
 - A central department which includes a commandment safeguarding missions base, a centre for crew training and an aircraft maintenance centre;
 - 22 helicopter bases plus one in Guadeloupe.
- An airbase.

Helicopter missions are, in increasing order of priority, the following:

- conditioning of personnel and equipment;
- police and technical assistance;
- forest fire fighting and non-emergency rescue;
- urgent rescue.

Civil protection has a fleet of 25 water bombers (Canadair CL-415, S-Tracker 2FT and Bombardier Dash 8) and 3 liaison and investigation aircrafts.

The chemical, biological, radiological, nuclear and explosives (CBRN-E) service is placed under the authority of the General Director of Civil protection and Crisis Management. Its mission is to develop intervention procedures that are intended to strengthen response capacity and resilience in managing a major CBRNE crisis on the French territory.

- Is provision made for governments to mobilise or commandeer private assets during crises?

As for human resources, when the material resources of authorities are insufficient to face an emergency, both because of the amount of equipments needed and because of the specificity of certain needs, competent authorities have the power to requisition needed resources.

5.3 Training

- National, local and departmental exercises

DGSCGC recommends organizing regular exercises at district, zone and national levels. To this end, it publishes various methodology guides for exercise management or field exercises. It also publishes guides for feedback.

- Centralised specialist training

Specialty trainings are made only in a small number of centres approved by the DGSCGC. The wild fire training levels 3, 4 and 5 can be done only at the ECASC (Civil Protection Application School). It is the same for mountain rescue team training. The fire training for ships is only performed by BMPM, etc...

- Training of volunteers and NGO personnel

Volunteer fire-fighters receive the same training as professional fire-fighters. Consequently, during field operations, it is not possible to differentiate between the two types of fire-fighters.

NGO training is the responsibility of their own structure in the framework of the DGSCGC agreement.

- Cross-border and multinational training activities

Cross-border training and exercises are under the responsibility of departmental prefects and departmental directors of fire and emergency services of border departments.

Some exercises are organised to the initiative of departments on the border. Those exercises are not mandatory and do not frequently occur but are more and more developed.

The last exercises operated on South of France are:

- NOVI (nombreuses victimes, several victims) with Italy
- RICHTER with Spain and Italy.

Reference: « Rapport sur les règles et principes applicables aux actions internationales en cas de catastrophe (IDRL) en France » croix Rouge Française. 2010¹⁰⁶⁵

- Is there a certification system? What standards are used to define specialists' training requirements?

France has engaged into an INSARAG¹⁰⁶⁶ (International Search and Rescue Advisory Group) certification process for its HUSAR (Heavy Urban Search and Rescue) teams and into an EU certification process for other specialised modules. It can provide the ERCC all specialised modules provided by the decision of the European Commission of 10 June 2010.

¹⁰⁶⁵ www.ifrc.org/PageFiles/93645/country-report-france-082010-fr.pdf

¹⁰⁶⁶ <http://www.insarag.org>

French education is unified and is described in national reference guides. Training must be approved by the DGSCGC who verifies that everything is in reference guides and in French doctrine in the concerned specialty.

- Are there specialised training programmes for high-level decision makers?

The DGSCGC deals more specifically with training for crisis management prefects and office chiefs. There is a general training for natural and technological risks.

- Training centres

France has a national school to train firefighter officers (ENSOSP) and a specialty school (ECASC). In addition, all departments have departmental schools to achieve basic training for their firefighters.

5.4 Procurement

5.4.1 Procurement regulation

- What needs to be procured? E.g. goods or services, including trainings?

Public procurement concerns all goods and services bought by the French government or local authorities. All expense above 1€ must be subject to a contract. Only procedures change depending on the amount of the financial transaction. These contracts must meet public procurement directives. (Code des marchés publics (*Décret n° 2006-975 du 1er août 2006 modifié*)).

Official laws for French public procurement: Public procurement code (CMP)

- Public procurement code¹⁰⁶⁷
- Circular letter for the application of the public procurement code¹⁰⁶⁸
- Corresponding table for public procurement codes of 2004 and 2006¹⁰⁶⁹.
- Decrees for modification of public procurement code¹⁰⁷⁰
- Circular letter for good practice of public procurement code¹⁰⁷¹.

- Which EU directive on procurement is applicable on procurement of CM tools and related?

¹⁰⁷⁰ <http://www.economie.gouv.fr/daj/Decrets-modificatifs-du-code>

¹⁰⁷¹ <http://www.legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000025364925>

The European directives applicable for the procurement of crisis management tools and related are the ones relevant for all public procurement in Europe: directives 2004/18/CE¹⁰⁷² and 2004/17/CE¹⁰⁷³ currently applicable and two new directives 2014/24/EU¹⁰⁷⁴ and 2014/25/EU¹⁰⁷⁵.

The directives 2004/17/CE and 2014/25/EU concern exclusively procurement by entities operating in the utilities sectors: water, energy, transports and postal services. It is called “sector directive”. Those directives are not applicable for crisis management tools and services.

The Directives 2004/18/CE and 2014/24/EU concern public procurement for all the others sectors, including crisis management tools and services. This directive (called “classical directive”) applies to public contracts concluded by a contracting authority in sectors other than the water, energy, transport and postal services sectors for supplies, services and works.

Extract from the “Summary of EU legislation¹⁰⁷⁶”: Public work contracts, public supply contracts and public service contracts:

“The “traditional directive” applies to public work contracts, public supply contracts and public service contracts which have a value excluding VAT estimated to be no less than the pre-established thresholds.

The value of the thresholds is the following (values updated every two years by the Commission):

- EUR 130 000 for public supply and service contracts awarded by central government authorities (ministries, national public establishments);
- EUR 200 000 for public supply and service contracts: awarded by contracting authorities which are not central government authorities; covering certain products in the field of defence awarded by the central government authorities; concerning certain services in the fields of research and development (RTD), telecommunications, hotels and catering, transport by rail and waterway, provision of personnel, vocational training, investigation and security, certain legal, social and sanitary, recreational, cultural and sporting services;
- EUR 5 000 000 in the case of works contracts”.

The new European directives (2014/24/EU) should be transposed into French law in order to be applicable no later than February 2016. They will be integrated into the French public market code (CDM).

A decree (n°2014-1097) dated on September 26th 2014 (JORF n°0225) transposes in an accelerated way the new European Directives 2014/24/EU in the French public market code (CDM).

- Decree n°2014-1097, September 26th 2014: public procurement simplification, transposed from European Directive 2014/24/EU¹⁰⁷⁷

¹⁰⁷⁷ <http://www.legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000029504714&categorieLien=id>

- DAJ (Direction of the Juridical Affairs) : decree for simplification measures on public procurement¹⁰⁷⁸

From this last reference, we precise that this decree concerns different points:

- The upper limit of the annual turnover due by the supplier: this request cannot be more than twice the value of the market. The aim of this decree is to open the procurement procedure to SMEs.
- The simplification of the application files.
- Creation of a new kind of procurement to facilitate public market in research and development.

- Are all articles of the directive applicable or are some articles not implemented?

From article 288 of the Treaty on the functioning of European Union¹⁰⁷⁹ (2008/C 115/01):

“A regulation shall have general application. It shall be binding in its entirety and directly applicable in all Member States.

A directive shall be binding, as to the result to be achieved, upon each Member State to which it is addressed, but shall leave to the national authorities the choice of form and methods.”

Directives are framework laws, mandatory because they link Member States to the result to be reached. Consequently, all the articles of the Directives must be transposed in French law, within the time limit allowed by the European Union.

Thus, Directive 2004/18/CE regarding Public procurement has been transposed in French law according to the transposition texts:

- Directive 2004/18/EC of the European Parliament and of the Council of 31 March 2004¹⁰⁸⁰ on the coordination of procedures for the award of public works contracts, public supply contracts and public service contracts
- Texts of transposition of the Directive 2004/18/CE¹⁰⁸¹
- Directive 2014/24/EU of the European Parliament and of the Council of 26 February 2014 on public procurement and repealing Directive 2004/18/EC¹⁰⁸²

¹⁰⁷⁸ http://www.economie.gouv.fr/files/files/directions_services/daj/marches_publics/textes/autres-textes/fiche-decret-mesures-simplifications-mp.pdf

¹⁰⁷⁹ <http://eur-lex.europa.eu/legal-content/EN/TXT/HTML/?uri=CELEX:C2008/115/01&from=FR>

¹⁰⁸⁰ http://europa.eu/legislation_summaries/internal_market/businesses/public_procurement/l22009_fr.htm

¹⁰⁸¹ <http://www.legifrance.gouv.fr/affichTexte.do?cidTexte=JORFTEXT000000702882&dateTexte=&fastReqId=342410301&fastPos=1&oldAction=rechExpTransposition>

¹⁰⁸² <http://eur-lex.europa.eu/legal-content/EN/TXT/HTML/?uri=CELEX:32014L0024&from=FR>

According to “New rules on public contracts and concessions¹⁰⁸³”:

“National freedom of organisation is not affected: it is for the Member States alone to organise public services as they see fit. A public authority remains free to perform the public interest tasks for which it is responsible, either using its own staff or by delegating these tasks to external firms – it is only in the latter case that the rules on public contracts and concessions apply.”

- Consolidated versions of the treaty on European Union and the treaty on the functioning of the European Union (2008/C 115/01)¹⁰⁸⁴
- SMEs' access to public procurement markets and aggregation of demand in the EU¹⁰⁸⁵
- Are additional national regulations applicable and/or are there additional requirements?

Generally, French laws are more restrictive than European directives. The French public procurement code does not have specific requirements regarding the procurement of tools and services for crisis management. Common law applies for these procurements.

Thus, the French public procurement code (CMP) plans:

- For local public authorities and communities, the procedures planned by the European Directives enforce on public contracts with a value higher or equal to 211000€ HT. Under this value, National law applies (French public procurement code, CDM).
- Procurements for the State and its public entities are governed by the public procurement code. This law sets thresholds from which different purchasing procedures should be followed.

Three thresholds exist for public procurement concerning the purchase of supplies and services for the French State and its local authorities, depending on the amount of the transaction (see: marchés publics.com, serve-public.fr). These different procedures are described in question 5.4.2.

- How often is there a need to jointly buy CM tools or services? And how often does cross-border procurement occur? Are there any considerations for future joint procurement? If yes, in what area and what are potential partner nations?

According to the DGSCGC with the Office of the Operations and Crisis Management, the tools for crisis management are homemade. Most are developed by their own offices, with the support of departments from the Ministry of the Interior such as the Directorate of Information and Communications Systems (DSIC). Public procurements can occur to carry out some services.

There is no joint buying or cross-border procurement for crisis management tools or services in France.

¹⁰⁸³ http://ec.europa.eu/internal_market/publications/docs/public-procurement-and-concessions_en.pdf

¹⁰⁸⁴ <http://eur-lex.europa.eu/legal-content/FR/TXT/?uri=CELEX:C2008/115/01>

¹⁰⁸⁵ http://ec.europa.eu/internal_market/publicprocurement/docs/modernising_rules/smes-access-and-aggregation-of-demand_en.pdf

- Is there a need for additional legislation with regard to cross-border procurement?

There is legislation for cross-border procurements for local authorities and their groups, excluding SDIS or interdepartmental groupings. It is the subject of the interministerial circular of 20 April 2001 for decentralised cooperation¹⁰⁸⁶.

This circular applies only to local entities and their groupings, this circular specifies that SDIS are not group of local entities.

From the “Cross-border competence and cooperation of the fire and rescue services in the European framework¹⁰⁸⁷”: “In this cooperation “French local and foreign local entities”, on one side the SDIS can only be an operator, and on the other side the sector of action has a limited extent, since it can’t concern directly the security and the protection of population, which are under the jurisdiction of the public authorities”.

However there are numerous bilateral agreements within the European Union. The countries of the South of Europe cooperate especially for forest fire fighting. These cooperations do not concern any procurement procedures.

Currently, there are no needs for additional legislation for cross-border procurement since none is envisaged.

- How important is interoperability and do issues arise around the interoperability?

Interoperability is a major concern for crisis management because it allows the adaptability of decision support tools for all natural or manmade disasters, and for all existing investigation tools. Likewise, crisis management tools must adapt to the different crisis management actors, on all operational levels: from the local entity to the National and European entities.

Interoperability is a real problem for crisis management. There are currently a lot of initiatives of Europe to develop interoperability. The actual directives are to develop “open systems” so any software can enter in any program.

Major crisis management in France is governed by the ministerial circular letter of the January 2d, 2012¹⁰⁸⁸. This circular sets the frame of the interoperability of the tools used during all crisis management, both at departmental, zonal and national levels. Please refer to section 2.

¹⁰⁸⁶ <http://www.senat.fr/ct/ct04-02/ct04-028.html>

¹⁰⁸⁷ http://crd.ensosp.fr/doc_num.php?explnum_id=7884

¹⁰⁸⁸ http://circulaires.legifrance.gouv.fr/pdf/2012/01/cir_34453.pdf

5.4.2 Procurement procedures

- Which organisations are involved in the procurement of CM tools? And how do they organise their procurement process?

The organisations implied in the procurement of crisis management tools are the French State through the Ministry of Interior and the DGSCGC as well as the SDIS of each French department.

Procurement procedures are governed according to the French public procurement code¹⁰⁸⁹ (CMP) and depend on the value of the contract. The next table sums up the thresholds and the associated procedures for the procurement of supplies and services (sector that concerns crisis management, another sector is for public works).

Public procurements of supplies and services

Thresholds		15000 € HT	90000 € HT	200000€ HT
Advertising	Supplies and services (art.29)	None	Adapted advertising	Compulsory advertising : compulsory national pattern: BOAMP or JAL + publication on the buyer profile
			Additional advertising is optional	
	Services (art.30)	Adapted advertising		
Competition		None	None but under buyer responsibility	Introducing competition

¹⁰⁸⁹ http://www.economie.gouv.fr/files/directions_services/daj/marches_publics/textes/cmp/code2004/decret_2004-15_consolide.pdf

Procedure	Supplies and services (art.29)	Adapted procedure	Relevant procedures: opened or restricted requests for proposal (art.33) ; negotiated procedures (art.35) ; competitive dialogues (art. 36) ; competition (art.38) ; dynamic acquisition system (art.78) ; (exclusively for common supplies)
	Supplies (art.30)	Adapted procedure	

Table 6: Public procurement Procedures for supplies and services (EPLFM document)

BOAMP: Official Bulletin for Public Procurement Announcing

JAL: Legal Announcing Journal

OJEU: Official Journal of European Union

Adapted procedure: freely decided by the buyer depending on the nature of the procurement, on the needs to be satisfied, on the number and localisation of suppliers and procurement circumstances.

- How is the procurement process in the non-EU countries organized? Are coordinating activities of any kind in place or are they planned?

Procurement procedures in non European countries are specific in each country and are unknown by the French State. Meanwhile we can find on the web some articles concerning procurement processes in some large countries. The next paragraph summarises the main links to information on the procurement procedures of some countries concerned.

- Government procurement in the United States¹⁰⁹⁰
- Government procurement in Russia¹⁰⁹¹
- Switzerland's Public Procurement system¹⁰⁹²
- Turkish public procurement authority (PPA)¹⁰⁹³

5.5 Niche capabilities

- Which niche capabilities of the country /IO are potentially of interest to the EU CM and disaster response?

The French State owns civil security means in various domains of natural or manmade disasters that have already proven their value in different European countries and in the world.

At the European level, there is a Common Emergency Communication and Information System (CECIS, ECHO reference: ECHO/B.1/SER/2011/01)¹⁰⁹⁴ which allows answering the demands from all countries (even outside of the European Union) when they are in a crisis situation.

The concerned country makes a request for help which is relayed to all the European countries offering their help, which is accepted or not by the demanding country.

There is also an Emergency Response Centre (ERCC)¹⁰⁹⁵ which works on the same principle with the financial participation of the European Commission for staff travelling expenses during operations (case of the intervention in Sweden in august 2014 for forest fires). See following references.

- Decision N° 1313/2013/EU of the European parliament and of the council of 17 December 2013 on a Union Civil Protection Mechanism¹⁰⁹⁶
- The European Emergency Response Centre Opens. European Commission MEMO/13/427 15/05/2013¹⁰⁹⁷

The Commission Decision of 29 July 2010 (amending Decision 2004/277/EC) as regards rules for the implementation of Council Decision (2007/779/EC) defining a Community civil protection mechanism, establishes the form that must take community assistance. This decision defines the general requirements that apply to European protection civil modules.

- **Commission Decision of 29 July 2010 amending Decision 2004/277/EC Euratom, as regards rules for the implementation of Council Decision 2007/779/EC Euratom, establishing a Community civil protection mechanism**¹⁰⁹⁸
- Council conclusions on Further Developing Risk Assessment for Disaster Management within the European Union¹⁰⁹⁹.

The niche capabilities for the French State are listed below:

¹⁰⁹⁴ <http://ec.europa.eu/echo/fr/funding-evaluations/public-procurement/call-for-tender/common-emergency-communication-and-information-system>

¹⁰⁹⁹ http://www.consilium.europa.eu/uedocs/cms_data/docs/pressdata/en/jha/121462.pdf

1. **Forest fires:**

- Aerial forest firefighting module using airplanes: the fleet of air tankers includes 12 Canadairs, 9 Trackers, 2 Dash 8 and 3 Beech crafts.
 - French detachments for far-off countries are most often composed of 2 Canadairs and one beech craft. They also include two plane pilot crews (of two pilots) and four maintenance staff. A senior forest fire fighter manager is in charge of the coordination of the intervention. A total staff of 17 people.
 - For bordering countries (Spain, Italy), the detachment is composed by only two Canadairs with their two pilot crews, they use the same work method as in France.
- Aerial forest firefighting module using helicopters :
 - Three helitankers with a capacity of 1000 liters.
- Ground forest firefighting : two kinds of modules
 - Ground forest firefighting using vehicles: 1 VLTT (off-road liaison vehicle) and 4 wildland fire tankers, a total staff of 30 people.
 - Ground forest firefighting without vehicles: airborne specialized intervention detachment (DIS). A staff of 30 people equipped with forest cutting tools, motor-pumps...

2. **Earthquake and explosion: urban search and rescue:** INSARAG classification¹¹⁰⁰

- Two HUSAR teams (heavy teams) have been classified in March 2014: UIISC1 and UIISC7 (military teams)
- One French NGO, Pompiers Urgence Internationale (PUI) is classified MUSAR (medium team).
- Two new HUSAR teams (Civil protections teams) should be classified in 2016 and 2017: south Zone team in 2016 and Ile de France team in 2017.
- (INSARAG, Preparedness-response) Each of these INSARAG classified teams owns the material needed for its actions. *“A heavy urban search and rescue team is required to have:*
 - *the equipment and manpower to work at a heavy technical capability at two separate work-sites simultaneously;*
 - *both a search dog and technical search capability;*
 - *the technical capability to cut structural steel typically used for construction and reinforcement in multi-storey structures;*
 - *the capability to conduct heavy rigging and lifting operations;*
 - *staff and logistic sufficient to allow for 24 hour operations at 2 independent sites for up to 10 days.”*

French HUSAR teams have 62 people.

3. **Chemical cleanup and clearing:**

- High pressure cleaners: 5 with hot water; 24 with cold water.
- Chain saw modules: 245.

4. **High capacity pumping : flooding, cyclone, marine flooding:**

¹¹⁰⁰ <http://www.insarag.org/en/methodology/guidelines.html>

- Mobil pumping units: 5 UMP5400 at 1.5m³/s.
- Pumping units: 8 UP850 at 850m³/h.
- Thermal motor-pumps: 152 at 50m³/h and 73 at 150 m³/h.
- Flood containment, pumping and drying unit CELPA, Modular floating rig.
- Flood rescue using boats: navigation unit CELNAV.

5. Field hospital:

European Commissions requirements (**Commission Decision of 29 July 2010**) for field hospital:

- Provide initial and/or follow-up trauma and medical care.
- 10 beds for heavy trauma patients, possibility to expand the capacity.
- Medical team for: triage, intensive care, surgery, serious, but not life-threatening injuries, evacuation, specialised support personnel.
- Appropriate tents for the medical activities, tents for personnel.
- Command post, logistic and medical supply deposit.

In France, we have a field hospital that can be operational in 24 hours. This unit called ESCRIM, includes a department for surgical support (Civil Protection Units) and a department for medicine and hospitalisation (Civil Security Military Units). This hospital with 33 tents and a surface of 1500 m², includes 100 beds, 2 operating blocks, medical imaging units, sterilization modules, laboratory of biological analysis, health centre, maternity.

Staff is composed of 75 people issued from civil safety and civil protection units who are periodically checked for capacity, availability and trained. Likewise materials are periodically checked.

This field hospital is available 24/7. It is totally autonomous and does not need any local help.

6. Water purification: flooding, biological hazard, earthquake, population displacement, cyclone.

- France owns 4 water treatment units: CELTE 5 m³/h of capacity each. No treatment of salted water.
- Semi automatic bag filler
- Mobile boosting station for drinkable water.

7. Chemical, biological, radiological and nuclear detection and sampling (CBRN)

- Individual protection kits: kit CLD NRBC
- Respiratory protection masks

8. Medical aerial evacuation of disaster victims

- Transport disaster victims to health facilities for medical treatment.
- Capacity to transport 50 patients per 24 hour, ability to fly day and night.
- Helicopters/planes with stretchers

Driving Innovation in Crisis Management for **E**uropean **R**esilience

GERMANY

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: FhG-INT (Maike Vollmer, Isabelle Linde-Frech)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by EPLFM and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

Germany is a federal republic consisting of 16 constituent states (*Bundesländer* or *Länder*). States have their own government and parliament and possess a high degree of autonomy. Subsequent governmental levels are the administrative counties (*Landkreise*) or county boroughs (*kreisfreie Städte*) – combined in administrative districts –, and the municipalities (*Kommunen*). The principle of subsidiarity has to be applied wherever possible. As given in the German Basic Law (*Grundgesetz*, comparable to a constitution) and in the Treaty of Lisbon, the states play an active role in the decision making process regarding the German EU policy.

Main risks in the DRIVER context are seen in weather related hazards such as floods, heat waves, and storms, while the risk of major losses caused by earthquakes or landslides is rather low.

Following the terrorist attacks on 11 September 2001, and the severe flood in Germany in 2002, a “New Strategy on Civil Protection” has been enacted in 2002, updated in 2010, providing the new political-strategical framework programme in civil protection. Main goal is an optimized collaboration of the federal level and the states in preparation to and coping with disasters relevant on national level.

The first authority in the event of a peacetime disaster is the cognisant rural district, county or municipality. In case a disaster exceeds capacities of the local government or affects several districts, the next highest hierarchical authority ensures coordination.

If needed, a state can call for the assistance of police forces of other states or of personnel and facilities of other administrative authorities, of the Federal Police or the Armed Forces. Also, the Federal Agency for Technical Relief (THW) may be called.

At the national level first of all the Federal Ministry of the Interior (BMI), assisted by the Federal Office of Civil Protection and Disaster Assistance (BBK) and the German Federal Agency for Technical Relief (THW) are the core institutions responsible for crisis management.

The Federal Foreign Office (AA) plays a role in case of crises abroad, which affect German nationals or German interests. The AA is also the national contact point for requests on assistance from third countries. Contact point for requests from the EU Civil Protection Mechanism is the BMI.

In general, Civil Protection and disaster management in Germany is to a high degree based on the availability of people with an honorary post.

THW	Federal Agency for Technical Relief

1 Policy

1.1 Risk Assessment

While there is no overall record on disasters on federal level in Germany, it can be noted that most recent major disasters have been caused by extreme weather conditions – storms (e.g. storm Kyrill in 2007, 11 dead; storm Felix in 2006, 10 dead), floods (e.g. in 2013 affecting several rivers, 8 dead; in 2002 affecting especially the Elbe, 27 dead), and heat waves (e.g. in 2003, 9.355 dead) (EM-DAT 2014; EC 2014; Badische Zeitung 2014). Further prominent examples are the interruption of the energy supply in the region of Münsterland (North-Rhine-Westphalia) for several days in 2005, or the ICE train accident in Eschede in 1998, 101 dead (EC 2014).

All these crises, however, did not pose a direct threat to the functioning of the state as a whole (Hegemann & Bossong 2013).

Following the terrorist attacks on 11 September 2001, and the severe flood in Germany in 2002, the “New Strategy on Civil Protection” has been enacted in 2002, providing the new political-strategical framework programme in civil protection. Amongst others, this strategy underlines the need for a coherent method for risk analyses between the federal and the state level (BBK 2010a).

Following the Civil Defence and Disaster Assistance Act (ZSKG), the federal level, supported by the states, conducts country wide risk analyses for civil protection, across different sectors. Reports from 2010, 2011, 2012, and 2013 describe the respective status of these risk analyses (Deutscher Bundestag 2013). The Federal Office of Civil Protection and Disaster Assistance (BBK) issued detailed methodological guidance (BBK 2010b). However, the implementation of this risk assessment methodology on state or communal level depends on the initiative of the respective governments, which diverge strongly with regard to their commitment and organisational capacities (Hegemann & Bossong 2013).

1.2 Policy and Governance

Germany is a federal republic consisting of 16 constituent states (*Bundesländer* or *Länder*), in the following referred to as states. States have their own government and parliament and possess a high degree of autonomy, especially in the areas of education, police, local administration, transport, and some medical measures. They receive income gained through taxation (revenues). Through the constitutional organ “Bundesrat” the states participate in legislation, administration and matters concerning the European Union. Subsequent governmental levels are the administrative counties (*Landkreise*) or county boroughs (*kreisfreie Städte*) – combined in administrative districts –, and the municipalities (*Kommunen*) (MSB 2009). The municipalities administrate inter alia local transport and road construction, electricity, water and gas supply, sewerage and daily life protection (EC 2014). The principle of subsidiarity has to be applied wherever possible. As given in the German Basic Law

(*Grundgesetz*, comparable to a constitution) and in the Treaty of Lisbon, the states play an active role in the decision making process regarding the German EU policy.

1.2.1 Strategy scope and focus

The “New Strategy on Civil Protection” (see above) provides the new political-strategical framework programme in civil protection. It has been updated in 2010 (BBK 2010a). Main goal of the strategy, which still provides the foundation for the new understanding in civil protection, is an optimized collaboration of the federal level and the states in preparation to and coping with disasters relevant on national level (ibid).

However, crisis management approaches in Germany do not follow the clustering by the terms Prevention, Preparedness, Response and Recovery, while with regard to contents, all of these topics are covered. No special focus on one or a few of them can be identified (expert interview).

1.2.2 Monitoring and analytical support to policy making; R&D

There are several R&D programmes that contribute to risk assessment supporting policy making. On national level, there is e.g. the “Research Programme for Civil Security” from the Federal Ministry of Education and Research (BMBF). Its purpose is “to develop innovative solutions that increase civil security while maintaining a good balance between security and freedom. What makes the programme special is that, rather than just being concerned with technology, it includes innovative organisational approaches and strategies for action. The success of the security research programme depends on interdisciplinary projects, knowledge transfer to the general public, social science research on data protection and ethics and transparency. The programme is also integrated in a European framework” (BMBF 2014).

Further, research benefiting civil protection is entrenched in section 4 subsection 1 No. 5 of the Civil Defence Act (“Zivilschutzgesetz”) as a task for the Federation:

“The following shall be in particular incumbent on the Federal Office of Civil Protection and Disaster Assistance...

5...the tasks for technical and scientific research in agreement with the Länder, the evaluation of research results, as well as collection and evaluation of publications in the field of civil defence.”

“Research at the Federal Office of Civil Protection and Disaster Assistance offers scientifically-sound problem solutions for civil protection, as well as new concepts, procedures and technology, and hence makes a major contribution towards upgrading civil protection mechanisms” (BBK 2014).

1.2.3 Policy for Prevention

As mentioned under 1.2.1, crisis management approaches in Germany are usually not clustered by the terms Prevention, Preparedness, Response and Recovery, while with regard to contents, all of these topics are covered (expert interview).

Prevention is part of the civil protection in Germany. Organisations responsible for prevention work closely together with those responsible for preparedness and/or response (European Commission 2014), see also chapter 3.1.

1.2.4 Policy for Preparedness

As mentioned under 1.2.1, crisis management approaches in Germany are usually not clustered by the terms Prevention, Preparedness, Response and Recovery, while with regard to contents, all of these topics are covered (expert interview).

See chapter 3.1 for organisations and responsibilities in crisis management.

1.2.5 Policy for Response

As mentioned under 1.2.1, crisis management approaches in Germany are usually not clustered by the terms Prevention, Preparedness, Response and Recovery, while with regard to contents, all of these topics are covered (expert interview).

See chapter 3.1 for organisations and responsibilities in crisis management.

1.2.6 Policy for Relief and Recovery

For organisations and responsibilities in crisis management see chapter 3.1.

There is no specific regulation on relief and recovery in Germany. Responsibility is with the states, who would request support from the federal level, if needed. Financial support from federal level would be released by the Federal Ministry of Finance (BMF). For international requested financial support, the Federal Ministry for Economic Cooperation and Development (BMZ), and the Federal Foreign Office are in charge. From EU level, the Solidarity fund can provide financial support, while there is no such fund on national level in Germany (expert interview).

1.3 Financing

1.3.1 Investing in preparedness

The report on Germany conducted in context with the “Outline for national reporting and information on disaster reduction for the World Conference on Disaster Reduction” (Kobe-Hyogo, Japan, 18-22 January 2005)¹¹⁰¹ lists the following budgets in the context of disaster risk reduction: The Federal Foreign Office (AA) has a regular annual budget for disaster prevention projects, and also the Federal Ministry for Economic Cooperation and Development (BMZ) funds programmes on

¹¹⁰¹ Outline for national reporting and information on disaster reduction for the World Conference on Disaster Reduction (Kobe-Hyogo, Japan, 18-22 January 2005), Report Germany 2004, <http://www.unisdr.org/2005/mdgs-drr/national-reports/Germany-report.pdf>

disaster reduction, especially a sector programme to incorporate risk reduction into development projects. The Ministry of the Interior (BMI) funds disaster preparedness structures. Further, two institutions are mainly funding disaster prevention research: the Federal Ministry for Education and Research (BMBF) and the German Research Foundation (DFG).

However, no specific number for investments in preparedness and consequence management (chapter 1.3.2) could be identified. The total number would include budgets from different departments of several organisations, e.g. from those named above, or the Federal Agency for Technical Relief (THW), the Federal Ministry of the Interior (BMI), the Federal Ministry for the Environment, Nature Conservation, Building and Nuclear Safety (BMUB), or the Federal Ministry of Health (BMG). Further, investments in vaccines, and also donations would need to be considered (expert interviews). These specific numbers are not available.

1.3.2 Investing in consequence management

As explained in chapter 1.3.1., specific numbers are not available.

In the first place, individuals are expected to cover their costs on their own. Then, money from insurance and reinsurances contribute to cover costs of recovery, and specific funds from EU (Solidarity fund) and national level (from BMF) help to cover costs of consequence management (expert interviews).

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

The information gained on post-disaster assessment is closely linked to information on lessons learned systems, and is thus included in chapter 1.4.3.

1.4.2 Departmental Lessons Learned systems

There are Lessons Learned systems on departmental level, while overarching information is not available. For example, federal state governments can request evaluation of missions after a crisis, while there is no general regulation. Organisations are handling their Lessons Learned differently, and also differently for different types of crisis. There is no general or common methodology. The THW for example distinguishes between national and international missions. International missions are less complex or more comparable to each other. For the lessons learned in these international 'standard' missions, the THW uses prepared sheets to be filled in during the mission. Also for national missions, data is usually collected already during missions, but adapted to the current operation (expert interviews).

See also chapter 1.4.3.

1.4.3 Centralised (national) Lessons Learned system

There is no centralised Lessons Learned system in Germany. The LÜKEX exercises (see chapter 5.3) are main sources for identification of improvement needs, they are partly conducted together with neighbouring countries, e.g. The Netherlands, and are also observed by EU delegates. Connections to international Lessons Learned are not institutionalised, but respective reports from other countries are in fact considered and evaluated (expert interview).

The following two paragraphs are mainly taken from the country study Germany, which has been prepared in the context of the ANVIL Project¹¹⁰² (Hegemann and Bossong 2013):

One major investigation, the “Kirchbach Report” (Kirchbach et al. 2002) was conducted after the signature crisis Elbe Flood in 2002. It was commissioned by the State of Saxony, focused on regional flood defence mechanisms, but also discussed the general effectiveness of the German civil security system. The report attested a high level of technical competence to first responders and specialised civil protection forces, while the support of military units in upgrading and defending dams was also praised. Thus, the basic principles of the German disaster and crisis response system’s effectiveness, namely a decentralised approach that builds on local capacities¹¹⁰³, were defended. Yet the report also highlighted severe coordination failures across district-level and state-level structures.

At the level of state governments, one could point to ministerial reports on the handling of regional crises, such as storm damages and power failures in 2005-7 (Landesregierung NRW 2010). However, these internal reports did not generate wider attention within Germany's civil security system. The German response to the H1N1 and EHEC epidemics, which generated wide-spread media attention as well as political debates, could be seen as the main exception (Deutscher Bundestag 2011). In the aftermath, professional actors in the health sector and the RKI meticulously documented their actions and worked towards improved coordination, risk assessment and public communication processes (Krause et al. 2010, RKI 2011). This fed into on-going discussions among German emergency professionals on how to revise risk communication strategies to be able to tackle complex emergencies and changing public attitudes (Weinheimer 2011).

1.4.4 International exchange for Lessons Learned

See under 1.4.3: Reports from other countries are considered and evaluated. LÜKEX exercises, being main source for identifying improvement needs, are partly conducted together with neighbouring countries, e.g. The Netherlands (expert interview).

¹¹⁰² Analysis of Civil Security Systems in Europe, <http://anvil-project.net/>

¹¹⁰³ Even though civilian actors needed to be temporarily reinforced by military units. It may be noted that the president of the investigative committee, Kirchbach, was the chief military commander that supported the response to the Elbe flood.

1.4.5 Regular policy reviews

There are no regular policy reviews, but they are conducted following specific occasions. One prominent example is the policy change regarding nuclear power energy after the nuclear disaster in Fukushima 2011 (expert interview).

1.5 Resilience

The concept of resilience has recently been discussed intensively in the academic field. Operationally, the concept is not directly applied, but there are approaches to consider this trend, e.g. as described in a “strategy on future topics in technology” (acatech 2014) (expert interview).

- *Do CM organization, local community and private business apply related standards, e.g. ISO 22301 "Business Continuity Management - Requirements" or any other (formal or industrial) standards? Please specify.*

ISO 22301 "Business Continuity Management - Requirements" is applied by internationally operating organisations (expert interview).

1.6 Information sharing and data protection

1.6.1 Please describe whether the country/ IO has adopted specific policies, measures or derogations from EU law with regard to data protection

Standards on data exchange are currently being developed, e.g. the BBK identified a gap regarding XML interfaces for data sharing in bi- or multinational cooperation and is currently working on a related project. By now, there is no legal basis for collecting data on e.g. spots at risk, critical infrastructures, human or material resources. Data exchange happens, but there is no formal regulation for this (expert interviews).

1.6.2 Does the country/IO have registers/databases of volunteers? If yes, under what circumstances can data be used/ shared? e.g. particular capabilities, level of readiness/ availability, contact information

Volunteers are registered with different organisations (see chapter 3.1), where respective information is stored. There is no overall database.

1.6.3 Does the country have or plan to use data gathered from social media during crises? If so how? (e.g. “crowd sourcing” and “crowd tasking”, "citizen as a sensor")

The guideline on crisis communication (only available in German) from the Federal Ministry of the Interior also includes some guidance on the use of social media during crisis (BMI 2014), but in general, the use of social media (Twitter, Facebook) for both information provision and data collection (e.g. track the outbreak of epidemics) remains very limited (Hegemann & Bossong 2013).

It has been an important topic in research, while the actual use is still under development. There is more and more education of personnel, e.g. for spokespersons, who are increasingly under pressure due to quick information that is spread through twitter or other social media (expert interview).

2 Legislation

2.1 Crisis (emergency, disaster) management concept

The states are responsible for “peacetime” disasters (see chapter 2.2), and have their own laws on disaster protection. These laws are listed and provided on the BBK website (BBK 2014b).

2.2 General crisis (emergency, disaster) management law

The following paragraph is mainly taken from the deliverable D2.1 “Report on current CM framework” of the ACRIMAS project¹¹⁰⁴ (Vollmer et al. 2012):

The division of power and assignment of responsibilities is defined in the **German Basic Law** (*Grundgesetz*, 1949). Relevant articles are:

- Article 30, 70 ff, 73 (1) no. 1: Division of legislative powers, the states are responsible for governmental tasks as e.g. threat prevention measures, taken by the police and other government agencies.
Threat prevention measures and related legislation (fire prevention, fire services, police) are competence of the states, as long as these do not involve defence/ protecting civilian population against war-related hazards (→ “peacetime” disasters, e.g. natural disasters, terrorist attacks). The Federal Government may supplement with wartime equipment that can be used during peacetime (e.g. NBC-Vehicles). Emergency planning in the event of war incl. war-related hazards or threat thereof is competence of the federal state. Wartime measures for Civil Protection are, however, carried out by the states on behalf of the federal government (Article 73 (1)).
- Article 35 (2): States can call assistance of police forces of other states and of personnel and facilities of other administrative authorities, such as the Federal Police, the Armed Forces (Bundeswehr), or the Federal Agency for Technical Relief (THW).
- Article 35 (3): In cases of major natural catastrophes or accidents, the Federal Government may instruct state governments to provide other states with assistance. It also may employ the Federal Police and the Armed Forces to support the states.
- Article 80a (1), Art. 115 a: Emergency laws can be applied in the case of severe tensions, the event of an armed conflict or the threat thereof.

As threat prevention measures (in peace time) are competence of the states, relevant regulations are **laws on state level**. They are listed and provided on the BBK website (BBK 2014b). Some states have

¹¹⁰⁴ Aftermath Crisis Management System-of-systems Demonstration Phase I, <http://www.acrimas.eu/>

separate laws on fire prevention and fire-fighting, rescue and disaster management (e.g. Bavaria), others have a single law that covers all (e.g. Hessen). In addition, the states have legislations on the police.

The **Federal Law on Civil Protection and Disaster Relief (2009)** was enacted to optimize the collaboration between federal and state level in disaster management.

It provides regulations regarding the provision of the states with Civil Protection resources of the federal government and the opportunity of a coordinated disaster management through the federal government.

2.3 Emergency rule

The following paragraph is mainly taken from the country study Germany, which has been prepared in the context of the ANVIL Project ¹¹⁰⁵ (Hegemann and Bossong 2013):

Under the German Basic Law, the declaration of a formal state of emergency at the federal level is reserved to internal and external armed conflicts, or serious (and intentional) threats to the “free democratic order”, and requires a two-third majority in national parliament. In this situation, it is possible to curtail numerous civil rights and expand the role of the federal government, including the deployment of the federal police and the armed forces (Art. 91 and 87a GG). Legal scholars have rejected the view that a natural disaster or a serious accident could qualify as a formal internal state of emergency, except for the unlikely case that an accident or a natural disaster causes situations that are comparable to civil war (Sattler 2008). Due to the absence of such large-scale violent unrest, Germany has hitherto not declared such a state of emergency.

In contrast, a state of disaster can be declared at the level of counties, cities or intermediary administrative districts by the respective chief administrative officers, which does not authorise wide-spread derogation to civil rights or to act outside regular legislative and judicial control (Kloepfer 2007). At the operational level, emergency responders nevertheless enjoy a considerable sphere of discretion. Based on a “blanket clause” (*Generalklausel*) that is typically included in state laws responsible agencies can take all measures they deem necessary for the fulfilment of their crisis management duties, as long as they remain within the confines to normal legal constraints such as the proportionality principle (Musil and Kirchner 2006).

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

There are specific working rules (Dienstvorschriften), often not publically available, which define the procedures within the respective organization in case of a crisis (expert interview).

¹¹⁰⁵ Analysis of Civil Security Systems in Europe, <http://anvil-project.net/>

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

For regulations on state level, see chapter 2.2. Lower levels have not been investigated.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

Following the Civil Defence and Disaster Assistance Act (ZSKG), rights and duties of helpers in civil protection are generally regulated in the laws on disaster protection on state level (listed and provided on the BBK website, BBK 2014a).

2.7 Legal regulations for international engagements of first responders and crisis managers

On UN level, UN OCHA regulations apply; for EU operations, respective EU regulations apply. Decisions on international engagements are taken by the AA, who requests capacities from different organisations (e.g. THW, German Armed Forces). These organisations provide the respective information, afterwards, the decision is taken, which is often also influenced by political reasons. Insurance is usually organised by the respective organisation (expert interviews).

3 Organisation

3.1 Organisational chart

The following descriptions are mainly taken from the deliverable D2.1 “Report on current CM framework” of the ACRIMAS project¹¹⁰⁶ (Vollmer et al. 2012):

Crisis management at national level

At the national level first of all the Federal Ministry of the Interior (BMI), assisted by the Federal Office of Civil Protection and Disaster Assistance (BBK) and the German Federal Agency for Technical Relief (THW) are the core institutions responsible for CM.

The Federal Foreign Office (AA) plays a role in case of crises abroad, which affect German nationals or German interests. The AA is also the national contact point for requests on assistance from third countries. Contact point for requests from the EU Civil Protection Mechanism is the BMI.

During a peacetime disaster affecting several states or a long term crisis the BMI may set up an inter-ministerial coordination group consisting of representatives of the BMI and other Federal Ministries, depending on the type of disaster (typically the contact persons for CM and counter-terrorism). The Federal Ministries are prepared to call up specific task forces at short notice, especially the Federal Ministry for the Environment, Nature Conservation and Nuclear Safety (BMU), in case of serious threats involving the illegal use of radioactive materials, and the Federal Ministry of Health (BMG), in case of pandemics and bioterrorism (EC 2014; BMI 2012).

The BBK conducts conceptual work on fundamentals in CM, including the evaluation of missions, exercises and findings in research. In addition, the BBK provides operational instruments:

- A Joint Information and Situation Centre (GMLZ) for efficient coordination of large area disasters,
- A web-based Emergency Preparedness Information System deNIS I + IIplus¹¹⁰⁷,
- A warning centre with a satellite based warning system (SatWaS),
- A Centre for the coordination of aftercare and for support of victims and their relatives (NOAH) (BBK 2014b).

During a military crisis the states are responsible for coordination within their respective areas, although the BMI gives respective orders. The federal planning in this case consists of measures to ensure continuity and social functions (continuity of government, Civil Protection, supply of goods and services, support of the Armed Forces).

The capability for Civil-Military Cooperation (CIMIC) has to be ensured at all ministerial levels, incl. planning, training, exercises. The BBK’s Academy for Crisis Management, Emergency Planning and Civil Protection (AKNZ) provides obligatory education for CIMIC personnel of the Armed Forces.

¹¹⁰⁶ Aftermath Crisis Management System-of-systems Demonstration Phase I, <http://www.acrimas.eu/>

¹¹⁰⁷ <https://www.denis.bund.de/>

Regular discussions of preparations for peace- and war-times disasters between civilian and military authorities are conducted (MSB 2009).

Crisis management at sub-national level

In Germany, the first authority in the event of a peacetime disaster is the cognisant rural district, county or municipality. Respective authorities manage local response assisted by (if necessary) representatives of other authorities, services, organizations. For the technical and tactical execution a director of operation, assisted by a staff composed of the involved organizations and units (e.g. police, fire department, non-governmental organisations, private enterprises) is appointed. In case a disaster exceeds capacities of the local government or affects several districts, the next highest hierarchical authority ensures coordination (MSB 2009).

If needed, a state can call for the assistance of police forces of other states or of personnel and facilities of other administrative authorities, of the Federal Police or the Armed Forces. Also, the Federal Agency for Technical Relief (THW) may be called.

In the “New Strategy on Civil Protection” (enacted in 2002, see above), the states agreed amongst others on standardizing recommendations for command and control structures (e.g. through a common “Fire Services Regulation 100”; guidelines for setting up administrative-organizational task forces) (BMI 2012).

Figure 1 illustrates the role of the different levels of government in Germany in Civil Protection and disaster response:

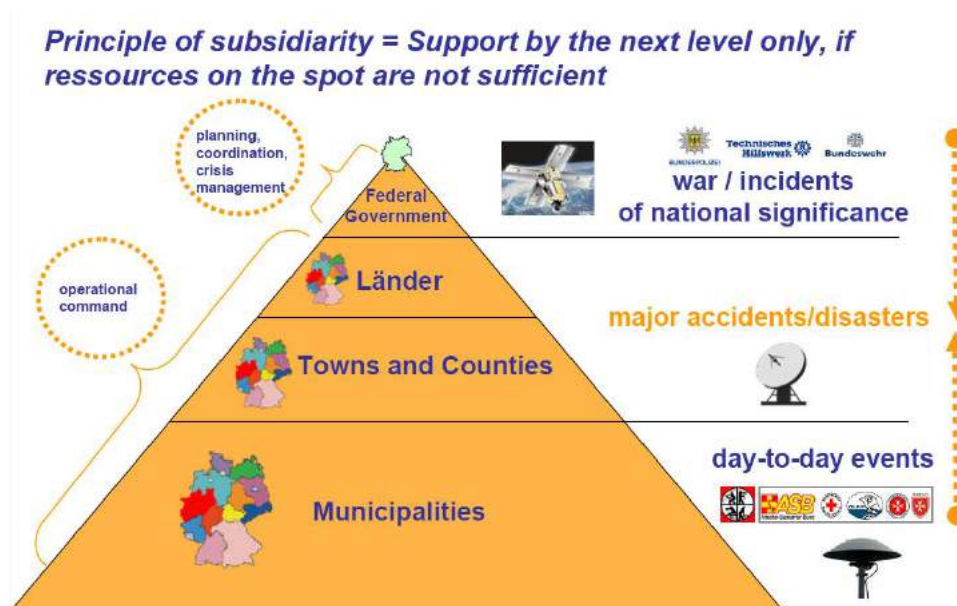

Figure 1: Organisation of Civil Protection in Germany¹¹⁰⁸

¹¹⁰⁸ The public alert system in Germany, Dr. Miriam Haritz, Head of the president's Office BBK: 8th GESA Conference in cooperation with EURALARM, Brussels, 16 June 2011. (taken from the ACRIMAS deliverable 2.1 Report on CM framework)

In general, Civil Protection and disaster management in Germany is to a high degree based on the availability of people with an honorary post. This leads to a comparatively high degree of tolerance and independence, but also to the fact that the availability of personnel is dependent on preferred recreational activities of the population, which might change over time. Also, the demographic change in Germany will have an impact on the availability of volunteers in the future.

Main parts of the following are taken from the country study Germany, which has been prepared in the context of the ANVIL project¹¹⁰⁹ (Hegemann & Bossong 2013), and from the “Vademecum for Civil Protection”, provided by DG ECHO (EC 2014):

Strict limitations on the military in domestic crises

Due to Germany’s historical experience under Nazi rule, the distinction between internal and external security and between civilian and military forces is deeply encoded. The domestic deployment of the armed forces is confined to especially severe disasters or the hitherto hypothetical scenario of a state of emergency that would be constituted by intentional threats and wide-spread violence. In practice, military assistance has to date been limited to, and not required beyond, short-term technical and logistical support for civilian authorities in response to exceptional natural disasters. The military would not be used for the maintenance of public order or beyond what could potentially be done by civilian responders who maintain overall command.

The role of the military in Germany also exemplifies how legal accountability may be maintained in the face of extreme threat scenarios. The attacks of 11 September 2001 led to calls for the employment of the *Bundeswehr* to protect potential targets, such as government buildings, and assist civil security agencies in the response to attacks, for instance through its CBRN units. The most controversial debates pertained to a law that would have allowed for the shooting down of hijacked airplanes. The Aviation Security Act, which was passed in 2005, was declared unconstitutional by the Constitutional Court only a few months later because it violated the right to life and especially the right to human dignity, which is enshrined in Article 1 of the Basic Law. According to the court, authorities could not pit the dignity of people in a potential target of the plane against the dignity of the people on the plane.

Volunteers; Role of societal/non-profit organisations/NGOs

The German civil security system officially and strongly relies on non-profit relief organisations and their volunteer staff. Their main task is emergency and crisis response through medical, rescue and ambulance services on behalf of public agencies. Most management tasks and everyday emergency services are carried out by professional staff, but volunteers remain essential for membership fees, training, public outreach, and more exceptional crisis management situations. Thus, non-profit organisations are included in all public crisis management structures and exercises, but retain their independent character and have to bear the costs of crisis operations. However, depending on their size and scope of activities, they receive official financial compensation.¹¹¹⁰ Despite the continuingly

¹¹⁰⁹ Analysis of Civil Security Systems in Europe, <http://anvil-project.net/>

¹¹¹⁰ That is, in addition to organizational membership fees. Regular emergency services are also paid for, such as by health insurances.

high number of volunteers, voluntary organisations face increasing challenges from various societal trends, as mentioned above.

The most important non-profit actors are the German Lifeguard Association (DLRG), the German Red Cross (DRK), the Order of Malta Ambulance Corps (*Malteser*), the St. John Accident Assistance (JUH), the Worker's Samaritan Federation (ASB), and the German Maritime Search and Rescue Service (DGzRS). The role of the DRK is illustrative in comparison with other countries. It constitutes a legally privileged actor in some respects, but otherwise closely corresponds to other non-profit actors in Germany. In 2011 the DRK had 3.38 million members with about 400,000 active volunteers (including youth groups) and a professional staff of 140,342 (DRK 2012). It is divided into 19 state associations.¹¹¹¹ There are 513 county branches and 4,609 local branches. Moreover, the DRK distinguishes five special sub-chapters dealing with emergency preparedness, mountain rescue, lifeguard service, youth work and social welfare. The local branches carry the primary responsibility for all operational tasks, including especially ambulance and rescue services. The federal office aims to ensure coordination and coherence (DRK 2012). These chapters are part of a "complex assistance and rescue system" (DRK 2011). The DRK's emphasis is on crisis response through its emergency and rescue services, but they also contribute to preparedness through research and first aid training (Lange et al. 2012).

In addition, volunteers work in voluntary fire brigades. The German Firefighter Association (DFV) represents the interests of the German fire brigades national-wide and abroad.

Further, important NGO's are the "Deutsches Komitee Katastrophen Vorsorge" (DKKV), the „Ständige Konferenz für Katastrophenvorsorge und Bevölkerungsschutz" (SKK), and the „Bergwacht" (Mountain Rescue Experts).

Role of private/profit-oriented organisations

In the field of the protection of Critical Infrastructures (CIP) as a part of civil protection, Germany closely cooperates with critical infrastructure providers on sectorial as well as on cross-sectorial issues, usually in a less formalized way. These providers represent different CI-sectors (e.g. provision of electricity/ energy transmission, rail traffic, financial services, water supply (further information in available in the National Strategy on CIP (2009)¹¹¹²).

Close cooperation exists in the field of the protection of IT-infrastructure (CIIP, see also the "National Plan for Information Infrastructure Protection"¹¹¹³).

Germany has highly developed regime of health and safety regulation as well as more general liability rules to protect employees, citizens, buildings, infrastructures and other privately-owned assets from harm and accidents. In line with EU law, privately-owned sites that can pose wider risks maintain special emergency plans and first response mechanism, such as plant fire brigades. Further market mechanisms for emergency and disaster management (e.g. mandatory insurance against flood) have been suggested, but are not yet part of the German civil security system (Schwarze and Wagner 2008).

¹¹¹¹ There are two organisations for Baden-Württemberg, North-Rhine Westphalia, and Lower Saxony respectively due to historic reasons.

¹¹¹² http://www.bmi.bund.de/cae/servlet/contentblob/598732/publicationFile/34413/kritis_englisch.pdf

¹¹¹³ https://www.bsi.bund.de/SharedDocs/Downloads/EN/BSI/Kritis/National_Plan_for_Information_Infrastructure_Protection.pdf?__blob=publicationFile

In non-regular emergency situations, state actors and security authorities bear responsibility for response operations, but can require private actors to provide additional assistance. This mainly pertains to the granting of priority access to, and maintenance of, essential services or goods. Beyond utility companies (power, water, fuels, telecommunications), this can apply to transport companies, apothecaries and pharmaceutical corporations.¹¹¹⁴ The maintenance of stockpiles and the distribution of emergency foodstuff remain an exclusive competence of state actors.¹¹¹⁵

While the restoration of power, transport and infrastructures has been a core mission of the THW since its establishment in the 1950s, state representatives have recognized the need for deeper engagement with private industry in the area of critical infrastructure and cyber-security. Since 2005, related strategy documents call for private inputs to detect new vulnerabilities and ensure the required technological expertise (BMI 2005, 2009b, 2011). Aside from numerous consultation rounds and preventive efforts, a notable result has been the private involvement in a 2011 national civil emergency exercises on cyber-attacks and food crises (Borchers 2011).

However, for the most part public actors maintain a distant approach, whereby private companies are expected to implement additional security measures (BMI 2011b), whereas they receive no direct compensation or influence on security planning. Private companies are also not widely mentioned as security partners for emergency preparedness.

3.2 Organisational cooperation

Main parts of the following descriptions are taken from the deliverable D2.1 “Report on current CM framework” of the ACRIMAS project¹¹¹⁶ (Vollmer et al. 2012):

Collaboration between national and sub-national levels of administration

In Germany, in case they ask for support, local and regional authorities as well as the states are supported by the federal government with (a) its own operational forces (Federal Agency for Technical Relief (THW), the Federal Police, and the Armed Forces (with limitations as regards the use of weapons)) and (b) services provided by the Federal Office of Civil Protection and Disaster Assistance (BBK) (MSB 2009).

All Civil Protection authorities contribute to the planning, administration, material & resources to the prevention of, disaster management during, and recovery from all kind of disasters as well as during armed conflicts.

Efficient interaction between federal and state CM is practiced in interministerial, interstate exercises (LÜKEX) on a biennial basis (BMI 2012), see also chapter 5.3.

CIMIC (see also paragraph on *Crisis Management at national level* in chapter 3.1) at regional level is ensured by joint planning for regional crisis, local training and exercises (MSB 2009).

¹¹¹⁴ For legal bases, see Kloepper (2009).

¹¹¹⁵ This traditional aspect of civil defence planning is regularly criticised, but has not been replaced by public-private partnerships. It is also worth mentioning that oil companies are to maintain a strategic stockpile of gasoline, whereas strategic gas reserves (for heating and power generation) are based on a voluntary agreement among corporations.

¹¹¹⁶ Aftermath Crisis Management System-of-systems Demonstration Phase I, <http://www.acrimas.eu/>

An Interministerial Coordination Group provides an important supplement to the setup that coordinates between the state and federal levels in case of threats that affect more than one state over a long period of time (e.g. accidents at nuclear power plants, pandemics and major natural disasters) (BMI 2012).

Collaboration with critical infrastructure providers

See last paragraph in chapter 3.1. Further, the Federal Ministry of the Interior (BMI) provides recommendations (in German) on how to ensure collaboration between crisis management on governmental level and critical infrastructure operators. It presents requirements for governmental institutions as well as the critical infrastructure operators when reacting to and coping with a crisis in order to assure an effective collaboration (BMI 2010).

Bilateral agreements, international assistance and collaboration with the EU

Germany is part of twelve bilateral support agreements (with its nine neighbouring countries plus Latvia, the Russian Federation and Hungary) that in some cases also include joint training and exercises and supports the development of new CM structures in Europe and third states (e.g. China). The agreements are available for download on the homepage of BBK.¹¹¹⁷

The information management for international assistance works as follows:

- In case of requests from the EU Emergency Response Coordination Centre (EERC), the Joint Information Centre (GMLZ) is the national contact point.
- In case of requests from third countries, the Federal Foreign Office is the first contact point.
- The BBK with its Joint Information Centre (GMLZ) provides information about the availability of appropriate resources to the BMI, the Foreign Office and the requesting state (EC 2014).

It is planned, however, to enable requests in the future directly via the BBK without engaging the Foreign Office or the BMI.

In general, Germany opts for the principle of subsidiarity for CM, also on European level. Based on the national approach, Germany advocates similar procedures on EU level: In order to limit coordinative and cooperative hurdles, the management of a crisis should be executed by the authority whose territory is affected. The local management might, however, be supported through provision of personnel and equipment by higher government levels or other EU MSs (BMI 2009).

The Academy for Crisis Management and Civil Protection (AKNZ) of the BBK offers training and education on the basis of the EU training & education system. The GMLZ (see above) operationally coordinates with the EERC (BMI 2009).

In events that require a coordinated response by EU MSs, the Secretariat General of the EU Council calls together the members of the EU Crisis Steering Group. The MSs concerned send their permanent representative or other specially designated representative to this group. Agreements have been made to ensure the flow of information between the Federal Foreign Office, the Federal Ministry of the Interior and other affected ministries as needed (BMI 2012).

¹¹¹⁷ http://www.bbk.bund.de/SharedDocs/Downloads/BBK/DE/FIS/DownloadsRechtundVorschriften/Katastrophenhilfeabkommen/Gesamtliste%20der%20Abkommen.pdf?__blob=publicationFile

Concerning events outside the EU, the THW was, amongst others, engaged in international disaster relief operations in China, Myanmar, Ecuador, Moldavia, Haiti and Japan. The THW provides rapid reaction forces for Search & Rescue operations as well as for water supply. Additionally, further critical resources and experts may be provided. In general, the THW may act upon request of the Ministry of Foreign Affairs, the EU and UN in areas as ad-hoc humanitarian aid, relief and reconstruction (BMI 2009).

The THW is the main public organisation in Germany, which contributes to international emergency operations. In the context of the EERC, it lists 14 specialised units for the EU's civil protection mechanisms. The THW also regularly contributes to EU exercises and research project. Since December 2006, it has been appointed by the European Commission as coordinator for the EU Exchange of Experts in civil protection (Hegemann and Bossong 2013).

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

There are SOPs in terms of disaster protection plans (“Katastrophenschutzpläne”) for specific areas, e.g. pandemics¹¹¹⁸, nuclear power (emergency plans), or mass casualty incidents (expert interview).

These specific plans for special disaster situations like storm surges supplement the normal disaster contingency plans (see 4.2). For this, states request plans for supporting the state disaster management from the local authorities¹¹¹⁹.

4.2 Operations planning

The report on Germany¹¹²⁰ conducted in context with the “Outline for national reporting and information on disaster reduction for the World Conference on Disaster Reduction” (Kobe-Hyogo, Japan, 18-22 January 2005) states that there are disaster contingency plans in place at Länder (states) level. Each Land has its own law and its own plan. Lower Saxony for example, has a uniform structure for plans, which have to be developed by all disaster relief agencies, containing relevant contact persons, materials, capacity in hospitals and assignment of relief units. This common structure enables the collective coordination at state level.¹¹²¹

4.3 Logistics support in crises

Main parts of the following descriptions are taken from the country study Germany, which has been prepared in the context of the ANVIL project¹¹²² (Hegemann and Bossong 2013):

With regard to emergency *logistics*, German authorities can utilise, but also have to protect a very dense network of road, rail, water and air transportation. Respective federal regulatory authorities (e.g. the German Authority for Freight Transport) maintain links with the BBK through the web-based Emergency Preparedness Information System deNIS (see chapter 3.1). The decentralised organisation of the civil security system adds a layer of resilience, as emergency response capacities do not regularly have to be brought in over long distances. The THW adds substantial logistical capacities for disaster management, including sixty-six specialised logistic units at the regional level (THW n.d.). In especially severe crises, the German army may provide additional logistical help through its so-called

¹¹¹⁸ E.g. national plan on pandemics: http://www.rki.de/DE/Content/InfAZ/I/Influenza/Pandemieplanung/Nationaler_Influenzapandemieplan.html

¹¹¹⁹ Outline for national reporting and information on disaster reduction for the World Conference on Disaster Reduction (Kobe-Hyogo, Japan, 18-22 January 2005), Report Germany 2004, <http://www.unisdr.org/2005/mdgs-drr/national-reports/Germany-report.pdf>

¹¹²² Analysis of Civil Security Systems in Europe, <http://anvil-project.net/>

territorial network (Baumgard 2012), as has been the case during the 2002 Elbe flood. Additional legal provisions allow for the requisition of private actors for logistical purposes, for example up to 12,000 trucks from freight companies (Bundesamt für Güterverkehr 2009), but have not been used at the federal level to date.

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

The Federal Ministry of the Interior (BMI) provides a guideline on crisis communication (only available in German, BMI 2014). Main goal of this guideline is to mentally instruct responsible personnel in agencies and companies for planning crisis communication. The guideline encompasses instructions on how to develop a crisis communication plan (BMI 2014).

In general, the responsible institution (depending on the type of crisis, see under 3.1) is also coordinating crisis communication to the public, while actually a “one-voice policy” applies. This policy is not always followed (expert interview).

Main parts of the following are taken from the country study Germany, which has been prepared in the context of the ANVIL project¹¹²³ (Hegemann and Bossong 2013):

German security organisations are in the process of transforming their emergency *communication* system, which can be summarised under three components. First, the German emergency law on telecommunication and postal services foresees prioritised access and special capacities for emergency responders. Since the end of the Cold War, the activation threshold has been lowered from a formal state of emergency to natural or technological disasters and terrorist attacks. Second, German security actors aim to integrate their different analogue radio networks, which experienced severe capacity limits during the major 2002 Elbe flood, into an integrated digital communication system. The introduction of the system is overseen by the newly created Federal Agency for the Digital Radio of Agencies and Organisations with Security Tasks (BDBOS).¹¹²⁴ Third, the BBK created the central web platform deNIS¹¹²⁵ (see chapter 3.1) that is directed to emergency professionals as well as the general public. The network provides a wealth of general information on crisis management, but also up-to-date situation assessments and sector-specific warning and communication platforms.

Communication to the general public

According to a Eurobarometer poll for September-October 2009, 27 percent of the respondents felt informed about disaster preparedness and 34 percent about disaster response (European Commission 2009). This reflects a lack of interest among the public as well as of pro-active strategies

¹¹²³ Analysis of Civil Security Systems in Europe, <http://anvil-project.net/>

¹¹²⁴ Further information (in German), e.g. on legal basics and state of play regarding the successive introduction of the system, is available at the BDBOS website http://www.bdbos.bund.de/DE/Digitalfunk_BOS/digitalfunk_bos_node.html.

¹¹²⁵ <https://www.denis.bund.de/>

of civil security agencies. Administrative and political actors at each level of government are responsible for the information of citizens regarding threat levels and impending crises, supported by different emergency services and specialised bureaucracies, such as the BBK. The nation-wide system of alarm sirens, whose main purpose was to warn citizens in the case of war, has been gradually deconstructed since the end of the Cold War. In 2001, Germany instead created the satellite-based system SatWaS to send priority alarm messages to participating news agencies, TV and radio stations as well as to the specialised electronic networks for security authorities (BBK n.d.). The increasingly coordinated, targeted and effective activation of different communication systems should transform SatWaS into MoWaS¹¹²⁶, the modular warning system, which should improve coordination across Germany and use a targeted mix of communication channels to maximise effectiveness (Tiesler 2010).

While large-scale TV and media campaigns are not undertaken, actors in the German civil security system seek to improve their information provision on both preparedness and response management via the internet. The publicly accessible online platform deNIS (see above/ chapter 3.1), offers information on current crises, crisis preparedness and response capacities and behavioural guidelines for concrete emergency situations. In addition, several web-based platforms offer news on water levels and the threat of floods¹¹²⁷ or the risk of forest fires¹¹²⁸. The use of social media (Twitter, Facebook) for both information provision and data collection (e.g. track the outbreak of epidemics) remains very limited.

5 Capabilities

5.1 Human resources

The number of relief personnel in Germany is approx. 3 million in total. The voluntary fire brigades account for approx. 1.2 million, medical personnel for 1.2 million, the THW for 80.000, and the Police for 600.000 (expert interview).

Concerning volunteers, non-profit organisations can draw on about 520,000 active volunteers, many of which contribute a substantial number of service hours per week. Volunteer figures or estimates provided by individual organisations are as follows: the German Lifeguard Association (DLRG) has 40,000 active members (DLRG 2011), the German Red Cross (DRK) 401,113 (DRK 2012), the Order of Malta Ambulance Corps (Malteser) 35,000 (Malteser 2012), the St. John Accident Assistance (JUH) 29,738 (Die Johanniter 2012), the Worker's Samaritan Federation (ASB) 12,559 (ASB 2011) and the German Maritime Search and Rescue Service (DGzRS) 800 (DGzRS n.d.)¹¹²⁹ (Hegemann and Bossong 2013).

For education and training of human resources, see chapter 5.3.

5.2 Materiel (non-financial) resources

No specific numbers on material resources are publicly available. The number would be a sum of declarations from several institutions, while official governmental numbers would probably not reflect real numbers, as the latter should be much higher than the expected official numbers resulting from the expenses of the country/states. Since there is a long history of high volunteer involvement in Germany, many local groups of such volunteers often have way more materiel resources at their disposal than financed by the states or country resulting from donations (expert interview).

5.3 Training

Training

The Federal Office of Civil Protection and Disaster Assistance's (BBK) Academy for Crisis Management, Emergency Planning and Civil Protection (AKNZ) in Bad Neuenahr-Ahrweiler is responsible for the training of senior civil protection experts in Germany. It is the only training institution in Germany, which brings together experts up to the political level from all actors involved in national emergency management, i.e. armed forces, intelligence services, the police and civil protection and critical infrastructures. In addition, the AKNZ is involved in the training activities at EU

¹¹²⁹ It needs to be underlined that the accuracy of these estimates is also affected by the fact that many organisational members may be passive or fulfil other social services beyond civil security and emergency management (e.g. regular care and social support for disadvantaged people).

level, inter alia running the "High level Coordination Course" under the EU Civil Protection Mechanism (EC 2014).

The Federal School of the Federal Agency for Technical Relief with its two headquarters situated in Hoya and Neuhausen provides practical and theoretical training for its specialists and executive staff. The school in Neuhausen provides also training at EU as well as at UN level (example: the "Operational Management Course" within the framework of the EU Civil Protection Mechanism).

All states provide training for fire-fighters in their respective schools for fire brigades (in total 19 schools).

Specialists and executive staff of the relief organisations are trained in the respective schools of each relief organisation (ibid.).

Further, AKNZ provides obligatory education for CIMIC personnel of the Armed Forces (MSB 2009), see chapter 3.1.

Exercises

The AKNZ is also in charge of civil protection exercises at national level. A biannual series of National Crisis Management Exercises (LÜKEX) is organised following the "Zivilschutz- und Katastrophenhilfegesetz" law. LÜKEX stands for 'Länder Übergreifende Krisenmanagement-Übung/Exercise' (National Crisis Management Exercise). LÜKEX is structured as a strategic staff framework exercise, i.e. it is not a complete exercise. During the execution phase, up to 3,000 persons from the crisis staff of the core states and other participants (the so-called framework management) are involved in the exercise. Periodical exercises are organised at regional and local levels (EC 2014).

Further information on LÜKEX is available (also in English) in a respective flyer¹¹³⁰ provided on the BBK website (BBK 2013).

Also some of the bilateral agreements as described in chapter 3.1 include joint training and exercises.

5.4 Procurement

5.4.1 Procurement regulation

Basically, the public procurement law („Vergaberecht“) applies. It comprises all regulations and directions that public agencies have to follow when procuring material resources and services needed to fulfil its function. It also includes regulations that define rights of bidders, when procedural rules have been broken in the procurement process.

¹¹³⁰

http://www.bbk.bund.de/SharedDocs/Downloads/BBK/DE/Publikationen/Broschueren_Flyer/Fremsprach_Publikationen/Luekex_englisch-flyer.pdf?__blob=publicationFile

There is not a lot of joint (cross-border) procurement, which is usually also not wanted in Germany. Reason is the principle of subsidiarity that Germany ops for (see also chapter 3.1). Thus, also additional legislation with regard to cross-border procurement is not wanted, as this would increase EU power and decrease MS's power (expert interview).

5.4.2 Procurement procedures

Responsible agency is the Federal Interior Ministry Procurement Office (Beschaffungsamt des Bundesministeriums des Innern), with its different departments. Depending on what is procured, for IT issues the Federal Office for Information Security (BSI) can be involved as well (expert interview).

5.5 Niche capabilities

Niche capabilities of interest to the EU could be available helicopters for disaster response in case of forest fires, C3 (Command, Control & Communication) forces including respective experts, drinking water provision, and the Centre for the coordination of aftercare and for support of victims and their relatives (NOAH) from the BBK (expert interview).

GREECE

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: ATOS (Nadia Politou, Adem Yaşar Mülayim, Alejandro Afonso Spinola, Dario Ruiz)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by FhG-INT and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

In 2011 Greece's administrative system was drastically overhauled according to the Kallikratis Plan¹¹³¹, a major administrative reform in Greece, introducing 7 decentralised administrations, which group from one to three regions under a government-appointed general secretary. Greece is also divided into 13 regions and 325 municipalities.

Figure 2: Greece's administrative divisions as per Kallikratis plan on 2011¹¹³²

- Decentralized Administration of Attica, with the capital of Athens and the sole region of ■ Attica.
- Decentralized Administration of Macedonia and Thrace, with the capital of Thessaloniki, with the regions of:
 - ■ Central Macedonia
 - ■ Eastern Macedonia and Thrace
- Decentralized Administration of Epirus and Western Macedonia, with the capital of Ioannina, with the regions of:
 - ■ Epirus
 - ■ Western Macedonia
- Decentralized Administration of Thessaly and Central Greece, with the capital of Larissa, with the regions:
 - ■ Central Greece
 - ■ Thessaly
- Decentralized Administration of Peloponnese, Western Greece and the Ionian, with the capital of Patras, with the regions of:
 - ■ Peloponnese
 - ■ Western Greece
 - ■ Ionian Islands
- Decentralized Administration of the Aegean, with the capital of Piraeus, with the regions of:
 - ■ North Aegean
 - ■ South Aegean
- Decentralized Administration of Crete, with the capital of Heraklion and the sole region of ■ Crete.

¹¹³¹ "Kallikratis Plan", last modified on 20 December 2015, https://en.wikipedia.org/wiki/Kallikratis_Plan

¹¹³² "Kallikratis Plan", last modified on 20 December 2015, https://en.wikipedia.org/wiki/Kallikratis_Plan

The list of municipalities per administrative region is available online at [https://en.wikipedia.org/wiki/List_of_municipalities_of_Greece_\(2011\)](https://en.wikipedia.org/wiki/List_of_municipalities_of_Greece_(2011)). The Autonomous Monastic State of Mount Athos is excluded from the Kallikratis Plan.

Civil protection in Greece aims to protect individuals, groups or communities from natural or manmade fast or slow evolution disasters. Disasters can be technological, biological, chemical or nuclear as well as of other type which may occur during peacetime, causing emergency situations. In More specifically in Greece the most typical types of disasters can be earthquakes, landslides/mudslides, forest fires, severe weather phenomena, floods, volcanic eruptions, technological hazards, C.B.R.N. accidents and anthrax incidents. The national civil protection authorities are responsible for the overall coordination of emergencies.

Civil protection in Greece is organised as a co-ordinated resource system whereby national, regional, provincial and local authorities work together with local and public institutions and services. Each of these authorities and institutions has developed its own part of the national civil protection plan (Xenokrates) and makes its own contribution towards achieving the aims of civil protection.

The Greek bodies responsible for the implementation of civil protection measures are:

- The General Secretariat for Civil Protection (GSCP)
- The Inter-Ministerial Committee for National Planning (ICNP)
- The Central Coordination Body for Civil Protection (CCB)
- Several authorities, organisations and institutions working together as an integral part in planning and rescue operations (e.g. the ministries, the fire brigade, the police, the defence forces, health and welfare institutions and aviation and radiation authorities)
- The General Secretariat of the region
- The prefectures
- The municipalities

A number of services are involved in providing disaster relief in Greece:

- The fire corps
- The coast guard
- The police
- The health services
- The armed forces
- The Earthquake Planning and Protection Organisation (EPPO)
- The competent agencies at regional and local levels
- Voluntary organisations with civil protection expertise

1 Policy

1.1 Risk Assessment

In Greece key risks areas of concern are: earthquakes, landslides/mudslides, forest fires, severe weather phenomena, floods, volcanic eruptions, technological hazards, C.B.R.N. accidents and anthrax incidents.

The General Secretariat for Civil Protection (GSCP) is responsible for directing and coordinating all actions related to prevention, control and management of crises. Decision-making responsibilities lie with the General Secretariats of the competent ministries.

Earthquakes are a very common phenomenon in Greece. Greece ranks first in Europe in terms of seismicity and the sixth worldwide. Its geographical position coincides with the area of the planet where big geotectonic phenomena occur such as convergence with the African Euro-Asian lithospheric plate resulting in high seismicity observed in the region.¹¹³³

The first most common disaster in Greece is the forest fires. Forest fire can be caused either by a natural cause, such as thunderbolts, or by human activity (such as burning of garbage, crop residues, etc.). In Greece, the forest fire risk from human activities has been found to be large.¹¹³⁴

Floods are positioned as the second most common natural disaster in Greece. The floods out of natural causes either present a slow evolution or belong to the category of sudden flooding, which is the most common phenomenon in Greece. In the Greek area floods are mostly caused by torrential rains followed by transitions of recessions.

As reported by GSCP in their national progress report on the implementation of the Hyogo Framework for Action (2013-2015)¹¹³⁵, Greece has carried out hazard mapping for major hazards, such as earthquakes, forest fires, floods, industrial hazards, contaminated land and volcanoes:

- Preliminary Flood Risk Assessment has been completed for all River Basin Districts based on historical records and on potential future floods. Areas with Potential Significant Flood Risks have been identified. Since December 2013 Flood Hazard Maps are completed and by December 2015 Flood Risk Maps will be completed. The Institute of Geology and Mineral Exploration carries out physical and environmental vulnerability assessment concerning strong ground motion (e.g. micro zonation studies), landslide susceptibility as well as land and water contamination.
- The Earthquake Planning and Protection Organization provides valid and timely notification to the authorities regarding seismic risk, enabling planning and confrontation. It provides the production/ update of the Greek Seismic Hazard Map.

There are also many finalised and ongoing research and other projects, such as:

- The Hellenic Unified Seismic Network with the Institute of Geodynamics (IG) as coordinator and three University Seismic Networks makes available at IG in near real time waveform data exchange with more than 150 stations.

¹¹³³ Source: Papazachos & Papazachou. 1999. Earthquakes in Greece

¹¹³⁴ Source: GSCP, civilprotection.gr

¹¹³⁵ National progress report on the implementation of the Hyogo Framework for Action (2013-2015), General Secretariat for Civil Protection, March 2015

- IG has led or participated in coordinated efforts to produce hazard, vulnerability and risk maps for natural hazards (mainly seismic events) and tsunami generation scenarios. So has the Institute of Environmental Research and Sustainable Development concerning weather-related hazards and adequate monitoring and forecasting.
- The Institute for Astronomy, Astrophysics, Space Applications and Remote Sensing has led or participated in coordinated efforts to produce hazard, vulnerability and risk maps for certain natural hazards, mainly forest fires, heat waves, atmospheric episodes and seismic events.

The following table includes major disasters occurred in Greece in the last 40 years.

Table 7: Major disasters in Greece

Year	Disasters
2014	Earthquakes, Limnos, Aegean Sea, 1 dead
2012	Forest fires, Chios
2009	Forest fires, Attica, lasted 4 days, 21000ha of forests burnt
2008	Earthquakes, Dodecanese, 1 dead
2008	Earthquakes, Peloponnese, 2 dead
2007	Forest fires, mainly affected western and southern Peloponnese as well as southern Euboea, 84 dead, 1500 houses burnt
2006	Flooding, Evros
2003	Floodings, Cyclades
2003	Crack in Nysiros
2002	Floodings, Athens
2002	Tornado in Athens airport
2002	Heavy snow and very low temperatures
2000	Extreme temperature, 2 dead
1999	Oil tanker explosion, Kammena Vourla, 5 dead
1999	Earthquakes, Athens, 143 dead, 700 injured
1997	Forest fires, Seih Sou forest, Thessaloniki, 55% of the forest was burnt
1992	Explosion in oil refining unit, Petrola, 14 dead
1989	Fire in oil refinery, Aspropyrgos
1986	Fire in oil tanks, Kalochori, Thessaloniki
1981	Earthquakes, Gulf of Corinth, 22 dead
1978	Earthquakes, Thessaloniki, 47 dead

1.2 Policy and Governance

The Master Plan with the code name "Xenokrates" has been designed in order to develop an effective system for the protection of life, health and property of citizens and the natural environment against the different disaster phenomena. The "Xenokrates" was compiled by the GSCP with Act 1299/2003 (Government Gazette 423 B / 10.04.2003) and revised by additional Act 3384/2006 (Government Gazette 776 / 28.6.06) approving the Special Plan "Managing human losses."

The "Xenokrates" plan:

- Defines the types of disasters and corresponding protection policy terms.
- Defines roles and provides design guidelines to Ministries, Regions, Prefectures and municipalities.
- Clarifies that all plans should be approved by the GSCP.

The plan also specifies all stakeholders involved and the responsible bodies for the direction and coordination the operational forces at all levels.

Essential elements are provided for risk assessment, labelling vulnerable areas and development of specific plans for each risk. Guidelines are provided for the development of strategies and tactics, good organization and equipment of services and organizational culture configuration. Also guidelines are delivered for early mobilization, motivation, direction and coordination of manpower and resources as well as creating logistical capabilities for troubleshooting both operational forces, and the affected citizens.

The plan foresees the creation of communication and flow of information between all the services involved and factors in crisis management. The plan is a basic design framework, under which the training of specialists at risk projects entrusted to substantive ministries. Already ongoing process of setting up working groups in ministries, on the initiative of the General Secretariat for Civil Protection in order to upgrade their special projects at risk.

The responsible bodies for the implementation of the Master Plan "Xenokrates" for Civil Protection are:

- The Inter-Ministerial Committee for National Civil Protection Planning, composed by the Minister of Interior, Public Administration and Decentralization as President and also the ministers of Finance, Defence, Development, Environment, Physical Planning and Public Works, Health and Welfare, Agriculture, Culture, Transport and Communications, Public Order, Mercantile Marine and the Press and Mass Media.
- The Central Coordinating Body for Civil Protection that is composed by the General Secretary for Civil Protection as President and the General Secretaries of the Ministries of Interior, Public Administration and Decentralization, Economy and Finance, Development, Environment, Planning and Public Works, Health and welfare, Agriculture, Transport and Communication, Public Order, Mercantile Marine, Press and Media, the competent Deputy Hellenic National Defence General Staff and the Presidents of the Hellenic Shipyards and of the Central Unit of Municipalities and Communities of Greece.
- The County Coordinating Body for Civil Protection that is composed by the Prefect as President, and also the President of the Local Union of Municipalities-Communities, the Head of Management of Policy Planning of the Region and the Prefecture, the Military Commander, the Police director, the Director of the Fire Service, the Harbour Master, the

Head of Management of Forests, the Head of Management of Health, the Regional Health System representative, representatives of Voluntary Organizations for Civil protection and where appropriate representatives of the affected regions.

- The Local Coordinating Body for Civil Protection, which is composed by the Mayor as Chairman, two Councillors, Civil Protection Executives of Regions and Prefectures, a Representative of the Military Commander, the Commander of the Police Department, the Head of the Municipal Police, the Commander of the Fire Department, the Head of Technical Services of the Municipalities and local communities of Greece, the Head of Forestry, representatives of Voluntary Organisations for Civil protection and Social Organizations representatives.
- The General Secretariat for Civil Protection which is responsible for the preparation and approval of plans drawn up by the relevant central and regional bodies and utilities, planning, organization and coordination of action on the prevention, preparedness, information and response to natural, technological, and other disasters or emergencies, preparation of resources and instruments for Civil Protection of the country to address the destructive phenomena in the context of the projects per category, the utilization of research plans and information, the coordinating all phases of the project and disaster restoration and editing, designing and monitoring the implementation of civil protection within the government's guidelines.

Within the above mentioned responsible bodies for the implementation of the national plan for Civil Protection are also included all state agencies, departments of local governments and utilities, which are responsible at the operational level for the individual civil protection actions, in particular for preparedness and response to disasters (such as Fire, Coast Guard, Greek Police, National Centre for Emergency Assistance, Armed Forces, Earthquake Planning & Protection services of the Regions, the Prefecture and primary Municipalities and Local Communities of Greece, the Public Power Corporation, the Hellenic Telecommunications Organisation, the Athens Water Supply and Sewerage Company, the Public Natural Gas Supply Corporation and the Hellenic National Meteorological Service).

1.2.1 Strategy scope and focus

Crisis management and disaster response has been given a more important role in Greece after the adoption of the Civil Protection Law 3013/2002 and especially by the introduction of National plans for every disaster and hazard issued by the GSCP. The Greek civil protection system is highly decentralized since each administrative level (Decentralized Administrations, Regions and Municipalities), is tasked to draw its own regional and local plans to ensure resistance against hazards. They include emergency and contingency plans for all kinds of natural and/ or manmade disasters and hazards aiming to build resilience, take appropriate preparedness measures and undertake prevention, preparedness, response and recovery actions. These plans and programs are adopted after extensive and sophisticated cooperation of all competent authorities involved in disaster reduction and disaster management and upon adoption become binding for all stakeholders involved. They are available publicly online on the web portal of GSCP.

1.2.2 Monitoring and analytical support to policy making; R&D

In Greece there is a lot of activity in the research and scientific sector as well as R&D programmes that contribute to the support of risk assessment in policy making as well as disaster risk reduction planning. GSCP holds also the role of coordination and facilitation of cooperation between research academic institutions of the country and public agencies to integrate and use applied research products as well as to promote and coordinate the cooperation between government departments and entities at central, regional and local level with research-academic institutions for this purpose.

As GSCP states in the national progress report on the implementation of the Hyogo Framework for Action (2013-2015)¹¹³⁶ there are various institutions and authorities involved in projects, such as:

- The CivPro “Regional Strategies for Disaster Prevention” project, co-financed by INTERREG IV C and led by the GSCP, is focused on exchanging and sharing know-how on the development of Regional Policies and on a Strategic Approach and Model to prevent and reduce any disaster effects. It was successfully completed in 2012 and established a Model Local/Regional Disaster Prevention Policy Plan, which considerably reduces disaster risk through long-term planned actions.
- The "Greco-Risks" Hellenic Natural-Hazards Risk-Mitigation System of Systems, approved under the Operational Program «Competitiveness and Entrepreneurship» (OPCE II), will deliver a Multi-Risk Geo-intelligent web-Platform integrating Risk Modules for 9 specific hazards: earthquake, volcano, landslide, ground movement, forest fires, flash-floods, extreme weather, tsunami and industrial accidents. GSCP is Lead Partner.
- The Rapid Analysis and Specialization Of Risk (RASOR) project, approved under FP7, will develop a platform to perform multi-hazard risk analysis to support the full cycle of disaster management, including targeted support to critical infrastructure monitoring and climate change impact assessment. GSCP is end user.
- On January 2015 the Institute for Astronomy, Astrophysics, Space Applications and Remote Sensing started the programme “TREASURE: Thermal Risk rEDuction Actions and tools for SecURE cities”, financed by the EU Call for proposals 2014 for prevention and preparedness projects in civil protection. It is related to the appraisal and quantification of spatially distributed heat wave risk. It integrates the expertise of epidemiologists, climatologists, Earth Observation scientists and IT developers into intelligent heat wave risk assessments for authorities and personalized tools for citizens in accordance to Hyogo and UNISDR initiatives.
- The Institute for Astronomy, Astrophysics, Space Applications and Remote Sensing has received a large Capacity Building programme, namely BEYOND, Building a Centre of Excellence for Earth Observation based monitoring of Natural Disasters. The programme started in June 2013 and will last for 3 years. New services have been developed during its first half under the three domains (i) Meteorological and/or human induced hazards, (ii) Geophysical hazards and (iii) Atmospheric composition perturbations and air quality degradation. It also increased the total estimated value of its infrastructure by 409,000 euro in the reporting period to attain ground based infrastructure for the acquisition of data relevant to natural disasters in the above areas. In addition, an agreement was signed between the European Space Agency and National Observatory of Athens for the latter to host the Greek mirror site for the acquisition of Sentinel data (Copernicus).

¹¹³⁶ National progress report on the implementation of the Hyogo Framework for Action (2013-2015), General Secretariat for Civil Protection, March 2015

Universities and research institutes in Greece focus their research efforts on hazards and some aspects of disaster preparedness and response. They also regularly receive grants under various programs for research related to natural and technological risks.

1.2.3 Policy for Prevention

According to the principal national legislation for civil protection (Law 3013/2002, Ministerial Decree 1299/2003) the basic goals of the civil protection system (protection of life, health and property of citizens from natural and manmade disasters) are met through working out prevention plans and programmes for all kinds of risks (natural and manmade), taking appropriate measures of preparedness and undertaking prevention, preparedness, response and recovery actions. These plans and programmes are elaborated with all the component authorities in national, regional and local level. GSCP collaborates with the competent Ministries and relevant institutions for drafting regulations and specifications to prevent natural, manmade and other disasters, while being responsible for approving all regional and local plans of civil protection, per category of risk.¹¹³⁷

GSCP also issues guidelines for self-protection on its website, which are available, in Greek, English, Spanish, French, Albanian and Arabic. Since 2013, GSCP makes use of social media on a pilot basis including Twitter, Facebook and YouTube.

Furthermore, actions are being pursued at decentralized, regional and local level by competent authorities, such as the Fire Service, the Hellenic Police, the Earthquake Planning and Protection Organization and the Hellenic Coast Guard that make use of social media to communicate information on disasters, in addition to information provided on their websites.¹¹³⁸

In an international perspective, Greece, as a member state of the European Union, takes actively part on a wider policy and strategy planning within the EU for disaster risk reduction, such as the European Civil Protection Mechanism, the Monitoring and Information Centre (MIC) and the Common Emergency Communication and Information System (CECIS).

1.2.4 Policy for Preparedness

Emergency preparedness programs are designed with risk reduction concepts that are incorporated into the “Guidelines for the composition and harmonization of special plans for each disaster at ministerial or central level” as well as according to the “Guidelines for the composition and harmonization of emergency plans by the Regions and Prefectures for each disaster”, both issued by the GSCP.

As reported by GSCP in the national progress report on the implementation of the Hyogo Framework for Action (2013-2015)¹¹³⁹, early warning systems are in place for all major hazards, with outreach to communities. The main authorities involved are:

- The Forest Fire Risk Map Working Team under GSCP. In cases of impending forest fires and according to the Daily Fire Risk Map issued by the GSCP, the whole civil protection

¹¹³⁷ The Hellenic National Platform for Disaster Risk Reduction (HNP-DRR), United Nations Office for Disaster Risk Reduction, Accessed February 2, 2016, <https://www.unisdr.org/partners/countries/grc>.

¹¹³⁸ National progress report on the implementation of the Hyogo Framework for Action (2013-2015), General Secretariat for Civil Protection, March 2015

¹¹³⁹ National progress report on the implementation of the Hyogo Framework for Action (2013-2015), General Secretariat for Civil Protection, March 2015

mechanism is put in the status of increased preparedness and a series of additional measures are adopted according to the National Plan for Forest Fires.

- Permanent Scientific Assessment Board for Short Term Seismicity Evolution
- National Hellenic Meteorological Service. In cases of increased danger from extreme weather conditions the National Hellenic Meteorological Service and GSCP issue immediate warnings to all competent authorities of civil protection, including communities
- Ministry of Reconstruction of Production, Environment and Energy (air pollution)
- Greek Atomic Energy Commission (nuclear accidents)
- Public Power Corporation (dam failures)
- National Centre for tsunami warnings
- Special Scientific Committee for Santorini Volcano Monitoring under EPPO (Volcanic eruptions).
- "FireHub" is a service platform developed by the Institute for Astronomy, Astrophysics, Space Applications and Remote Sensing that consolidates a real time fire detection and monitoring application, a large scale burnt scar mapping during and after wildfires, and a fire smoke dispersion forecasting tool. The service has been qualified in the framework of several EC, Copernicus/ GMES & ESA projects. The platform is online and addresses real decision-makers' needs and has been deployed on an operational basis to several stakeholders. "FireHub" is integrated into the Global Fire Monitoring Center belonging to the International Strategy for Disaster Reduction.
- The Institute of Geodynamics has developed an almost real time seismicity monitoring tool, available to the community. Crustal deformation data are available every day to the scientific community and to the public.

1.2.5 Policy for Response

During a disaster in Greece, there is a central body responsible for all coordination at national level of the civil protection actions and forces in cases the Civil Protection Mechanism is activated in order to respond to an emergency. This body is the Operational Centre for Civil Protection (OCCP) and functions under the GSCP. Furthermore, the OCCP is the national contact point for the European Civil Protection Mechanism and is responsible to post demands for aid on the MIC / CECIS.

In case of a major national disaster the OCCP is gathered under the presidency of the GSCP with presence of all involved General Secretaries to exchange information and decide on further proceedings in order to respond to the emergency and manage the disaster consequences.

At regional level, disaster response is carried out by the competent authorities supported by volunteers and private institutions. All levels of administration and private institutions cooperate to respond, reduce damages and protect citizens' life and property. The interoperability, competences and actions of these authorities are set up in the National Civil Protection Plan "Xenokrates" (Ministerial decision 1299/2003) and further specialized in the National Plans drawn up by GSCP. More specifically, the competent authorities participate at the Coordinative Body of Civil Protection with similar tasks and at local level the competent authorities participate at the Coordinative Local Body. Each level is activated, according to Law 3013/2002, on the basis of the magnitude of each disaster. Each competent authority has its own specialized personnel that can be deployed according to the type of disaster risk, which falls into its scope.

1.2.6 Policy for Relief and Recovery

Disaster recovery is carried out in cooperation of the central level authorities (Ministries) with the regional and local authorities. In principle GSCP, except from the approval of the national planning for the civil protection in Greece, is also responsible for the reporting of the application of the governmental recovery measures after different types of disasters.

GSCP lists in the national progress report on the implementation of the Hyogo Framework for Action (2013-2015)¹¹⁴⁰ the actions that take place for the post-disaster (seismic, flood, fire, landslides) recovery and reconstruction phase:

- Trained engineers check and evaluate the buildings using the appropriate check sheets
- Damaged areas are integrated into rehabilitation programs
- Temporary settlements are created to shelter homeless population
- The reconstruction and the repairs of damaged buildings is refunded
- Rent fee may be subsidized according to the rehabilitation program
- Regulations are institutionalized in order not only to repair but also to reinforce the damaged buildings and reduce the seismic risk. Construction and seismic regulations for new buildings are improved and rehabilitation and strengthening regulations of existing buildings are developed.

In the disaster recovery phase, the Hellenic Red Cross also works with various institutions and donors to implement recovery projects to support the population of the affected areas by providing psycho-social support and health assistance. After major forest fires measures of erosion control and flood prevention are taken by the Forest Services while during the recovery process of floods, local civil protection authorities (regions, municipalities) take measures for risk reduction of future similar events like reinforcement of river embankments, restoring the normal flow of rivers etc.

1.3 Financing

In the Greek national progress report on the implementation of the Hyogo Framework for Action (2013-2015)¹¹⁴¹, GSCP states that all administrative levels in Greece, besides central level authorities (Decentralized Administrations, Regions and Municipalities), include a special civil protection unit, either Directorate or Department/ Office, with responsibility for all non-central civil protection matters of its geographical competence. There is a fund specifically allocated by the Ministry of Interior and Administrative Reconstruction (Directorate of Local Government Economic and Development Policy) to the Municipalities for taking up prevention measures against forest fires that also cover risk reduction aspects. This competence of the Ministry is based on a Common Ministerial Decision issued each year which usually also includes criteria and procedures for the allocations. This funding is an institutionalized asset of the Local Government. The allocations are based upon a relevant GSCP proposal, factoring in data, such as fire risk, forest coverage, demographical data, NATURA sites etc. The funding takes the form of grant. Furthermore, according to Law 3013/2002

¹¹⁴⁰ National progress report on the implementation of the Hyogo Framework for Action (2013-2015), General Secretariat for Civil Protection, March 2015

¹¹⁴¹ National progress report on the implementation of the Hyogo Framework for Action (2013-2015), General Secretariat for Civil Protection, March 2015

the GSCP can propose to the Minister of Interior the allocation of additional funds for prevention and risk reduction measures.

1.3.1 Investing in preparedness

As reported by GSCP in the national progress report on the implementation of the Hyogo Framework for Action (2011-2013)¹¹⁴²¹¹⁴³, disaster risk reduction activities are financed on a project base either by research projects (e.g. European), or by the local authorities and relative bodies. In the second case only the preliminary stages of the study are usually financed.

Moreover, in 2012 the Hellenic National Platform for Disaster Risk Reduction was established. All common initiatives undertaken by the Platform are co-financed by the participating parties and individual activities are financed by the members of the Platform according to policy field. The members of the National Platform will seek additional and differentiated financial resources, giving priority to absorbing funds within the framework of the National Strategic Reference Framework (2007-2013) and the Sectoral Operational Programs that constitute it.

1.3.2 Investing in consequence management

According to the same report, the budget allocated to GSCP from the annual national budget is dedicated to emergency response and immediate disaster relief actions for all natural and man-made disasters and is provided upon request from the competent authorities who are in charge of responding to these emergencies (e.g. Regions, Municipalities etc.). These allocations have been used, for example, for the affected population (temporary housing and sheltering, medical aid, transportation) following an earthquake or a large forest fire.

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

Part of the responsibilities of GCSP is the review and follow-up of the national policies of civil protection and more specifically prepare review reports on the actions of the responsible bodies as well as provide suggestions for the improvement of those actions.

1.4.2 Departmental Lessons Learned systems

Information on this subject could not be found.

1.4.3 Centralised (national) Lessons Learned system

Information on this subject could not be found.

¹¹⁴² National progress report on the implementation of the Hyogo Framework for Action (2011-2013), General Secretariat for Civil Protection, January 2013

¹¹⁴³ Hyogo Framework for Action (HFA), accessed January 12, 2016, <http://www.preventionweb.net/drr-framework/hyogo/>

1.4.4 International exchange for Lessons Learned

Greece, as a member of the European Union and ECHO, is participating to the European Experts training and exchange programme. The Civil Protection Mechanism's experts exchange system allows for the secondment of civil protection experts to participating states. This exchange of experts provides participants with knowledge and experience on all aspects of emergency intervention and the different approaches of national systems. In Greece, GSCP has the coordinating role of the experts exchange programme.

1.4.5 Regular policy reviews

GSCP has the responsibility of performing regular policy reviews and ensuring the proper execution of the national civil protection policies. GSCP is responsible in ensuring that the connections between the different bodies as well as the cooperating bodies are able and up to which level to accomplish their mission.

1.5 Resilience

As reported by GSCP in the [national progress report on the implementation of the Hyogo Framework for Action \(2013-2015\)](#)¹¹⁴⁴, GSCP has launched a number of campaigns on disaster prevention and preparedness at the citizen and household level:

- Following an official permission by the Ministry of Education, it has also started a programme of secondary school training by experts on self-protection guidelines against natural and technological disasters.
- The National Center for Public Administration and Local Government has been conducting courses on Civil Protection for government employees, also at local/ regional level.
- The Ministry of Education in collaboration with Municipalities runs the course project "Protecting Myself and Others (P.R.O.T.E.K.T.A.)" aiming at providing disaster prevention and preparedness public education and training community emergency response teams. The training includes a cycle of separate but coordinated seminars by different authorities/ organizations.
- The Earthquake Planning and Protection Organization, in cooperation with the Ministry of Education, provide information systematically to the educational community on management of earthquake risk.
- EPPO has made a great effort towards education of different groups on seismic protection issues, such as the public, officials, the school community, volunteers, people with disabilities and tourists. The education procedure includes, depending on the target group, lectures, development of emergency plans and implementation of earthquake drills at schools, seminars, publication of books, handbooks, brochures, leaflets and CD-ROMs. EPPO is carrying out a national project covering all Regions of Greece concerning workshops with staff members of the Local Civil Protection Authorities. The topic is related to the design and prevention - preparedness for emergency management in case of an earthquake.

¹¹⁴⁴ National progress report on the implementation of the Hyogo Framework for Action (2013-2015), General Secretariat for Civil Protection, March 2015

1.6 Information sharing and data protection

Information on this subject could not be found.

2 Legislation

GSCP reported in the National progress report on the implementation of the Hyogo Framework for Action (2013-2015)¹¹⁴⁵ that the national civil protection legislation was recently updated. According to the report:

Since 2012 the Fire Service was placed under the General Secretariat for Civil Protection and become its main operational branch, while with Law 4249/2014 the core role of GSCP was enhanced. Law 4249/2014 describes the core role of GSCP in coordination and facilitation of cooperation between research-academic institutions and public agencies to integrate and use applied research products in Disaster Risk Reduction planning as well as to promote and coordinate the cooperation between government departments and entities at central, regional and local level with research-academic institutions for this purpose.

2.1 Crisis (emergency, disaster) management concept

National Plans for every disaster and hazard are issued by the GSCP. These National Plans are adopted after extensive and sophisticated cooperation of all competent authorities involved in disaster reduction and disaster management and upon adoption become binding for all stakeholders involved. Law 3013/2002 and the National Civil Protection Plan “Xenokrates” followed by the National Plans for every hazard and disaster form a substantial legal framework of operation in disaster management including disaster reduction aspects.

2.2 General crisis (emergency, disaster) management law

The following laws apply in Greece for crisis management:

1. Ministerial Decision 770/1999, Regulation of Organisation Operations Centre for Civil Protection
2. Law 3013/2002 , Upgrade of Civil Protection
3. Presidential Decree 338/2003, Establishment of Scientific and Research Centre for Civil Protection
4. Ministerial Decision 1299/2003, General Plan on Civil Protection “Xenokrates”
5. Presidential Decree 151/2004, Organisation General Secretariat for Civil Protection
6. Ministerial Decision 3384/2006, Completion of “Xenokrates”
7. Ministerial Decision 7270/2006 on Establishment of Supportive Team for CBRN Management
8. Law 3448/2006, establishment of Teams for the Identification of Victims of Disasters
9. Law 3491/2006, Supportive Team for CBRN Management
10. Law 3516/2007, Issue settings for Civil Protection
11. Law 3613/2007, Issue settings for GSCP
12. Decision 2007 from the EU Council for the Mechanism of Civil Protection (recast)
13. Decision 2007, from the EU Council, Financial Instrument

¹¹⁴⁵ National progress report on the implementation of the Hyogo Framework for Action (2011-2013), General Secretariat for Civil Protection, March 2015

2.3 Emergency rule

The competent body for the declaration of emergency rule for natural or manmade disasters is the General Secretary of GSCP. Emergency rule for civil protection is defined when a specific disaster is involved and for its confrontation is necessary for:

- the GSCP to coordinate all involved stakeholders that take action at a central, decentralised or local level and
- Increased mobilisation of resources and bodies more than the usual under normal conditions.

Emergency rule may be declared by the General Secretary of GSCP or the authorised General Secretaries only in the following cases:

- The suggested proposal needs to be referred to a disaster that derives from one of the categories of disasters that are mentioned in detail in the national civil protection plan "Xenokrates".
- The suggested proposal should list in detail the direct consequences of the disaster together with the reasons for which is deemed necessary the declaration of emergency rule.
- The suggested proposal should state the location according to its administrative name, so that it is easy to identify the correct bodies that should be activated.

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

The decision of the declaration of emergency rule of an area is associated with the coordination of all stakeholders who are responsible for the immediate confrontation of natural, technological and other disasters as listed in detail in the national civil protection plan "Xenokrates", as well as with the magnitude of mobilisation. In the occasion of low intensity disasters the General Secretary of GSCP can authorise the General Secretary of the decentralised administration, municipality or region for the decisions to be adopted. The declaration of emergency rule of a decentralised administration, municipality or region by its General Secretary can only be done after authorisation by the General Secretary of GSCP.

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

In the Greek Civil Protection system, every administrative level (decentralised administrations, regions and municipalities) needs to have in place their own regional and local plans for preparedness against hazards. These plans are prepared under the supervision of GSCP.

This fact is a clear evidence that even though local and regional level have some sort of autonomy, the main responsibility lies with the GSCP.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

In addition to what has been described in Section 2.2, the general direction of local initiatives is influenced by international policies and programmes¹¹⁴⁶, especially from the European Union. There is no specific legal framework for volunteers in Greece¹¹⁴⁷. Therefore, volunteering activities are not legally protected. As a consequence, any legal conflict that arise regarding volunteers or the organisations to which they are related to are generally dealt with on a case-by-case basis.

Similarly, NGO's activities respond to the codes of conduct established by the National Agency for Volunteering even though there is no coherent legal framework regulating the status of NGOs. As a result of the code of conduct, 6 principles have been put forward by the Charter of Social Responsibility of the Organisations of Civil Society:

1. The principle of freedom
2. The principle of transparency and accountability
3. The principle of democratic operation
4. The principle of social solidarity
5. The principle of social responsibility and trust
6. The principle of social dialogue and participation

In conclusion, it can be argued that there have been a few steps taken by Greece towards a better regulation in regards to volunteering and NGOs activities. Needless to say, there is still significant room for improvement until a local legal framework can be established.

2.7 Legal regulations for international engagements of first responders and crisis managers

GSCP has the sole responsibility of submitting international assistance requests for Greece according to Article 27, paragraph 2 of Law 3536/2007.

The policy of GSCP in the management of requests either from the Greek Authorities or other states for assistance, with means and human resources, for the confrontation of natural and technological disasters of major scale, concerns the immediate response and coordination between the different stakeholders. The objective is the effective management of international assistance.

The GSCP, through a specialised information system and based on the procedures of the "European Mechanism Activation Policy" (Decision N.121, GSCP), coordinates the process of offering and receiving assistance through international organizations (EU, NATO, Organization of the Black Sea Economic Cooperation (BSEC), etc.) and enabling government agreements.

¹¹⁴⁶ National Report – Greece. Study on Volunteering in the European Union. Council of Europe. 2011

¹¹⁴⁷ Association of Voluntary Service Organisations (AVSO) and the European Volunteer Centre (CEV), Legal Status of Volunteers: Country Report Greece, Brussels, 2003

3 Organisation

3.1 Organisational chart¹¹⁴⁸

The mission of GSCP is to protect the citizen's life, health and property from natural, technological and other major hazards. In addition, it comprises the protection of cultural heritage, historic buildings and monuments, resources and infrastructure. The GSCP studies, plans, organises and coordinates the country's policy concerning issues of public awareness, prevention and confrontation of natural or man-made disasters. It coordinates the actions of the public services and the civil volunteers while ensuring the country's alertness to confront these disasters.

All ministries, regions and prefectures should draw up special plans for the confrontation of disasters based on the national civil protection plan "Xenokrates". The GSCP is the general coordinator of the planning. The Inter-Ministerial Committee for National Planning (ICNP), composed of the heads of the competent ministries, approves the annual national plan for civil protection, including each ministry's civil protection budget. It also reports on the implementation of governmental measures for rehabilitation after major catastrophes.

The Central Coordination Body for Civil Protection (CCB), comprised by the secretaries general of the competent ministries and chaired by the GSCP, presents the civil protection annual national plan and budget for approval by the ICNP. The CCB is responsible for following up and evaluating the annual national planning and for coordinating the response to and recovery and rehabilitation of major catastrophes.

The GSCP and the general secretaries of the regions and the prefects are in charge of coordinating all operational forces depending on whether the disaster is general, regional or local. The National Operational Centre for Civil Protection provides all kinds of assistance to the civil protection forces.

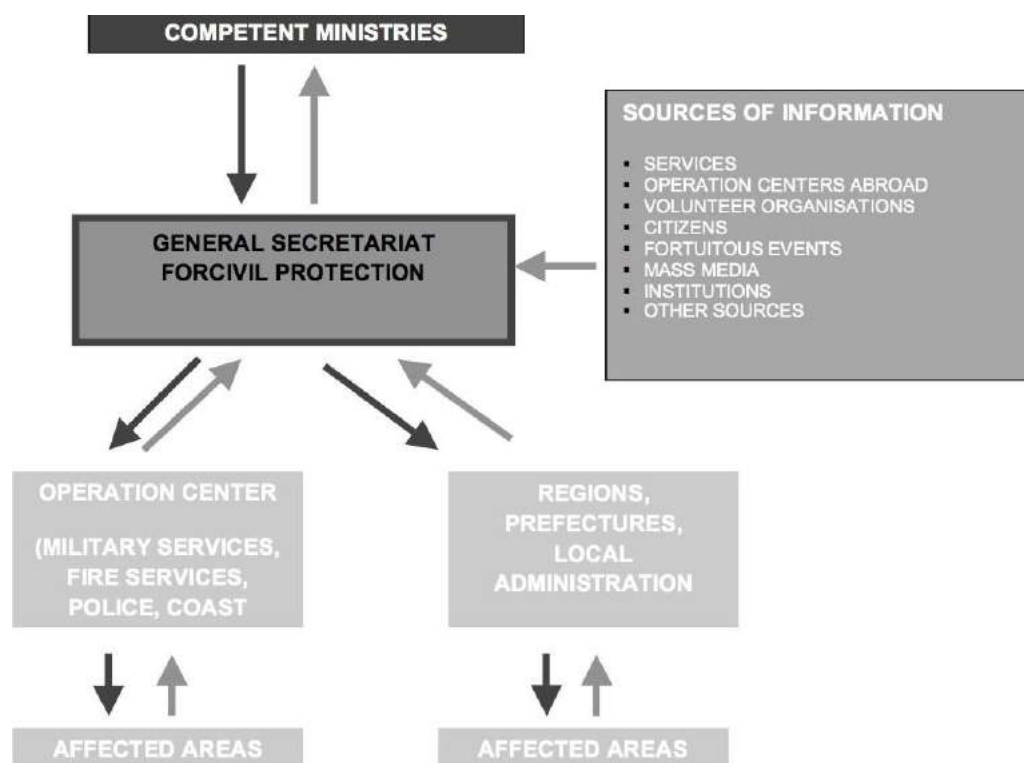

Figure 3: Civil Protection Structure in Greece

Supportive Group for the Management of Chemical, Biological, Radiological and Nuclear Threats and Incidents

According to law 3491/2006, Article 15, there was established an inter-ministerial group within the General Secretariat for Civil Protection, which reports directly to the Civil Protection Secretary and is the Executive Advisory Board, which supports at tactical, operational, and political level the competent forces and organs for civil protection, by providing scientific information and specialized expertise for the management of chemical, biological, radiological and nuclear threats and incidents.

The support team is staffed by higher education officials of appropriate industries, for the confrontation of chemical, biological, radiological and nuclear threats and incidents, from the General Secretariat for Civil Protection, the Ministry of Health and Social Solidarity, the Ministry for the Environment Physical Planning and Public Works, the Ministry of Rural Development and Food, the General Chemical State Laboratory of Greece, the Greek Atomic Energy Commission, the National Meteorological Service and from scientific or suitable trained personnel of the Coast Guard, the Greek Police, the Fire Brigade and the National Defence General Staff. From each operator there are defined four representatives. (Ministerial Decision 7270/2006).

The support group is convened by the Secretary-General for Civil Protection in ordinary and extraordinary meetings. Regular meetings take place within working hours and are for better organization and preparation of the team. The extraordinary meetings relate to the convening of the group for the management of incidents or threatened incidents in which are involved chemical, biological and / or radiological agents. Extraordinary meetings may take place outside working hours and days that are exempt and can be continuous meetings depending on the intensity and extent of the incident that is asked to manage. In case of continuity of the meeting, representatives of organizations involved in the group can be rotated in shifts. The closing of the group is made by the Secretary-General of Civil Protection.

The support group may meet in quorum with the participation of representatives of all agencies or partially depending on the type of threat or incident.

Teams for the Identification of Victims of Disasters

According to article 23 of law 3448/2006, there were created within the General Secretariat for Civil Protection, Teams for the Identification of Victims of Disasters which have the task of recognition and identification of victims of accidents, disasters and criminal and terrorist activities. These teams consist of qualified medical staff, experts and officers of the Greek Police and can be sent to other countries on request and by decision of the Minister of Interior.

3.2 Organisational cooperation

As reported by GSCP in the Greek national progress report on the implementation of the Hyogo Framework for Action (2013-2015)¹¹⁴⁹:

There is increased cooperation with neighboring and other countries in several fields of risk reduction and disaster management. For example, Greece works closely together with the competent Bulgarian authorities in the field of risk reduction and prevention from river floods in the Bulgarian-Greek borders. As further examples, Greece has ratified the Convention on the transboundary effects of National Progress Report 2011-2013 15/43 industrial accidents with the Law 25446/1997 and EU Floods Directive 2007/60/EC, already incorporated into Greek legislation, establishes transboundary cooperation on a national and international level for floods disaster risk reduction. Several bilateral and multilateral agreements have been signed. Bilateral agreements have been signed and are in force with Cyprus, Turkey, Malta, Russia, Ukraine and USA, or pending ratification (with France, Hungary, Montenegro and Azerbaijan). Others are under preparation. Multilateral agreements include, among others, the Common Declaration on the Operational cooperation within the European Civil Protection Mechanism known now as FIRE 5 (France, Italy, Spain, Portugal, Greece, Cyprus and Belgium), the Organization of the Black Sea Economic Cooperation, the Adriatic and Ionian Initiative, the EUR-OPA Agreement. The European Center on Prevention and Forecasting of Earthquakes operates within the Framework of EUR-OPA. It belongs to the Network of the Specialized Centers of the Agreement and it is based in Athens. The European Center for Forest Fires, also based in Greece, operates within EUROPA belonging to the same Network of the Agreement and is tasked with the research on forest fires issues. The Institute of Geodynamics has a close cooperation with other European Organizations. Since 2010 it has been appointed as the National Tsunami Warning Center. It has strong relations and co-operation with other EU countries and Organizations (North East Atlantic Mediterranean TWS) and recently became Tsunami Watch Provider.

In more detail:

Organization of the Black Sea Economic Cooperation (BSEC)

The BSEC was launched in 1992 as an informal intergovernmental Black Sea Economic Cooperation and transformed into an international financial institution on 1/5/1999, the date on which entered

¹¹⁴⁹ National progress report on the implementation of the Hyogo Framework for Action (2013-2015), General Secretariat for Civil Protection, March 2015

into force the Charter of the Organization, which was signed in June 1998 (4-5 / 6 / 1998) in Yalta. The Greece participates as a founding member of the BSEC since 1992.

In BSEC, whose headquarters are in Istanbul, participate twelve countries (Albania, Armenia, Azerbaijan, Bulgaria, Georgia, Greece, Moldova, Romania, Russian Federation, Serbia, Turkey and Ukraine) whereas nine countries are acting as observers (France, Germany, USA, Israel, Italy, Croatia, Belarus, Poland, Slovakia, Czech Republic and Tunisia).

The Intergovernmental cooperation within the BSEC focuses principally on the areas of organized crime, natural disasters, energy, product transport facilitation and customs formalities, the promotion of SMEs and finally the protection of the marine environment of the Black Sea.

Within the framework of cooperation between the Member States in Civil Protection, the following have been signed:

- Agreement on cooperation in emergency assistance and rapid response to natural and technological disasters among the BSEC countries (15/04/1999, Sochi Russia)
- Additional Protocol to the Agreement on cooperation in emergency assistance and rapid response to natural and technological disasters (20/10/2005, Kyiv Ukraine)

Adriatic and Ionian Initiative (All)

The All was presented by Italy at the European Council in Tampere, during the Finnish Presidency in October 1999 and was endorsed by the EU and Greece. The purpose and areas of cooperation were established in Ancona in 2000 with the participation of coastal Adriatic and Ionian countries.

The Declaration of Ancona identified by two pillars:

- safety and the prevention of crime in the area, and
- the gradual but systematic planned development of the area.

In All participate all Adriatic – Ionian countries (Albania, Bosnia-Herzegovina, Croatia, Greece, Italy, Montenegro, Serbia and Slovenia) who signed the Declaration of Ancona for the "Development and Security in the Adriatic and Ionian" (March 2000).

The meetings of the countries are determined by the presiding country. So far they are roundtable meetings, where all issues are raised for discussion in the order, in the presence of all representatives and country experts.

Hellenic - France Joint Working Group for Civil Protection (HE-FRA /J1)

HE-FRA aims for the time being at enhancing the bilateral cooperation in forest firefighting. The two countries face every summer disastrous forest fires with common characteristics. The recognition of this common threat and the significant experience that has been accumulated in the past years through joint trainings but, mainly, through joint operations in the context of mutual assistance offered, has led the political leaders of the countries to the enhancement of this cooperation.

The results of these official meetings are the following:

On 27/11/2007 a special Memorandum of Mutual Assistance in aerial means (CL – 415) was signed between the two countries to combat forest fires. The two countries have significant experience in matters of mutual assistance in aerial means. The Common Decision, which was taken by the two national authorities on 30/10/2007 and ratified on 27/11/2007 established the Hellenic – France Joint Working Group for Civil Protection; the well-known "HE-FRA/J1". Its mission, composition as well as further operational details are defined in this Decision.

The Common Decision of the two national authorities is the unique to be signed so far in the history of this institution by Greece and France; thus underlining the importance given by the two

governments in this cooperation. HE-FRA/J1 is held under the presidency of a senior official at the GSCP while other officials from Air Force and Fire Service of Greece are also participating.

The common proceeding of HE-FRA/J1 was signed on 13/06/2008 at the GSCP in Athens and SGDSN in Paris. It was accepted as a whole by the Greek and French Civil Protection national authorities as well as of the two national Air Forces and Fire Services.

HE-FRA/J1 also includes exchanges of experts of the Civil Protection Operational Centers of the two countries, joint trainings, exercises with ground and aerial means in Greece and France, as well as the implementation of a special training programme for high – ranking officials of the Fire Service.

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

The GSCP issues each year circulars about the most common disasters in Greece to all stakeholders indicating the appropriate action that has to be taken and coordinates all involved authorities in order to ensure that all resources are in place in case of a major disaster.

The GSCP organizes training drills and exercises at national/ subnational level where the procedures described in the National Plans are tested in order to assess, analyse and improve them. It also has issued national guidelines concerning the preparation, organization and evaluation of these exercises. For example, the EU POSEIDON 2012 Simulation Exercise project was held in Crete in 2009-2011 and this was the first exercise of the EU Civil Protection Mechanism with a tsunami scenario. Tsunami early warning procedures were tested and lessons learned were identified.

There are search and rescue teams, well trained, for some categories of disasters according to the body they belong, that can be employed by the competent authorities. The Greek State has also stocks of relief supplies stored in depositories in several areas of the country.

Voluntary organizations, registered in the GSCP, are included in planning guidelines and integrated into action plans at local and regional levels. The extensive list of the voluntary organisations can be found on the website of GSCP.¹¹⁵⁰

From a regional perspective, the efforts for the operational setup of a Joint Hellenic-Turkish Standby Disaster Response Unit, consisting of Greek and Turkish experts, should be mentioned. In this context, some disaster preparedness training exercises have already taken place.

4.2 Operations planning

The General Civil Protection Plan “Xenokrates” calls for the development of hazard-specific plans at the local, regional and national levels nationwide. GSCP issues National Plans for every disaster and guidelines to other competent authorities on the methodology of making emergency and contingency plans. Decentralized Administrations, Regions and Municipalities prepare their own emergency and contingency plans and send them to the GSCP for approval.

According to the general guidelines provided by GSCP, each responsible body involved in the design of plans, designs the plans solely based on the mission and the ones defined in the institutional framework governing each body’s operation. All generated plans should involve the four phases for mobilising the civil protection system:

- **Phase 1 - Alertness:** are included all preparatory actions and activities that ensure the conditions for implementation of the approved plans and the operational readiness of the response mechanism, such as maintenance, sourcing (materials, personnel, etc.)

¹¹⁵⁰ Registry of Volunteering Bodies, GSCP, Accessed February 2, 2016, <http://civilprotection.gr/el/%CE%BC%CE%B7%CF%84%CF%81%CF%8E%CE%BF-%CE%B5%CE%B8%CE%B5%CE%BB%CE%BF%CE%BD%CF%84%CE%B9%CE%BA%CF%8E%CE%BD-%CE%BF%CF%81%CE%B3%CE%B1%CE%BD%CF%8E%CF%83%CE%B5%CF%89%CE%BD>

- **Phase 2 - Increased alertness:** all necessary bodies are placed on and alert for the execution of their duties and take, where appropriate any additional precautions. These precautions are associated with the appearance and treatment of the phenomenon and are aimed at reducing the probability of the occurrence of the phenomenon that will cause destruction and / or reduce its consequences (e.g. increased surveillance in forests to ensure timely notification and timely interference).
- **Phase 3 - Addressing (mobilisation – intervention):** during this phase is the actual development of all the necessary resources of the civil protection system for the control and repression (if possible) of the catastrophic phenomenon and particularly the tackling and moderation of the immediate consequences. Where appropriate, citizens are informed about measures for self-protection and also the assistance and facilitation of the work of the forced of the corresponding bodies.
- **Phase 4 – Recovery:** the first damage assessment is made as well as the assessment of the situation and any immediate assistance is provided to those affected (food, shelter, etc.). All actions are implemented for the restoration of the daily operations in the affected area (e.g. traffic restoration, ensuring electricity and water supply, etc.)

And the three levels of government, control and coordination are:

- political – strategic
- operational
- tactical

Except from all the above, plans also include the necessary actions for the safeguard of the operation of the corresponding body in emergency situations as well as the actions for the support of the plan (training, exercises, review)

More importantly, every plan:

- has institutional base;
- is based on sound scientific information and knowledge;
- clearly defines the hierarchical levels of government, control and coordination and the corresponding responsibilities;
- has a system for the collection, evaluation and transfer of information and evaluation of the staff;
- has, if possible, recorded the critical parameters for the implementation of actions and their scalability levels;
- anticipates and clearly describes the actions and the estimated resources necessary in all phases of the mobilization system for the civil protection;
- provides opportunities for making decisions and implementing actions that will be decided during the course of the emergency;
- has a modular structure and gives, if possible, clear guidelines on existing hierarchical levels and regional and local services;
- has been prepared based on interdepartmental cooperation and interoperability

4.3 Logistics support in crises

GSCP issues every year, and according to the period, summer or winter, detailed plans and circulars per subject. With these circulars, all related bodies responsible for each disaster are informed for all actions that should be taken in order to avoid and tackle any types of disasters.

At this moment, GSCP has published on their website detailed circulars for the following subjects among others:

- Civil Protection design and actions to address risks from snow and frost for the period 2014-2015
- Civil Protection design and actions to address risks from the event of floods for the period 2014-2015
- Publication of daily risk forecasting map for the fire season of 2014
- Circular to address risks from major accidents SEVESO facilities
- Civil Protection design and actions to address risks from forest fires for 2014
- Civil Protection design and actions to address risks from seismic phenomena for 2012
- Waste Management (Non-Dangerous, Hazardous and Hazardous Waste Health Units): Institutional framework roles and responsibilities of stakeholders
- Institutional Framework for Air Pollution
- General plan for addressing technological accidents of big volume (SATAME) in 2009
- Drafting of emergency plans per catastrophe of regions and prefectures
- Institutional framework for the quarrying and mining activities, roles and responsibilities
- Institutional framework for air and marine pollution, roles and responsibilities
- Institutional framework for electricity activities, roles and responsibilities
- Institutional Framework for the Activities of Natural Gas, roles and responsibilities
- Institutional framework for monitoring water quality and drinking water, roles and responsibilities
- Map of Forests and woodland areas susceptible to fires

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

According to the nature of each crisis and phenomenon, different approach is taken. GSCP is the central responsible for the communication to the general public and for the publication of alerts and warning, but according to the nature of the phenomenon, there are more bodies involved.

GSCP reports in the Greek national progress report on the implementation of the Hyogo Framework for Action (2013-2015)¹¹⁵¹ that after each disaster all involved Authorities are responsible to forward all necessary data and reports to the GSCP which then gathers all the information, evaluates it, analyses it and conducts a thorough report of the disaster. In more detail:

- The Earthquake Planning and Protection Organization provides notification to the State Authorities regarding seismic risk.

¹¹⁵¹ National progress report on the implementation of the Hyogo Framework for Action (2013-2015), General Secretariat for Civil Protection, March 2015

- The Institute of Geodynamics issues everyday an earthquake (seismicity) catalogue. Greece's seismicity is systematically reported the last 70 years via monthly bulletins. It runs a GPS Network for monitoring the crustal deformation in real time. Data are available to the public and to the scientific community online. IG has developed an almost real time seismicity monitoring tool, available to the communities.
- The Institute of Environmental Research and Sustainable Development has recently completed a systematic database of weather-related hazards over Greece from 2000. In 2006 it started to operate a weather stations network across the country (205 stations in 2012). It operates devices for continuous monitoring of lightning activity over Europe and the Mediterranean.
- The Institute for Astronomy, Astrophysics, Space Applications and Remote Sensing operationally maps the annual burnt area over Greece since 2007 using state-of-the-art technologies and satellite imagery. It's the only reliable technique ensuring assessment of fires damages to forest ecosystems with a high spatial precision at mapping scales from 1:10.000 to 1:50.000 and at short delays (2 months after end of fire season). It operates the Atmospheric Remote Sensing Station, in order to monitor atmospheric conditions over Athens and recognize atmospheric episodes over Greece like Saharan dust intrusions, forest fire smoke dispersion and volcanic ash advection.
- At international level, the competent Greek agencies monitor the flow of information of two international co-ordination centres, NATO's Euro-Atlantic Disaster Response Coordination Centre (EADRCC) and the European Commission's Monitoring and Information Centre (MIC).

5 Capabilities

5.1 Human resources

According to the Master Plan “Xenokrates”, and to the nature of each disaster, there are different responsible bodies. The following table shows the responsibilities of each body according to the nature of the disaster.

Each detailed plan contains a specific section with a detailed description of the human resources (teams and working positions) within all levels where the detailed plan is involved. A complete description on the mission, composition, function and all responsibilities each of the involved persons and groups is provided as well as the sectors, specializations and other special qualifications wherever necessary.

Body		Natural Disasters										Technological	
		Forest Fires	Earthquake	Flood	Extreme weather			Landslides	Volcanic action	CBRN Incidents	Production/distribution units of electricity and gas	Installations with dangerous substances	Major fires in industrial
					Tornados / Gale	Heavy snow / snowstorm / frost	Heatwave						
1	Finance												
2	Interior												
3	National Defense	x	x	x		x				x			
4	Interior, Public Administration and Decentralisation												
5	Development		x		x			x		x	x	x	x
6	Environment Physical Planning and Public Works		x	x	x	x		x	x			x	x
7	Education and Religious Affairs												
8	Labour and Social Affairs

11	Justice												
12	Culture and Science												
13	Transportation and Communications				x					x			
14	Public Order	x	x	x	x	x		x	x	x	x	x	x
15	Mercantile Marine		x	x	x					x			
16	Press and Media												
17	Macedonia and Thrace												
18	Aegean												
19	Regions and Prefectures	x	x	x	x	x	x	x	x	x	x	x	x

Table 8: Responsibility Matrix per disaster in Greece according to "Xenokrates"¹¹⁵²

¹¹⁵² Emergency Plans – Planning Philosophy and Objectives, Direction of Civil Protection, Decentralised Administration of Macedonia – Thrace, Athanasia Douma

5.2 Materiel (non-financial) resources

Each responsible body for the design of a plan for a specific disaster according to “Xenokrates”, provides within these plans a detailed list of categories of material resources, such as facilities, machinery, vehicles, equipment and other materials that are used for the execution of the plan.

5.3 Training

In the Greek national progress report on the implementation of the Hyogo Framework for Action (2013-2015)¹¹⁵³, GSCP reported the following:

The GSCP has launched a number of campaigns on disaster prevention and preparedness at the citizen and household level. It is also the coordinator for the EU Civil Protection Training Mechanism.

The National Centre for Public Administration and Local Government has been conducting two courses on Civil Protection for local government employees. In addition, two courses in disaster and emergency management are offered by the Inter-Balkan Institute for Public Administration; Hellenic Red Cross Instructors are often called to teach classes within these courses.

The Ministry of Education in collaboration with Municipalities runs the course project “Protecting Myself and Others (P.R.O.T.E.K.T.A.)” aiming at providing disaster prevention and preparedness public education and training community emergency response teams. The training includes a cycle of separate but coordinated seminars by different authorities/organizations, such as the GSCP, the Hellenic Red Cross, the Earthquake Planning and Protection Organization and others. At the end of the project the volunteers receive a certificate of attendance.

The Earthquake Planning and Protection Organization (EPPO), in cooperation with the Ministry of Education, provides information systematically to the educational community on management of earthquake risk.

EPPO has made a great effort towards education of different groups on seismic protection issues, such as the public, officials, the school community, volunteers, people with disabilities and tourists. The education procedure includes, depending on the target group, lectures, development of emergency plans and implementation of earthquake drills at schools, seminars, publication of books, handbooks, brochures, leaflets and CD-ROMs.

EPPO is carrying out a national project covering all Regions of Greece concerning workshops with staff members of the Local Civil Protection Authorities. The topic is related to the design and prevention - preparedness for emergency management in case of an earthquake.

The Hellenic Red Cross also provides training programmes to the public, including but not limited to first aid, psychosocial support, and citizen disaster awareness and self-protection.

¹¹⁵³ National progress report on the implementation of the Hyogo Framework for Action (2013-2015), General Secretariat for Civil Protection, March 2015

5.4 Procurement

5.4.1 Procurement regulation

Greece is currently under huge reforms. One of the actions of the reform program in Greece is to modernize public procurement, known concepts and processes in the country. The development of a national strategy on public procurement is part of a broader national policy of the country and a tool to achieve sustainable development policy, social policy, anti-corruption policy in terms of good governance, given that the resources spent on procurement attribute to 10% of the country's GDP.

In this context the Greek State is through an, inter alia, in-depth review of the structures of public administration and the general philosophy of the applicable government policy on public procurement, with a view to sound financial management, the rationalization of public expenditure and administrative practices, the emergence of a transparent and competitive public procurement market as a growth lever of the Greek economy and the implementation of the necessary structural changes.

Member States need to implement directive 2014/24/EU before 18 April 2016. Greece has not yet implemented the directive. Given the complexity of many of the new rules of the directives, and the flexibility offered to the Member States on the means of implementing, Greece identified the need for effective integration which extends, as far as possible beyond the simple repetition of the directives, with consultation and proposals from all stakeholders. The updated plan is available under public open deliberation until 19/02/2016 by the Independent Single Public Procurement Authority on their portal <http://www.opengov.gr/>. The Authority published a detail action plan which envisions the adoption of the directive within February 2016.¹¹⁵⁴

5.4.2 Procurement procedures

As stated in the publication from Zepos & Yannopoulos, Public Procurement – Greece (2012) currently in Greece, four types of procurement procedures exist as follows:

- The open procedure, where any interested economic operator may submit a tender.
- The restricted procedures, any economic operator may request to participate and only candidates invited to do so may submit a tender.
- The negotiated procedure, where the contracting authority consults the economic operators of its choice and negotiates the terms of the contract with them. The negotiated procedures are further divided into procedures with prior publication and procedures without prior publication of a tender notice. In the former case, once the contracting authority has received the requests for participation, it invites the selected candidates (a minimum of three) to negotiate.
- The competitive dialogue. This procedure is used for the assignment of complex contracts. The contracting authority invites the selected candidates to conduct a dialogue until the (technical and/or economic and legal) solutions have been defined. At the end of the dialogue the tenders submit their final offers.

¹¹⁵⁴ Independent Single Public Procurement Authority, Accessed February 4, 2016, <http://www.opengov.gr/aads/?p=5406>

5.5 Niche capabilities

Earthquakes in Greece are a common phenomenon, making it one of the world's most seismically active areas. During the last two years, the Institute of Geodynamics has expanded its monitoring capabilities leading the Hellenic Unified Seismological Network which is operational 24/7. Immediately after an earthquake it informs the GSCP and the Earthquake Planning and Protection Organization. It runs a GPS Network for monitoring the crustal deformation in real time and an extensive Strong Motion Network, with many stations operating in real time.

On the other hand, forest fires are the first most common disaster in Greece. The Institute for Astronomy, Astrophysics, Space Applications and Remote Sensing developed a service platform called "FireHub" that consolidates real time fire detection and monitoring application, a large scale burnt scar mapping during and after wildfires, and a fire smoke dispersion forecasting tool. The service has been qualified in the framework of several EC, Copernicus/ GMES & ESA projects. The platform is online and addresses real decision-makers' needs and has been deployed on an operational basis to several stakeholders. "FireHub" is integrated into the Global Fire Monitoring Center belonging to the International Strategy for Disaster Reduction. It was elected as winner of the Best Service Challenge of Copernicus Masters 2014.

HUNGARY

Policy, Legislation, Organisation,
Procedures & Capabilities (PLOPC) in
crisis management and disaster response

Responsible Partner: CSDM (Vesselin Petkov, Todor Tagarev)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by ATOS and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Overview

- Hungary is a landlocked country in Central Europe with a territory of slightly over 93 thousand square kilometres. It has boundaries, shared with Austria to the west, Serbia, Croatia and Slovenia to the south and southwest, Romania to the southeast, Ukraine to the north-east, and Slovakia to the north. The country is crossed by rivers Danube and Tisza, which are navigable 418 and 444 kilometres, respectively.
- The crisis management system in Hungary has been under significant pressure in the last years, which revealed weakness and vulnerabilities to be addressed through policies and actions. Numerous disasters – from the notorious red sludge spill, via floods, to storms and droughts – made it evident that a profound reform of the Hungarian crisis management and disaster response architecture was needed.
- A new disaster management law was adopted in 2011 (in force since 1 January 2012), laying the foundations of a system in which professional disaster management service cooperates closely with obliged and volunteer civil protection structures. As put by the law, disaster management has been named a national cause.

Figure 4: The Logo of the NDGDM.

- The National Directorate General for Disaster Management (NDGDM) within the Ministry of Interior is the national authority for disaster management. As of 1 January 2012 a new organisational structure of the NDGDM was introduced, which has been built on three pillars: civil protection, fire protection and industrial safety, with the National Inspectorate General of Fire Services, the National Inspectorate General of Civil Protection and the National Inspectorate General of Industrial Safety constructing the backbone of the NDGDM.
- The Disaster Management Governmental Coordination Committee (DMGCC) is an inter-agency coordination body ensuring consistency between sectors. At county and local level, protection committees are in place to concert disaster management.
- From an operational perspective, the central structures for disaster management at the county and local level include 20 county directorates for disaster management, their subordinated offices for disaster management, the professional fire departments and the municipal fire departments.

1 Policy

The crisis management system in Hungary has been under significant pressure in the last years, which revealed weakness and vulnerabilities to be addressed through policies and actions. Numerous disasters – from the notorious red sludge spill, via floods, to storms and droughts – made it evident that a profound reform of the Hungarian crisis management and disaster response (CMDR) architecture was needed.

A new disaster management law was adopted in 2011 (in force since 1 January 2012), which put greater emphasis on “prevention and preparation, and on a more intensive cooperation with the population, on self-reliance, and on taking responsibility”¹¹⁶⁴, laying the foundations of a system in which professional disaster management service cooperates closely with obliged and volunteer civil protection structures. As put by the law, disaster management has been named a national cause.

In the period January-June 2011, when Hungary presided over the Council of the European Union, disaster management was specifically included in the Justice and Home Affairs part of its programme, stressing the need of enhanced cooperation between Member States in the field, and drawing attention to flood management and risk assessment activities, in order to improve the protection of European citizens.¹¹⁶⁵ The Hungarian programme (quoting the example of the Gulf of Mexico spill in 2010) also stressed the need for action in relation to the safety aspects of offshore oil and gas exploration licensing, operation, inspection and the revision of overall responsibility. The document recalled that the European Commission had presented a Communication on “Facing the challenge of the safety of offshore oil and gas operations.” In this respect, the Hungarian Presidency aimed to have the first exchange of views on the European Commission’s legislative proposal on the safety of offshore oil and gas activities.

As part of the EU Hungary is also supporting the implementation of the Hyogo Framework for Action and relevant disaster risk reduction initiatives including through the development of a national disaster risk reduction platform, involving actors from the development, humanitarian, planning, environment, agriculture and civil protection side.

1.1 Risk Assessment

In February 2009 the European Commission adopted the Communication on a Community approach to reducing the impact of natural and man-made disasters within the EU. Further, in November 2009 Council Conclusions on a Community Framework on Disaster Prevention within the EU, adopted during the Swedish Presidency, underlined the importance of the national and international elements of disaster prevention policies, such as hazard and risk identification and assessment, impact analysis, risk mapping and regular review.

In April 2011, during the Hungarian EU presidency, the Justice and Home Affairs configuration of the Council adopted Conclusions, issued under number 8068/11, on “Further Developing Risk Assess-

¹¹⁶⁴ Ministry of Interior of Hungary, National Directorate General for Disaster Management, 2012, available at: http://www.katasztrofavedelem.hu/letoltes/eng/szervezet/NDGDM_intro.pdf.

¹¹⁶⁵ *Strong Europe with a Human Touch*, The Programme of the Hungarian Presidency of the Council of the European Union, http://www.eu2011.hu/files/bveu/documents/HU_PRES_STRONG_EUROPE_EN_3.pdf.

ment for Disaster Management within the European Union.” The Conclusions invite the member states to initiate national risk assessments by the end of 2011, by structuring the process and setting the methodological framework, organising coordination between stakeholders, identifying and analysing single-risk scenarios, consider multi-risk scenarios, etc.¹¹⁶⁶

In Hungary, as a first step in the process of implementing the requirements of the Council, the main risks have been identified, namely “floods and inland waters, earthquakes, forest fires, industrial accidents, extreme weather phenomena and man-made disasters.”¹¹⁶⁷ Second, to carry risk assessment relevant actors and were involved in a national conference (divided into working groups), organised in June 2011. The final document from the conference concluded that “the availability of or the differences in the data did not allow a detailed analysis in each case” and called to “the European Commission to support a more accurate risk assessment, preferably by inviting international calls for proposals.”¹¹⁶⁸

Although the above-mentioned document does not qualify as a comprehensive national risk assessment, there exists partial risk assessment for Hungary, as part of national or international projects.

In 2007 the Joint Research Centre's Institute for the Protection and Security of the Citizen published a report on “Risk Mapping in the New Member States,” a result of research carried within the 5th and 6th Framework Programmes, aimed, among others, at examining the existing situation in the 10 PECO (standing for Pays d'Europe Centrale et Orientale; French for Countries of Central and Eastern Europe) countries for mapping of eight priority natural (floods, forest fires, storms, earthquakes, landslides) and technological hazards (industrial installations, transport of dangerous goods and contaminated lands).¹¹⁶⁹

From a methodological point of view, the JRC project relates “high risk” with a hazard that is present within the vast majority of the country (more than 2/3 of it) or, alternatively, when the hazard is confined only to particular areas but in case of an accident, the effect could be significant for at least one major population centre or an important economic resource.

Table 9: Classification of Risks.

Type of risk	Territory	Population/resource affected
High risk	HR>2/3	Major population centre
Medium risk	1/3<MR<2/3	Minor population centre
Low risk	LR<1/3	No population centre affected

For Hungary, qualitative analysis by national experts classified the eight hazards as follows:

¹¹⁶⁶ Council conclusions on Further Developing Risk Assessment for Disaster Management within the European Union, <http://register.consilium.europa.eu/doc/srv?l=EN&f=ST%208068%202011%20INIT>.

Figure 5: Risk Mapping of Hungary.

- Carrying low risk relevance – storm, earthquakes, landslides
- Medium risk relevance – industrial installations, forest fires, contaminated lands
- High risk relevance – floods, transport of dangerous goods

It is also worth noting that in a related report ¹¹⁷⁰ on flood risk mapping, no less than six examples involving Hungary were quoted to show how increased number of floods in eastern and central Europe, had been affecting life of citizens on a large scale, namely:

- July 1997 in Poland, the Czech Republic, Slovakia and Hungary;
- November 1998 in Hungary and Slovenia;
- March-April, July 1999 in Hungary and Romania;
- April-May 2000 in Hungary and Romania;
- March 2001 in Hungary and Romania, June-July 2001 in Poland;
- April and August 2002 in Romania, Hungary, the Czech Republic and Slovakia

Floods

¹¹⁷⁰ “Risk Mapping of Flood Hazards in the New Member States,” JRC Scientific and Technical Reports, available at: http://eusoils.jrc.ec.europa.eu/Esdb_Archive/eusoils_docs/other/EUR22902EN.pdf.

As evident from statistical data tabled below, floods have affected the largest number of people in Hungary and together with droughts have been most damaging to the country's economy.

Table 10: The most affecting (in terms of financial damage) disasters in Hungary for the period 1900 – 2014.

Disaster	Date	Damage (000 US\$)
Drought	Jun-86	500000
Flood	15/05/2010	440000
Drought	May-92	384000

Table 11: The most affecting (in terms of people killed) disasters in Hungary for the period 1900 – 2014.

Disaster	Date	No Killed
Extreme temperature	Jul-07	500
Flood	1/5/1970	300
Extreme temperature	Dec-01	81
Extreme temperature	27/12/2005	48
Storm	Feb-99	40
Extreme temperature	Jan-08	17
Extreme temperature	Feb-12	16
Flood	9/7/1999	8
Storm	1/2/2003	7
Storm	20/08/2006	5

In Hungary, there are two any legal instruments that mandate or guide official mapping of flood hazards, namely Act LXXIV of 1999 and Act LVII of 1995. Hungarian authorities produce national maps for floodplain inundation areas of 1/100 and 1/1000-year frequency. Most of the maps are in paper, and some are digital. National, regional and provincial maps were created in 1977 and have not yet been updated, while the municipal were produced in 1984 and were updated in 2002. Notably, Hungary is among the PECO countries that indicated that flood hazard maps tended to contain detailed information related to flooding potential, particularly on high scale maps.

Table 12: Summarised table of natural disasters in Hungary between 1900 and 2014.

		# of Events	Killed	Total Affected	Damage (000 US\$)
Drought	Drought	3	-	-	984000
	ave. per event		-	-	328000
Earthquake (seismic activity)	Earthquake (ground shaking)	1	-	1800	-
	ave. per event		-	1800	-
Extreme temperature	Cold wave	3	114	500	-
	ave. per event		38	166.7	-
	Extreme winter conditions	1	48	-	-
	ave. per event		48	-	-
	Heat wave	1	500	-	-
	ave. per event		500	-	-
Flood	Unspecified	3	300	200	85000
	ave. per event		100	66.7	28333.3
	General flood	12	10	229883	881400
	ave. per event		0.8	19156.9	73450
Storm	Unspecified	2	9	300	10000
	ave. per event		4.5	150	5000
	Local storm	4	51	14000	-
	ave. per event		12.8	3500	-

Flood hazard data collected by Hungary includes:

- Surface water hydrometry – water level, discharge, water quality;
- Ground water hydrometry – depth, discharge, quality;
- Climatology & Meteorology – precipitation, temperature, pressure, solar radiation, evapo-transpiration;
- Soil – soil moisture deficit, permeability.

Earthquakes

Statistical studies show that four to five 2.5–3.5 magnitude earthquakes can be expected every year in Hungary, which can be felt near the epicentre, but cause no damage. Earthquakes causing light damages occur every 15–20 years, while stronger, more damaging 5.5–6 magnitude quakes happen about every 40–50 years.¹¹⁷¹ Only one earthquake in 2014 was with a magnitude of >4, thus coded orange.

¹¹⁷¹ Seismological Observatory of the Hungarian Academy of Sciences, www.seismology.hu/index.php/en/.

The Seismological Observatory of the Hungarian Academy of Sciences produces earthquake hazard maps, as well as regular earthquake bulletins.

Risk Maps

For risk mapping purposes, Hungary maintains DTA 50 and DDM 200 maps – with topic layers with information on vulnerabilities, hazard sources, etc. The maps allow searches, operations with coordinates, graphic-based selections.

1.2 Policy and Governance

Before the year 2000, the two pillars of the Hungarian disaster management were the firefighting and the civil protection organisations, carrying out disaster response and crisis management tasks. The merger into a National Directorate General for Disaster Management was regulated by the provisions of Act LXXIV of 1999 on the management and organisation of disaster protection and the prevention of major accidents involving hazardous substances. The law was aimed at providing a comprehensive framework for the activities of the central and local authorities, operating at different levels, with tasks and responsibilities in the prevention and control of disasters and in eliminating the consequences thereof.

However, disasters of the past decade exposed some deficiencies of the crisis management system. Taking these into account, a new Disaster Management Law was adopted, which came into force on 1 January 2012. The Law and related amendments; the Defence Law of 2011; and the government decree on the establishment, organisation and operation of the coordination committee for disaster management currently form the legal basis of Hungary's crisis management.

1.2.1 Strategy scope and focus

The acts listed define responsibilities “relatively well.”¹¹⁷² The changes of 2011-2012 concern the subordination of municipal firefighting to disaster management authorities, the improvement of the connection between local government and disaster management professionals, stricter control over volunteer firefighter organisations. In addition to that, an enlarged group of industrial plants and dangerous material transport belong under the supervision of disaster management authorities.¹¹⁷³

1.2.2 Monitoring and analytical support to policy making; R&D

R&D support to policy making is provided within the framework of several EU-funded projects.

SEERISK

The National Directorate General for Disaster Management (NDGDM) of Hungary is the lead partner in a project, called SEERISK, together with 19 project partners (local and regional municipalities, meteorological institutions, disaster management organisations, universities) from Hungary, Austria, Bosnia and Herzegovina, Bulgaria, Croatia, Romania, Serbia, Slovakia and Slovenia. SEERISK is aimed at improving the consistency of risk assessment legislation and practices used by the project partner

¹¹⁷² Viktoria Takacs and Piotr Matczak, “Country Study: Hungary,” Analysis of Civil Security Systems in Europe, http://anvil-project.net/wp-content/uploads/2013/12/Hungary_v1.0.pdf.

¹¹⁷³ Ministry of Interior of Hungary, National Directorate General for Disaster Management, 2012, available at: http://www.katasztrofavedelem.hu/letoltes/eng/szervezet/NDGDM_intro.pdf.

countries at national and local level, especially in case of disasters intensified and/or triggered by climate change in the Danube macro-region.

The project started in July 2012 and first collected and processed risk-related information from the partner countries. Then, project partners produced a Common Risk Assessment Methodology to help create risk maps taking into account various risk factors. A GIS Best Practices Questionnaire was also developed which aims to look at the geographic information systems software, hardware and human resource penetration in the countries.

DRAVIS

The National Association of Radio Distress-Signalling and Infocommunications (RSOE) as lead partner, the Somogy County Disaster Management Directorate, the Baranya County Disaster Management Directorate, the Zala County Disaster Management Directorate, Koprivničko-križevačka County and Osječko-Barajska County are involved in a project for enhancement and geographical extension of cross-border joint planning in Hungarian-Croatian disaster management cooperation.

DRAVIS project is implemented in the frame of the „Hungarian-Croatian IPA Cross Border Cooperation Programme 2007-2013,” to improve disaster management in River Drava region. The project provides help for developing GIS and for the implementation of joint exercises for the involved Hungarian and Croatian disaster management organisations. Furthermore a web-interface information exchange system was developed, which can be used to request assistance from neighbouring disaster management organisations in case of emergency.

INCA

In the period 2011-2013 Hungary's meteorological service OMS and the Somogy County Disaster Management Directorate were part of the INCA-CE (INCA Central Europe - Integrated nowcasting system for the Central European area, <http://www.inca-ce.eu/index.php>) project, aimed at creating a common tool that allows more precise weather warnings; a transnational web-based dissemination system conveying the weather information and warnings to authorities and the public; a more efficient interface between warning data providers (weather services) and their applications and users. The project also evaluated strengths and weaknesses of current methods in natural disaster warning and risk prevention by making it easier for both public and private users to incorporate meteorological risk assessments into their planning. Project partners were from Austria, Czech Republic, Germany, Hungary, Slovakia, Poland, Italy and Slovenia.

1.2.3 Policy for Prevention

The NDGDM operates an Industrial Safety Information System which collects and stores detailed data on more than 730 dangerous plants. The system includes “data about license requests, safety analysis and safety reports, external emergency plans and other public information submitted by operators of dangerous plants.” The system contains all the information required for carrying out regular inspections and prevention tasks.

According to their activity, the plants subject to the Disaster Management Law are divided into the following categories: gas industry (87); storage of fertilizers (56); oil industry (44); power- and heating plants (31); deposits and logistics centres (63); general chemical industry (51); manufacture of medicines (13); manufacture and storage of plant-health products (48); explosives and ammunition; pyrotechnics (15); plastics industry (35); dangerous waste (23); produce and consumption of biofuel

(9), food industry (95), building industry (19), agriculture (90), heavy industry (35), waterworks, bath, swimming pool (28) and other dangerous plants (27).

The NDGDM of Hungary registers and analyses the emergency incidents involving dangerous substances and major accidents occurring in Hungary, and in accordance with the provisions of the Seveso II Directive forwards report to the MARS (Major Accident Reporting System), renamed eMARS (<https://emars.jrc.ec.europa.eu/?id=4>).

1.2.4 Policy for Preparedness

Preparedness in Hungary's crisis management system relies on early warning systems with outreach to communities, namely:

Territorial information Centre (TIC)

TIC operates a database and a GIS system in order to manage emergencies, supporting the interventions of the municipal fire brigades. In addition to that, in the Baranya County, an sms notification system was established to alert all mayors in the county at the same time, in case of emergency. Public media have also been included in order to immediately inform the population by issuing public notices in case of emergency.

Monitoring and Public Alarm System (MoLaRi)

In order to reduce risks related to disasters, in 2006 Hungarian authorities launched the MoLaRi project as a human-centred early warning system for prevention and rapid emergency response. The project focuses on major industrial accidents in the surroundings of hazardous industrial plants, where operational accidents would endanger the inhabitants.¹¹⁷⁴ In the period 2006-2013, 80 chemical and meteorological, 280 chemical monitoring stations and 565 alarms have been set up around 20 hazardous industrial plants in 9 counties in order to ensure public awareness. The system carries out continuous monitoring and measuring in the surroundings of hazardous industrial plants perceiving the concentration of poisonous and explodable gases. The data is forwarded automatically via a national centre to the 24 / 7 duty services of the disaster management directorates and relevant local fire-brigades. In case a critical level is reached, the system launches electronic alarming and information mechanisms to inform the population immediately. MoLaRi was set to TETRA standard in 2010.

Early warning system for the prevention of nuclear accidents

The system is operational since 2009 and its main activities include early warning of the whole country in case of nuclear accidents, international radiological monitoring and data exchange. There is continuous contact with national and neighboring countries' radiological data exchange centres. The system includes Radiological Telemetry Stations and their IT background.

Storm-signal systems at the lakes Balaton and Velencei (BVR) and Information and Emergency Response Systems at Lake Balaton, Tizsa River (TISR) and Danube River (DISR) are also in operation.¹¹⁷⁵

¹¹⁷⁴ Hungary: National Progress Report on the Implementation of the Hyogo Framework for Action (2009-2011) – Interim, available at http://www.preventionweb.net/files/31275_hun_NationalHFAprogress_2011-13.pdf.

¹¹⁷⁵ Hungary: National Report 2009-2011 of Hungary on the Progress on the Implementation of the Hyogo Framework for Action, available at http://www.preventionweb.net/files/27580_hyogo20082011tisza.pdf.

1.2.5 Policy for Response

The national emergency number for fire-fighting (105) has been linked to the regional Operations Management Duty Services, where experienced fire fighters receive the calls and alert manpower and assets, according to the type of the incident. They direct them to the site in the shortest possible time, taking into consideration technical and economical requirements.¹¹⁷⁶

1.2.6 Policy for Relief and Recovery

The Red Sludge case study in section 4.1 provides some information on the policy for relief and recovery “in action”.

1.3 Financing

1.3.1 Investing in preparedness

According to the National progress report on the implementation of the Hyogo Framework for Action (2013-2015)¹¹⁷⁷, substantial resources were invested in the development of the volunteer fire service. Accordingly, the support in 2012 amounted to 120 million Ft, in 2013 – to 220 million Ft and in 2014 – to 300 million Ft. This made it possible to supply and operate special technical equipment and tools, to restore vehicles and their equipment, to provide training, as well as communication equipment.

1.3.2 Investing in consequence management

The Hungarian government operates a vis major fund (i.e. money allocated from the central budget) that is activated upon a government decision. After the red sludge spill in 2010, the Government covered the affected municipalities' extra expenditures and the cost of the reconstruction of municipal properties with money from the fund. Thus Devecser received a grant of over HUF 1,6 bln., Kolontar – of almost HUF 50 mln., Somlovasarhely – of over HUF 270 mln. and Tuskevar – of HUF 242 000. The three former municipalities also received subsidies amounting to a total of HUF 503.707 mln.¹¹⁷⁸

In addition to that, a government decision of 04 November 2010 on the mitigation of damages of the spill, on financing the reconstruction and rehabilitation and on the mitigation of further damages to non-residential buildings was adopted, classifying the area designated for construction as an investment area with the intention to build new houses to replace the destroyed ones.

A total of 120 new houses were built in Devecser and Kolontar. Besides that, 127 used properties were purchased for over HUF 1.2 bln., while 117 victims of the disaster received cash compensations. The government also covered so-called “green damage” (livestock, gardens, unharvested crops, etc.),

¹¹⁷⁶ Website of National Directorate General for Disaster Management.

¹¹⁷⁷ National progress report on the implementation of the Hyogo Framework for Action (2013-2015), http://www.preventionweb.net/files/43038_HUN_NationalHFAprogress_2013-15.pdf.

¹¹⁷⁸ National Directorate General for Disaster Management, Red Sludge – Hungary 2010, http://www.katasztrofavedelem.hu/letoltes/eng/szervezet/red_sludge_2010_eng.pdf.

damage caused to clothing and food deposits, motor vehicles, furniture amounting to over HUF 320 mln.

According to experts, the private insurance option is unpopular among many people who prefer the solidarity of national compensation.

International aid

Created as a reaction to the heavy floods in Central Europe in the summer of 2002, European Union's Solidarity Fund is aimed at responding to major natural disasters and express Europe's solidarity to region suffering the consequences of disasters. Since then, it has been activated on 60 occasions, including floods, forest fires, earthquakes, storms and drought in 23 European countries. As of September 2014, the Fund has provided funding of over Euro 3.6 bln. Hungary has received a total of EUR 37.6 mln of aid for the floods in April 2006 and in May 2010.

Figure 6 . EU Solidarity Fund Activations.

	April 2006	Floods	major	519	15.1	37.6
	May 2010	Floods	major	719	22.5	

Another source of funding, supporting Hungary's efforts for disaster recovery is the Disaster Relief Emergency Fund (DREF) of the International Federation of Red Cross and Red Crescent (IFRC).

Recently, in March 2013 CHF 178,068 was allocated from DREF to support the Hungarian Red Cross Society with the replenishment of their own emergency stocks, already distributed to some 15,000 beneficiaries after unexpected and belated severe winter weather in March paralysed almost half of Hungary for several days.¹¹⁷⁹

Back in the 2001-2002 Hungary received CHF 50 000 from the DREF after an appeal related to heavy floods resulting in a record-rise of the levels of river Tisza and its tributaries rose. In addition to that, Hungary received CHF 165,752.47 (in cash) and CHF 215.859 (in kind).¹¹⁸⁰

Over the last years several governments (Austria, Czech Republic, Germany, Slovakia, Switzerland) have also provided support (cash or in-kind), based on bilateral agreements with Hungary for managing the consequences of various disasters.¹¹⁸¹

1.4 Policy review, Evaluation & Organisational Learning

1.4.1 Post-Disaster Assessment

In the last years, post-disaster assessment has been high on the agenda of Hungary's Commissioner for Fundamental Rights (i.e. the Hungarian Ombudsman). After the red sludge spill in October 2010, the Commissioner launched a complex assessment of the state's tasks related to disaster manage-

¹¹⁷⁹ DREF Operation Update, Hungary: Extreme winter conditions (2013), <http://reliefweb.int/sites/reliefweb.int/files/resources/Extreme%20winter%20conditions%20-%20DREF%20operation%20no%20MDR%20HU001%20Update%20no%201.pdf>.

¹¹⁸⁰ DREF Operation Update, Hungary, Romania, Ukraine: Floods (2003), <http://reliefweb.int/sites/reliefweb.int/files/resources/1054ED87F4BA87BD85256CAA0066E519-ifrc-hun-08jan.pdf>.

¹¹⁸¹ Authors' processing of information by UNOCHA (<http://fts.unocha.org/>).

ment and an examination from a fundamental rights protection perspective the cooperation of state organs in the event of disasters.

The findings of the examination were included in the Annual Report of the institution of 2011. In the Report, the Commissioner recommended that the relevant legal base needed revision, pointing out that “legislation relating to the prevention and management of disasters should, as far as possible, be unified, simplified and their number should be reduced.”¹¹⁸²

Further, the report noted in disaster management regulations “one should as far as possible avoid a parallel regulation of identical subjects or regulations relating to the same subject which are different or contrary to each other.” The report indicated that a very complex management mechanism was in place, regulated by a multitude of acts. Further, the report called for “regular and real training” for the mayors and their specialised staff in order to be able to perform their tasks in full.

The report also went back to the deaths resulting from the severe storms (case discussed in detail below, in section 4.1) in August 2006 and stressed that in case of a disaster “informing the public was and is a legal obligation of the disaster management organs, therefore such information must be given in a professional way and using such terminology which is in line with the terminology used in weather reports. Citizens can only adequately cooperate in the prevention and management of situations of danger or of disasters if they are aware of the given threat. For this purpose we need appropriate information material which gives comprehensible information to the public.”¹¹⁸³

1.4.2 Departmental Lessons Learned systems

No specific information could be obtained.

1.4.3 Centralised (national) Lessons Learned system

No specific information could be obtained.

1.4.4 International exchange for Lessons Learned

Section 3.2 delivers more detailed information as to the international cooperation maintained by Hungary’s NDGDM in various formats, which is also pertinent to the exchange of lessons learned.

1.4.5 Regular policy reviews

Within the framework of or with the support of international organisations (UN, EU) studies and reports have been produced on aspects of the Hungarian disaster management policy, organisation and practice. Two examples are listed below:

The ANVIL project, funded by FP7, provided an assessment of the Hungarian crisis management capacity from the point of view of ‘civil security’, focusing on three criteria: legitimacy, effectiveness, and efficiency. The project has produced ‘key findings’ but did not draw policy recommendations.

¹¹⁸² Report on the Activities of the Parliamentary Commissioner for Civil Rights in the Year 2011, available at http://www.ajbh.hu/en/web/ajbh-en/annual-reports-archiv#_48_INSTANCE_zBJ6X6dsEcyu_=http%3A%2F%2Fwww.ajbh.hu%2Fstatic%2Fbeszamolok_en%2F%3F.

¹¹⁸³ Report on the Activities of the Parliamentary Commissioner for Civil Rights in the Year 2011, available at http://www.ajbh.hu/en/web/ajbh-en/annual-reports-archiv#_48_INSTANCE_zBJ6X6dsEcyu_=http%3A%2F%2Fwww.ajbh.hu%2Fstatic%2Fbeszamolok_en%2F%3F.

For their part, the national progress reports on the implementation of the Hyogo Framework for Action (HFA) contain self-declared strategic goals, to be achieved over a two-year period, and a self-assessment on the progress made over the two years, preceding the moment of reporting.

1.5 Resilience

Hungary has set three strategic goals in the context of the implementation of the Hyogo Framework for Action 2005-2015: Building the Resilience of Nations and Communities to Disasters:

- The more effective integration of disaster risk considerations into sustainable development policies, planning and programming at all levels, with a special emphasis on disaster prevention, mitigation, preparedness and vulnerability reduction.
- The development and strengthening of institutions, mechanisms and capacities at all levels, in particular at the community level, that can systematically contribute to building resilience to hazards.
- The systematic incorporation of risk reduction approaches into the design and implementation of emergency preparedness, response and recovery programmes in the reconstruction of affected communities.

1.6 Information sharing and data protection

No specific information could be obtained.

2 Legislation

2.1 Crisis (emergency, disaster) management concept

The “Security threats and challenges for Hungary and their management” part of the Hungarian National Security Strategy says in art. 33 that “due to its geographical characteristics, Hungary is particularly exposed to the effects of environmental and civilisation hazards emanating from the countries bordering the Carpathian Basin, to floods and water and air pollution. The environmental sources of danger also have an indirect effect on the health of the population.”¹¹⁸⁴ Art. 34 notes that “Uncontrollable processes in certain industrial, biological, chemical and especially nuclear facilities may jeopardise or cause damage to the health of masses of people, as well as to the environment, the security of life or property. Further risks are posed by the transportation of hazardous goods by land and rail, on waterways, in the air or through pipelines.”

As regards the ways and means to implement the strategy in its part concerning crisis management, art. 50 states: “Hungary must increase capabilities at its disposal with a view to allowing the operation of a complex prevention system ensuring a quick, effective and well-organised response to natural or industrial disasters in order to protect the life and essential property of the population, and to minimise consequences. Special attention must be paid so that such a response interferes as little as possible in the life of the population and the activities of the productive units in the course of reacting to events. To this end, organisations concerned need to be in possession of tools required for command, control and implementation, both domestically and internationally. In line with international processes and requirements, special attention must be paid also to the usability of internal crisis management capabilities abroad, and to the optimisation of capability development on site.”

2.2 General crisis (emergency, disaster) management law

The general act regulating the field of disaster management was adopted by the Hungarian Parliament in September 2011, entering into force on January 1st, 2012. The disaster management law stipulates the tasks of various ministries and the composition of the Disaster Management Governmental Coordination Committee (DMGCC), i.e. the state level of Hungary's disaster management system. The Act further defines the role of the county and local protection committees, operating at the regional and local level, respectively. The professional disaster management authorities operate under the supervision of the Minister of Interior. These include the National Directorate General for Disaster Management, county directorates for disaster management, local branches and disaster management posts.

In practice, the Act and Hungary's Fundamental Law (relevant provisions are discussed below) updated the rules pertaining to prevention and preparedness, enabling “effective extraordinary measures in case of disasters and emergencies and establishing a uniform disaster management system.”

¹¹⁸⁴ Hungary's National Security Strategy, available at <http://2010-2014.kormany.hu/download/4/32/b0000/National%20Security%20Strategy.pdf>.

2.3 Emergency rule

In terms of emergency rule, the Hungarian Fundamental Law ¹¹⁸⁵ of 2011 distinguishes between four extraordinary states of legal order – of national crisis, of emergency, of preventive defence, and of danger.

According to the Fundamental Law, the Parliament declares a state of national crisis and establishes the National Defence Council in the event of a state of war or an imminent danger of armed attack by a foreign power. The state of emergency is declared “in the event of armed acts aimed at the overturning of the constitutional order or at the exclusive acquisition of power, and of serious mass acts of violence threatening life and property, committed with arms or in an armed manner.” State of preventive defence is activated “in the event of a danger of external armed attack or in order to meet an obligation arising from an alliance.” The state of danger is declared by the Government in the event of “any natural disaster or industrial accident endangering life or property, or to mitigate the consequences.”

2.4 Specific, department/agency-level legal arrangements and regulations on emergency and disaster management

A list of legal acts that pertain to the roles of agencies and departments in disaster management:

- Act XXXI of 1996 on the protection against fire and technical rescue work and the fire service
- Act CXVI. of 1996 on the peaceful use of nuclear energy
- Act CV of 2004 on the Hungarian Defence Forces and National Defence ¹¹⁸⁶

2.5 Specific to the regional and local authorities legal arrangements and regulations on emergency and disaster management

No specific information was obtained.

2.6 Legal regulations on the involvement of volunteers and specialised NGOs

There exist a number of instructions that regulate the involvement of volunteers in disaster management. An exhaustive list could be obtained from the website of the NDGDM. ¹¹⁸⁷

¹¹⁸⁵ The Fundamental Law of Hungary, available at <http://www.kormany.hu/download/e/02/00000/The%20New%20Fundamental%20Law%20of%20Hungary.pdf>.

¹¹⁸⁶ A comprehensive list in Hungarian is available at: http://www.katasztrofavedelem.hu/index2.php?pageid=hatosagi_kozerdeku.

¹¹⁸⁷ Available at http://www.katasztrofavedelem.hu/index2.php?pageid=szervezet_jogszabaly.

2.7 Legal regulations for international engagements of first responders and crisis managers

Hungary (through NDGDM) maintains bilateral relations with 17 countries (Austria, Azerbaijan, the Czech Republic, Greece, Croatia, Poland, Latvia, Lithuania, Macedonia, Germany, Russia, Romania, Serbia, Slovakia, Slovenia, Turkey, Ukraine and Mongolia) based on government agreements for disaster management.

The organisation puts special emphasis on enhancing cooperation with neighbouring countries and on the development of operational work. A framework agreement with each of Hungary's seven neighbouring countries for cooperation in disaster management is in place. Close cooperation is based on the fact that there are cross-border disasters, eradication of these joint efforts of the countries concerned in that we need. This is true for prevention activities, as well as disaster relief.

Within the framework of the Central European Initiative, in 1996 Hungary was among the parties signed Cooperation Agreement¹¹⁸⁸ on the Forecast, Prevention and Mitigation of Natural and Technological Disasters, together with five more countries, aimed at:

- exchange of scientific and technical information and relevant data on a regular basis;
- implementation of common research programmes;
- training of experts in the field of forecast, prevention and relief, in order to set up common programmes on Civil Protection and Disaster Management

Several EU documents and pieces of legislation apply to crisis management at EU and member state level.

- Treaty establishing a Constitution for Europe;
- COM (2010) 673: Objective 5: Increase Europe's resilience to crises and disasters - Action 2: An allhazards approach to threat and risk assessment
- Directive 2007/60/WE of the European Parliament and of the Council of 23 October 2007 on the assessment and management of flood risk;
- Council Directive 2008/114/EC of 8 December 2008 on the identification and designation of European critical infrastructures and the assessment of the need to improve their protection;
- Council Directive 82/501/EEC of 24 June 1982 on the major-accident hazards of certain industrial activities (Seveso);
- Council Directive 96/82/EC of 9 December 1996 on the control of major accident hazards (Seveso II);
- Directive 2000/60/EC of the European Parliament and of the Council of 23 October 2000 establishing a framework for Community action in the field of water policy

It is also a signatory of the Convention on the Transboundary Effects of Industrial Accidents.

¹¹⁸⁸ Available at http://www.biicl.org/files/4299_cei_cooperation_agreement.pdf.

3 Organisation

3.1 Organisational chart

The National Directorate General for Disaster Management (NDGDM) within the Ministry of Interior is the national authority for disaster management.

As of 1 January 2012 a new organisational structure of the NDGDM was introduced,¹¹⁸⁹ which has been built on three pillars: civil protection, fire protection and industrial safety, with the National Inspectorate General of Fire Services, the National Inspectorate General of Civil Protection and the National Inspectorate General of Industrial Safety constructing the backbone of the NDGDM.

The main tasks of the National Inspectorate General of Fire Services include prevention activities, firefighting, coordination of tasks related to firefighting and technical rescue activities during emergencies and disasters; providing guidance for unified implementation of activities related to fire protection; etc.

The National Inspectorate General of Fire Services carries out the tasks pertaining to the field of fire protection in cooperation with the citizens, partner organizations, business and voluntary organisations and, last but not least, with industrial and local governmental fire brigades and fire associations.

The activities of the National Inspectorate General for Industrial Safety, which is responsible for tasks related to industrial safety, include four main functions: the supervision of hazardous plants, the control of the transportation of dangerous goods, the protection of critical infrastructures, and averting nuclear accidents.

The NDGDM has 20 county directorates (for the 19 counties and for the capital, Budapest), namely:

1. Baranya County Directorate for Disaster Management
2. Bács Kiskun County Directorate for Disaster Management
3. Békés County Directorate for Disaster Management
4. Borsod Abaúj Zemplén County Directorate for Disaster Management
5. Csongrád County Directorate for Disaster Management
6. Fejér County Directorate for Disaster Management
7. Győr Moson Sopron County Directorate for Disaster Management
8. Hajdú Bihar County Directorate for Disaster Management
9. Heves County Directorate for Disaster Management
10. Jász Nagykun Szolnok County Directorate for Disaster Management
11. Directorate for Disaster Management of the Capital
12. Komárom–Esztergom County Directorate for Disaster Management
13. Nógrád County Directorate for Disaster Management
14. Pest County Directorate for Disaster Management

¹¹⁸⁹ Ministry of Interior of Hungary, National Directorate General for Disaster Management, 2012, available at: http://www.katasztrofavedelem.hu/letoltes/eng/szervezet/NDGDM_intro.pdf.

15. Somogy County Directorate for Disaster Management
16. Szabolcs Szatmár Bereg County Directorate for Disaster Management
17. Tolna County Directorate for Disaster Management
18. Vas County Directorate for Disaster Management
19. Veszprém County Directorate for Disaster Management
20. Zala County Directorate for Disaster Management

The operational disaster management structures at the county level include¹¹⁹⁰:

- 65 Branch Offices for Disaster Management;
 - 46 Disaster Management Offices;
 - 65 Disaster Management Guards;
- 105 Professional Fire Departments;
 - 60 Local Government Fire Brigades;
 - 72 Industrial Fire Brigades;
 - 564 Volunteer Fire Associations.

As regards civil protection units, there are 47 central civil protection organisations with 452 of personnel subordinated to the NDGDM. According to information as of 2012, the non-professional, volunteer and obliged civil protection organisations include civil protection organisations of settlements (20609) and civil protection organisations at the workplace (1011).¹¹⁹¹

An important part of the Hungarian crisis management system is the professional rescue team with specialised equipment that has been established under the auspices of the NDGDM, called HUNOR (Hungarian National Organisation for Rescue Services), which can also operate abroad, when needed. HUNOR is tasked with the search for and rescue of victims trapped under ruins, and with the provision of first aid, if necessary. In areas affected by earthquakes its tasks include technical rescue, removing victims and ensuring their chances for survival. All of the professional firefighters who have applied for the rescue service have several years' experience in technical rescue and four or five special qualifications.

In addition, the HUSZOR medium urban search and rescue team has been created with the involvement of voluntary rescue services with national qualifications and of the local organisations of civil protection.

The two teams were certified as meeting the respective UN INSARAG Guidelines in 2012 on the basis of a 36-hrs field exercise.

Disaster Management Governmental Coordination Committee

The Disaster Management Governmental Coordination Committee (DMGCC) is an inter-agency coordination body ensuring consistency between sectors. Its chair is the Prime Minister of Hungary, while its members are the relevant ministers. The meetings are attended by the directors of the law en-

¹¹⁹⁰ Website of the National Directorate General for Disaster Management, in Hungarian, http://www.katasztrofavedelem.hu/index2.php?pageid=szervezet_szervezeti_abra.

¹¹⁹¹ Ministry of Interior of Hungary, National Directorate General for Disaster Management, http://www.katasztrofavedelem.hu/letoltes/eng/szervezet/NDGDM_intro.pdf.

forcement agencies, the Chief of the Defence Staff and the heads of relevant national authorities. DMGCC is the Government's decision support organisation. The DMGCC operates the National Emergency Management Centre, which coordinates operational tasks, collects the necessary information, evaluates and analyses them together with leadership of the professional disaster management body, involving experts from the ministries.

Protection committees

At county and local level, protection committees are in charge of decision making for crisis preparedness and response. Protection committees are under central coordination; the members are stakeholders (local authorities, representatives of disaster management bodies, etc). As of 1 January 2012, the county protection committees are chaired by the county government commissioner, while one of their vice-chairs is the county disaster management director, while the other is a representative of the Ministry of Defence. The chairs of the local (municipal) protection committees are the heads of the government's district offices.

Table 13: Levels of Hungarian Crisis Management System.

	State Level	County Level	Local Level
Coordination	Disaster Management Governmental Coordination Committee	County Protection Committee	Municipal Protection Committee
Management	DGDM	County Directorate of NDGDM	
Operational element		Professional Fire Departments	Municipal Fire Departments

Disaster Response Platform

Another consequence of the reorganisation of the Hungarian crisis management system was the establishment of Hungarian National Platform for Disaster Reduction in 2001. The Hungarian platform is now working under the NDGDM and is presided by the Director General of NDGDM. The members of the platform include:

1. Government organisations: ministries
2. Non-governmental organizations
2. Scientific institutions
3. Media
4. Private sector organisations
5. Private companies

The aim of the platform, comprising over 30 members who meet once a year, is to discuss their contribution and efforts taken in the field and to come up with new ideas to reduce disaster risks. NDGDM updates the platform members' on the current international DRR themes and upcoming events. Additionally, certain members of the platform also belong to the governmental coordination committee described above and the Humanitarian Assistance Coordination working group of the Ministry of Foreign Affairs.

3.2 Organisational cooperation

NDGDM is actively engaged in international activities within EU, NATO and UN.

NDGDM represents Hungary in the Civil Protection Workgroup of the Council (PROCIV) and other relevant task forces, and acts as the official national contact point for the Emergency Response Coordination Centre (previously EU Monitoring and Information Centre (MIC) – the body responsible for tasks related to providing and requesting international assistance.

In Hungary NDGDM also coordinates civil emergency planning (CEP) activities, and participates in the meetings of the NATO Civil Emergency Planning Committee (CEPC) and in the work of the Civil Protection Group (CPG). Furthermore, the NDGDM is the national contact point for NATO's Euro-Atlantic Disaster Response Coordination Centre (EADRCC).

NDGDM serves as the national contact point for the UN OCHA.

Last but not least, the NDGDM is involved in formats such as the Disaster Preparedness and Prevention Initiative for South-Eastern Europe (DPPI SEE); the disaster management cooperation in V4; the International Association of Fire and Rescue Services (CTIF); and the Federation of the European Union Fire Officer Associations (FEU).

4 Procedures

4.1 Standing Operating Procedures (SOPs) and Guidelines

The Red Sludge Accident

Hungary's most severe test to disaster response procedures was an industrial accident that occurred on 4 October 2010, when a corner of the dam of one of the reservoirs collapsed on site at the Ajka Alumina plant (operated by Hungary's MAL). As a result, almost one million cubic meters of red sludge and alkaline water were freed and flooded the lower parts of the settlements of Kolontar, Devecser and Somlovasarhely. Ten people were killed during and after the sludge flow, almost 300 persons were hospitalised. The total number of people affected by the accident was over 700. More than a thousand hectares of arable land were contaminated.

A waste product of alumina (form of aluminium oxide) production, the red sludge was measured to have a very high pH (11-14), which was responsible for severe chemical burns to humans and animals and killing specimens in the rivers and in the contaminated soils.

After several alerts by the local population the police alarmed the Ajka Professional Fire Brigade. Two trucks and nine fire fighters were sent on site. After due reconnaissance was carried, the chief fire officer alerted the rest of the personnel. In the first phase of the reconnaissance, the fire-fighters had no information on the composition of the red material, which resulted in 17 rescuers, fire-fighters, policemen, soldiers receiving burns and respiratory damages. As the regular fire-fighting equipment was not suitable to cope with such an incident, the rescuers had to use civilian earthmoving machines, bulldozers. At a later stage, all fire and rescue forces available in the county, including volunteer fire brigades, fire-fighting associations, special rescuers, joined their efforts to rescue the population in Kolontar (60 persons) and Devecser (over 700 persons).

Acting on basis of the Constitution and the Act on Civil Protection of 1996, the Hungarian Government declared emergency for three counties – Veszprem, Győr-Moson-Sopron and Vas, effective as of 1500 hrs, 06 October 2010. An Onsite Operational Staff was established to manage the process of mitigating the consequences of the accident, involving civil protection, fire fighting, police, and military units, and volunteers.

Onsite tasks focused on the cleanup of built-in areas, decontamination of outer areas, and on the elimination of damage to living waters.

The Police organised checkpoints to regulate the traffic. On 9 October partial evacuation was ordered for the Kolontar (40 people) and Devecser (500 people). Lodging was provided to affected people, staying at the settlements, by the municipalities and charity organizations provided lodging.

On 6 October the following services and equipment were on site at Kolontar and Devecser.

Service	Staff	Equipment
Fire Service	84	12 vehicles
4 Emergency Detection Teams (EDT)	12	
Police	103	22 vehicles

Military	174	39 vehicles
Civil Protection	29	20 vehicles
Civilians	149	43 machines
National Medical Service	5	2 vehicles
MAL	50	
Total	606 persons	142 units of equipment

By 20 October the number of people and equipment involved in mitigation activities reached 1,125 and 292, respectively. In November, a total of 8,535 persons and 4,881 units of equipment took part in the relief and recovery efforts, with an average of 400 to 500 persons and 70 units of equipment involved on a daily basis.

In the meantime, NDGDM issued daily reports to EU Member States through the EU Monitoring and Information Centre. Additionally, the NDGDM requested, through EU MIC, experts with relevant experience to consult the process of mitigating the environmental damage. On 9 October the EU MIC sent a liaison officer to Hungary and on 11 October, a five-member team consisting of Belgian, German, Swedish, French and Austrian expert arrived onsite. A Swiss environmental expert from the UN Environment Program, exchanging information with the team, and experts from UN World Health Organisation, making assessments in Devecser, concerning the health status of the population, were also involved in the recovery phase.

After the end of its mission, the EU team issued both short- and long-term recommendations. On 18 October European Commissioner for International Cooperation, Humanitarian Aid and Crisis Response, Kristalina Georgieva also visited the site.

On 4 November a Governmental Coordination Centre for Reconstruction (GCCR) was established from the professional disaster management personnel. The GCCR managed the decontamination, rehabilitation and reconstruction tasks. The state of emergency was lifted and the GCCR disbanded on 1 July 2011.

Storms in Budapest

A severe hit Budapest on 20 August 2006, causing havoc during the celebrations of the National Holiday. Around 1.2 million citizens attending fireworks display were hit by storm and hail shortly after the display started at 21:00 local time. Torrential rain and winds of over 120 km/h tore down trees, smashed cars and windows and ripped tiles off rooftops. Five people died and hundreds were injured as a result of the storm.

The Hungarian Meteorological Service (OMSZ) had issued the forecast about the storm on its publicly available web-based warning system, with a red code. Additionally, on the day of the tragical event the service had sent several warnings to the disaster management authorities¹¹⁹². The main reasons for the tragic event to happen, as concluded by an inquiry of the Commissioner for Fundamental

¹¹⁹² Marta Sallai, "The Tragical Story of the August 20,2006," Website of the World Meteorological Organisation, <https://www.wmo.int/pages/prog/drr/events/Pula/Presentations/MHEWSHungary.pdf>.

Rights, were serious legal deficiencies pertaining to the communication among the responsible parties and the responsibility for taking preventive measures.¹¹⁹³

In its report, the Commissioner asked “asked the Minister heading the Office of the Prime Minister, the Minister of Local Government and Regional Development and the Minister of Justice and Law Enforcement to make the necessary arrangements to redress the disclosed improprieties” and issued several recommendations:

- for a legal regulation of the OMSZ,
- for reconsideration by the Assembly of Budapest Capital of the rules defining the tasks and operation of the Budapest protection committee
- for issuing by the Minister of Local Government and Regional Development of a ministerial decree on detailed rules of the national disaster management regulations.¹¹⁹⁴

In practical terms, the following changes have been made in the Hungarian crisis management system:

- As of October 2006, the OMSZ has been a member of the operational staff, responsible for organising national celebrations, so the staff receive first-hand meteorological information. Since 20 August 2006 the meteorological support is a compulsory part of the management plan for every state-organised event;
- For its part, the OMSZ refined the criteria for issuing warnings, in order to avoid confusion. Code “red” is now only issued in the case of the most dangerous, rarely occurring weather events. The web-based system of the service was updated, and an alarm page has been established, accessible to everyone from the front page of met.hu.¹¹⁹⁵

As a result from the improvements, on 20 August 2007, albeit in different weather conditions, a storm of similar intensity hit Budapest during the National Day celebrations. OMSZ had already forecasted the storm in the morning hours. The hundreds of thousands of people who took part in the events (air parade, cultural programs, religious procession etc.) were informed of the weather conditions through screens and loud speakers. As a result of the concerted efforts of the authorities, nobody was hurt during the 2007 storm.

4.2 Operations planning

Information could not be obtained.

4.3 Logistics support in crises

Information could not be obtained.

1193 Annual Report on the Activities of the Parliamentary Commissioner and the Deputy Commissioner for
Civil Rights in 2006, <http://www.ajbh.hu/en/web/ajbh-en/annual-reports-archiv#48> INSTANCE zBJ6X6dsEcyu =[http%3A%2F%2Fwww.ajbh.hu%2Fstatic%2Fbeszamolo en%2F%3F](http%3A%2F%2Fwww.ajbh.hu%2Fstatic%2Fbeszamolo%20en%2F%3F)

Story of the August 20, 2006," Website of the World Meteorological Organisation."

4.4 Crisis communication to general public; Alert system; Public Information and Warnings

The “Red Sludge” accident represents an example of how crisis communication is carried out in Hungary.

Before and during the evacuation, the communication with the people from affected settlements was carried through public information materials, including rules of conduct, the contents of the emergency package, notification of disabled persons, rules of self-evacuation, route of evacuation and reception points. A total of five evacuation zones were designated, comprising about 200 residential buildings and one or two streets per zone, between 25 and 65 residential buildings per zone.¹¹⁹⁶

In the meantime, due to movement restrictions in the affected areas and the state of emergency, communication was centralised. Furthermore, spokespersons were appointed to help the work of media and guide media representatives to the reservoir, the evacuation sites, etc. in a controlled manner. The Hungarian authorities were extremely cautious when providing information about the disaster for fear of loss of credibility, economic paralysis and potential diplomacy issues with neighbouring countries.¹¹⁹⁷

¹¹⁹⁶ National Directorate General for Disaster Management, Red Sludge – Hungary 2010.

¹¹⁹⁷ National Directorate General for Disaster Management, Red Sludge – Hungary 2010.

5 Capabilities

5.1 Human resources

Volunteer associations

The Hungarian volunteer law, Act LXXXVIII of 2005¹¹⁹⁸ on voluntary activities in the public interest, defines "volunteer activities with a public aim" as work carried out within a host organisation without compensation. In article 4, the law also specifies that any person with legal capacity above the age of ten can become a volunteer.

According to data by the Hungarian Statistical Office, in 2010 there were nearly 65,000 registered non-profit organisations. Among those, 1.4% declared to have civil protection and fire protection related activity, 3.75% - public safety related activity, while 5,749 were charity organisations.

Since 2012 the involvement of volunteer rescue services in crisis management operations is only possible if the organisations meet certain requirements, which is verified by means of certification exercises. If the volunteer services passed the "exam," they could take part in different type of rescue activities in cooperation with the NDGDM for 5 years.

Private business

Private business is involved in crisis management activities in a number of ways. For example, the training for the fire protection exam is done by private companies. The registration of training organisers and examinations is coordinated by the disaster management directorates at the county level. Also, under the SEVESO directive the industrial plants have an obligation to prepare internal security plans, risk assessments and special reports in case of accidents. Similarly, critical infrastructure security analysis is required. Those activities could be performed by registered experts / companies. Among the members of accredited rescue teams can be private companies with specific expertise.

5.2 Materiel (non-financial) resources

An example for outsourcing some of the logistic activities is the agreement with the association of transportation companies. The Association of Hungarian Forwarding and Logistic Services signed an agreement with NDGDM on outsourcing some logistic tasks for private logistic companies. The agreement contains certain tasks like transportation preparedness, storage of sand bags, and provision of rescue staff for flood protection. As a result, the overall costs of preparedness will be smaller, and the capacity of NDGDM can be used more efficiently.

5.3 Training

Disaster Management Education Centre

¹¹⁹⁸ Act LXXXVIII of 2005 on voluntary activities in the public interest www.civil.info.hu/uploaded/documents/onkentes/1212746798vol_act_pub_int_2005_hu.pdf.

Since year 2000, a Disaster Management Education Centre has been operational in Hungary, which focuses on professional training for disaster management, fire and civil protection, and industrial safety outside the school system as defined in the laws on vocational and adult education. This institution is also a national examination centre. The training is supported by taking advantages of opportunities provided by tenders, international relations, professional events and exercises. The staff and the students may be involved in operations in case of major disasters as it happened in case of floods and the red sludge disaster 2010. The Centre provides methodological support for on-site training and for the operation of the newly formed district educational centres.

In addition to that, the Hungarian authorities organise trainings for (high-level) officials, such as: protection committee chairmen, mayors, regional administrative staff, notaries, etc. According to the NDGDM, as of 2012 a total of 3,629 people had undergone training. The regular disaster management trainings for mayors are often linked with civil protection exercises. The trainings for notaries are organised in the framework of the county notary meetings.

Teachers in Hungary are also involved in relevant trainings, aimed at enhancing their awareness of disaster management and at equipping them with adequate information for preparing effectively their students. The programme has two levels – awareness training courses, organised twice a year, where teachers may receive disaster management knowledge, teaching methodology guidelines, and knowledge in related areas such as environment protection, consumer protection, energy security, first aid and panic treatment.; and one-day long trainings in local schools. They latter are carried out by the heads of the local civil protection branches once a year. Between 2003 and 2010, 559 teachers took part in disaster management trainings (305 persons from the capital and 254 persons from the counties). Several educational materials for teachers are available on the homepage of NDGDM.

In addition to that, each year the NDGDM announces the national disaster management youth team-competition for the 10-18- year old members of associations, organizations, clubs. The competitions are organised on local, on regional and national level with the aim to reach out to children and young people.

Institute of Disaster Management of the National University of Public Service

The Institute of Disaster Management of the National University of Public Service, which comprises the Department of Disaster Management Operations, the Department of Fire Protection and Rescue Control, and the Department of Industrial Safety, was established on 1 January 2012. In 2013 the Institute planned to launch an independent BSc programme in disaster management with three specialties - in disaster management operations, fire protection and rescue control, and industrial safety.

EU-funded trainings

Crisis management structures are also involved in EU-funded trainings, such as EU-HUROMEX 2008. The project (from 1 January 2008 to 30 June 2009) included the preparation, implementation and evaluation of a full-scale simulation exercise of civil protection interventions in case of serious flooding and the recovery of damages to the critical infrastructure.

5.4 Procurement

5.4.1 Procurement regulation

In Hungary, new provisions are applicable regarding public procurement as of 1 January 2012, i.e. the Public Procurement Act (PPA).

The law is criticised for reasons related to transparency as art. 9 lists no less than 13 cases in which the procedures laid down in the Act shall not apply, including when the fundamental security and national security interests of the country are concerned, and in the field of defence public supplies, services and works specifically designed for military and public order purposes.

According to art. 4, p. 4 of the Act, “procurement related to fundamental security interests of the country” is any procurement the subject-matter of which is directly linked to public works, public supply and services, which may exercise an influence on the physical, environmental, health, economic, national defence security of the population, including procurement in the benefit of preventing immediate flood damage in times of flooding emergency.

The PPA distinguishes among public procurement reaching EU thresholds (Part II of the Act) and national procedures (Part III of the Act). The latter are applied when public procurement contracts do not exceed EU thresholds and at the same time are equal or above national thresholds.

The “national thresholds” are determined annually by the Budget Act of Hungary and for the current year they are, exclusive of value added tax, as follows:

For the purposes of Part III – except for Chapter XIV (defining special rules for the contract award procedures in the public utility sector) – of the PPA:

- for public supplies and services: HUF 8 million
- for public works: HUF 15 million
- for public works concessions: HUF 100 million
- for service concessions: HUF 25 million

For the purposes of Part III, when applied together with Chapter XIV of the PPA:

- for public supplies: HUF 50 million
- for public works: HUF 100 million
- for public services: HUF 50 million

Also importantly, art. 122, p. 7 of the Act stipulates that the “contracting authority may launch a negotiated procedure without prior publication of a contract notice in the following cases as well: (a) If the estimated value of public supply or services does not reach HUF 25 million (app. EUR 81000, current currency rates on 21 October 2014) or the estimated value of public works does not reach HUF 150 million (app. EUR 488 000).”

Part III, art. 120(h) (h) stipulates an exception of the provisions of Act when the procurement is below EU threshold – “to Article 3(e)(f)(i)(k) of the Act LXXIV of 1999 on the management and organisation for the prevention of disasters and prevention of major accidents involving dangerous substances; as well as, in case of a crisis, emergency or serious situation, to public procurements carried out with the aim of preventing epidemic diseases in animals, directly preventing or avoiding damage caused by serious industrial or traffic accidents or by water, preventing adverse impacts on water quality, as well as for the purposes of protective preparedness or the subsequent reconstruction.”

5.4.2 Procurement procedures

The National Directorate General for Disaster Management is responsible for organising procurement in the field. For example, since 2012 the NDGDM has published at TED contract notices for services, work or supply, including but not limited to:

- digital cadastral maps
- disinfecting and exterminating services in urban or rural areas
- fire engines
- firefighting vehicles
- natural gas
- security services
- security, fire-fighting, police and defence equipment
- site-safety equipment
- software package utilities

5.5 Niche capabilities

The HUNOR and HUSZOR are considered described in detail in section 3.1 are considered as good examples of niche capabilities with respect to Hungary's CM system.

Driving Innovation in Crisis Management for **E**uropean **R**esilience

IRELAND

Policy, Legislation, Organisation, Procedures & Capabilities (PLOPC) in crisis management and disaster response

Responsible Partner: Q4PR (Michelle Comer, Peter MacDonagh, Martin Mackin, Ruth O'Byrnes)

Scope and limitations

This study serves as supporting information for further work within DRIVER.

Only limited time and budget has been available for this first general survey, which needs to be considered in terms of scope and completeness of the respective studies.

The author/s of this study is/are responsible for its content and quality.

This report was revised at the end of 2015, reviewed internally by CSDM and amended according to reviewer's comments and recommendations upon the decision of the author/s.

Background & Overview

Background

While Ireland has experienced a number of significant emergencies it has not suffered disasters of the severity and scale witnessed by other EU member states. Its geographic position means it has limited vulnerability to most high-impact natural disasters. Flooding and sustained winter storms are the principal events for which coordinated crisis management procedures have been deployed. The EU's Solidarity Fund has been used to assist Ireland only once – for flooding in 2009.

In the national risk assessment procedure the Irish authorities have identified the country's exposure in relation to energy supplies and ICT infrastructure as having particular potential to have severe impact. In the same context, a major disruption of maritime trade has been identified as representing a potential severe crisis.

Ireland organises its crisis management and resilience capabilities through the principles of a national framework, identified principal responders, comprehensive risk assessment and 'all hazards' preparation. It does not have significant specialist crisis management agencies or legislation.

Overview:

- Due to Ireland's relatively small experience of widespread crises the overall policy focus is on developing strong basic emergency services and then ensuring that they are capable of coordinating and upscaling in order to deal with exceptional situations. The priority is to embed key assessment and preparation steps within organisations rather than to develop separate stand-alone organisations or capabilities.
- Ireland has a well-developed system of strategies and coordination for crisis management and disaster response. This is mostly operated on an administrative rather than statutory basis.
- Strategic policy is set out at a cross-government level and is then supplemented by sectoral strategies and Standard Operating Procedures to be implemented within agencies and across a wider coordinated response.
- An active approach is taken to risk assessment at both national and local levels.
- An ongoing process of strategic planning and coordination is implemented on a cross-government basis led by the Office of Emergency Planning and the Government Task Force. The core response strategy is 'all hazards' with principal responders identified for each potential crisis and a coordination system for wider national crises.
- Principal response agencies cooperate and jointly plan at the national, local authority and non-statutory regional levels.
- Key stakeholders are: the Office of Emergency Planning (based in the Department of Defence), Department of the Environment, Community & Local Government (especially through its National Directorate for Fire and Emergency Management), the Health Service Executive, local authorities (including the fire service), an Garda Síochána (police service), Office of Public Works (flood control), utility companies (all are public sector), military, transport companies and critical infrastructure operators.
- Ireland has a relatively flat government structure, with just 31 local authorities and no statutory regions under the central government. As such, it is in a position to ensure the relatively consistent implementation of agreed strategies at national, regional and local levels.
- Mitigation and preparedness activity varies by sector. A national climate change policy is in place. Flood mapping is being expanded and made publicly available. This is accompanied by investment in flood prevention measures. Public health authorities run ongoing public awareness campaigns promoting responses which are relevant to major public health hazards.
- The bulk of financing is incorporated within the budgets of principal response agencies and is not separated from funding for ongoing work. As such it is not possible to estimate national financing for the area.
- Ireland has a number of prominent NGOs with extensive experience of humanitarian aid projects. Together with state agencies, these give Ireland a significant expert base for international emergency humanitarian activity as well as longer-term mitigation and recovery efforts.
- The Irish Army and Garda Síochána have 60 years of experience in peace-keeping and related work through the United Nations and OSCE.

- There is no specialist crisis management agency and no state of emergency legislation for natural disasters.
- There is no national alerting system though there are sectoral procedures including a colour-coded weather alert system and some local text and telephone warning systems.
- A range of NGOs supplement state activity particularly in the response and recovery phases.
- The impact of policies is difficult to assess. However, the after-event report on the severe winter storms in the period 2013-14 showed the impact of these storms, particularly in terms of loss of life, being significantly below the levels of two decades previously. The detail of warning and response activity would suggest that much of this improvement is attributable to recent planning and coordination work.

RWG	Regional Working Group
SAR	Search and Rescue
SOP	Standard Operating Procedure

List of Definitions

All Hazards approach: An approach to major emergencies that recognises the common features of coordinated response and the management of common consequences regardless of the origin of the emergency.

Command: the process of directing the operations of all or part of a particular service or group of services, by giving direct orders.

Control: the process of influencing the activity of a service or a group of services, by setting tasks, objectives or targets, but without the authority to give direct orders.

Coordinate: to bring the different elements of a complex activity or organisation into an efficient relationship through a negotiated process. In an emergency context this may include a mandate/ authority to make certain decisions in pre-defined areas, where a normal consensual approach does not appear to meet the needs of an emergency situation.

Cooperate: to work together towards the same end.

Collaborate: to work jointly on an activity.

Hazard: Any Phenomenon with the potential to cause harm to members of the community, the environment or to the physical infrastructure, or being potentially damaging to the economic and social infrastructure.

Impact: The consequences of a hazardous event being realised, expressed in terms of a negative impact on human welfare, damage to the environment or the physical infrastructure or other subsequent consequences.

Lead Department: The government ministry or agency identified as leading on a particular hazard.

Major Emergency: is any event which, usually with little or no warning, causes or threatens death or injury, serious disruption of essential services or damage to property, the environment or infrastructure beyond the normal capabilities of the principal emergency services in the area in which the event occurs, and requires the activation of specific additional procedures and the mobilisation of additional resources to ensure the effective, co-ordinated response.

Risk: The combination of the likelihood of a hazardous event and its potential impact.

Risk Assessment: The process by which the hazards facing a particular community are identified and analysed in terms of the threat or risk that they pose.

Risk Management: Mitigation includes all actions taken to eliminate or reduce the risk to people, property and the environment from the hazards which threaten them.

Systems Approach: The systems approach to Major Emergency Management involves a continuous cycle of activity. The principal elements of the five-stage management cycle are; hazard analysis/ risk assessment, mitigation risk management, planning and preparedness, coordinated response, and recovery.

Ireland has relatively little experience of widespread crises but has a well-developed crisis management system. The core policy divides strategic and ongoing considerations from implementation. A substantial focus is on developing strong basic emergency services and then ensuring that they are capable of coordinating and upscaling in order to deal with exceptional situations. The priority is to embed key assessment and preparation steps within organisations rather than to develop separate stand-alone organisations or capabilities.

1.1 Risk Assessment

Ireland has a limited experience with dealing with crises on a national scale. For example, the November 2009 floods remain the only example of a crisis reaching a scale where Ireland applied for support from the EU's Solidarity Fund.

Ireland undertakes an ongoing approach to risk assessment at both national and local levels. Ireland also ensures compliance with EU requirements¹²⁰³ that Member States develop a national risk management strategy which will support an EU approach to the prevention and management of natural and man-made disasters.

The Office of Emergency Planning publishes *A National Risk Assessment for Ireland* the latest version of which was published in December 2012.¹²⁰⁴ This document details a systematic approach to risk assessment across all areas. Risk assessment starts with an examination of the potential impact (severity of consequences to life and health, property and infrastructure, and the environment) of the hazards identified. A five-point scale is then used for categorising both impact and likelihood, ranging as shown in Tables 1 & 2. In considering the potential impact of a hazard two factors are taken into account - the type or nature of the impact, and the scale.
